For twelve months the law raged, to the great profit, doubtless, of the parties employed, on the one side to labour through the most revolting falsehoods and attempts at villany, and on the other to defeat them. The law, as usual, showed its total impotence, where it would have been for the interests of society that it should have power. It can apprehend, imprison, arraign, convict, and execute, in the course of a very few days, a misled and miserable creature, who, unwilling to starve, puts forth his hand and steals to satisfy the cravings of his hunger; but it takes years, and an enormity of expense and labour, to bring to conviction the villain who contrives to abuse the confidence of his friend, and finally dismisses him, with only an injunction to restore the plunder he has in the mean time purposely spent or secreted; and by means of which he can still, by the forms instituted for the protection of the honourable and unfortunate, secure himself from all punishment whatever. This is "a sore evil under the sun;" but this evil exists; and let the young and sanguine beware of it, for it is sufficient to dry up the springs of humanity for ever, and give us gall for blood.

While the supreme court of the kingdom was sitting to weigh the gross falsehoods of a reckless plunderer, that plunderer was disposing of and dissipating the fruits of his spoil, in open day, and laughing at the law and all who relied on it.

Meantime his victim was ruined. His engagements for this scoundrel, the expense of a tedious and weighty law-suit in the endeavour to bring him to justice, and some considerable failures in other quarters (for when misfortunes come they come in troops), completely overpowered him. Some friends

(for, to do the world justice, he *had* friends) obtained him the protection of the court, when he was little heedful of what was done, by rendering him a bankrupt, under one or other of the fictions known in law; and he accordingly appeared in that rank that puts a gulf for ever between its occupants and the hopeful world. I saw him in the first days of his grief! and, like a soldier that has been branded with cowardice, he seemed to think that every eye was turned upon him in wonder. He felt unfit to breathe the very air that was breathed by ordinary men! His anguish was indescribable!

And this was not the first of it. For weeks and months before this he had not enjoyed a sound sleep, either from apprehension of what was to happen, or anxiety to devise the means of warding it off. Often did he rise with a palpitating heart and burning brain, to seek, in wandering through his dark apartment, some mitigation of the torture of a sleepless pillow! It was wonderful that rupture of the brain did not follow, or insanity or imbecility relieve him from the tortures of a rational consciousness, to deliver him from the tortures of a consciousness without reason. He escaped all, but to end in a misanthropy and suspicious hauteur, that for a time equally distorted his feelings. No longer a solvent citizen, he shunned the resorts of all men. When he could not avoid meeting a friend, he waited with the most searching suspicion to be recognised; and if not recognised, or not in the style which he conceived had been usual, or his situation demanded, from that moment he refused to be recognised at all; and all peace and truce was at an end between them!

I attended the meeting of his creditors, where I understood some proposal was to be made in his name; but to my astonishment he himself appeared. He had heard that some questions had been asked, and some difficulties started; and pride, that makes a man shrink in ordinary circumstances, impelled him in circumstances of more moment to come forward with a decision that put all ceremonies to flight. He explained every thing with the greatest clearness and the most imperturbable temper, though I could see that every question seeming to infer a shadow of suspicion rivetted his eye on the propounder. There was at last, at the very last, some asperity in his manner; and the person answered ventured to remark, that he seemed to conduct himself as if he were the party injured. "And so I am!" he exclaimed. "You have lost twenty pounds, or such part of it as I cannot pay. I have lost ten thousand! You are the creditor or pretended creditor of an infamous scoundrel! and through him have got hooked on me; and you come here to badger me with questions and suspicions, that ought never to have stood in my presence!" With that he seemed disposed to avenge himself somewhat summarily; but the individual having, it is presumed, satisfied his curiosity, very speedily left the apartment. After this a proposal for compromise seemed out of the question; but it was made, of an amount beyond what the estate could in any probability pay, and with security. This was all that could be desired. But unfortunately the security was cavilled at. A man—a devout man too—and now rich, but who, as it proved, had formerly been otherwise, and while in these circumstances had received many kindnesses from the individual then before him, both in person and in family, had become a creditor through his wish to serve him, and remained a creditor by mere accident. This individual doubted the ability of the proposed cautioner to pay. "I do not mean that he should be called upon," said the bankrupt calmly; "I intend to pay myself. But you are of those wise persons, who having trusted, and been happy to be allowed to trust a man for twenty shillings, cannot, when it happens to be necessary, think of trusting him for less! or perhaps, as you are a religious man, you wish to punish your debtor, as you wish those to punish you who may have debts against you! or as I have fed and clothed you and your children, you think the proper return is to endeavour, as far as in you lies, to prevent me from ever feeding myself, or my children if I should ever have any! If your voice is necessary to my release, may I never receive it in this world! and if it is necessary to remain one moment longer where you are, in order to settle this business, here the business must end, so far as I am concerned!"—and with that he walked from the apartment. It is obvious that such a spirit was not fitted for the part assigned it. He was incapable of following out his release through such a process as the law had rendered necessary, and he from that moment relinquished all thoughts of it.

Yet he was not subdued. He fell into no vice, and submitted to no meanness; but, determined to be restored where he had been hurt, he continued where he was; and, pursuing the avocations left to him, as if nothing had happened, determined to suffer imprisonment rather than submit to the degradations necessary to extricate himself. He lived by tolerance, unmolested, till, his character restored, and confidence so far regained, he found the means of satisfying every claim; and seems likely to die, an instructed, but cold and unconquerably retiring man.

His plunderer lives, but universally avoided; and has often, with his brood, known something of the misery he inflicted, and which they had mocked at. But the punishment of a villain is a slender compensation to society for the loss of a useful member, or to that member for the loss of every comfort of mind and person to which his character had entitled him.

The moral of all this is, that FACILITY, when carried too far, is attended to the individual, and may be so to his family, with all the consequences of crime, except its shame; and that if we wish well to ourselves, if we would even continue to think well of human nature, we will avoid, as at once a crime and a folly, the first approaches of FACILITY.

IRISH COTTAGERS.

We do not know who Martin Doyle is,—we are not so much as informed if this be his real name; but we have no hesitation in allowing that he is one of the most prolific and useful writers at present belonging to "poor old Ireland." Martin is a great writer of shilling publications—half volume and half pamphlet, every one of which is intended to instruct the Irish peasantry in some important particular affecting their condition, and calculated—if they would but "take a thought and mend," to raise them in the scale of civilization and comfort. Martin's "Hints to small Farmers" is a complete system of agriculture, suited to men who cultivate from half a dozen to a dozen acres; his "Hints on Planting," and "Roadmaking," are something of the same nature; his "Address to Landlords" should be read by every absentee and resident proprietor; his "Hints to Emigrants" we have already commended; and his "Irish Cottagers" gives us an insight into the interior of Irish cabins, and presents us with a correct picture of the mode of life of the inmates—their marriages and deaths, fights and frolics,—interlarded with the moral, which, by the way, has been seldom or ever told the Irish before—that they owe most part of their misery to their own misconduct and idleness, and that there is little or nothing to hinder them from being happy and comfortable, provided they would be but industrious. Our honest friend Martin gives us the example of a good and bad cottager; and for the benefit of my readers across the water, we shall endeavour to extract the story of the first of these characters from the different parts of the publication in which he is mentioned.

STORY OF MICK KINSELLA.

"Ah! then, could I be after spaking a few words to you, Peter Brady?" said old Daniel Kinshella, some years ago, to the other, as they were leaving their parish chapel on the Sunday before Shrove-tide, and proceeding together in the direction of their homes, which were in the same township.

"To be sure you can, Dan," responded Peter; "and why shouldn't you? Aren't we neighbours, and neighbours' childer, these hundred years and more? And haven't you a good right to ax me what you please, when I know 'tis all in civility?"

"I'll tell you, Peter," said Daniel; "and if you're not plased, why we won't be any worse friends, I expect, after. My boy Mick has a liking for your daughter Joanny" (something like a grunt from Peter); "and so I was thinking, as we're neighbours and neighbours' childer ourselves, we might knock up a match between them: that's what I wanted to say to you."

"Dan," replied Peter, "Mick Kinshella is no match for Joanny Brady, barring you maue to give him the biggest half of your little houlding, a couple of cows, and lashings of money besides. The best boys in the parish are after Joanny, I can tell you, because they know I'll give her!"

"Ah! then, what will you give her?" so quickly demanded Daniel, as to embarrass, for a moment, his cautious companion, who had no intention whatever of having the depth of his purse fathomed, or of prematurely committing himself in this or in any other matter of bargain.

"Why, I'll give her penny for penny with you, Daniel Kinshella."

"No," said the other, "that won't do; but I'll tell you what Mick Kinshella shall have, since he's so entirely bothered about the girl. I'll divide the parkens equally with him, perch for perch, and give him the brindled cow, and the year old breeding sow, and (after a pause) five guineas in gold."

"It won't do, Dan; you must mend your hand."

"Why, Peter Brady, man, you're mighty hard upon me this day, of all blessed days in the year. Where would I get any more, barring a sheep or two?"

"Well, Dan, give me your hand," taking and slapping it on the palm. "Double the five guineas, and it's a match."

Here Peter Brady's hand was seized by his friend, who giving it a tremendous bang in return, offered, by way of a clincher, two guineas more.

"Seven guineas, Peter; that's the sum total of what I'll give Mick, provided that you give Joanny the thirty hard guineas you have in the box."

"No; make it the even ten guineas," rejoined Peter, "and it's a contract; and I'll give Joanny five-and-twenty guineas in hand."

"Split the difference," sagaciously hinted Dick Doyle, who had just come up, "and let us have a naggin at Pat Colfer's; for there's no luck in a dry bargain anyhow."

"I won't brake your word, Dick," added each of the old boys; so, after a little more hard dealing, when matters were pretty well concluded, they drank—something more than one naggin, you may be sure, at Peter Brady's expense, in Pat Colfer's little parlour, without altering the terms already stated, farther than making mutual stipulations, through Dick's management, that Joanny was to receive a bed, and some other articles of furniture, with two geese and a gander, from her father, while it was admitted by the other party that the marriage-money should be paid by the Kinshellas, and, what was of more importance to the young folks, that they should live, for the first year, turn about with their parents.

These preliminary arrangements being thus concluded, and the marriage determinately fixed on, it only remained to consult Father Murphy, the aged and respected priest of the parish, as a point of duty; and to submit the matter, as an affair of courtesy (a due proportion of self-interest, of course, involved in it) to Mr Bruce, the landlord, a gentleman of rank and character, who a few years before had left England, where he had been chiefly educated, to reside altogether on his Irish estate, in the vicinity of which he became acquainted with a very charming woman, to whom he soon became united by marriage. From the former a wedding was almost sure of approval, from the latter it met no discouragement in this case; and as the young people had long before made up their minds to the match, there was nothing to prevent it from taking place on the succeeding Shrove-Tuesday. It is true that there were a few trifling things to be looked to—beef and mutton, turkeys and geese, chickens and bacon, puddings and pies, whisky and sugar, and a few bottles of port for Father Murphy, his coadjutor, and the landlord (whose condescension in promising to appear for an hour or two at the wedding excited no little vanity in the two families so especially interested), cakes and bread, tobacco and candles, were to be provided; besides petticoats, shifts, caps, shoes, stockings, cloak, bonnet, and gloves. However, as there was nearly a day and a half for the buying, killing, scalding, plucking and cooking, cutting out, stitching, sewing, washing, starching, and drying these necessities for the inside and the outside; and as Joanny Brady, always prompt and diligent, now laboured with double assiduity, the aforesaid preparations were completed in due time. Fortunately there was no need of an attorney to draw up a settlement; the stipulated fortune was paid into Mick's hands an hour or two before the priests and the squire had arrived, and just as nine or ten pair of young men and women were in view, riding double, and "fiery red with haste," to win the bride's garter. One of the jockeys in this sweepstakes, however, was so intent, as many a greater man has been, on the garter, that he left the companion with whom he started, pillion and all, sprawling on the spot where she had fallen from her seat, and arrived singly at the winning post; but not having brought up his weight, he was sent back, very properly, for the girl he left behind him. But the secrets of this wedding shall not be disclosed by me. I might be extremely entertaining and communicative on this subject, if I thought proper to indulge my humour, and could relate many things which occurred at it; for instance, how, when the cloth was taken off, the plate of cake was handed round, first to the landlord, who took a bit, and laid down a guinea in its stead, and how crowns and half-crowns emulously followed, in contribution to the priest's fees; and how Father Murphy drank a blessing to the newly married couple, in a bumper out of his own bottle, which nobody else presumed to meddle with; and how the bride's heart thumped against her ribs when she got up to dance before the gentlemen, and how gracefully she did "heel and toe," and "covered the buckle," and "cut it across;" and how Tom Duff came for the coadjutor to marry him to Mary Donohoe, although he had promised the day before to have Biddy Doyle; and how Biddy got over her disappointment by taking Pat Whelan; and how the coadjutor had afterwards to perform the same ceremony for Mr Bruce's four dairy-maids and their lads; and how tired both their reverences were from all the duty they had discharged in this way during the two days and nights preceding; and how Father Murphy's watch was an hour slower on this night, just to keep within canonical hours; and how the same accident, as to time, had annually happened at the same hour, for half a century preceding; and how he rode home on his own horse that night, which was remarkable, as he was a very absent man, and usually mounted the first horse that was brought to him, provided that he was a steady, sober-going beast, like his own, and somewhat of the same altitude and colour; and how Mick Kinshella, when he was retreating to the bridal bed-room, escaped from the volley

of cabbage stalks which was prepared for him, by cleverly throwing his coat and waistcoat over Nick Moran, who was drunk in a corner of the kitchen, and only roused to sensibility by receiving on his own person the whole discharge of the vegetable artillery which had been designed, according to custom, as a *feu de joie* for the body of the bridegroom; and many other events of that wedding I could also narrate, if I chose to do so; but I won't disclose a single particular that happened, because even if I had been there (and no matter whether I was there or not), I make it a point of honour to keep all matrimonial secrets to myself.

During the year which they passed with their respective parents, our new married folks were industriously employed. Mick, having hired an able young fellow to assist him for a month or two, commenced his mud-walled house, and Joanny plied the wheel (she had sown half a rood of flax on her father's land during the preceding year), until she had as much thread spun as furnished her with a good supply of strong sheets and table-cloths; she also spun two stones of wool for blankets, and made up cheap calico curtains for the bed and window of the intended sleeping room, as neatly as if they had been executed by the mistress general of the Education Society's Model School in Dublin, which confessedly sends out some excellent hands at all kinds of needlework; nor did she allow this occupation to prevent her from keeping Mick's shirts and stockings in good order, nor even from adding a few pair to his supply.

Mr Bruce had recommended that their united fortunes should be deposited in a saving bank, and only taken out as necessity required; a plan of good management from which the young couple afterwards derived profit and comfort. The building of the house, however, cost a smart sum in the first instance; and the hire of the man, during Mick's busy time, came to four pounds, besides the sum expended in the purchase of an ass and cart, and a good heap of dung, and some lime, from a neighbour who was going to America, which, when paid for, left very little in the bank; but still the *nest egg* was there, a matter of great moment to the thrifty and provident.

Mick at first had thought of buying a horse; but when Mr Bruce showed him that his capital would be totally sunk by doing so, and that the farm could never afford such an incumbrance, he adopted the plan of buying the ass for drawing the manure from the emigrant's farm, and materials for roofing and thatching the house from the wood, and his father's bawn, where he got the straw for nothing.

The first piece of farming work was to level the furze fences (if crumbling and uneven banks deserve the name), which, during the time of his grandfather and father, had, at different times, on one foolish plea or another, been raised to divide and subdivide the ill-tilled and dirty fields which they inclosed. By this process the *tenth* part of his land, previously lost to any useful purpose, was brought into cultivation, and not an inch of his four acres (the total quantity of the little farm) left useless; and as much furze stumps and faggots were collected from these levelled fences as afterwards supplied half a year's fuel.

While Mick was engaged in throwing down these mouldering banks, Mr Bruce rode into the field; for this gentleman was constantly encouraging and directing the rural improvements on his estate, as well as promoting the household comforts of his tenants; and seemed highly pleased with Mick's economy of his land, and took the opportunity of explaining to him, that the only parts of those ditches or banks then valuable were the tops and sides, though they had originally formed the worst part of them. He pointed out the fact, that if a bank be made for the purpose of a fence, suppose four or five feet wide at bottom, and diminishing to three at top, the stuff of which that bank (or ditch) is made will in the course of no great number of years entirely alter its nature and condition; for, in the construction of the bank, all the productive soil is at the bottom, and all the unproductive in the upper part; yet, after a lapse of years, when it comes to be levelled, the qualities or characters of its constituent parts will be found exactly reversed: the top will have become mellow and kindly soil, and all parts of it *which were not too far removed from the action of the air* will be found to have improved, while even the fertile surface, or rather the surface which had been fertile when the bank was built, will be found to have changed its texture, to have become hard and stiff, and to have forfeited all claim to fertility. Mr Bruce, therefore, advised Mick to lay off the upper part and sides of his old broken ditches (the dykes of which were very narrow, and not deep), and to dig the foundation part of the bank pretty deeply, filling up the small dykes with part of it, and covering the entire of the levelled surface with what had been laid aside; and assured his young tenant, that when the whole mass should have been exposed for two or three years, by repeated diggings, to the influence of the air, with the addition of some enriching substances, those new parts of his fields would become as productive as any other.

"But here," continued Mick's landlord, pointing

to half an acre of wet land, "you have something to do. Is there a spring in this place to be cut off? or has an under drain been closed? For surely it cannot have been left by your father and grandfather in this unprofitable state, without some effort to drain it."

Mick, however, honestly stated that it had never been thought *worth while* by his predecessors to mend such a *small patch* (although they would at once have gone to law if a square yard had been damaged, or encroached on, by a neighbour), which had been found to answer grazing purposes well enough in summer. It appeared that there was no spring to be cut off, but that a stiff impenetrable bottom prevented the surface waters from soaking downwards; that, while in winter it was in a state of mortar, in dry seasons it was too hard, and apt to open in cracks, until saturated again with water.

"You must treat this," said Mr Bruce, "in the Gloucestershire way. Lay it in ridges thirty feet wide, a few of which will include all the diseased part, and raise them to the height of three or four feet in the centre."

Mick, who though he had never seen nor heard of such highly elevated and broad ridges, had judgment enough to inquire if corn crops would ripen evenly on land so formed, the sunny and sheltered side being likely to ripen sooner than that which would be exposed to the prevailing winds, and less open to the sun.

"It is true," said the landlord, "and I give you credit for your inquiry, that one side will ordinarily produce a better crop than the other; but, on the whole, the return from a field so managed will be much greater than from ridges laid in a flatter form, with a *much greater number* of furrows, which, from being always under water in wet weather, will never yield anything but sour grass in summer. Take your spade and shovel," continued he, "throw off *all* the corn earth, or upper soil, into rows at the distances I have recommended; then shape the hard under clay in the intermediate space into ridges four feet high in the centre (work, in short, as if you were making a road, except in making your ridges much higher than for that purpose), and then spread the earth which you had removed equally over this new surface. By this mode of treatment you will render your land *perfectly* dry at all times, which, with such an under soil, could not be the case even if drains were cut in it as close as the bars of a gridiron; and all your upper soil will be of uniform depth; and when once these ridges are formed, they are completed for ever."

In occasional conversations of this kind, Mick acquired much solid knowledge from his benevolent landlord, which he immediately applied to practice, to the surprise of his neighbours, who could not be persuaded that he was not making a fool of himself by changing the *old method*. One notion, however, quickly got into their heads, namely, that he was only trying to humour the master, and that all his losses, for losses they anticipated as certain) would be made good by him. But this never proved to be the case; because Mick became a gainer, not a loser, by following the new system recommended to him; and Mr Bruce, on principle, abstained from giving any undue advantages to this man, whom he designed for a model to his other small holders. It is true that he gave a fair and accommodating time for paying up the rent, and in this way was more indulgent to him than he would have been had Mick's general habits been different, and his husbandry practices unimproving.

To stimulate his tenantry to the improvement of their farms, and the cleanliness, and even embellishment of their cottages, Mr Bruce had, two years before this time, proposed annual premiums, which, after a very careful and rigid inspection at midsummer, were distributed, according to a fixed scale, among those whose houses, fields, gardens, orchards, and cattle were in the best condition; there was at the same time a minute inquiry into the moral state of each competitor's family, with a well-understood condition that no candidate whose children were of proper age to receive benefit from the schools provided for them, should under any pretences be excused for neglecting to avail themselves of the advantages which these seminaries afforded.

On one of those days in June, when, even in comparatively rude and unimproved districts, the face of nature has that smiling appearance which gladdens the heart of man, which makes him feel that even merely to exist is happiness, the Bruces, the Gumbletons, Father Murphy, Doctor O'Neill the medical superintendent of the dispensary, and several strangers invited for the occasion, assembled at the "great house" to breakfast, after which the visiting procession issued forth in all the pomp of visitatorial dignity. The list of prizes comprehended many heads:—cottage premiums—green crops, including clover and vetches, for summer, and mangel wurzel, turnips, cabbage, and rape for winter food—stall feeding—dairy management—hedges—trees, &c. &c. The respective claims being minutely examined into, each successful candidate was classed according to his merit.

The state of Michael Kinshella's house and farm was as follows: First, as to the interior of his house

the floors, which had been remarkably well and evenly laid with a composition of yellow clay and lime, were as clean as possible; the dresser well scrubbed, and filled with its pewter garniture as bright as silver; the tables perfectly clean; a coarse clean piece of rubber cloth hung suspended from a roller, for the purpose of wiping the face and hands before and after meals, a process especially necessary in a labouring family, whose manual operations are so varied and unceasing. The sleeping-room was equally neat and comfortable; its floor boarded, its window opening on hinges to admit the air, its curtain, as well as that of the bed, neatly arranged, the sheets white and clean though coarse, and the quilt (Joanny's patchwork while a spinster) corresponding in cleanliness. There was a decent chest of cherry-tree drawers, too, and a rack on which Joanny's bonnet and Mick's Sunday clothes were usually hung. Nor was the parlour without its appropriate furniture: a cupboard full of cups and saucers, with a somewhat ostentatious display of china plates, broken at the manor-house, but ingeniously reunited, and here "wisely kept for show," gave an appearance of snugness to the household economy, which was rendered complete by the appearance of two chubby children, the younger just learning to walk, tidily dressed in good strong linsey of home manufacture, and gazing with amazed yet delighted eyes on the group of gentry visitors.

The dairy was next inspected; it was a very little room outside the house, and with a northern aspect, just large enough for the purpose; the small churn and milk-pail, cooler, strainer, wooden bowl, and skimming dish, were each and all of them just as they should be, untainted to the smell, and perfectly clean to the eye.

The garden before the house was small, but well cropped, the walks clean, fruit trees growing in the borders, and the young thorn quicks which had been planted in the breast of the surrounding fence carefully preserved from weeds; carrots, parsnips, turnips, cabbages, onions, and beans, thriving well; and in a sheltered corner there stood nine or ten beehives.

The outside of the cottage presented a very agreeable appearance, being neatly dashed and coloured. The windows of the cottage were large, and a few hop plants and roses appeared over the front wall. Nor were these plants unprofitable: Mick had sold the hops in the preceding year for five shillings, and the roses were taken by a neighbouring apothecary in exchange for some medicines which the children required. The cow was in her shed, feeding most voluptuously on vetches, secure from the attack of the gad-fly and the relaxing effects of a hot sun, and most liberally adding to the accumulations of the dunghill. There were two sheep also confined in a little yard with a covered shed in it, fattening on the refuse of the garden vegetables and clover. A very fat pig, in a dry and well littered sty, completed the stock of this improving small holder. Nor were all these matters arranged merely for the day, and then suffered to fall into disorder.

Mr and Mrs Bruce, who had been in the habit of unexpectedly popping in on the Kinshellas, always found them in the same state. They never embarrassed these cottagers by a visit, for in their little establishment there was time and place for every thing, and every thing was timed and in its place.

The field, too, which three years before had been in a miserable condition, now showed the effects of skill and industry. According to the proposed premiums, Mick was awarded the total sum of L.4. 10s. The visitors, after expressing their admiration of the Kinshellas, proceeded on their inspection, and viewed some other premises, most of which were immeasurably inferior to those of Michael Kinshella. The last upon the list for a cottage premium was the unfortunate drunken and idle wretch Nick Moran, whose house had been so recently trimmed up for the expected remuneration, that there was hardly yet time for its decay; the panes of glass were still unbroken, so that there was not need for stopping up vacancies with the remnants of Nick's corduroy unmentionables, the crown of his *caubeen*, or the tattered fragments of his wife Molly's dirty garments.

The history of this thriving family need not be pursued further. The honest and industrious Mick gradually rose in general estimation, and even wealth, on his small farm, showing what could be accomplished under many disadvantages by the Irish small farmers, simply by paying due attention to their fields and cottages, especially if encouraged in their exertions by the presence and advice of *resident landlords*.

THE PRODUCTIONS OF NEW BRUNSWICK.

The soil seems favourable to the production of most of those grains, fruits, and vegetables which are in general request in Europe; together with the maize or Indian corn, in America always, from its being so extraordinarily prolific, a favourite article of culture. The soil, of which we are scarcely ena-

bled to give a correct geological description, has been found, in all those parts yet subjected to tillage, favourable to the production of wheat, rye, oats, barley, beans, peas, buckwheat, and flax. To these may be added the ordinary esculent roots of Europe, such as turnips, carrots, parsnips, onions, beet, radishes; with domestic vegetables, as cabbages, salads, cauliflowers, peas, &c. not omitting that invaluable root the potato, which here yields as bountiful an increase as in any country in which its advantages have yet been introduced. The islands, islets, and slips of interval near the beds of streams, afford good pasture and abundance of hay, which render the rearing of live stock easy and profitable. Botanical investigation, we believe, has not yet been pursued to the length of producing a catalogue of the various plants and grapes indigenous to the soil; but white and red clover, timothy, lucerne, browntop, sainfoin, and others, ordinarily grow in this country, and produce satisfactory crops.

Apples, plums, cherries, currants, gooseberries, strawberries, raspberries, and cranberries, are plentiful, and form the ordinary produce of gardens; some grapes, of small size but good flavour, are also produced; whilst hazel nuts, beech nuts, and butter nuts, abound in the woodlands, and falling on the ground after the great frosts in large quantities, furnish a seasonable assistance towards the fattening of hogs. There are, besides, a variety of wild plants of trifling value, which it would be here superfluous to enumerate, especially without a scientific classification.

The animals found in this country differ but little from those which characterise the United States. The moose deer, or elk, has been nearly extinguished by the avidity with which it was pursued by the early settlers for the sake of its skin. Bears, foxes, wolves, cariboo, sables, racoons, the minx, squirrel, weasel, musk rat, wild cat, and that valuable animal the beaver, are also natives of the soil, and, though not abundant, are not extinct.

The ordinary domestic fowls of Europe, such as turkeys, geese, ducks, fowls, are here reared with every facility; whilst partridges, wild geese and ducks, and pigeons, furnish objects for the sportsman. Crows, owls, and swans, are also found, with many small birds, offering no peculiarities worthy of description.

The rivers abound with salmon, shad, eels, trout, perch, chub, and smelt; and the harbours, coasts, and adjacent fishing ponds supply large quantities of cod, haddock, mackerel, and herrings.—*Macgregor's British America.*

SCHOOLMASTERS.

In the article upon SCHOOLS in a recent number, I forgot to allude to a circumstance of particular moment to English readers. In various papers on the subject of a general system of education in England, the writers have usually represented the impossibility of procuring as many as perhaps ten or twelve thousand men capable of being parochial teachers. This, I am happy to state for their satisfaction, need be no longer an obstacle. Scotland could take in hand to furnish at present two or three thousand individuals every way suited to the duties of a country schoolmaster, and would, with little or no trouble, send across the borders the whole ten or twelve thousand in the course of two or three years at most. The whole of these young men would possess a competent knowledge of the classics, and a general education in mathematics and other useful branches; they would possess a moral and religious character which would bear any scrutiny; they would feel no scruple in conforming to the usages of their southern brethren; while, I have reason to believe, they would be well contented with the remuneration of L.100 per annum, with the chance of rising in their profession. The proposal of irrigating England with Scottish schoolmasters is perhaps ludicrous enough, and may remind some of my readers of the native of Aberdeen, who, according to Smollet, in his Roderick Random, came to London to teach the natives English. The absurdity, is, however, more apparent than real, as the Scotch, however broad they may speak, read in a different style, and according to the just pronunciation of the language. But be this the case or not, it is tolerably evident that there is no other source from whence a large portion of the teachers could be procured than Scotland. Most unfortunately for England, it has no means of educating schoolmasters to a sufficient extent. Its universities can be attended only by the sons of the wealthiest classes, and it possesses no other gymnasia suited to the preparation of teachers. Now, the Scottish grammar schools are excellent preparatories for tutors and masters; and the Scottish colleges, with all their faults, are eminently adapted for finishing the studies of young men whose profession will not demand a knowledge of the very highest branches of classical lore. They could send forth annually some thousands of active, well-informed young men of this description, who would be willing to make themselves available as teachers in any part of the world. The

English may therefore give themselves no further uneasiness on this score; their neighbours in the north being ready at a moment's warning to afford the most efficacious assistance in the great and glorious work of disseminating the blessings of education!

DELHI.

CAPTAIN SKINNER, in his new work on India, presents us with the following vivid sketch of Delhi.

"Generally in the towns of the East the streets are very narrow, and little better than dark passages. In Grand Cairo, if you unfortunately meet a string of masked beauties upon donkeys, you must make a rapid retreat, or resign yourself to be squeezed to a mummy against the wall for daring to stand in their course, if your curiosity should tempt you to do so. The Chandy Choke, in Delhi, is, however, a great exception to this rule, and is perhaps the broadest street in any city in the East. The houses in it have occasionally balconies in front of them, in which the men sit, loosely arrayed in white muslin, smoking their hookahs; and women, who have forfeited all pretensions to modesty, are sometimes seen unveiled, similarly occupied. The din of so populous a place is very great, for every house seems as well furnished as a hive of bees. The population is nearly 200,000 souls, in an area of seven miles in circumference, which is the extent of the wall of modern Delhi. The great peculiarity of an eastern town is, that every thing is done in public; the people talk as loudly as they can, and sometimes, when engaged in unimportant matters, seem to be scolding each other in the most outrageous manner; the neighing of horses, the lowing of cattle, the creaking of cart-wheels, and the 'clinking of pewterers' hammers' (for all occupations are carried on in a little open space in front of each shop), are beyond all endurance. The trumpeting noises of the elephants, with the groaning of the camels, varied occasionally by the roaring of a leopard or a cheator (which animals are led about the streets hooded to sell for the purposes of hunting), with the unceasing beat of the tom-tom, the shrill pipe, and the cracked sound of the viol, accompanied by the worse voices of the singers, are enough to drive a moderately nervous person to desperation. Among the natives of Mahometan towns there seems to be a familiarity of manner that places every one in a moment at his ease. If a stranger enter the town and find a group engaged in any amusement, he will not scruple to join it instantly, and take as much interest in its pursuit as if he had known the members of it all his life; and then, perhaps, tendering his pipe to one of the party, or receiving one from it—a sure sign of intended hospitality—sit down and relate his history with as much frankness as if he had met a brother. The houses are generally irregular in their construction, and not unfrequently curiously decorated. Different coloured curtains hang before the doors; variegated screens serve as blinds to the windows; and the custom of hanging clothes, particularly scarfs of every hue, pink, blue, yellow, green, and white, on the tops of the houses to dry, makes them look as gay as a ship on a gala-day with all its colours flying. The clouds of dust from the number of equipages, with the insects that surround the pastry-cooks' shops, are the most intolerable plagues of all. The rancid smell of the nasty-looking mixtures that are constantly in course of manufacture before you, with the general stench of the town, is a sign that it is seldom indeed that a 'musk caravan from Koten passes through it.' I think, in the *Arabian Nights' Entertainments*, there is a story of a princess threatening to have a confectioner beheaded, if he did not put pepper in his tartlets. However despotic it may appear in this lady, I cannot help thinking it a just satire upon the pastry of the East; for to season it out of all taste of its own fundamental ingredients, is the only way to make it palatable. This cook, I think, nearly fell a martyr to the honour of his profession, and refused to be dictated to; and I do not believe any thing would induce his brethren of the present day to improve their confectionary. Riding through the town requires much management and some skill. It is necessary to shout, push, and kick the whole way, to warn the multitude to get out of the road. Occasionally you have to squeeze past a string of loaded camels, or start away from a train of elephants; and if your horse be frightened at these last animals, which is frequently the case, it needs some ingenuity to avoid being plunged into the cauldrons, which simmer, on each side of the way, in front of the cooks' shops. The fear is mutual very often; and the elephants, in attempting to escape from the approach of a horseman, may well be supposed to throw the whole street into a fine confusion. In one of my strolls through the city on horseback, I was nearly swept away by a species of simoom, caused by the progress, through the dusty town, of some important personage travelling in state. When overtaken by such a storm, it is a long time before you can recover either your sight or position. The idle cause of all this tumult was reposing quietly in a shining, yel-

low palanquin, tricked out with gilt moulding in every possible direction. He was preceded by a large retinue of strange-looking beings, mounted on horses and dromedaries, and dressed in the most fantastic style. The animals were covered with scarlet housings, bound by gold lace, their bridles studded with shells; round their necks were collars of gold or silver, with little drops hanging to them, that kept time most admirably with their jogging measure. The camels were likewise adorned with bells. The riders were in large cloth dresses, caftans, reaching from their necks to their heels, open only on each side from the hip downwards, for the convenience of sitting on horseback. These were fastened round the waist by a cotton shawl, either of white or green, in several folds. The common colours of the coats were red and yellow. A cimier hung by their sides, and they bore matchlocks upon their right shoulders. A helmet, sometimes of steel and sometimes of tin, pressed close to the head, in shape not unlike a dish-cover; a pair of jack-boots reaching to the knee, and fitting quite tight to the leg; the loose trousers gathered above, giving to the tunic the appearance of being the seat of a dropsy; and a pair of spurs resembling two rusty weather-cocks, completed the equipment of these splendid retainers. Then followed a mass of servants on foot, some naked, and some with their limbs bare and bodies covered. They carried sheathed swords in their hands, and shouted out the titles of their lord at frequent intervals in their passage through the city. They were followed by the stud, each horse beautifully caparisoned, and led by a groom; then came the elephants with their showy trappings, gilt howdahs, and umbrellas of gold or silver tissue. The palanquin, bearing the owner of these motley assemblages, at length appeared, and he was followed by a guard similar to the one that preceded him. At a distance these processions look very grand, particularly the elephants and their castles; but when near there is a great deal of tawdry and ill-assorted tinsel. The horsemen of the party add greatly to the interest of the scene, by exhibiting their evolutions upon the line of their route. Some tilt at each other with their spears, and others affect to pursue with drawn swords the runaways of the party, who, in their turn, chase their followers back into the ranks. In the management of the horse, and the use of the spear, the natives are generally very skillful; but some of the irregular cavalry of the country excel all belief in these exercises. They will gallop at a tent-peg, stuck firmly into the ground, and divide it with the point of a spear, not abating their speed in the least; and I have seen a troop of men, one after the other, break a bottle with a ball from their matchlocks, while flying past at a racing pace."

POPULAR RHYMES.

THE common people of Scotland preserve a species of poetry, which has as yet received but little attention from antiquaries, notwithstanding that in many instances it possesses an inexpressible charm both for the ear and the understanding. This poetry consists chiefly in short snatches of rhyme, which they hand down from one generation to another, respecting the places and natural objects they see around them, and which, it is easy to perceive, are in many cases almost as old as the language itself. For our own part, at the risk of being charged with puerility of taste, we have a strange liking for these old bits of natural verse, which we always think of as things that arose in a distant age, beside the happy firesides of a peasantry that lived, and breathed, and rejoiced like ourselves, but have long been inurned in forgetfulness, leaving no memorial but the songs which they sung, or the rhymes in which they embodied their simple observations and local knowledge. There is a charm, too, it must be recollected, in the mere sound of versified lists of localities; otherwise how does it happen that an ordinary reader will delight just as much in such a passage as the following in "Paradise Lost," as in any average part of that admirable poem.

His eye might there command wherever stood
City of old or modern fame, the seat
Of mightiest empire, from the destined wall
Of Cambala, seat of Cathaian law
And Samarchand by Oxus, Timur's throne,
To Paquin of Sinezan kings; and thence
To Agra and Lahor of Great Mogul,
Down to the golden Chersonese; or where
The Persian in Ecabatan sat, or since
In Hispahan; or where the Russian Kear
In Moscow; or the sultan in Bizance,
Turchestan born; nor could his eye ken
The empire of Negus to his utmost port
Erecca, and the less maritime kings,
Mombaza, and Quiloa, and Melind,
And Sofala, thought Ophir, to the realm
Of Congo, and Angola farthest south;
Or thence from Niger flood to Atlas mount,
The kingdoms of Almanzar, Fez, and Sus,
Morocco, and Algiers, &c.

The truth is, all names of places have their own peculiar associations; and thus, instead of such

verses being poor or cold, they are in reality rich in both thought and feeling. This particularly holds good respecting the local rhymes of one's native land, because the associations awakened by them are much more germane to our own hearts, as connected with all that we have held dear from our youth upward.

There is, besides, a poetical merit in some of these verses, or at least an unintentional power of exciting the mind to a certain extent. We hold, for instance, that in the rhyme which compares the respective attributes of the river Tweed, and its Northumbrian tributary the Till, there is something approaching to sublimity.

Tweed said to Till,
What makes ye rin so still?
Till said to Tweed,
Though ye rin wi' speed,
And I rin slaw,
Yet where ye doun ae man,
I droun twa.

The dreadful truth of this rhyme, the striking idea which it gives of the sullen fordless river, so noted for its destructiveness to unwary travellers, and the great force of the impersonation of the two streams, accomplished by a dash of the natural pencil in three or four lines, and involving as complete a contrast of character as if the streams were sentient beings, render this altogether a most extraordinary piece of poetry.

Of the same order, but hardly so effective, is a little rhyme respecting Perth:

Says the Shochie to the Ordie,
Where shall we meet!
At the cross of Perth,
When a' men are fast asleep.

The Shochie and Ordie are two tributaries of the Tay, falling into that river about five miles above Perth. The rhyme conveys the threat of an inundation to take place at some future time, and which shall overwhelm the sleeping inhabitants of a large city. This idea is not without its sublimity; and the words are the more impressive as proceeding from the waters which are to effect the menaced destruction. It must be observed, that the probability of such an inundation is ascertained by the historical fact, that in the year 1210 the town suffered very severely from a great rising of the waters of Tay, met by a spring-tide. It is curious, also, that the Highlanders have a rhyme of their own to the following effect:

Tatha mhor na 'n toun
Bheir i' scriob lom
Air Peart—

Signifying that "great Tay of the waves shall sweep Perth bare." It may be questioned, however, whether these rhymes refer to the past or to an expected inundation. They may perhaps be only prophecies after the fact.

It will be recollected that Dr Johnson, in his journey to the Western Islands, indulges in an enthusiastic expectation that the glories of Iona may all be renewed at some future time. "Perhaps," he says, "in the revolutions of the world, Iona may again be the instructress of the western regions." It is curious that this is in exact accordance with a Gaelic prophecy which the common people ascribe to the great Columba himself, and which is to the following effect:

An i mo chridhe! I mo ghraidh!
An aite guth nhanach gu geum ba;
Ach mun tig an saoghal gu crich
Bithidh i mara bha!

What follows is an English translation:

In Iona of my heart, Iona of my love,
Instead of the voice of monks shall be lowing of cattle;
But ere the world come to an end,
Iona shall be as it was.

Whether this ancient prophecy was reported to the learned tourist when he visited the island, is more than we can say. It is worth mentioning, however, that other sayings of the great Columba are recollected by the Scottish islanders. One is,—

Far am bi bo bidh bean,
'S far am bi bean bidh mallachadh.

He is said to have used this apophthegm on resolving to exclude the female sex from his insular retreat. The rhyme signifies literally, "where there is a cow there will be a woman, and where there is a woman there will be mischief." He found it necessary, it seems, in order that none of his followers should have an excuse for introducing a woman, to decree that there should never be a cow in Iona. We are informed, however, that at no great distance, and close to the shore of Mull, there is a snug islet, somewhat less than Iona, which bears the rather suspicious name of "Eilean nam Ban," that is, the Women's Island.

Another of Columba's rhymes is of a more pathetic sort. It promises that Iona, from its sacred character, shall be the sole port of the land of Erin (that is, of the Scoto-Irish country) which shall survive a dreadful inundation which is to take place seven years before the last day.

Seanch bliadhna roimh 'n bhra a
Thig mair thar Eirinn re an tra;
'S thar le ghluim ghlaish
Ach naambaidh Icoluim chleirich!

Dr Smith of Campbellton gives an elegant version of the rhyme in two English ballad verses:

Seven years before that awful day
When time shall be no more,
A dreadful deluge shall o'ersweep
Hibernia's mossy shore.
The green-clad Isla too shall sink,
While with the great and good,
Columba's happier isle shall rear
Her towers above the flood.

It is remarkable that a considerable proportion of the popular rhymes refer to inundations, and to the powers of water in general. In the neighbourhood of Eddlestone, in Peebleshire, is a hill of considerable magnitude, with a deep and spacious lake at the top. This is called Powbate, *pow* signifying pool. The common people often amuse themselves by the winter fire-side with speculations as to the mischief which Powbate would occasion if it were to burst through the sides of the hill. Observing the *lay* of the country, they calculate that it would deluge the whole vale of the North Esk, carrying off, in the first place, three farms in its own immediate neighbourhood. They throw their conjectures into the following shape:

Powbate, an ye break,
Tak the Moorfoot in your gate,
Moorfoot and Mauldsle,
Huntly-cote, a' three,
Five kirks and an abbacy.

The five kirks are those belonging to the parishes of Temple, Carrington, Borthwick, Cockpen, and Dalkeith; and the abbacy (which shows the antiquity of the rhyme) is that formerly existing at Newbattle.

Among the rhymes most remarkable for an imposing sound, and a strange indefinite feeling of grandeur, we would instance the following, which appears in a somewhat different shape in Gordon's *Itinerarium Septentrionale*:

Atween the camp at Ardoch
And the Greenan hill o' Keir,
Lie seven kings' ransoms,
For seven hunder year.

The space here pointed out is very small,—only the breadth of the narrow valley which interposes between the Great Roman camp of Ardoch (Perthshire), and the Greenan, *i. e.* sunny hill of Keir, on the opposite side of the Knaic water. In the most of minds, we are persuaded, this simple but most euphonous stanza will raise a train of grander ideas than many longer and more laborious compositions.

There is another which breathes the spirit of old misty tradition and early forgotten history. It is current along the coast of East Lothian and Berwickshire.

St Abb, St Helen, and St Bey,
They a' built kirks, which to be nearest the sea—
St Abbs' upon the nabs,
St Helen's on the lea,
St Ann's, upon Dunbar sands,
Stands nearest to the sea.

Not only is the melody of this as beautiful as can be imagined, but the ideas which it excites respecting the piety of the early Christian ages, when the daughters of kings were proud to assume the humblest guise of sanctity, have, by reason of the vague impression which they give, an effect exceedingly fine. St Abb, it is well known, was the daughter of a Northumbrian king, and some time in the sixth century built a small church and monastery upon the top of the wild headland which yet bears her name. The popular idea is, that she and two sisters, St Helen and St Bey (or St Ann, it seems uncertain which), contended which should build a church nearest the sea. St Abb erected hers upon the nabs or points of the headland mentioned; St Helen placed hers on a lea near Cockburnspath, where the empty walls are yet to be seen; and St Ann gained the victory by pitching hers on the very sands or beach of Dunbar, which she perhaps would not have done if she had been properly acquainted with the New Testament. The truth probably is, that the rhyme only arose as a kind of comment upon the somewhat remarkable circumstance, that three churches should have been planted near the coast in such a short space.

For these specimens we are indebted to the collection published some years ago by Mr R. Chambers, under the title of "Popular Rhymes of Scotland."

As a specimen, however, of the whimsical enumerations of localities which the peasantry sometimes compose as a relaxation in the winter-nights, we shall present one which never before appeared in print, and cannot fail, we should suppose, to tickle the ear of the reader. It embodies not only the principal localities, but also many of the families which flourished at a particular period, in the neighbourhood of Whitburn and Bathgate:—

The lang Flints o' Whitburn,
And Temants i' the Inch,
John McCall o' Bathgate
Sits upon his bench.
Tarrybaun, Tarrybaun,
Tarbane-hills and Scout-yawds,
Easter Whitburn's assy pets,
And Wester Whitburn's bra lads.
The Deuck i' the Head,
The Drake o' the Reeve,
The laird o' Craigmalloch and Birnieton-ha',
Hen-nest and hare-nest,
Cock-hill and Cripple-rest,
Belstane and the Belstane byres,
Bickleton-ha' and the Gutter-myres.

SEVENTY-NINTH REGIMENT, OR CAMERON HIGHLANDERS.

THE Cameron Highlanders were raised in 1793, in virtue of letters of service granted to a Perthshire gentleman, Allan Cameron of Errach, who, in consequence of his exertions, was appointed lieutenant-colonel-commandant. No bounty was allowed by government, Mr Cameron and his officers, who, like himself, recruited for their commissions, being at the sole expense. The regiment, on being embodied at Stirling, was numbered the 79th; and in a short time afterwards was increased to a thousand men. Scarcely were the men properly enrolled when it was found necessary, in consequence of the revolutionary war with France being prosecuted with vigour, to order them to Flanders; and they accordingly shared in the campaigns of 1794 and 1795. In the summer of the latter year the regiment embarked for the West Indies, where two seasons spent in Martinique considerably reduced it. In 1797 the privates were invited to volunteer into other corps in the West Indies, with the understanding that such of them as preferred returning to Europe should join the 42d, then under orders to embark, while the officers and non-commissioned officers should retire to Scotland to recruit for another battalion. Many preferred remaining in the West Indies, but 210 returned home—every one of whom landed in England in perfect health. In the course of a single year after his return, Colonel Cameron, who was greatly beloved in his own district, with the support of his officers raised a new corps of 780 men, who, before twelve months expired, gave proof of the gallant spirit that animated them, by deporting themselves with great bravery in the expedition to the Helder in 1799. In 1800 the regiment embarked for Ferrol under Lieutenant-General Sir James Pulteney, from whence it proceeded to join the force under Sir Ralph Abercromby destined for Egypt, in which memorable campaign it gained fresh laurels. In 1804 a second battalion was added to the regiment, the officers raising men for their promotion. In 1808 the 79th embarked for Portugal, and entering Spain under Sir John Moore, accompanied all his movements till his fall at Corunna. In the following autumn it embarked for Zealand under the Earl of Chatham, in which unfortunate campaign it suffered much less from the climate than any other corps. In 1810 it sailed for Spain, where it remained constantly employed in services of danger, till the war was carried into France, and peace proclaimed. At Fuentes d'Onor, in 1811, the 79th mainly contributed to repulse one of the formidable columns sent forward by Massena, in his repeated and desperate assaults on that village. The same observation applies to the Highlanders at the passage of the Nive in December 1813, where their cool and well-directed fire spread death along the enemy's line. At the battle of Toulouse they also bore a conspicuous part, and distinguished themselves for their steady bravery. On that occasion, in common with their countrymen of the 42d, they were mainly instrumental in carrying, and subsequently defending, the batteries which covered that city; and four officers were left dead on the field, three of whom bore the name of Cameron. On the termination of hostilities they returned to England, but were again ordered on service to Flanders in 1815, which led to their being present at the memorable battle of Waterloo. In the precursory action at Quatre Bras their discipline and military qualities were put to a severe proof, but they nobly supported the name they had won in many a former conflict. Each corps might be said to fight separately on its own ground, and to rely entirely on its own individual exertions. Not satisfied with merely repelling the enemy, the Camerons drove them off the ground, yet, at the same time (says General David Stewart, from whose work this memoir is chiefly compiled), "preserved such regularity of formation, that they were prepared for every fresh attack." These attacks were received sometimes in position; at other times

the Highlanders advanced to meet the charge of the French infantry, which never stood the onset. The cavalry were received in squares, and with equal success. In the grand struggle of the 18th June, the third day of the battle, the 79th, under Lieutenant-Colonel Neil Douglas, was in Major-General Kemp's brigade with the 28th and 32d regiments, and formed the centre of the gallant Picton's division. The 32d and 79th were stationed 150 yards in rear of a hedge occupied by a corps of Belgians and part of the rifle brigade. About two hours after the commencement of the battle, three heavy columns of the enemy, preceded by artillery and sharpshooters, advanced with a seeming determination to take possession of the hedge. The Belgians fired a volley, and retreated in great confusion. The 32d, 79th, and rifle corps, instantly pushed forward, occupied the ground left by the Belgians, and, forming upon the hedge, fired a volley and charged. This threw the enemy into confusion as they were deploying into line. The French then made an attempt to turn their opponents' right, but were received by the 28th, which opened a heavy fire as they advanced. The other two regiments followed up the advantage, by each attacking the column opposed to them; and at length the enemy had to sound a retreat. It was at this moment that General Picton fell. General Kemp was also severely wounded, but refused, with a spirit worthy of his old commander Sir Ralph Abercromby, whose confidential secretary he had been, to quit the field. The enemy, anxious to gain the position behind the hedge, repeated their attempts, but in every instance without success. The cannonading and skirmishing of the sharpshooters, however, galled the 79th dreadfully; but what it lost in number was compensated by the honour which, in common with other corps, it acquired in this decisive engagement. It is worthy of remark, that the 79th is the only regiment particularized by Byron in his *Childe Harold*, when describing the marshalling of the British army on the first morning of the battle. He says,

"And wild and high the Camerons' gathering rose,
The war-note of Lochiel, which Albyn's hills
Have heard, and heard, too, have their Saxon foes;
How, in the noon of night, that pibroch thrills
Savage and shrill. But with the breath that fills
Their mountain pipe, so fill the mountaineers
With the fierce native daring which instils
The stirring memory of a thousand years,
And Evans's, Donald's fame, rings in each clansman's ears."

The 79th remained in France attached to the army of observation, and did not return to Britain till 1818. In an eventful period of twenty-two years' service from its formation, till the final peace in 1815, it bore an active share in perilous operations in Europe, Africa, and the West Indies. The affection of Colonel Cameron, the father of the corps, for his gallant mountaineers, was unbounded. Though far advanced in life when he girted on the claymore, he never lost a day's duty when any perilous service was to be performed, till his promotion to the rank of major-general rendered further regimental duty incompatible. He headed the regiment in Flanders, the West Indies, Holland, Egypt, Portugal, and Spain, at a period of life when men of less strength of mind and common constitutions and habits would have been incapable of encountering such changes of climate and such exhausting duties. His eldest son, Lieutenant-Colonel Phillips Cameron, a young officer of talents and professional promise, fell at Fuentes d'Onor; and his second, a major of his regiment, died of sickness brought on by severe soldierly toil. Under the same honourable banner also fell Captain James Campbell of Duntroon, killed at Bergen in 1799, a perfect model, says General Stewart, of one of Ossian's heroes; also Lieutenant-Colonel Macdowal, nephew of the Earl of Dumfries, who was killed in Egypt; Major Lawrie at Burgos; and Captain Purves, only son of Sir Alexander Purves, at Toulouse; all officers whom their friends and country had great cause to lament. The 79th Highlanders bear on their colours and appointments, in token of their meritorious services, the words Egmont-op-Zee, Egypt, Fuentes d'Onor, Salamanca, Pyrenees, Nivelle, Nive, Toulouse, Peninsula, and Waterloo.

The foregoing account of this gallant corps was written by the late lamented Alexander Sutherland, Esq. editor of the *Edinburgh Observer*, in which it first appeared.

SONNET.

BY WILLIAM WORDSWORTH

It is not to be thought that the flood
Of British freedom, which to the open sea
Of the world's praise from dark antiquity
Hath flowed, "with pomp of water, unwithstood,"
Roused though it be full often to a mood
Which spurns the check of salutary bands,—
That this most furious stream in bogs and sands
Should perish, and to evil and to good
Be lost for ever. In our halls is hung,
Armoury of the invincible knights of old;
We must be free or die, who speak the tongue
That Shakespeare spoke; the faith and morals hold
Which Milton held.—In every thing we are sprung
Of earth's first blood, have titles manifold.

SCOTTISH ANECDOTES.

EXAMINATION OF A CANDIDATE.

About the middle of the 17th century, the office of schoolmaster at Dirleton becoming vacant, several of the *literati* made suit to the patron for the living. A laird then, like our ministers of state now, was accessible only through his principal servant, who was called his *gentleman*. The laird of Dirleton had a gentleman called Hugh —, who presided over his levee service, and turned the admission of tenants and dependents into the presence-chamber considerably to his pocket account. One of the candidates, not very purse-proud, but close-fisted enough, often addressed Hugh for a word of the laird, but was always either very coldly received by Hugh, or industriously shifted, as he would never even so much as attempt to mumble at *speaking to the purpose*. Effectually disgusted at last with Hugh's indifference, the candidate watched an opportunity of the laird going abroad, and, accosting his honour becomingly, told his errand. As the benefice was to be collated on the candidate who should best acquit himself at the competition, Dirleton, being on horseback, and in a hurry, bid him explain the following rule of syntax in *Despauter's Grammar*:—

En ecce hem, semper primum quantum requirunt;
Heu petit et quantum, velut O; hei vaeque dativum;
Proh primum, quantum quintumque, tenere notatur.

And thus the candidate commented:—*En*, an like your honour; *ecce hem*, see what sad hcmplies are laird's men; *semper primum quantum requirunt*, we maun always creesh their loofs before we can get a word of their masters; *heu*, what think you of your man Hugh? *petit et quantum*, he seeks even a fifth part of the salary; *velut O*, like a cipher as he is; *hei vaeque dativum*, deil tak him that gies it; *proh*, 'tis a shame for your honour to keep him in your service; *notatur*, for he's a greatascal; *teneo primum, quantum quintumque*, and is worth a thousand merks. Struck with the punster's ready humour in turning the grammatical rules so happily to his own circumstances, Dirleton ordered Hugh to deliver the key of the school to him instantly, and to cause write out his call, maugre all postponing *interjections* whatsoever.

AYRSHIRE COURTSHIP.

A respectable farmer in the parish of Cumnock being a widower, went a-courting a young lady, the daughter of a neighbouring farmer in the parish of Auchinleck. The farmer, who was no great orator, but was young, had a good person, and was in affluent circumstances, addressed his fair one rather bluntly, and proposed marriage without much ceremony. The lady replied, in the same frank and open way, "Deed, Jamie, I'll tak ye, but ye maun gie me my dues o' courtin' for a' that." The wedding took place accordingly.

THE MAD MINISTER OF MOFFAT.

Dr Walker, Professor of Natural History at Edinburgh, a man of great science, and also of great worth, was not a little finical in dress. His hair-dressing was, till afterwards that he got a wig, the work of two or three hours every day. Once when he was travelling from Moffat, where he was then minister, to pay a visit to the late Sir James Clerk of Penny-cuik, he stopped at a country barber's on the way, in order to have his hair dressed. The barber, who, although he had often heard of his customer, but was unacquainted with his person, did all that he could to obey the numerous directions which he received; with astonishing patience did he, for three hours, curl, uncurl, friz, and labour at the doctor's hair. At length, however, he could not avoid exclaiming, "In all my life, I never heard of a man so ill to please as you, except the mad minister of Moffat."

HUMOROUS REPROOF.

A late nobleman, in whose character vanity and parsimony were the most remarkable features, was, for a long time before he died, in the habit of retailing the produce of his dairy and his orchard to the children and poor people of his neighbourhood. It is told, that one day observing a very pretty little female child tripping through his grounds with a milk-pipkin, he stooped to kiss her; after which he said, in a pompous tone, "Now, my dear, you may tell your grandchildren, and tell them in their turn to tell their grandchildren, that you had once the honour of receiving a kiss from the Right Honourable the Earl of B—." The girl looked up in his face, and, with a strange mixture of simplicity and archness, remarked, "But ye took the penny for the milk, though!"

TIMBER TO TIMBER.

At the placing of Mr F-r-l-ng, minister of the Chapel of Ease, Glasgow, of whose abilities Mr Thom entertained no great opinion, when they came to that part of the ceremony where the hands are imposed, the other members of the presbytery were making room for Mr Thom, that he might get forward his hand on the head of Mr F-r-l-ng likewise; but Mr Thom, keeping at a distance, said, "Na, na; timmer to timmer will do well enough," laying his staff on the head of the new divine.

Another Column for the Fancy.

TRAINING.

ONE of the most important concerns of a regular man of the *Fancy* is the art of training; for without the grand preparative, the human frame is unable to endure exertions in the field, or in any feat of pedestrianism. Without training, a man is a mere *lath*, when it comes to the push; and that closes the philosophy of the subject. Let us see how Pierce Egan, Captain Barclay, and other great men of the *Fancy*, have laid down the rules of this ingenious art. "The pedestrian who may be supposed in tolerable condition enters upon his training with a regular course of physic, which consists of three doses. Glauber salts are generally preferred; and from one ounce and a half to two ounces are taken each time, with an interval between each dose. After having gone through a course of physic, he commences his regular exercise, which is gradually increased as he proceeds in the training. When the object in view is the accomplishment of a pedestrian match, his regular exercise may be from twenty to twenty-four miles a day. He must rise at five in the morning, run half a mile at the top of his speed up hill, and then walk six miles at a moderate pace, coming in about seven to breakfast, which should consist of beef-steaks or mutton chops underdone, with stale bread, and old beer. After breakfast, he must again walk six miles at a moderate pace, and at twelve lie down in bed, without his clothes, for half an hour. On getting up, he must walk four miles, and return by four to dinner, which should also be beef-steaks or mutton chops, with bread and beer, as at breakfast. Immediately after dinner, he must resume his exercise, by running half a mile at the top of his speed, and walking six miles at a moderate pace. He takes no more exercise for that day, but retires to bed about eight; and next morning proceeds in the same manner. After having gone on in this regular course for three or four weeks, the pedestrian must take a four-mile sweat, which is produced by running four miles in flannel at the top of his speed. Immediately on returning, a hot liquor is prescribed, of which he must drink one English pint. It is termed the *sweating liquor*, and is composed of the following ingredients: one ounce of caraway-seed, half an ounce of coriander-seed, one ounce of root liquorice, and half an ounce of sugar-candy, mixed with two bottles of cider, and boiled down to one half. He is then put to bed in his flannels, and being covered with six or eight pair of blankets and a feather-bed, must remain in this state from twenty-five to thirty minutes, when he is taken out and rubbed perfectly dry. Being then well wrapt in his great coat, he walks out gently for two miles, and returns to breakfast, which, on such occasions, should consist of a roasted fowl. He afterwards proceeds with his usual exercise. These are continued weekly till within a few days of the performance of the match, or, in other words, he must undergo three or four of these operations. If the stomach of the pedestrian be foul, an emetic or two must be given about a week before the conclusion of the training, and he is now supposed to be in the highest condition. Ardent spirits are strictly prohibited; and broths, soups, and tea or other solids, are also pernicious. Besides his usual or regular exercise, a person under training ought to employ himself in the intervals in every kind of exertion which tends to activity, such as cricket, bowls, throwing quoits, &c.; so that, during the whole day, both body and mind may be constantly occupied."

A SPORTING DRESS.

THE first consideration, in our variable climate (says the author of *British Field Sports*), is defence against rheumatic attacks, which ultimately may occasion even the pleasures of the field to be bought at too great a price; and against danger to the lower limbs whilst passing hedge, ditch, wood, or waste, and the attacks of venomous reptiles. In point of general convenience, HALF BOOTS which lace close, and having a sole as substantial as consists with good speed and the safety of the ankle joints and back sinews, with trousers or overall; strongly defended within side by leather, and *thorn proof*, deserve a preference as lower attire. The sole and leather of the boots should be varnished, and rendered water-proof. [Ordinary boots and shoes may be rendered impervious to water by applying the following compost:—Take three ounces of spermaceti, and melt it in a pipkin or other earthen vessel, over a slow fire; add thereto six drachms of India rubber, cut into slices, and these will presently dissolve. Then add successively eight ounces of tallow, two ounces of hog's lard, and four ounces of amber varnish. It will be soon sufficiently mixed, and will be fit for use immediately. The boots or other material to be treated are to receive two or three coats with a common blacking brush, and a fine polish is the result.] For the upper attire, there is no need to urge the use of flannel, so suited to our climate, since, at some periods, our young men have been accustomed to load and waistcoat themselves in the style of *veining jockeys*. I entirely agree with Mr Hawker in the proper materials for the SHOOTING JACKET. In the early and warm season, *jean, satteen, or nankeen*; for late autumn and winter, *fustian or velvet* are to be chosen, the SHOOTING WAISTCOAT to be made of the same stuff. Then, as the French say, persons *d'un certain age*, who would wish to guard against those exquisite comforts during a sleepless night, *lumbago and sciatica*, will not be offended at the caution, to have their winter jackets and waistcoats made long, as a defensive comfort to the loins. A SIDE POCKET next the heart is with me a *sine qua non*, being so convenient for wadding, and various small articles; and the larger, or HARE POCKET, should either be lined with oil-skin, which may be sponged, or, that which is still more cleanly, have a thick lining, which may be taken out and washed. A copper-wire, pendant from a button, should always be at hand to clear the touchhole; and generally the sportsman should go into the field fully provided with all those little tools which will readily occur to the memory, and which are indispensable in cases of emergency, by no means forgetting a flask of the best Nantz, and biscuit.

CURIOUS CRICKET AND RUNNING MATCH.

ABOUT six and thirty years since, when England was a little more "merry" than it has latterly been, the fancy men of the metropolis, and all those loving "a bit of fun," were amused with the announcement of a cricket-match, to be played by eleven *Greenwich pensioners* with one leg, against eleven with one arm, for one thousand guineas, at the new Cricket Ground, Montpellier Gardens, Walworth. An immense concourse of people of course assembled, and about nine o'clock the men arrived in the Greenwich stages; about ten the wickets were pitched, and the match commenced. Those with but one leg had the first innings, and got ninety-three runs. About three o'clock, while those with but one arm were having their innings, a scene of confusion took place owing to the pressure of the populace to gain admittance; but this speedily subsided, and about six o'clock the game was renewed. The field was

now all expectation and anxiety. Those with one arm got but forty-two runs during their innings. The one legs commenced their second innings, and six were bowled out after they had got sixty runs, so that they left off one hundred and eleven more than those with one arm. The match was played again on the Wednesday following, and the one legs beat the one arms by one hundred and three runnings. After the match was finished, the eleven one legs ran one hundred yards for twenty guineas; the three who were first in the race divided the money.—Such are the amusements of John Bull!

"THE GOOD OLD COUNTRY GENTLEMAN."

"THIS character, now worn out and gone, was the independent gentleman of three or four hundred pounds a year, who commonly appeared in his drab or plush coat, with large silver buttons, and rarely without boots. His time was principally spent in field amusements, and his travels never exceeded the distance of the county town, and that only at assize and sessions, or to attend an election. A journey to London was by one of these men reckoned as great an undertaking as is at present a voyage to the East Indies; and it was undertaken with scarcely less precaution and preparation. He always appeared regularly at church on Sunday; and never played at cards but at Christmas, when he exchanged his usual beverage of ale for a bowl of strong brandy punch, garnished with a toast and nutmeg.

"The mansion of one of these squires was of plaster, or of red brick striped with black timber (this is a style very common in some parts of England); large casement bow-window, a park with seats in it, and over it a study; the eaves of the house were well inhabited by martins, and the court set round with holy-hooks and clasp yews; the hall was provided with flitches of bacon, and the mantle-piece with fowling-pieces and fishing-rods of different dimensions, accompanied by the broadsword, partisan, and dagger, borne by his ancestors in the civil wars; the vacant spaces were occupied by stags' horns; in the window his library, consisting of *Baker's Chronicle*, *Fox's Book of Martyrs*, *Glanvil on Witches*, *Quincey's Dispensary*, *Bracken's Farriery*, and the *Gentleman's Recreation*. In this room, at Christmas, round a glowing fire, he entertained his tenants. Here were told and heard exploits in hunting, and who had been the best sportsman of his time; and while the glass was in continual circulation, the traditional tales of the village were solemnly recounted. The best parlour, which was never opened but on some particular occasion, was furnished with worked chairs and carpets, by some industrious female of the family; and the wainscot was decorated with portraits of his ancestors, and pictures of running horses and hunting matches.

"Among the out offices of the house was a warm stable for his horses, and a good kennel for his hounds; and near the gate was the horse-block, for the convenience of mounting.

"But these men and their houses are no more; the luxury of the times has obliged them to quit the country, to become the humble dependents on great men, and to solicit a place or a commission to live in London, to rack their tenants, and to draw their rents before being due. The venerable mansion is suffered to tumble down, or is partly upheld as a farm-house, until, after a few years, the estate is conveyed to the steward of the neighbouring lord, or else to some lawyer or fortunate contractor."—*Sporting Anecdotes*.

CAPTAIN BARCLAY.

IN the last "Column for the *Fancy*," in number thirteen of the Journal, it was stated in the sketch of Captain Barclay, that that celebrated pedestrian on one occasion, for a bet of a thousand guineas, lifted from the ground "twenty-one half-hundred weights," being upwards of half a ton. This extraordinary feat, it seems, has been doubted, or supposed to be a typographical error; but I can assure my readers among the fancy that it is quite correct, and consistent with the other feats in the life of the Captain. It will be recollected that in lifting weights a very great deal depends on retaining the body in a particular position, so as not to strain the spine; and it is more than likely that Captain Barclay put this *knack* in practice.

THE TOURIST'S ADVENTURE.

SAUNTERING on the road between Nairn and Campbeltown, in the north of Scotland, I was overtaken by a Highlander, a thick-set, hardy, rough looking fellow, all nerve. "Fine day, Sir," said he, with a friendly sort of smile on his countenance. "Beautiful," replied I. "How far is it to Campbeltown?" "About three miles, Sir."—There is no bittock at the end, I hope?—"No, Sir; the distance is not more than three English miles."—"If you are going thither," said I, "and do not march in quick time, we are comrades." He doffed his bonnet and took out his mull. The Waterloo medal was glistening on his breast, and my own thrilled with pleasure at the sight; I felt respect for the wearer; unconsciously I projected my finger and thumb for a pinch of snuff. "You have seen some service, my good fellow; in what regiment?"—"The Forty-Second, Sir."—"Then you have been in the thick of it."—"Aye, Sir; our regiment has a good name; there are many others as brave, I think."—"Perhaps so," said I, "but not so conspicuously brave; the recollection of this gives a becoming pride to your heart—that medal is your country's sanction of the feeling."—"I think highly of it, certainly," replied he. "I am not a soldier," continued I, "but I have some intimacies with the pleasures and privations to which he is subjected. I visited the field of Waterloo shortly after the battle; saw the scattered fragments of military equipment, the newly raised heaps of mould, and the scorched earth, where fire had assisted in hiding the havoc of that day; were you wounded?"—"I was hit, Sir, towards the close of battle, and while on the ground pierced by a lancer as his horse leaped over me; but by good luck I was carried to the rear, and afterwards to an outhouse at Mont St Jean, where my wounds were attended to, and being in good health, I soon lessened the trouble of the surgeon, refused to go to Antwerp with my disabled comrades, but joined my regiment in time

to march into Paris; never did I feel such pleasure as when the regiments of Russia saluted us as we passed."—"You have been a fortunate, and are a happy fellow," said I. "Yes, Sir, and my pleasure is renewed whenever I meet with one who knows what we had to do." Waterloo would have furnished us with subject for three hundred miles, tired as I was. My travelling trunk had been forwarded to Campbeltown by the coach, as I purposed to cross the Moray Frith. When we arrived at the inn, I invited the Waterloo man to take refreshment with me; he accepted my offer, seemed grateful and happy. He told me he was going home to Inverness; but as I was a stranger in these parts, in return for my kindness he should feel pleasure in pointing out the striking objects which might be seen from a lofty sandhill at the back of the town. Accordingly away we trudged, conversed and took snuff like old acquaintances. On the way a tall thin Highlander accosted my companion in Gaelic, and detained him a few minutes. I had no doubt of being the subject of their remarks, their eyes being frequently turned towards me. I felt uneasy, and could not suppress an increasing dislike to the figure and countenance of the meagre Highlander, whose features exhibited all the characteristics of his country. His eyes were deeply sunk, his brown cheek-bones harshly prominent, a long thin nose, with lips so remarkably narrow, they seemed to increase the width of his mouth; a broad chin, covered with a bristly red beard, and huge whiskers connected with a fiery head of hair, gave him a peculiar expression of ferocity. A small bonnet was placed on one side his head, his shirt-collar was unbuttoned, his clothing was thread-bare, and his general appearance excited the idea of a barbarian. I was glad when my Waterloo man joined me, and we proceeded to the summit of the sandhill. "This," said he, "is the spot on which Oliver Cromwell encamped; no one knew better how to select a good station. That building jutting into the Frith is Fort St George, well placed to intercept the navigation, and to keep these parts in awe; but no longer necessary. On the opposite side of the Frith is the town of Fortrose, and near it the village of Rosemarche, backed by the hills of Ross. A little to the east is the entrance, by the Souters, to Cromarty, a mart for herrings in the season. Onward is the North Sea. On this side of the Frith to the south-east are immense mounds of sand, stretching along the coast from this to Nairn, past the mouth of the Findhorn, and beyond Forbes, where the lofty building stands in memory of Nelson. Looking inland, the celebrated castle of Cawdor may be seen, and far in the south highlands of Perthshire. To the west, near the banks of the Frith, is the famous field of Culloiden; beyond it is the bonny town of Inverness; farther are the highlands that overlook the Hebrides and the Western Ocean. These few leading features of the country I point out to you, Sir, because I know them to possess interest. The great historical events connected with them you are better acquainted with than I." My eyes had followed his finger, and my mind was satisfied. "Thank you, my good fellow," said I, putting a piece of money into his hand as I shook it. He would have refused my present—he would remember me, he said, in connection with Waterloo. "Farewell, Sir, the latest passage of the Frith is about eight o'clock, when the ferry-boat comes with the mail; may health and happiness attend you, Sir." "The same to you; farewell." The last glimpse I had of him was while he was waving his bonnet in the air to me, as he passed on his way to Inverness. I sat down and reviewed the delightful scene. The sun now and then illumed the white sails of the shipping as they passed, and touched with brightness many distant objects I had not seen before. I regretted the loss of my guide, for I desired to know more than sight afforded; a pleasing melancholy came over me; I seemed deserted, oppressed I knew not why; perhaps I had been strongly excited; I felt a loneliness, and gazed about with an approach to unconsciousness, till I was aroused by seeing the tall Highlander slowly pacing along the sandy road that wound from the hill towards the ferry at Fort George. All the unfavourable impressions I had received at first sight of that man returned. We can dislike an object till we dread it; perhaps some fear mingled in my thoughts. I judged our comparative strength. I knew how to use my stick, and it was a stout one; he might know how to use the claymore. I knew the use of my fists, at least with the gloves on; he might have a dirk;—but why either should have occasion to attack or to defend, did not appear. The days of violence have passed away, and I began to think I was unjust to an individual of whom I knew nothing; yet his glancing small grey eyes conveyed sufficient to put any one on his guard; there was nothing to lull awakened suspicion, and the possibility of bad intention remained. I saw I was observed by him, but sat until a ridge of sand intervened; he passed on, and I returned to my inn. The time for departure came, and I engaged a youth to take my trunk to the ferry, about a mile and a half distant. As we walked along I inquired about the tall Highlander, and described

him; he was perfectly represented in my mind's eye. The lad knew nothing of such a man. The Waterloo man he knew well; a better fellow never breathed. The evening was advancing; I was the only passenger, and I felt great anxiety to cross before darkness came on. The lad told me, that by the payment of threepence, I could have a signal hoisted, which the ferrymen on the opposite side would immediately attend to; but it was too near the time at which the mail usually arrived for the signal to be noticed. The lad returned home, and I sat down on my trunk. The sun had shed his farewell beam on the hills beyond Inverness, their dark masses were reflected on the Frith, the gleam that hovered in the west faintly marked the increasing ripple, the wind came chilly from the north-west for August, and I wrapped my cloak about me, looking out for relief like a wrecked seaman. The scene which had so delighted me but an hour ago became dreary. The walls of Fort St George rose behind me in solemn stillness, and I regretted having left the inn at Campbellton. Turning to cast a longing look that way, I beheld, with horror, the tall Highlander! He was leaning with his hands crossed on the top of his long staff, and his bristly chin resting on his hands; his keen grey eyes flashed a fierceness at which I started; but resuming a degree of composure, I inquired if he were waiting for the ferry-boat! He nodded. I observed it was getting cold and dark. He nodded. I looked across the water, perceived with pleasure the ferry-boat standing over with a freshening breeze, and soon heard her stout keel grate on the shore. A man hurried off with the mail-bag; I gave my trunk to one of the boatmen, and ascended a plank to the boat, which was capacious for the conveyance of horses,—rigged with main and fore-sail, and managed by two stout weather-beaten old seamen. Before I had seated myself astern, I saw the tall Highlander spring over the bow of the boat, and haul on board the plank, with a loud Gaelic yell, at which the boatmen laughed. The sails were set, and we commenced a beating passage. Night came on apace, with a drizzling shower, and the spray beat over us, so as to make me feel uncomfortable and melancholy. By tack for tack we reached the opposite shore. The town of Fortrose was a mile and a half from the ferry; how was my trunk to be conveyed thither? The boatmen recommended the tall Highlander, who sprang forward, speaking Gaelic, while he took up my trunk and stalked on shore. I asked the boatmen if they knew the man? "No; but they dared say he would take my trunk safe enough." This was a rude repellant of my suspicion that I did not like. I followed the tall Highlander along the shore, where the sand was so interspersed with tufts of rushes, that I was alternately stumbling over them, or sinking up to my ankles in sand, and it was by great exertion that I could keep up with my trunk, hurried on as it was by the huge strides of the bearer. I called to him—he stopped, and seeing some lights a short distance to the right, I directed his attention to them, inquiring if they were not at Fortrose? He nodded, and away he strode through fields of potatoes. I felt exhausted, and a painful regret at having intrusted a stranger with all on which my comfort depended; danger seemed to surround me, but nothing could be done, save the endeavour to treat it lightly. The Highlander stopped in the middle of a field, seated himself on my trunk, and muttering, wiped his forehead. I watched him with earnestness, and thought he was fatigued; he sat while the lights one after another were extinguished. This, thought I, is the spot, concerted with the boatmen, on which I am to be attacked, and I expected no other than a struggle for my life. All was silent; I asked the Highlander if he were tired? he nodded. Could he proceed? he nodded. Not a word, no voice but my own—where was I? why had I been so rash? what means could I adopt? Thus was my mind occupied, till I became overpowered by apprehensions.—The Highlander rose—the time is come, thought I, glancing my eye around; no one appeared—it was nearly dark—he made to the nearest cottage—I followed in silence, but was glad to find we were on road. I rapped repeatedly at the door; at length a head appeared through a small window.—I learned that we were at Rosemarche, that there was no inn in the place, and that Fortrose was nearly two miles westward. The state of anxiety I had endured prevented my speaking more than was absolutely necessary. I pointed to the road, and the Highlander proceeded in sullen silence till we reached the inn at Fortrose. Here also all were in bed, the house being kept by Miss —, a good kind of lady, who preferred a life of single blessedness to all the happiness a double-tongued gentleman had promised by marriage. She had but one servant, a short, stout, freckled Dingwall lassie, who had been in service far south, and now filled the stations of waiter, boots, ostler, and chamber-maid. She came cheerfully at the first summons. I could have a bed, but no refreshment save oat cake and whisky. I however felt at home, and began to remonstrate with some severity at the Highlander's having subjected me to such disagreeables. He spoke to the girl in Gaelic,

and she became interpreter; it had never occurred to me that he could not speak English. However, I learned from the girl that he was ashamed at having deceived me as to his knowledge of the road; that his necessities had induced him to become my guide; that he was a native of Dornoch, travelling for work as a miller. I gave him half a crown. He gazed at me with astonishment; his grey eyes filled with tears; he called on God to bless me; that he would thank me while memory should last; that had I ten miles farther to go, he would have seen me placed in safety, for he had received directions so to do from his cousin the Waterloo man. Extraordinary! all my fears were caused by that morbid sensibility which often induces tourists to represent that which has no existence but in imagination.

MASSACRE OF THE MAMELUKES.

It has been related that one of the chief means employed by Mahomet Ali in civilizing Egypt, or in improving the state of the country, was the destruction of the Mamelukes—a class of hired foreign soldiers, who, as usual in such cases, were opposed to all changes in the government. It was only by resorting to a barbarous stratagem in one of his campaigns that the sanguinary blow was struck. The following is the account given of this dreadful affair, by Giovanni Finati, in the narrative of his life and adventures.

"The chiefs of the Mamelukes, with their adherents, being assembled, by invitation from the Pasha of Egypt, within the citadel of Cairo, after a time, according to Eastern custom, coffee was brought, and last of all, the pipes; but at the moment when these were presented, as if from etiquette, or to leave his guests more at their ease, Mahomet Ali rose and withdrew, and, sending privately for the captain of his guard, gave orders that the gates of the citadel should be closed; adding, that as soon as Saim Bey and his two associates should come out for the purpose of mounting, they should be fired upon till they dropped, and that at the same signal the troops posted throughout the fortress should take aim at every Mameluke within their reach, while a corresponding order was sent down at the same time to those in the town, and to such even as were encamped without, round the foot of the fortress, to pursue the work of extermination on all stragglers that they should find, so that not one of the proscribed body might escape. Saim Bey, and his two brothers in command, finding that the pasha did not return to them, and being informed by the attendants that he was gone into his harem (an answer that precluded all farther inquiry), judged it time to take their departure. But no sooner did they make their appearance without, and were mounting their horses, than they were suddenly fired upon from every quarter, and all became at once a scene of confusion, and dismay, and horror, similar volleys being directed at all the rest, who were collected round, and preparing to return with them, so that the victims dropped by hundreds. Saim himself had time to gain his saddle, and even to penetrate to one of the gates of the citadel; but all to no purpose, for he found it closed like the rest, and fell there pierced with innumerable bullets. Another chief, Amim Bey, who was the brother to Elfi, urged the noble animal which he rode to an act of greater desperation, for he spurred him till he made him clamber upon the rampart; and preferring rather to be dashed to pieces than to be slaughtered in cold blood, drove him to leap down the precipice, a height that has been estimated at from thirty to forty feet, or even more; yet fortune so favoured him, that though the horse was killed in the fall, the rider escaped. An Albanian camp was below, and an officer's tent very near the spot on which he alighted. Instead of shunning it, he went in, and throwing himself on the rites of hospitality, implored that no advantage might be taken of him; which was not only granted, but the officer offered him protection, even at his own peril, and kept him concealed so long as the popular fury and the excesses of the soldiery continued. Of the rest of that devoted number, thus shut up and surrounded, not one went out alive; and even of those who had quietly remained in the town, but very few found means to elude the active and greedy search that was made after them, a high price being set upon every Mameluke's head that should be brought. All Cairo was filled with wailing and lamentations; and, in truth, the confusion and horrors of that day are indescribable; for not the Mamelukes alone, but others also, in many instances wholly unconnected with them, either from mistake, or from malice, or for plunder, were indiscriminately seized on and put to death; so that great as the number was that perished of that ill-fated body, it yet did not comprehend the total of the victims. For myself, I have reason to be thankful, that, though I was one of the soldiers stationed in the citadel that morning, I shed none of the blood of those unhappy men, having had the good fortune to be posted at an avenue where none of them attempted to pass, or came near me, so that my pistols and musket were never fired. The strange fact of the leap and escape of Amim Bey, and of his asylum in the officer's tent, reached at last the pasha's

ears, who sent instantly to demand him; and when the generous Albanian found that it would be impossible any longer to shelter or screen his fugitive, he gave him a horse, and recommended him to fly with all speed into Asia, where I afterwards saw him, living in the palace of Suleyman Pasha at Acre, at the time of my first visit there with Mr Banks."

ANCIENT VESSELS.

MAGNIFICENT and large as are some of our modern steam-vessels, they are inferior, if we may judge from description, both in size and splendour, to the vessels constructed by the kings of Egypt and Syracuse, on a scale of grandeur corresponding to the immense preparations of their sculpture and architecture. Ptolemæus Philopater, king of Egypt, built a vessel 420 feet long, 56 feet broad, 72 feet high from the keel to the top of the prow, but 80 to the top of the poop. She had four helms of 60 feet; her largest oars were 56 feet long, with leaden handles, so as to work more easily by the rowers; she had two prows, two sterns, seven rostra or beaks, successively rising and swelling out one over the other, the topmost one most prominent and stately; on the poop and prow she had figures of animals, not less than 18 feet high; all the interior of the vessel was beautified with a delicate sort of painting, of a waxen colour. She had 4000 rowers; 400 cabin boys, or servants; marines to do duty on the decks, 2820; with an immense store of arms and provisions. The same prince built another ship, called the *Thalamegus*, or *Bedchamber-ship*, which was only used as a pleasure yacht for sailing up and down the Nile. She was not so long or large as the preceding, but more splendid in the chambers and their furnishings.—Hiero, king of Syracuse, built an enormous vessel, which he intended for a corn-trader; her length is not given. She was built at Syracuse, by a Corinthian ship-builder, and was launched by an apparatus devised by Archimedes. All her bolts and nails were of brass; she had twenty rows of oars; her apartments were all paved with neat square variegated tiles, on which was painted all the story of Homer's *Iliad*. She had a gymnasium, with shady walks, on her upper decks; garden-plots stocked with various plants, and nourished with limpid water that flowed circulating round them in a canal of lead. She had, here and there on deck, arbours mantled with ivy and vine branches, which flourished in full greenness, being supplied with the principle of growth from the leaden canal. She had one chamber particularly splendid, whose pavement was of agates and other precious stones, and whose panels, doors, and roofs, were of ivory, and wood of the *thya-tree*. She had a scholasterium, or library, with five couches, its roof arched into a *polus* or vault, with the stars embossed; she had a bath, with its accompaniments all most magnificent; she had on each side of her deck ten stalls for horses, with fodder and furnishings for the grooms and riders; a fish-pond of lead, full of fish, whose waters could be let out or admitted at pleasure; she had two towers on the poop, two on the prow, and four in the middle, full of armed men, that managed the machines invented by Archimedes, for throwing stones of 300 pounds weight, and arrows eighteen feet long, to the distance of a furlong. She had three masts, and two antennæ or yards, that swung with hooks and masses of lead attached. She had, round the whole circuit of her deck, a rampart of iron, with iron crows, which took hold of ships, and dragged them nearer, for the purpose of destroying them. The tunnels or bows on her masts were of brass, with men in each. She had twelve anchors and three masts. It was with difficulty they could find a tree large and strong enough for her highest mast. Great Britain—an ominous circumstance for the superiority of British oak!—had the glory of bestowing upon her a sufficient tree for that purpose; it was discovered amid the recesses of Albion's forests by a swineherd! What is remarkable in the construction of this gigantic vessel is, that her sentina, or sink, though large and deep, was emptied by one man, by means of a pump invented by Archimedes. Hiero, on finding that the *Syracusan* was too unwieldy to be admitted with safety into the harbours of Sicily, made a present of her to Ptolemy, who changed her name to the *Alexandrian*. We may add, as a *panegeron* to this long tale of a ship, that Archimedes, the Greek epigrammatist, wrote a little poem on the large vessel, which was rewarded by Hiero with 1000 measures of corn—a premium proportioned, if not to the poem, at least to the magnitude of the theme celebrated.—From *Mr Tennant's contributions to the Edinburgh Literary Journal*.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19 Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20 Argyll Street.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19 Waterloo Place. Price of a quarter of twelve weeks, 1s 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster Row, for circulation throughout England and Wales. Stereotyped and printed by THOMAS ALLAN Junior, Caledonian Mercury Office, Edinburgh.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER" AND
"INFORMATION FOR THE PEOPLE."

No. 33.

SATURDAY, SEPTEMBER 15, 1832.

PRICE THREE HALFPENCE

COUNTRY AND TOWN ACQUAINTANCES.
THE exact balance of favours in ordinary acquaintanceship is a matter very difficult to be adjusted. Sometimes people think they are giving more entertainments than they get, and on other occasions you would suppose that they are mortally offended at their friends for not coming oftener to eat of their meat and drink of their cup. It is hard to say whether a desire of reserving or of squandering victuals predominates; for, though one would argue that it is more natural to keep what one has than to give it away for nothing, yet, to judge by the common talk of the world, you are far more likely to give offence by coming too seldom than by coming too often to the tables of your friends. From this cause, I have often been amused to hear people, about whose company I was not very solicitous, making the most abject apologies for having visited me so seldom of late, but promising to behave a great deal better for the future—that is to say, to give me henceforward much more of what I never desired before, even in the smallest portions.

But this kindness of language is not confined to the party threatening a visit; the party threatened is also given to use equally sweet terms of discourse. "Really, you have been a great stranger lately. We thought we never were to see you again. What is there to hinder you of an evening to come over and chat a little, or take a hand with the Doctor and Eliza at whist? We are always so happy to see you. I assure you we are resolved to take it very ill; and if you don't repay our last visit, we will never see you again." With an equally amiable sincerity, the shocking person with whom you have been long quite tired, having ceased to gain any amusement or any eclat from the acquaintance, replies, "I must confess I have been very remiss. Indeed, I was so ashamed of not having called upon you for such a length of time, that I could not venture to do it. But, now that the ice is broken, I really will come some night soon. You may depend upon it." And so the two part off their several ways, the one surprised at having been betrayed into so many expressions of kindness towards an individual about whom he or she is quite indifferent; and the other, either benevolently resolving, in the simplicity of his heart, to pay the promised visit, or as much surprised at having been brought into circumstances where he was reduced to make such a promise—which, however, as he is sure to forget it in a few minutes, is a matter of very little moment. If these, however, be the puzzlements which beset a town acquaintanceship, ten times more difficult is it to adjust the mutual rights and balance of advantages appertaining to one in which the one party is of the town and the other of the country. In most such cases, either the one party or the other has great and real cause of complaint. For example, a citizen of tolerable style, who has been confined to some laborious employment all the year round, amidst gas light within doors, and a foggy and smoky atmosphere without, with what delight does he throw himself into the country some fine sunshiny day in September, for the purpose of paying a long-promised visit of three days to a country friend! He is received with boundless hospitality. The best bedroom, situated in that part of the house where you generally find a city drawing-room, is aired and provided in the most agreeable manner for his accommodation. The goodman rides about with him all day, and dines and drinks with him all night, except during those intervals when the lady or her daughters solace him with tunes on the piano, learned many years ago at a boarding-school in town. The whole house, in fact, from the worthy agriculturist-in-chief to the chicken that has latest chipped in the barn-

yard, are at his service, and he drinks in health, and rapture, and a taste for natural objects, every hour. The three days are imperceptibly elongated to as many weeks, till at last he has become just like one of the family, calls the lady goodwife, and the daughters by their abbreviated Christian names, and is a very brother and more to his excellent entertainer. At length, replenished with as much health as will serve him through a whole twelvemonth of city life, rosy in cheek and in gill, sturdy as a pine on the hills, and thickened immensely about the centre of his person, he finds it necessary to take his leave. The whole of the worthy ruralists gather about him, and, as if not satisfied with what they have already done for him while he was in their presence, load him with other acts of kindness, the effect of which is only to be experienced on the way, or after he has reached his own home. If he could carry a ewe cheese on each side, like the bottles of John Gilpin, they would have no objection to give them. In fact, there is no bounds to the kindness, the sincere heartfelt kindness of these people, except his capacity or willingness to receive. Of course, he feels all this most warmly for the time; and while the impression is strong upon him, he counter-invites right and left. The goodman is never to be a day in town without coming to take pot-luck. The ladies are to come in next winter, on purpose, and have a month of the amusements of the town, residing in his house. Any of their friends whatsoever, even unto the fourth generation, or no generation at all, he will be delighted to see, whenever they are in the city. He throws himself, his bosom, his house—all, all, open to them. But what is the real result of all this? He goes back to town, and resumes the serious labours of his profession. The roses fade from his cheeks, and gratitude from his heart. Some day, when he is up to the ears in a mysterious green box, like a pig in his trough, or a pullet in a well; or perhaps some day as he is rushing swiftly along the streets, intent upon some piece of important business, his city eyes awake upon a vision of the country, in the shape of that very friend who so lately was rendering him so many acts of kindness. The case is felt at once to be a scrape;—however, he must make the best of it. With almost breathless apprehension, he asks Agricola what stay he is going to make in town. What joy—he goes within an hour to Falkirk tryst! But, ah! this is but a short relief. He comes back the day after to-morrow, and can then spend a day. Well, a day it must be: it is all settled in a moment; and, three minutes after having entered the house, Agricola finds himself shaken by the hand out at the door, which is closed behind him ere he can well believe that he has as yet seen his city friend. He walks a little way in a confused state of mind, hardly able to say distinctly that he is himself, or that his late guest is the identical good fellow he seemed to be three months ago. The whole appears a dream, and he thinks it must be hours since he entered the house, though it is only minutes. Falkirk tryst over, he comes back, and, at the appointed hour, attends his city acquaintance, who meanwhile, having consulted with his spouse, has taken the opportunity, since there was to be a dinner at any rate, to invite all the stiff people he knows, in order to pay off his old debts. The honest agriculturist gets a place among the rest, perhaps a good one; but in such a scene he finds no entertainment, and hardly gets a word of conversation with his friend during the whole evening. At the proper hour, he rises to take his leave among the rest. The host inquires when he leaves town—this is always a leading question for a country friend—hears, to his unspeakable

comfort, that it is to be by the morning coach—and so good night. Of course, after this, there is little inducement for Agricola to send his daughters to spend a month in the house of his city friend. The girls, however, do come in somehow or other, and are living with some other person on a visit, when one day, walking along the most crowded and fashionable street, they meet Urbanus arm in arm with his wife. Seeing that they have first perceived him, he runs forward in the kindest manner, and, after introducing them to his partner, inquires after every particular individual left at home. Some miscellaneous talk ensues, and then, just at the skirts of the conversation, when they are hovering on the point of separation, he throws in—"You will be sure to see us some evening before you leave town." And then—and then there is no more about it.

A varied case often occurs as follows:—A young lady of perfect accomplishments, though of the middle ranks of life, happens to be particularly convenient to a neighbouring family of gentry in the country, where she is constantly invited by them, and becomes the bosom friend of all the young ladies, but only because her accomplishments are useful to them as a means of spending their time. But this acquaintance, though of use in the country, and there felt as involving no risk of dignity, becomes inconvenient when the parties happen to meet in town. The high-born demoiselle, who elsewhere would have rushed into the arms of her humble, but ingenious friend, now tamely shakes her hand, and, with cold complaisance, addresses her thus: "Mamma is keeping no company this winter, but I dare say she would be glad to see you some evening to tea; and—good morning."—Such is the world!

CHARACTERISTICS OF ENGLAND.

THE militia of the counties, the London police, village constables, and Mr Macadam, have among them contrived to destroy all the romance of travelling—so that the most adventure-loving knight-errant who wanders forth in search of the picturesque, may now journey from John o' Groat's to the Land's End in Cornwall, without ever meeting with a single incident worthy of noting down in his memorandum book—unless, perchance, the coach wherein he travels be overturned, a horse fall lame, or mine host of the roadside, contrary to his wont on such occasions, serve up a bottle of bad old Port. No making of wills before setting out on a long journey is now necessary; no unexpected pitfalls or quagmires now bisect the road; no postilions now league together with rascally innkeepers and robbers; no gallantly horsed highwaymen, ready booted and spurred, with faces covered with black crape, now leap the hedge to demand, as they politely cock their pistols, "your money or your life." The age of such doughty deeds has veritably passed away; and in travelling in merry old England, you may now either doze, conscious of security, in one corner of your carriage, or look wistfully out of the window, and watch houses, fields, trees, cottages, hedges, and ditches, whirl behind you, while thoughts, some bright with joy, others overcast with sadness, flit like shadows across your brain. Reader, it is the well-known fashion of this country to pass a certain number of the summer or autumn months away from the din of cities—"the buzz—the hum—the shock of men;" some retire from Edinburgh—splendid city as it is—to Portobello or Newhaven, or prefer the lovely neighbourhood of Aberdour, or the classical old city of St Andrews; others betake themselves to the Western Islands, or ramble as far as Inverness; but we, unen-

cumbered by wife or weans, taking advantage of these peaceable times, propose proceeding direct to England, by the intellectual safety-coach, lately started under the title of CHAMBERS'S EDINBURGH JOURNAL, which travels with the most unexampled rapidity through all parts of the United Kingdom.

Hail to thee, fellow traveller! 'Tis now noon—the sun shines warm and bright—it is the month of August, and we have already proceeded far on our road to England; not indeed to take up our abode in that wilderness of dust and brick houses—London; not to sojourn in any crowded manufacturing town, where all is hurry, bustle, and confusion, and the voice of human nature hushed amidst the hum of money-seeking, money-gaining, money-spending denizens: let us rather proceed to some quiet inland village, where youth and age are alike uncontaminated by those artificial habits, which, begotten of luxury and vice, hold always despotic dominion in large and populous cities. Mankind, it would seem, cannot congregate in large masses, without becoming sophisticated and addicted to those follies and vices which undermine human happiness, and fall like a withering blight on the human mind—we, therefore, shall proceed, as 'tis our fancy, to some sequestered retreat, nor shall we, like other travellers, care to gain admission into those circles of gaiety and fashion, where “pale-faced beauty holds her languid court,” and is too often, amidst the dignity of rank and pomp of riches, “girl with the silent crimes of capitals.” But where are we? The black, granitic, heathery hills of old Scotland, have receded—the rough irregular stone walls that lined the road on either side have given place to luxuriant hedges—the uplands and pasture fields are clothed with a softer and richer green than aught we have heretofore witnessed—the sky has a more intense and deeper blue; and surely we are breathing a milder and more balmy air. Yes—this is England! Nor can we help observing, as we proceed on our journey, how the mere luxuries of travelling appear to be augmented; for the coach now whirls along with greater rapidity; the horses now are obviously of a nobler and a finer breed; and even the coachman himself has become a staidier and more important personage: now cracking his whip with an air of conscious pride, he hurries along through the village, tipping, as he goes, a knowing nod to the smirking wench of a bar-maid, who has just run out, and stands gaping and wondering at the inn door. His shining white broad-brimmed beaver hat—his brown coat with huge silken-knotted buttons, and a large nosegay through the button-hole on the left side—his corduroy unmentionables, and snow-white top boots, augur that he has taken no inconsiderable pains with his costume; for the race of English coach-drivers differs marvellously from the race destined to the same calling in Scotland, owing, as report saith, to there being less spirit among the Scottish than among the English coach proprietors; and owing, as we farthermore opine, to the duties of the coachman being of a more arduous and miscellaneous description in Scotland; for the Scottish stage coachman, we have been credibly assured, officiates not only as driver, but as groom, a thing hardly to be believed by the dashing coachmen on the Cheltenham or Brighton road, who have no duties to perform, save when officially enthroned upon their coach boxes. But the increased rattling and jolting of the coach—the more frequently repeated smacking of the whip—the half-musical and half-discordant sound of the guard's horn, now apprise us that we are entering into some large town; and a peculiar sensation—that something “within which passeth show,” and is every whit as intelligible as the booming of the gong, or the sound of the dinner-bell—admonishes us that we shall dine at this hotel; and as we draw up close upon the pavement edge, the anxious look of the master, the hurrying to and fro of the waiters, each with a clean napkin swung under his arm; and the stout landlady seen in perspective at the end of the passage, signify that all within has been haste and anxious activity; and that a good dinner, “tired Nature's sweet restorer,” here at length awaits us. By the memory of the great Epicurus, and the glorious achievements of that prince of gastronomers, Doctor Kitchener, we are not disciples of Heliogabalus; but, assuredly, it escapeth us not, that there is better fare exhibited at stage-coach dinners in England than in Scotland—a fact peculiarly deserving of the attention of all honest and well-disposed landlords, landladies, and deputy-innkeepers, on this side of the Tweed. But these things are of the “earth, earthy;” nor do we desire any stimulus, beyond the healthy excitement inspired by the contemplation of Nature. At the next village, therefore, shall we alight. It consists but of the clergyman's rectory, and a few scattered cottages, and is within a few miles of the spot which was chosen by Milton as the scene for Comus. Here, then, we rest on the brow of a small hill, which commands an extensive prospect; for, from this point, the eye may wander over five adjoining and beautiful counties; and now bearing in mind Scotland, we cannot fail to observe how much more uniform is the face of the whole prospect of this English scene; for in no direction do we here observe any wild and rugged peaks of rocks or mountains—no sudden depressions into wide and deep glens—no openings into extended and winding ravines—no bare bleak moors, with here and there a fertile spot, like “beauty sleeping in the lap of horror.” No; there is less variety, less contrast. The whole scene is chastened and softened down into gentle undulations of rich and fertile land, which,

compared with the scenery of the north, seems like a sea becalmed on a bright summer day, contrasted with the more sublime and awful spectacle of a sea, when its billows are raging mountains high amidst the terrors of the tempest. But let us descend this gentle declivity, and enter the road; and here, again, we cannot but remark, that the thick hedge, rising high on each side the road, and the trees, the boughs of which almost droop with their luxuriant and abundant foliage, seem as if Nature, prodigal of her munificence, sought to shelter alike from sunshine and from storm the weary pedlar, as much as the more wealthy traveller. Nor is this all; for the shortness of the roads, and the graceful curves they take in sweeping gradually out of sight, have, in most parts of England, a peculiarly picturesque effect, seeming, indeed, to invite our footsteps onwards, and inducing a belief, that, at every turning, some new and more lovely prospect will open upon our enchanted sight. But, behold! the road is here bisected with an opening; it is a green lane, so narrow that neither carriage, gig, baggage-wagon, nor cart, can pass along; and on each side arises a bank, covered with weeds and wild-flowers, exhaling delicious odours; while above them a hedgerow, prodigal of its leafy branches, curtains out even a glimpse of the adjoining corn field. Never have we in our northern rambles met with a green lane worth entering; not that we would hesitate, were we a travelling bagman, to explore the most wintry-looking byroad that ever run across a country. All we mean is, simply, that we have never, north of the Tweed, met with that retired, quiet, grassy-looking green retreat, which, under the form of a “green lane” in England, seems destined for the evening walk of two confiding and loving beings, who may there pour forth their secret vows, interrupted only by the occasional murmurs of the passing wind, and overlooked only by the all-seeing eye of Heaven. Such a green lane as this is a peculiar feature of English scenery, and is worth travelling a thousand miles to walk through on a quiet summer evening. Here we may again pause to look around; nor are we less struck with the smooth and verdant aspect of the country. Here extend the richest pasture grounds—there crops of turnips, not indeed drilled, as in Scotland (a practice now becoming general in English counties), but broad-cast—there, again, the richest yellow-looking corn fields, which now reflect, with many softened and chastened hues, the rays of the setting sun. Hush! we hear the light silvery tones of a sheep-bell in the adjoining field. It is a sound we do not remember to have heard in our country rambles through Scotland; but, in the silence and twilight of evening, it has an extremely pleasing, nay, touching effect. We see, too, from this point, rising above the trees, the village spire, which, “tapering, points to heaven;” and, far as we have travelled, we feel forced to confess, that in no country have we seen simpler and more appropriate buildings for the worship of the great God. But, even now, we have entered the churchyard, and meet a train of young persons, chiefly dressed in white, bearing in their hands flowers. They do not speak to each other; but one of them sobs aloud. Here let us pause. They make their way over the briar-bound mounds, significant of the repose of those who have died in hope and faith. They kneel. Their young hearts are now pouring forth a stream of fervent prayer. They rise, and scatter the flowers over a new-raised grave. There is something peculiarly affecting in this simple, but heartfelt ceremony. We would willingly abolish all needless forms and customs, and do not even admire the *Père la Chaise* in Paris; because it is not kept up as a matter of feeling, but of public exhibition. The flowers we there behold may excite soothing and pleasing associations in the mind of a stranger; but these soon vanish, when we recollect that they are not placed there as tributes of love and affection, but for the idle purpose of worldly ostentation. How different is it with the simple ceremony which we have so often witnessed in England, when a gentle and beloved being has been cut down like a flower in the spring of life! Young persons dressed in white, the emblem of purity and innocence, bear the coffin themselves to the grave; they afterwards, generally in the dusk of the evening, go together, carrying flowers, and, after praying round the grave, plant them in the earth. This custom, so affecting, when voluntarily performed, and without any desire of vain display, we are sorry to observe, is now fast dying out, and is only preserved in a few counties immediately bordering on Wales. We have repeatedly, however, witnessed the ceremony under the most touching circumstances, and seldom have failed to remember the beautiful lines of the poet Herrick:—

Thus, thus, and thus, we compass round
Thy harmless and enchanted ground:
And as we sing thy dirge, we will
The daffodil
And other flowers, lay upon
The altar of our love. The stone,
May no wolf nor screech-owl stir
A wing about thy sepulchre,
No boisterous winds or storms go thither,
To starve or wither
Thy soft sweet earth; but, like a spring,
Love keep it ever flourishing!

But passing through the rude little country churchyard gate, we re-enter the road; and as we walk back to the village, hear the chimes, or evening bells, which are still rung almost in every village in England, to summon the peasantry to their labours, or to advise

them that they may cease their toils. Here, too, we meet with an English labourer, returning from his daily occupation. He is dressed in a coarse, and, without offence, we must add, dirty-looking frock, thrown over his shoulders, plaited on the breast, and descending to a little above the knees. Upon his shoulder he suspends a spade, a hoe, and some farming utensils; and his walk is heavy and cumbersome. Behind him follows a young clownish-looking boy, probably his son, who bears upon his shoulder a pole, at the end of which is hung a small barrel, which, probably, was filled with cider or perry, the beverages of the county. Here we are compelled to confess, that the English labourer is naturally a dull, heavy clodhopper, who has scarcely an idea beyond satisfying his mere animal necessities. He can, in general, neither read nor write, nor is he in the slightest degree curious to learn any thing that does not appertain to his own immediate interest.—But twilight is now stealing up the valley, and we shall retire to the village, to take “our ease in our own inn.” But we do not do so, without promising to renew our perambulations, for the purpose of pointing out those minute differences, which, when grouped together, constitute the whole distinction between Scotland and England.

COMETS.

In our previous article on this subject, it was shown that the forthcoming luminary will occupy that point of the earth's course round the sun (and hence the only place in which there is the least danger of its mingling its atmosphere with the earth's) a month before that planet reaches the same spot. This would at once decide the question, but for the following objection:—With respect to comets, the theoretic position calculated, and the real position observed, do not exactly coincide; and this difference cannot be accounted for upon the principle of planetary attraction: hence has arisen the theory, that the resistance of a subtle fluid called ether, which is supposed to fill space, is the cause. There can be little doubt that such is the fact. The question then comes to be, how much will this ether retard the velocity of the comet? Will that body be stayed so long in its progress as to afford the earth an opportunity of coming up with it? It may be observed, that the resistance which this fluid offers to the earth is not appreciable, because of the density of our planet; whereas comets, being for the most part simple masses of light vapours, are susceptible of being sensibly retarded. [The principle of bodies of the same bulk, but of unequal weights, passing through the atmosphere with different degrees of velocity, will be found explained in the article *Attraction*, No. 26 of this Journal.] However startling it may at first sight appear, theory and observation demonstrate the fact, that the motion of the comet will be *accelerated*, and *not retarded*—that its encroachment upon the line of the earth's orbit will be rather before than after the time specified. The cause of this can be easily explained. The rapidity with which a body revolves round the sun depends upon its proximity to that luminary. This being allowed, and it is indisputable, the whole mystery becomes plain. The comet is in the first instance retarded—its centrifugal force, or the rapidity with which it recedes from the centre of the sun, is diminished. Now, a little reflection will show that this is just equivalent to an increase of the sun's attractive powers; hence the comet being brought nearer to the sun, the dimensions of its primitive orbit will be reduced, but its motion, according to the principle already laid down, will be *increased*. Thus, then, the resistance of the ether, instead of affording any grounds for alarm, must be looked upon as another strong argument against the probability of the dreaded catastrophe occurring.

But another question arises: Although the collision should not take place, will the comet be able, in any way, sensibly to affect the earth; for instance, will it modify, in any shape, the seasons of the present year? In 1811, a brilliant comet illuminated the heavens. That year was remarkable for the elevation of its temperature, the abundance of its harvest, and the superior quality of its wines: the cause of all this, vulgar prejudice ascribed to the influence of the luminary. That the idea was visionary and absurd, appears both from fact and theory. Comets, say these sapient reasoners, warm our globe with their beams. Now it is a fact, that a majority of the years most prolific in comets were not distinguished for their temperature. For instance, 1808 was a cold year, and yet seldom have so many comets appeared in so short a time. 1829 was rather a cold year, and yet one appeared. Last year, none made their appearance, and yet the temperature was higher than it was in 1819, which was honoured with a visit from three, one of which was very brilliant. There is another fact strongly militating against the theory of cometary influence; it is, that cold years are commonly cloudy, and the most brilliant comets might pass unperceived through a sky thus enveloped.

To set the subject at rest, let us pursue it through its details. According to all philosophical principles, a comet can act upon the earth only in three ways—by attraction—by reflecting luminous and caloric rays—and by the gaseous matter which composes its nebulousity, or its tail, which, in certain positions, may happen to invade the terrestrial atmosphere. It is unnecessary to examine this third species of action, as

the forthcoming comet possesses no tail, and its nebulosity will be situated at an immense distance from the earth.

The comet of 1811 had a brilliant tail, with a maximum length of forty-one millions of leagues; but it could not possibly touch the earth, for at its nearest approach it was distant forty-seven millions of leagues. At the height of its splendour, it did not throw upon the earth a light equal to the one-tenth part of that we receive from the full moon. The rays were concentrated to the focus of the largest lens, and acted on the blackened bulb of a thermometer, and yet no sensible effect was produced. Now, since by this mode of experimenting, a hundredth part of a degree of an ordinary thermometer would be perceptible, we must for ever abandon the idea of the calorific influence of the comets being capable of affecting the earth so as to produce an abundant crop.

Let us now consider the attractive power of comets. The tides of the ocean are caused by the attraction of the moon, and upon the power of this attraction depends the size of the tide. Now, the comet of 1811 exercised not the slightest influence over the waters of the deep; hence the action of the comet upon the earth can only amount to a very trifling part of that of the moon. The attractive influence of the moon cannot fail to produce an atmospheric tide, the strength of which would be ascertained by the barometer; and yet, from an immense number of observations made in different places, and with the utmost exactness, the strength of the lunar atmospheric tide was scarcely susceptible on the scale of the instrument. After this, it would be ridiculous to suppose that in this way the comet could exercise any influence upon the earth. The vine-dressers of the continent must, therefore, look to something else than the appearance of the expected luminary for a realization of their hopes of an abundant harvest.

ON THE PHYSICAL CONSTITUTION OF COMETS.

In describing, in a former paper, the most common appearance assumed by a comet, I mentioned the nucleus, coma, and tail. I shall now enter into a detail of what telescopic observations have discovered of the peculiar constitution of these heavenly bodies. It has been already mentioned, that many comets have no perceptible tail; that several are destitute of any apparent nucleus; but none have been discovered, after having been carefully observed by the telescope, wanting that species of nebulosity or mistiness which the ancients named the coma.

OF THE NEBULOSITY.

Among the comets destitute of any apparent nucleus, and which seem to be simple globular masses of vapour slightly condensed towards the centre, it is only necessary to mention those of 1795, 7, and 8, observed by Olbers, and the small one of 1804, the nebulosity of which had a diameter of 6000 miles.

Seneca informs us that stars could be seen through comets. This is true of those destitute of any nucleus; and the nebulosity is so rare and transparent, that a feeble light, though placed at an immense distance behind it, will be visible. Herschel discovered a star of the sixth magnitude through the comet of 1795, and others have done the same even with respect to stars of considerably smaller magnitude.

When the comet possesses a nucleus, the nebulosity rarely tends towards it with a progressively increasing intensity; on the contrary, the parts of the nebulosity next the nucleus are the least luminous. They appear to be very rare and transparent. At some distance from the centre there is a sudden increase of brightness, which gives the comet an appearance of being encircled by a luminous ring. Sometimes two, and even three of these, have been discovered, each separated by an interval where the light was scarcely perceptible.

To form some idea of this, let us simply suppose there are three layers of clouds, at three different heights, enveloping the earth; and that all of these, besides being diaphanous, possess certain optical qualities, distinguishing them from the pure atmospheric air which is interposed between each. In the comet of 1811, the envelope was not less than 30,000 miles in thickness, and its inner surface was 36,000 miles distant from the nucleus. When the comet has the appendage of a tail, the ring appears closed only on the side next the sun, and is semicircular. The extremities of this semicircle are the points of the departure of those rays of light, the elongation of which forms the limits of the tail.

THE NUCLEUS.

Comets have often nuclei similar to the planets in their form and brilliancy. In general they are very small, but the reverse is sometimes the case. The comet of 1798 had a nucleus of thirty-three miles in diameter, and in one of those which appeared in 1811, it amounted to 3267 miles. A knowledge of the nature of this nucleus is of considerable importance, and, accordingly, the subject of its transparency or non-transparency has been warmly canvassed by several philosophers. One party states that they have seen stars through this nucleus, and others that they have seen them completely eclipsed by it. The following theory has been proposed:—We have seen that there are comets without any apparent nucleus, which, in all their extent, shine with the same splendour, and yet are nothing but simple agglomerations

of a gaseous substance. A second degree of concentration of these vapours, let us suppose, produces a nucleus in the centre of the nebulosity remarkable for its brilliancy, but, being still in a liquid state, is diaphanous. At a more advanced period, the liquid being sufficiently cooled, will be enveloped with a solid crust, and from that moment all transparency will cease. This nucleus being interposed between a star and the observer, will produce an eclipse as complete as those resulting daily, with the moon and planets. Nothing absolutely disproves the existence of comets with a solid nucleus. The variety of aspect and brightness which these bodies present, proves that they are not all fashioned after a uniform manner. The archives of science supply us with a variety of facts in support of this position. Keeping out of view those numerous stories which would doubtless be considered fabulous, recourse will only be had to incontestible observations.

In the forty-third year before the Christian era, a comet was seen by day with the naked eye, and was looked upon by the Romans as the metamorphosed soul of Cæsar, who had been assassinated a short time preceding the event. In 1402 there appeared two very remarkable comets. The first was so brilliant, that, in March, the light of the sun at meridian day did not prevent its being visible, as contemporary authors express it, to the extent of two fathoms. The second appeared in June, and was seen a long time before sunset. It was pretended that this comet announced the approaching death of Jean Galas Visconti. This prince, who had got his horoscope calculated in youth, was so struck with the appearance of the comet, that the fear incident upon this no doubt contributed to realize the prediction.

Cardan relates, that, in 1532, a comet appeared at mid-day, which greatly excited the curiosity of the inhabitants of Milan. At the time it shone (about the period of Sforza the Second's death), Venus was not in a favourable position to be seen in presence of the sun. The star of Cardan was then a comet, and is the fourth mentioned by historians as visible at mid-day. The famous comet of 1577 was discovered by Tycho Brahe before sunset.

But to come to a more modern luminary, the observations upon which have been properly detailed: On the 1st of February, the comet of 1744 was, according to Chezeaux, more luminous than Sirius, the brightest star in the heavens. On the 8th, it equalled Jupiter; and some days after it did not yield in splendour to Venus. At the commencement of the following month, it was seen by several persons at one o'clock of the day.

After mentioning the appearance of comets so brilliant as these, and knowing that others lately observed vanish almost before the telescope can be brought to bear upon the point of space which they occupy, it can scarcely be doubted that these bodies are of different physical constitutions. It may be concluded, then, that there are comets *without* a nucleus, comets whose nucleus is probably diaphanous; and, lastly, comets more brilliant than the planets, and whose nuclei are probably solid and opaque.

OF THE TAIL.

That long luminous train with which comets have been frequently accompanied, has in all ages and countries borne the name of tail.

Pierre Appian, in observing attentively the comet of 1531, noticed that the tail, whatever might be the motion or situation of the star, was placed on the prolongation of the line which joined the sun and the nucleus. Some philosophers have attempted to generalize this principle, but at the expense of facts. It is true that usually the tail is placed behind the comet and opposite to the sun, but the line which unites the two does not always conform to the axis of the tail. It has also been found, that the tail inclines constantly towards the region which the comet has quitted. It would appear from this, that, in passing through a gaseous medium, the substance of which it is formed experienced a greater resistance than that of the nucleus. In proof of this, it may be stated that the deviation is greater the farther from the head. These deviations are such that the tail acquires a very sensible curve. That of 1744, for instance, formed nearly a quadrant in the extent of some degrees. Suppose, then, that the cause of the curvature is correctly accounted for, it will follow that the convexity will always be turned from that region towards which the comet travels. Only two imperfectly ascertained exceptions have been offered to this rule.

The tail enlarges greatly at a distance from the head of the comet. The sides of the curvature are more luminous than the middle, which commonly shows an obscure stripe, dividing the tail longitudinally into two distinct, and often almost equal parts. Ancient observers believed this stripe to be the shadow of the comet. But this explanation cannot apply to tails not directed towards the sun. It is more consistent with phenomena to consider the tail as a hollow cone. The visual line, directed to the borders of this cone, it is easily seen, will take in a greater quantity of nebulous particles than the line passing through the centre. Now, whether these particles shine by themselves, or only reflect the sun's rays, it is their total number which, in each direction, ought to determine the intensity of the light.

Comets have sometimes several tails. That of 1744, on the 7th and 8th of March, had six, each about six

degrees in breadth, and from 30 to 44 in length. Their borders were bright and well defined, while their middle emitted only a very attenuated light; and, between two of the different tails, it was as dark as the rest of the sky. These tails sometimes stretch out to the prodigious length of 97 degrees; so the head of the comet could thus set, whilst a portion of its tail remained in the zenith.

My readers will, perhaps, look for some details of the nature of cometary light—the of the causes of their tails—what changes their forms—what gives rise to the systems of concentric envelopes, which the nebulosity sometimes forms—are comets inhabited? &c. But, as nothing certain can be stated on these points, I refrain from indulging in vague hypotheses, or philosophical romance. Cometary astronomy has made great progress within the last century and a half, but it still remains in a state of considerable obscurity, notwithstanding the zeal and assiduity which philosophers have displayed to elucidate and explain the subject.

SLEEP-WALKING.

Sleep-walking is in general a profitless occupation. There are, however, instances in which somnambulists have employed themselves in their daily labours, with considerable diligence. We were lately told in the newspapers of a servant girl in the neighbourhood of Falkirk, who, having been one evening desired to prepare a baking of cakes early next morning, arose in the night, brought water, of which there happened to be none in the house, from the canal, whence it was commonly taken for the use of the family, baked a large farl, placed it upon the girdle, which she adjusted properly over the grate, but overlooked the necessity of lighting the fire. All this she discovered next morning when she awoke. What is more to our present purpose, is a relation given by Henricus ab Heeres, in his *Medical Observations*, of a student whose poetical talent was more lively at such times than when awake. This young man cudgelled his brains sometimes the whole day, in making verses, correcting and blotting them out again; and, not being able to please himself, was forced to leave many gaps till a more lucky sitting. Sometimes, after leaving his compositions in this imperfect state, he would rise in the night, open his desk, fall to writing, fill up the chasms, read aloud what he had written, laugh heartily at what pleased him, and call his chamber-fellow to do the like, and yet all this while he was fast asleep: then putting off his shoes and clothes, shutting his desk, and laying his papers aside, he went to bed again, and slept till he was called up, utterly ignorant of what he had written, said, or done in the night time. In the morning, returning to his studies, and finding the blanks in his verses filled up with his own hand, he was at a loss to know whether it was done by man or some evil genius, and was in great perplexity, till his fellow-students set his mind at rest by a recital of his behaviour during his sleep. Some time after, he left the schools, and betaking himself to a virtuous wife, was haunted by the same infirmity, would rise in the night, take the child out of the cradle, walk about the house with it, and answer any question truly that his wife then propounded to him, which he would not do at other times. About the fortieth year of his age, and to his great satisfaction, this custom left him, unless he had drunk hard overnight. His wife and whole family, that had seen him walking, reading, and writing, being desired to observe it, affirmed that he spoke as plainly as if he had been awake, and that his eyes were open all the time, of which he was wholly ignorant, and sincerely protested he saw not at all, and remembered nothing of what they said he had done.

MY NATIVE BAY.

My native bay is calm and bright,
As e'er it was of yore
When, in the days of hope and love,
I stood upon its shore;
The sky is glowing, soft, and blue,
As once in youth it smiled,
When summer seas and summer skies
Were always bright and mild.
The sky—how oft hath darkness dwelt,
Since then, upon its breast;
The sea—how oft have tempests broke
Its gentle dream of rest!
So oft hath darker woe come o'er
Calm self-enjoying thought;
And passion's storms a wilder scene
Within my bosom wrought.
Now, after years of absence, pass'd
In wretchedness and pain,
I come and find those seas and skies
All calm and bright again.
The darkness and the storm from both
Have trackless pass'd away;
And gentle as in youth, once more
Thou seem'st, my native bay!
Oh, that, like thee, when toil is o'er,
And all my griefs are past,
This ravaged bosom might subside
To peace and joy at last!
And while it lay all calm like thee,
In pure unruffled sleep,
Oh, might a heaven as bright as this
Be mirror'd in its deep!

BURIAL FANCIES.

"THE seventeenth stanza of the second book of the *Minstrel*," says Sir William Forbes, in his *Life of Beattie*, "in which he so feelingly describes the spot of which he most approved for his place of sepulture, is so very exact a picture of the situation of the churchyard of Laurencekirk, which stands near to his mother's house, and in which is the schoolhouse where he was daily taught, that he must certainly have had it in his view at the time he wrote the following beautiful lines:—

Let vanity adorn the marble tomb
With trophies, rhymes, and scuteneons of renown,
In the deep dungeon of some Gothic dome,
Where Night and Desolation ever frown;
Mine be the breezy hill that skirts the down,
Where a green grassy turf is all I crave,
With here and there a violet bestrewn,
Fast by a brook or fountain's murmuring wave;
And many an evening sun shine sweetly on my grave!

"The wish that our bones should be laid 'in the sepulchre with our fathers,' has been so prevalent in all ages, that it seems to be a sentiment inherent in our nature. No wonder, therefore, that the local scenery, where his nearest and dearest connections were interred, should have made an early and deep impression on the mind of young Beattie, and should have suggested to him the idea, that *there*, perhaps, might be his own place of sepulture.

"At a later period, however, he had changed his design in that respect; and after he began to spend so much time at Peterhead, he became fond of an ancient burying ground, at six miles distance, where had originally stood the church, now in ruins, of the parish of St Fergus, in the middle of the beautiful links of that name. This was a favourite spot of Dr Beattie's, where he much delighted to take his walks of meditation. Combining the idea of solitude and repose with the solemn purpose to which the scene was devoted, he felt a more than common interest in that sequestered spot, and used to say to his friends, that it was there he wished his remains might be laid. With that view, the first season in which his niece, Mrs Glennie, accompanied him to Peterhead, he carried her to visit the churchyard in the links of St Fergus. It was the recollection of that circumstance which induced Mrs Glennie to ask him, after the death of both of his sons, where he desired to be interred? to which he replied, that he 'would wish his body to be laid beside those of his two sons, rather than beside that of the greatest monarch upon earth.' He was, accordingly, buried at Aberdeen."

The remark that the wish to be buried with our fathers is inherent in our nature, is a frequent one. Whether it is true or not, the anecdote just cited proves that the wish is not so deep rooted but that it may be superseded before the course of human life is run. Beattie was susceptible of the romantic to a degree seldom equalled; his feelings, indeed, in this respect, bordered upon the morbid; and yet we see him changing his mind twice concerning his burial place: the first, or inherent wish, that he should be laid in the sepulchre with his fathers, having been abandoned upon a fancy that he had found a sequestered spot, where it would be rather an agreeable sort of thing to be buried; for some are so much impressed with the beauties of local scenery, that they could almost wish to die for the sake of having their bones deposited in their favourite retreat.

Wilson, the American ornithologist, as his biographer informs us, "while in the enjoyment of health, had, in a conversation with a friend on the subject of death, expressed a wish to be buried in some rural spot, sacred to peace and solitude, whither the charms of nature might invite the steps of the votary of the Muses and the lover of science, and *where the birds might sing over his grave*. It has been matter of regret," adds this writer, "to those of his friends to whom was confided the mournful duty of ordering his funeral, that this desire had not been made known to them, otherwise it should have been piously observed."

Wilson's wish, that his body should lie where the birds might sing over his grave, was a sentiment as finely conceived as any thing of the same kind to be met with in poetry; but the propriety of "piously observing" such wishes may be questioned; it would only encourage other similar fantasies—for it is nothing but a fantasy: man has done his duty to his dead brother when he has committed dust to dust—it matters nothing where. A certain carpenter had such an idea of the dignity conferred upon man by the upright posture, that he thought the purposes of nature ought not to be thwarted even in death. As far as regarded himself, in particular, he could not bear the idea of being laid on his back in the grave, but

wanted to have a deep hole dug, and the coffin placed on end. He was quite serious and earnest on the subject; and, though a man of no public fame, his dying wishes were certainly as binding on his surviving relatives, as if he had been a great poet, philosopher, statesman, or warrior; but the thing was palpably a whim, and was disregarded accordingly. Wilson's fancy had not such an air of absurdity about it; it took a different direction, but was not more founded on reason. Where it is a matter of indifference, there is no harm in attending to injunctions of this kind; but to lay it down as a principle, that they should be "piously observed," and to act upon it, were but to delude, and be deluded. The dead, disguise it as we may, are buried for the sake of the living, not because it is of any consequence to themselves; and no outrage was done to the manes of the carpenter, who was interred in a recumbent instead of a standing posture; nor to Wilson, when buried in the churchyard, and not in the woods, any more than to those of Beattie, because his body was not divided among the three places which, at different periods of his life, he had chosen for his burial ground.

Yet though, to the eye of reason, no one spot, abstractly considered, is more desirable as a place of sepulture than another, the attachment which binds us to the graves where our fathers repose is connected with some of our noblest feelings, and helps to cherish them. We cannot expect to see all mankind raised to the dignity of Stoic philosophers, nor is it certain that that state would confer more real happiness than is derived from the indulgence of prejudices, which, though numerous, are harmless, and even amiable. "Where is your *earth*?" is a question frequently to be heard among the Scottish peasantry; and if all the associations which such an allusion is calculated to awaken, were rooted from our bosoms, why, really, after all, this would be an exceedingly uncomfortable world to live in. In this way is it often found, that those things which we are most sensible are weaknesses, contribute materially to promote that kindness of disposition, without which society were repulsive in its aspect, and unendurable in reality.

The fancy of being laid apart from the resting places of our fellow-creatures, is so beautifully developed in a small poem by the late Mr Crabbe, that we cannot resist the temptation of quoting it. It must be understood as the address of an ill-fated lady, slightly tinged with insanity, to her sister, when on her death-bed.

Let me not have this gloomy view

About my room, around my bed;

But morning roses, wet with dew,

To cool my burning brows instead.

As flowers that once on Eden grew,

Let them their fragrant spirit shed,

And every day the sweets renew,

Till I, a fading flower, am dead.

Oh, let the herbs I loved to rear

Give to my sense their perfumed breath;

Let them be placed about my bier,

And grace the gloomy hour of death.

I'll have my grave beneath a hill,

Where only Lucy's self shall know,

Where runs the pure pellucid rill

Upon its gravely bed below;

Their violets on the borders blow,

And insects their soft light display.

Till, as the morning sunbeams glow,

Their cold phosphoric fires decay.

That is the grave to Lucy shown,

The soil a pure and silver sand,

The green cold moss above it grown,

Unpluck'd of all but maiden hand:

In virgin earth till then unturn'd,

There let my maiden form be laid;

Nor let my changed clay be spurn'd,

Nor for new guests that bed be made.

There will the lark—the lamb, in sport,

In air—on earth—securely play,

And Lucy to my grave resort,

As innocent, but not so gay.

I will not have the churchyard ground,

With bones all black and ugly grown,

To press my shiv'ring body round,

Or on my wasted limbs be thrown.

With ribs and skulls I will not sleep,

In darkening beds of cold blue clay,

Through which the ringed earthworms creep,

And on the shrouded bosom prey;

I will not hear the bell proclaim

When those sad marriage rites begin;

And boys, without regard and shame,

Press the vile mouldering masses in.

Say not it is beneath my care,

I cannot those cold truths allow:

These thoughts may not afflict me there,

But, oh, they vex and tease me now.

Raise not a turf, nor set a stone,

That man a maiden's grave may trace,

But let my Lucy come alone,

And let affection find the place.

Oh, take me from a world I hate!

Men, cruel, selfish, sensual, cold;

And in some pure and blessed state,

Let me my sister minds behold:

From gross and sordid views refined,

Our heaven of spotless love to share,

For only generous souls design'd,

And not a man to meet us there.

THE SEA SHORES OF BRITAIN.

ONE of the most remarkable, and yet, perhaps, least regarded phenomena in nature, is the incessant change which is going on in the configuration and dimensions of the sea shores of this and the adjacent continental countries. So fierce and unceasing is the action of the tides and currents of the ocean, especially if affected by the influx of rapid streams, that in few parts of the coast do we find that outline and appearance which our ancestors beheld some hundreds of years since. Where there were once bare rocks, or bleak sand and morasses, we may find beautiful extensive meadows of alluvial soil; and where the fields once bloomed in perennial beauty, we may behold nothing but huge stones, garnished with marine herbs, and forming the habitation of innumerable shell-fish.

The extraordinary changes of this nature daily in action, are not observable in detail, but, after the interval of years, they can easily be distinguished. It is probably not generally known that the island of Great Britain is melting away, like a mass of ice affected by the warming rays of the sun. Every hour it is becoming less in weight or bulk than it was the hour preceding—every day many hundreds of tons of matter are washed from its declivities, and carried by rivers and floods into the bed of the ocean. The result of so extensive a diminution is no where so observable as in the sea betwixt our island and Holland. Here the ocean is discovered to be fast filling up. It is now full of large banks, extending to a great length, the most extensive being the Dogger Bank, which stretches upwards of three hundred and fifty-four miles from west to south. The mountains rising beneath the waves of the sea are composed of matter chiefly drifted from the land; and as they will in time elevate their summits above the surface of the water, they will next begin to be covered with vegetation; and the period may arrive when there will exist a country as large as our own, though certainly flat in its character, and which will afford a home and support to a nation as powerful as those of elder creation. It is calculated that the banks we speak of would cover Great Britain to the depth of twenty-eight feet, were they scattered evenly on the ground; and this alone may give us an idea of the loss which our country has sustained. Our hills and valleys every where exhibit traces of the devastations which torrents and impetuous rivers have accomplished: every rivulet in our mountains exhibits, by their excavated banks, that large portions of the soil have been irrecoverably lost, or been floated off to form the base-work of new countries not yet emerged from their watery bed.

It is a subject fruitful in interest to the reflective, the great change which must have been thus effected in the character of our dearly beloved island throughout the succession of past ages. On a close examination of facts and appearances, we have the strongest circumstantial evidence that Great Britain was by no means originally an island, but formed merely a prolongation to the north of the continent of Europe. "Whether England," says Lyell, in his *Principles of Geology*, "was formerly united with France, has often been a favourite speculation; and in 1753, a society at Amiens proposed this as the subject of a prize essay, which was gained by the celebrated Desmarest, then a young man. He founded his principal arguments on the identity of composition of the cliffs on the opposite sides of the channel; on a submarine chain, extending from Boulogne to Folkestone, only fourteen feet under low water; and on the identity of the noxious animals in England and France, which could not have swam across the straits, and would never have been introduced by man. He also attributed the rupture of the isthmus to the preponderating violence of the current from the north. It will hardly be disputed that the ocean might have effected a breach through the land which, in all probability, once united our country to the continent, in the same manner as it now gradually forces a passage through the rocks of the same mineral composition, and often many hundred feet high, upon our coast. Although the time required for such an operation was probably very great, yet we cannot estimate it by reference to the present rate of waste on both sides of the channel. For when, in the thirteenth century, the sea burst through the isthmus of Staveren, which formerly united Friesland with North Holland, it opened, in about one hundred years, a strait more than half as wide as that which divides England from France; after which, the dimensions of the new channel remained almost stationary. The greatest depth of the straits between Dover and Calais is twenty-nine fathoms, which only exceeds, by one fathom, the greatest depth of the Mississippi at New Orleans." The speculative philosopher might perhaps deduce, from this ingenious theory, that, at some early period in the history of the world, our island was thus providentially cut off from France, in order that it might, at some future day, be inhabited by a people peculiar in their habits, and calculated to offer an example for the conduct of neighbouring nations.

With respect to the formation of alluvial land, there can be no doubt that it takes place almost entirely from the deposit of muddy particles brought from the interior by rivers, and prevented from going out to

sea by the action of currents and tides. Thus, Holland and the adjacent low countries are supposed to be formed by the flux of earthy matter from the Rhine and other large rivers. At the mouth of the Thames, there are various examples of the gain and loss of land. On the south shore of the Firth of Forth, there are some places where land is in the course of being saved from the sea to a great extent, particularly near Bo'ness; and there are other places—for instance, betwixt Leith and Newhaven—where the loss has been very great, though not of such importance as to rouse the people to a just sense of the injury. The Carse of Falkirk has, in the same way, been formed of alluvial matter; and the Carse of Gowrie and Strathearn exhibit every appearance of being of the same consistence. The Tay and the Earn are two of the largest Scottish rivers, both disembodying into an estuary called the Firth of Tay. It is apparent that these beautiful streams do not flow in the channel which they once pursued.

The traditions of the country people, although always suspicious, are generally worthy of some credit, especially when local appearances give them countenance. It is a common tradition, that the Tay, instead of forming the southern boundary of the Carse of Gowrie, formerly bounded it on the north, running under the Sidlaw Hills. The usual tale is, that the Tay turned off from its present course about two miles below Perth, and, making the circuit described, fell into the Firth, at the eastern extremity of the Carse; the Earn occupying by itself the channel of the two (now) united rivers. They ran along all the way down the Carse, parallel to, and at no great distance from, each other, winding round, and almost isolating various rising grounds which lay between them, and which, from that circumstance, were called *Inches*, or islands, as Inchira, Meginch, Inchmartin, Inchmichael, Inchture, and others. A countryman, having drawn a furrow with his plough from the Tay along a low field which he wished to irrigate, caused the whole river to take this direction, and to flow into the course of the Earn, leaving its former channel bare, and taking away from the Inches their pristine insular character. Another result has been, that the Tay now appears to flow into the Earn as a tributary, instead of sustaining its real character as a principal. Wild and improbable as this story may appear, it is partly borne out by local facts. It is the opinion of the present writers, that the whole of that district of country, or space forming the beds of the Tay and Earn, with the carses on their banks, from that part of the Tay where it becomes shallow, a few miles above Dundee, to the eminences which bound the Carse of Strathearn on the west, was, at an early period, one immense lagoon, or jungle, such as is now seen on the continent of America, wherein was a trackless labyrinth of watercourses, pools, brushwood, and forest trees. How or when the aboriginal forest disappeared, or the waters of the swamp betook themselves to defined channels, are questions which no writer can answer. It is only a matter of certainty that the country continued in a condition far from reclaimed after the land became inhabited, because the etymologies of the names of places now in use, are significant of the original nature of their respective localities. By these names we further discover that the district was the habitation of beasts of prey and animals of the chase. Boars, wolves, and foxes, from such a deduction, must have been the common inhabitants of the thickest and wilds. It has been shown by the ingenious naturalist, the Rev. Dr Fleming of Flisk, that what is now the bed of the Tay was once a forest, and this is proved by the discovery of the roots of trees, still in their natural position, within low watermark; immense beds of clay, full of the leaves of fresh-water plants; also beds of peat, containing hazel nuts in great quantities; deposits of shell-marl, and other remains equally significant. The process of forming dry arable land, out of the sludge of a shallow river, easily diverted from its course, has been pursued, first by Nature, and, in the second place, by Art. The cause of the windings, or links, of the Forth may be referred to a something so trifling, that it is hardly worthy of belief. The fall of a tree has sent a stream in a new direction; the slight opposition offered by the edge of a stone has directed the water into an opposite course. On a smaller scale, the whole operation may be seen in the case of a rivulet meandering through the bottom of a meadow. The growth of the land is likewise of no difficult solution. The grounds of the carse are the deposition of particles of earthy matter, washed down by the floods from the upper country, mingled with the residuum of forest trees and decayed vegetables. It is interesting to view the spectacle of the reclaiming of land from the Tay, now in operation, at the instance of both nature and art. This large and fine river is constantly bringing down from the recesses of the Highlands an infinitude of particles of sand or other matter, individually so small, that they cannot be seen by the naked eye, and whose presence is only known by the colour they infuse in the water. These particles are not carried out to sea. They are arrested by the tides opposite the carse ground above noticed, and, sinking to the bottom, they imperceptibly form a fine species of mire. In the course of time, this mire rises to the surface of the estuary. It is first left dry at ordinary high tides, and next becomes visible at the height of spring tides. For a very long while, it forms merely long bare reaches at low water, and at these ebbs of the tide, a

person might, from appearances, be of opinion that he could walk across the bed of the estuary with little difficulty. Floods and high impetuous tides at last drift so much matter on these rising reaches and half-formed islets, that they remain, at all times, above water, and finally, by the action of the winds in blowing thither the seeds of plants, or by other causes beyond the reach of human discovery, the land so formed is covered with a rich herbage, shrubs, plants of a various nature, and even trees. In the bed of the Tay there have risen, in this manner, Grange Island, Rhind Island, Cairney Island, Carpow Island, Chisbiny Island, and Mugdrum Island, and perhaps these islands may at a future day be joined to each other, or to the mainland on one side, so as to offer a complete specimen, in modern times, of the way in which the great body of the carses have sprung into existence. The ingenuity and wisdom of man are hastening, though not with a very creditable rapidity, the extension of the dry land on the banks of the Tay, and gradually diminishing the unprofitable breadth of its channel. The work of creation is going on chiefly upon the Fife side, a short way below Newburgh. Rude piers or dikes are run out from the shore, to the length of a few yards, at certain distances from each other, and at every flux of the tide, a small portion of the mire is left betwixt them. Little by little, the margin of the land is protruded farther and farther into the water, and when it has reached the outer termination of the dikes, additional projections are made, and the same result follows of an increase of land. In this way many flat fertile fields have been added to this portion of Fife; and, judging from a superficial calculation, it would seem to be no difficult matter to hem in the Tay to a narrow deep channel on the Perthshire side, thereby not only increasing the quantity of productive land to a vast amount, but doing much for the benefit of navigation.

BIOGRAPHIC SKETCHES.

WILLIAM BERRY.

THE individual whom we this week introduce to notice, in our biographical department, was one who exhibited great talents of a peculiar order, under very unfortunate circumstances, and, what is far more, who, notwithstanding these unfavourable circumstances, conducted himself through life in the most creditable manner, as a private citizen, and as the father of a family.

William Berry, an ingenious artist, was born about the year 1730, and bred to the business of a seal engraver. After serving an apprenticeship under a Mr Bolton, at Edinburgh, he commenced business for himself in that city, and soon became distinguished for the elegance of his designs, and the clearness and sharpness of his mode of cutting. At this time, the business of a stone engraver in the Scottish capital was confined to the cutting of ordinary seals; and the most elaborate work of this kind which they undertook was that of engraving the armorial bearings of the nobility. Mr Berry's views were for several years confined to the usual drudgery of his art; but, by studying some ancient intaglios, he at length conceived the design of venturing into that higher walk, which might be said to bear the same relation to seal engraving, which historical painting does to portrait painting. The subject he chose for his first essay was a head of Sir Isaac Newton, which he executed with such precision and delicacy as astonished all who had an opportunity of observing it. The modesty of Mr Berry permitted him to consign this gem to the hands of a friend in a retired situation of life, who had few opportunities of showing it to others. He resumed his wonted drudgery, satisfied, we may suppose, with that secret consciousness, which, to some abstracted minds, is not to be increased, but rather spoilt, by the applause of the uninitiated multitude. For many years this ingenious man narrowed his mind to the cutting of heraldic seals; while, in reality, he must have known that his genius fitted him for a competition with the highest triumphs of Italian art. When he was occasionally asked to undertake somewhat finer work, he generally found, that, though he only demanded perhaps half the money which he could have earned in humbler work during the same space of time, yet even that was grudged by his employers; and he, therefore, felt, that mere considerations of worldly prudence demanded his almost exclusive attention to the ordinary walk of his profession.

Nevertheless, in the course of a few years, the impulse of genius so far overcame his scruples, that he executed various heads, any one of which would have been sufficient to ensure him immortal fame among judges of excellence in this department. Among these were heads of Thomson, author of "The Seasons," Mary Queen of Scots, Oliver Cromwell, Julius Cæsar, a young Hercules, and Mr Hamilton of Bangour, the well-known poet. Of these, only two were copies from the antique, and they were executed in the finest style of those celebrated intaglios. The young Hercules, in particular, possessed an unaffected plain simplicity—an union of youthful innocence, with strength and dignity—which struck every beholder as most appropriate to that mythological personage; while it was, at the same time, the most difficult of all expressions to be hit off by the faithful imitator of nature. As a painter finds it much less difficult to imitate any extravagant violence of character, than to represent, with truth and perspicuity, the elegant ease of the

gentleman, so he can much more easily delineate the most violent contortions of countenance than that placid serenity, to express which requires a nice discrimination of such infinitely small degrees of variation, in certain lineaments, as totally to elude the observation of men on whose minds nature has not impressed, with her irresistible hand, that exquisite perceptive faculty which constitutes the essence of genius in the fine arts.

Berry possessed this perceptive faculty to a degree which almost proved an obstruction rather than a help in his professional career. In his best performances he himself remarked defects which no one else perceived, and which he believed might have been overcome by greater exertion, if for that greater exertion he could have spared the necessary time. Thus, while others applauded his intaglios, he looked upon them with a morbid feeling of vexation, arising from the sense of that struggle which his immediate personal wants constantly maintained with the nobler impulses of art, and to which his situation in the world promised no speedy cessation. This gave him an aversion to the higher department of his art, which, though indulged to his own temporary comfort, and the advantage of his family, was most unfortunate for the world.

In spite of every disadvantage, the works of Mr Berry, few as they are in number, became gradually known in society at large; and some of his pieces were even brought into competition, by some distinguished cognoscenti, with those of Picclet at Rome, who had hitherto been the unapproached sovereign of this department of the arts. Although the experience of Picclet was that of a constant practitioner, while Mr Berry had only attempted a few pieces, at long intervals, in the course of a laborious life; although the former lived in a country where every artificial object was attuned to the principles of art, while Mr Berry was reared in a soil remarkable for the absence of all such advantages, the latter was, by many judges, placed above his Italian contemporary. The respective works of the two artists were well known to each other; and each declared, with that manly kind of ingenuousness, which superior genius alone can confer on the human mind, that the other was greatly his superior.

Mr Berry possessed not only the art of imitating busts or figures set before him, in which he could observe and copy the prominence or depression of the parts, but he possessed a faculty which presupposes a much nicer discrimination—that of being able to execute a figure in *relievo*, with perfect justness in all its parts, which was copied from a painting or drawing upon a flat surface. This was fairly put to the test in the head he executed of Hamilton of Bangour. That gentleman had been dead several years, when his relations wished to have a head of him executed by Berry. The artist had himself never seen Mr Hamilton, and there remained no picture of him but an imperfect sketch, which was by no means a striking likeness. This was put into the hands of Mr Berry by a person who had known the deceased poet, and who pointed out the defects of the resemblance in the best way that words can be made to correct things of this nature; and from this picture, with the ideas that Mr Berry had imbibed from the corrections, he made a head, which every one who knew Mr Hamilton allowed to be one of the most perfect likenesses that could be wished for. In this, as in all his works, there was a correctness in the outline, and a truth and delicacy in the expression of the features, highly emulous of the best antiques, which were, indeed, the models on which he formed his taste.

The whole number of heads executed by Mr Berry did not exceed a dozen; but, besides these, he executed some full-length figures of both men and animals, in his customary style of elegance. That attention, however, to the interests of a numerous family, which a man of sound principles, as Mr Berry was, could never allow himself to lose sight of, made him forego those agreeable exertions for the more lucrative, though less pleasing, employment of cutting heraldic seals, which may be said to have been his constant employment from morning to night, for forty years together, with an assiduity that almost surpasses belief. In this department, he was, without dispute, the first artist of his time; but even here, a modesty, which was so peculiarly his own, and an invariable desire of giving perfection to every thing he put out of his hand, prevented him from drawing such emoluments from his labours as they deserved. Of this the following anecdote will serve as an illustration, and as an additional testimony of his very great skill:—Henry, Duke of Buccleuch, on succeeding to his title and estates, was desirous of having a seal cut, with his arms properly blazoned upon it. But as there were no fewer than thirty-two compartments in the shield, which was of necessity confined to a very small space, so as to leave room for the supporters and other ornaments within the compass of a seal of ordinary size, he found it a matter of great difficulty to get it executed. Though a native of Scotland himself, the noble Duke had no idea that there was a man of first-rate eminence in this art in Edinburgh; and, accordingly, he had applied to the first seal engravers in London and Paris, all of whom declared it to be beyond their power. At this time, Berry was mentioned to him, with such powerful recommendations, that he was induced to pay him a visit, and found him, as usual, seated at his wheel. The

gentleman who had mentioned Mr Berry's name to the Duke accompanied him on his visit. This person, without introducing the Duke, showed Mr Berry the impression of a seal which the Duchess Dowager had got cut a good many years before, by a Jew in London, now dead, and which had been shown to others as a pattern, asking him if he would cut a seal the same as that. After examining it a little, Mr Berry answered readily that he would. The Duke, at once pleased and astonished, exclaimed, "Will you, indeed!" Mr Berry, who thought that this implied some doubt of his ability to perform what he undertook, was a little piqued, and, turning round to the Duke, whom he had never before seen, he said, "Yes, sir; if I do not make a better seal than this, I will charge no payment for it." The Duke, highly pleased, left the pattern with Mr Berry, and went away. The original contained, indeed, the various devices of the thirty-two compartments distinctly enough to be seen, but none of the colours were expressed. Mr Berry, in proper time, finished the seal, on which the figures were not only done with superior elegance, but the colours of every part so distinctly marked, that a painter could delineate the whole, or a herald blazon it, with perfect accuracy. For this extraordinary and most ingenious labour, he charged no more than thirty-two guineas, though the pattern seal had cost seventy-five. Thus it was, that though possessed of talents unequalled in their kind, at least in Britain, and assiduity not to be surpassed—observing, at the same time, the strictest economy in his domestic arrangements—Mr Berry died at last, in circumstances far from affluent, June 3, 1783, in the 53d year of his age, leaving a numerous family of children. It had been the lot of this ingenious man to toil unceasingly for a whole life, without obtaining any other reward than the common boon of mere subsistence, while his abilities, in another sphere, or in an age more qualified to appreciate and employ them, might have enabled him to attain at once to fame and fortune in a very few years. His art, it may be remarked, has made no particular progress in Scotland, in consequence of his example. The genius of Berry was solitary, both in respect of place and time, and has never been rivalled by any other of his countrymen. It must be recorded to the honour of this unrequited genius, that his character in private life was as amiable and unassuming as his talents were great; and that his conduct on all occasions was ruled by the strictest principles of honour and integrity.—*Chambers's Scottish Biographical Dictionary.*

AN AMERICAN STORY.

THE following story, the simple and domestic incidents of which may be deemed scarcely worth relating, after such a lapse of time, awakened some degree of interest, a hundred years ago, in a principal seaport of the Bay Province. The twilight of an autumn day; a parlour on the second floor of a small house, plainly furnished, as be seemed the middling circumstances of its inhabitants, yet decorated with little curiosities from beyond the sea, and a few delicate specimens of Indian manufacture—these are the only particulars to be premised in regard to scene and season. Two young and comely women sat together by the fireside, nursing their mutual and peculiar sorrows. They were the recent brides of two brothers, a sailor and a landsman, and two successive days had brought tidings of the death of each, by the chances of Canadian warfare, and the tempestuous Atlantic. The universal sympathy excited by this bereavement drew numerous condoling guests to the habitation of the widowed sisters. Several, among whom was the minister, had remained till the verge of evening, when, one by one, whispering many comfortable passages of Scripture, that were answered by more abundant tears, they took their leave, and departed to their own happier homes. The mourners, though not insensible to the kindness of their friends, had yearned to be left alone. United, as they had been, by the relationship of the living, and now more closely so by that of the dead, each felt as if whatever consolation her grief admitted, were to be found in the bosom of the other. They joined their hearts, and wept together silently. But after an hour of such indulgence, one of the sisters, all of whose emotions were influenced by her mild, quiet, yet not feeble character, began to recollect the precepts of resignation and endurance, which ~~they~~ had taught her, when she did not think to need them. Her misfortune, besides, as earliest known, should earliest cease to interfere with her regular course of duties; accordingly, having placed the table before the fire, and arranged a frugal meal, she took the hand of her companion.

"Come, dearest sister; you have eaten not a morsel to-day," she said. "Arise, I pray you, and let us ask a blessing on that which is provided for us."

Her sister-in-law was of a lively and irritable temperament, and the first pangs of her sorrow had been expressed by shrieks and passionate lamentation. She now shrunk from Mary's words, like a wounded sufferer from a hand that revives the throb.

"There is no blessing left for me, neither will I ask it," cried Margaret, with a fresh burst of tears. "Would it were His will that I might never taste food more!"

Yet she trembled at these rebellious expressions, almost as soon as they were uttered, and, by degrees,

Mary succeeded in bringing her sister's mind nearer to the situation of her own. Time went on, and their usual hour of repose arrived. The brothers and their brides, entering the married state with more than the slender means which then sanctioned such a step, had confederated themselves in one household, with equal rights to the parlour, and claiming exclusive privileges in two sleeping rooms contiguous to it. Thither the widowed ones retired, after heaping ashes upon the dying embers of their fire, and placing a lighted lamp upon the hearth. The doors of both chambers were left open, so that a part of the interior of each, and the beds with their unclosed curtains, were reciprocally visible. Sleep did not steal upon the sisters at one and the same time. Mary experienced the effect often consequent upon grief quietly borne, and soon sunk into temporary forgetfulness, while Margaret became more disturbed and feverish, in proportion as the night advanced with its deepest and stillest hours. She lay listening to the drops of rain, that came down in monotonous succession, unswayed by a breath of wind; and a nervous impulse continually caused her to lift her head from the pillow, and gaze into Mary's chamber and the intermediate apartment. The cold light of the lamp threw the shadows of the furniture up against the wall, stamping them immovably there, except when they were shaken by a sudden flicker of the flame. Two vacant arm-chairs were in their old positions on opposite sides of the hearth, where the brothers had been wont to sit in young and laughing dignity, as heads of families; two humbler seats were near them, the true thrones of that little empire, where Mary and herself had exercised, in love, a power that love had won. The cheerful radiance of the fire had shone upon the happy circle, and the dead glimmer of the lamp might have befitted their reunion now. While Margaret groaned in bitterness, she heard a knock at the street door. "How would my heart have leapt at that sound but yesterday!" thought she, remembering the anxiety with which she had long awaited tidings from her husband. "I care not for it now; let them begone, for I will not arise."

But even while a sort of childish fretfulness made her thus resolve, she was breathing hurriedly, and straining her ears to catch a repetition of the summons. It is difficult to be convinced of the death of one whom we have deemed another self. The knocking was now renewed in slow and regular strokes, apparently ~~coming~~ with the soft end of a doubled fist, and was accompanied by words, faintly heard through several thicknesses of wall. Margaret looked to her sister's chamber, and beheld her still lying in the depths of sleep. She arose, placed her foot upon the floor, and slightly arrayed herself, trembling between fear and eagerness as she did so.

"Heaven help me!" sighed she. "I have nothing left to fear, and methinks I am ten times more a coward than ever."

Seizing the lamp from the hearth, she hastened to the window that overlooked the street door. It was a lattice, turning upon hinges; and having thrown it back, she stretched her head a little way into the moist atmosphere. A lantern was reddening the front of the house, and melting its light in the neighbouring puddles, while a deluge of darkness overwhelmed every other object. As the window grated on its hinges, a man in a broad-brimmed hat and blanket coat stepped from under the shelter of the projecting story, and looked upward to discover whom his application had aroused. Margaret knew him as a friendly innkeeper of the town.

"What would you have, Goodman Parker?" cried the widow.

"Lack-a-day, is it you, Mistress Margaret?" replied the innkeeper. "I was afraid it might be your sister Mary; for I hate to see a young woman in trouble, when I haven't a word of comfort to whisper her."

"For Heaven's sake, what news do you bring?" screamed Margaret.

"Why, there has been an express through the town within this half hour," said Goodman Parker, "travelling from the eastern jurisdiction with letters from the governor and council. He tarried at my house to refresh himself with a drop and a morsel, and I asked him what tidings on the frontiers. He tells me we had the better in the skirmish you wot of, and that thirteen men reported slain are well and sound, and your husband among them. Besides, he is appointed of the escort to bring the captivated Frenchers and Indians home to the province jail. I judged you wouldn't mind being broke off your rest, and so I stept over to tell you. Good night."

So saying, the honest man departed; and his lantern gleamed along the street, bringing to view indistinct shapes of things, and the fragments of a world, like order glimmering through chaos, or memory roaming over the past. But Margaret staid not to watch these picturesque effects. Joy flashed into her heart, and lighted it up at once, and breathless, and with winged steps, she flew to the bedside of her sister. She paused, however, at the door of the chamber, while a thought of pain broke in upon her.

"Poor Mary!" said she to herself. "Shall I waken her, to feel her sorrow sharpened by my happiness? No; I will keep it within my own bosom till the morrow."

She approached the bed to discover if Mary's sleep were peaceful. Her face was turned partly inward to the pillow, and had been hidden there to weep; but a look of motionless contentment was now visible upon

it, as if her heart, like a deep lake, had grown calm because its dead had sunk down so far within. Happy is it, and strange, that the lighter sorrows are those from which dreams are chiefly fabricated. Margaret shrunk from disturbing her sister-in-law, and felt as if her own better fortune had rendered her involuntarily unfaithful, and as if altered and diminished affection must be the consequence of the disclosure she had to make. With a sudden step, she turned away. But joy could not long be repressed, even by circumstances that would have excited heavy grief at another moment. Her mind was thronged with delightful thoughts, till sleep stole on, and transformed them to visions, more delightful and more wild, like the breath of winter (but what a cold comparison!) working fantastic tracery upon a window.

When the night was far advanced, Mary awoke with a sudden start. A vivid dream had lately involved her in its unreal life, of which, however, she could only remember that it had been broken in upon at the most interesting point. For a little time, slumber hung about her like a morning mist, hindering her from perceiving the distinct outline of her situation. She listened with imperfect consciousness to two or three volleys of a rapid and eager knocking, and first she deemed the noise a matter of course, like the breath she drew; next, it appeared a thing in which she had no concern; and, lastly, she became aware that it was a summons necessary to be obeyed. At the same moment, the pang of recollection darted into her mind; the pall of sleep was thrown back from the face of grief; the dim light of the chamber, and the objects therein revealed, had retained all her suspended ideas, and restored them as soon as she unclosed her eyes. Again, there was a quick peal upon the street door. Fearing that her sister would also be disturbed, Mary wrapped herself in a cloak and hood, took the lamp from the hearth, and hastened to the window. By some accident, it had been left unhasped, and yielded easily to her hand.

"Who's there?" asked Mary, trembling as she looked forth.

The storm was over, and the moon was up; it shone upon broken clouds above, and below upon houses black with moisture, and upon little lakes of the fallen rains curling into silver beneath the quick enchantment of a breeze. A young man in a sailor's dress, wet as if he had come out of the depths of the sea, stood alone under the window. Mary recognised him as one whose livelihood was gained by short voyages along the coast; nor did she forget, that, previous to her marriage, he had been an unsuccessful wooer of her own.

"What do you seek here, Stephen?" said she.

"Cheer up, Mary, for I seek to comfort you," answered the rejected lover. "You must know I got home not ten minutes ago, and the first thing my good mother told me was the news about your husband. So, without saying a word to the old woman, I clapt on my hat, and ran out of the house. I couldn't have slept a wink before speaking to you, Mary, for the sake of old times."

"Stephen, I thought better of you!" exclaimed the widow, with gushing tears, and preparing to close the lattice; for she was no whit inclined to imitate the first wife of Zadig.

"But stop, and hear my story out," cried the young sailor. "I tell you we spoke a brig yesterday afternoon, bound in from Old England. And who do you think I saw standing on deck, well and hearty, only a bit thinner than he was five months ago?"

Mary leaned from the window, but could not speak.

"Why, it was your husband himself," continued the generous seaman. "He and three others saved themselves on a spar, when the Blessing turned bottom upwards. The brig will beat into the bay by daylight, with this wind, and you'll see him here to-morrow. There's the comfort I bring you, Mary, and so good night."

He hurried away, while Mary watched him with a doubt of waking reality, that seemed stronger or weaker as he alternately entered the shade of the houses, or emerged into the broad streaks of moonlight. Gradually, however, a blessed flood of conviction swelled into her heart, in strength enough to overwhelm her, had its increase been more abrupt. Her first impulse was to rouse her sister-in-law, and communicate the new-born gladness. She opened the chamber door, which had been closed in the course of the night, though not latched, advanced to the bedside, and was about to lay her hand upon the slumberer's shoulder. But then she remembered that Margaret would awake to thoughts of death and woe, rendered not the less bitter by their contrast with her own felicity. She suffered the rays of the lamp to fall upon the unconscious form of the bereaved one. Margaret lay in unquiet sleep, and the drapery was displaced around her; her young cheek was rosy-tinted, and her lips half opened in a vivid smile; an expression of joy, debarred its passage by her sealed eyelids, struggled forth like incense from the whole countenance.

"My poor sister! you will waken too soon from that happy dream," thought Mary.

Before retiring, she set down the lamp, and endeavoured to arrange the bed-clothes, so that the chill air might not do harm to the feverish slumberer. But her hand trembled against Margaret's neck, a tear also fell upon her cheek, and she suddenly awoke.—*From the TOKEN, an American Annual.*

ENGLISH ANECDOTES.

PROMOTION.

The late Duke of York once remarked to Colonel W., at the mess of the 11th regiment, that the colonel was uncommonly bald, and, although a younger man than his royal highness, he stood more in need of a wig. The colonel, who had been of very long standing in the service, and whose promotion had been by no means rapid, informed his royal highness that his baldness could be very easily accounted for. "In what manner?" asked his royal highness, rather eagerly. To which Colonel W. replied, "By junior officers stepping over my head." The duke was so pleased with the reply, that the gallant colonel obtained promotion in a few days afterwards.

A LAWYER CANNOT BE TOO BAREFACED.

A barrister observed to a learned brother in court, that he thought his whiskers were very unprofessional. "You are right," replied his friend; "a lawyer cannot be too barefaced."

SHARP ENOUGH ALREADY.

A solicitor, who was remarkable for the length and sharpness of his nose, once told a lady, that if she did not immediately settle a matter in dispute, he would file a bill against her. "Indeed, sir," said the lady, "there is no necessity for you to file your bill, for I am sure it is sharp enough already."

NEW CONSTRUCTION OF "EQUAM MEMENTO."

A gentleman told Lord North, that, from a variety of losses, he had found himself compelled to reduce his establishment. "And what," said his lordship, "have you done with the fine mare you used to ride?" "I have sold her." "Then you have not attended to Horace's maxim—

Equam memento rebus in arduis servare."

VENETIAN BLINDS.

Three Venetians, whom the late Lord Byron brought with him into this country, were so dreadfully attacked by ophthalmia, as almost entirely to lose their eye-sight. "What can we do with these poor fellows?" said his lordship, when he heard of their misfortune. "Why," said Dr. L., "at the worst we can set each of them up as a *Venetian Blind*."

LORD LOUGHBOROUGH.

Lord Loughborough rallying a physician, one day, on the inefficacy of his prescriptions, the doctor said, he defied any of his patients to find fault with him. "That," answered the witty lord, "is exactly what the hangman says."

NATIONAL PARADOXES.

Somebody once remarked, that the Englishman is never happy but when he is miserable; the Scotsman is never at home but when he is abroad; and the Irishman is never at peace but when he is fighting.

A HARD RUN.

A droll equivocal, and not unreasonable, took place between Sir — and Mr M., at the time of the great cash distresses in 1826. The baronet overtook the latter on returning from a fox chase; and, supposing the banker had been one of the field, and wishing to say something civil as he passed, observed, "A hard run to-day, Mr M." "Oh, no, sir, I assure you!" replied the conscious man of money, not of straw; "no such thing, sir, not in the least *hard-pressed* to-day; no run at all!" "Why, we run him in!" rejoined the baronet, with evident surprise; "would you have all knocked up?" "Oh! you are talking of the fox, perhaps," said the banker, "and I was thinking of my bank. I have not been hunting, but *hunted* all the week by a pack of fools."

A MOVING DISCOURSE.

A certain reverend drone in the country, preaching a very dull sermon to a congregation not used to him, many of them slunk out of the church, one after another, before the sermon was nearly ended. "Truly," said a gentleman present, this learned doctor has made a very moving discourse."

PURITANISM AT BOWLS.

The puritans carried their peculiar tenets into the minutest affairs of life. When Lord Brooke, one of the number, played at bowls, he would sometimes run after his cast, and cry, "Rub, rub, rub," in the eager but absurd hope that such a cry would give effect to his play. On such occasions, his chaplains would run after him with equal eagerness, and earnestly exclaim, "Oh, good my lord, you must leave that to God."

FIAT LUX.

A bishop of Lincoln adopted the strange conceit of having the grand Scripture sentence, "*FIAT LUX*," painted on all the windows of his house. In his hall, in particular, it was so thickly painted, that the reverse of the command was observable, and, as a wag remarked, you could scarcely see for light. A mad scholar, at last, happened to wait upon the bishop, and, observing the opacity of the light, fell a-breaking the windows with his stick. Being carried by the servants into the presence of the bishop, and questioned as to the cause of his conduct, "Why, my lord," answered he, "I was only obeying your lordship's commands: *Fiat Lux*."

WIT IN CHOOSING TEXTS.

A young preacher, in the time of James the First, being appointed to hold forth before the vice-chancellor and heads of the colleges of Oxford, chose for

his text, "What! cannot ye watch one hour?" which carried a personal allusion, as the vice-chancellor happened to be one of those heavy-headed persons who cannot attend church without falling asleep. The preacher repeating his text, in an emphatic manner, at the end of every division of his discourse, the unfortunate vice-chancellor as often awoke; and this happened so often, that at last all present could very well see the joke. The vice-chancellor was so nettled at the disturbance he had met with, and at the talk it occasioned, that he complained to the Archbishop of Canterbury, who immediately sent for the young man, to reprove him for what he had done. In the course of the conference which ensued between the archbishop and the preacher, the latter gave so many proofs of his wit and good sense, that his grace procured him the honour of preaching before the king. Here also he had his joke: he gave out his text in these words—"James First and Sixth, *Waver not*;" which, of course, every body present saw to be a stroke at the indecisive character of the monarch. James, equally quick-sighted, exclaimed, "He is at me already;" but he was, upon the whole, so well pleased with this clerical wag, as to make him one of his chaplains in ordinary. He afterwards went to Oxford, and preached a farewell sermon on the text, "Sleep on now, and take your rest."

THE SCOTTISH DUKES.

ARGYLE.

The first of this family was a gentleman of Anglo-Norman lineage, designated Gillespie (or Archibald) Campbell, who, in the eleventh or twelfth century, married the heiress of an old Celtic race of heroes, who had possessed the barony of Lochow, in Argyleshire, if we are to believe the sennachies, from the year 404. Sir Neil Campbell of Lochow, seventh in descent from Gillespie, was a notable adherent of King Robert Bruce, through all his various fortunes; he married the sister of that monarch, and was endowed by him with a great quantity of lands, forfeited by the adherents of Baliol. The estates of the family, from this period, increased very fast, inasmuch that Sir Duncan, the fourth in descent from Neil, on becoming a hostage for the ransom of James the First, in 1424, was found to be worth 1500 merks a-year. This great baron was made a Lord of Parliament in 1445, under the title of Lord Campbell. Colin, his grandson, added immensely to his territories, by marrying one of the three heiresses of Lorn; and, in 1457, was elevated to the rank of Earl of Argyle. The family had no political importance till the great division of opinion at the Reformation. It then obtained distinction by embracing the Protestant side. Archibald, the fourth earl, was the very first of the Scottish nobility who did so; and it is remarkable, that, so long as there was the least dispute between the principles of protestantism and popery, or liberal and anti-liberal politics, the weight of this great territorial house was uniformly thrown into the former scale. The family of Argyle thus bear a conspicuous part in Scottish history, from the Reformation downward. It is scarcely necessary to remind the reader, that, in the covenanting movement in Scotland, Archibald, the eighth earl, was, almost from the beginning, in 1637, to the end, in 1651, the dominant spirit. It is related of this nobleman, that he never travelled without a Bible and Concordance. Charles the First, in his absurd endeavours to pacify the Scots, created their favourite, Argyle, a marquis. He was, however, like all the rest of his countrymen, a royalist, and, as such, exerted himself in favour of Charles the Second, who was admitted to a limited, or rather nominal, sovereignty in Scotland long before the Restoration. After that event, Argyle was beheaded for his cruelties to the ultra-royalists, and his acceptance of place under Cromwell. His son Archibald, styled ninth earl, was the eminent patriot so highly eulogized by Fox. He was beheaded in the reign of James the Second, after an unsuccessful attempt at an insurrection. The family estates, forfeited on this occasion, were restored after the Revolution, to Archibald, the tenth earl, son of the last unfortunate nobleman, who made a conspicuous figure under the liberalized reign of King William, and was raised to a dukedom by that monarch in 1701. Though a clever man, he was too dissipated to be a great statesman: it was alleged, by the scandal of the time, that he died from a wound received in a brothel. This event took place in 1703, when his son, Duke John, succeeded. This amiable and most accomplished nobleman, who, according to Pope, was

— the state's whole thunder born to wield,
And shake alike the senate and the field,

performed to the government of George the First the eminent service of suppressing the insurrection of 1715; which he did with an amazingly small force, and only by an exertion of the most consummate prudence. Archibald, the brother and successor of Duke John, was the confidant of Walpole, and his chief adviser in Scottish affairs. The family, since that period, has only been distinguished as a great territorial house, on the liberal side of the question. The present duke, who is a Whig, is understood, however, to have greatly reduced the estates collected through so many ages.

ABERDEEN JOKES.

The following *facetiae Aberdeenenses* we extract from the last number of the *Aberdeen Magazine*:—"A venerable Aberdeen baillie, long, long ago called to his fathers, had once, on a most extraordinary occasion, to travel all the way to that great city, London. He was informed, before his departure, by an economical friend, that the cheapest way of living in London was to dine at a coffee-room. This practice he accordingly adopted. Seated in a coffee-room one forenoon, very hungry, he could by no means name to the waiters any dish which there was a possibility of procuring. At length, hearing a gentleman call for coffee, he vociferated, "I'm sayin', waiter, I'll hae coffee, tee." "Coffee tea, sir," said the waiter; "sorry we've no beverage called that ere in the ouse." "Lord sake, min," said the baillie, "canna ye gie's coffee, the thing theither chap's gettin'?" "Oh, yes, sir; bring you a cup of coffee." But when the coffee was produced, our townsman liked not the three miserable slices of toast which accompanied it; so, having crunched them all up, he vociferated, "I'm sayin', waiter, I'll hae nae mair o' them wafers; ye maun bring me a shave o' loaf at ance." "Yes, sir, immediately." But the waiter was not so good as his word; for, returning, he stated, "We've sent and searched every bake-ouse in the street, sir, and can't find no such thing as a shave o' loaf among 'em all." Now, this was truly perplexing, and our townsman had still to rack his ingenuity for his dinner. At length a lucky thought struck him. He saw some pigeons perched on a chimney close by, and he would have a "doo tert;" but what this meant, all the learned men in the coffee-room could not discover, and he was at last enabled, by means of a series of signs, to make known that he wished a "pigeon pie."

THE WEST INDIAN VIPER.

The great viper, called *fer de lance*, is one of the most dreadful scourges in the West Indies, but is found only in Martinique, St. Lucia, and another small island. This viper is so savage, that the moment it sees any person, it immediately erects itself and springs upon him. In raising itself, it rests upon four equal circles, formed by the lower part of the body; when it springs, these circles are suddenly dissolved. After the spring, if it should miss its object, it may be attacked with advantage; but this requires considerable courage, for as soon as it can erect itself again, the assailant runs the greatest risk of being bitten. Often, too, it is so bold as to follow its enemy by leaps and bounds, instead of flying upon him, and it does not cease the pursuit till its revenge is glutted. A M. Moreau de Ionnes was once riding through a wood; his horse reared; on looking round to discover the cause of the animal's terror, he discovered a *fer de lance* standing erect in a bush of bamboo, and heard it hiss several times. He would have fired at it with his pistol, but the affrighted horse drew back so unobeyingly, that he was obliged to look back to somebody to hold him. He now espied at some distance a negro upon the ground, wallowing in his blood, and cutting with a blunt knife the flesh from the wound occasioned by the bite of the same viper. When M. Ionnes acquainted him with his intention of killing the serpent, he earnestly opposed it, as he wished to take it alive, and make use of it for his cure, according to the superstitious notions of the negroes. He presently rose, cut some leaves, made a snare with them, and then, concealing himself behind a bush near the viper, he attracted his attention by a low whistling noise, and suddenly throwing a noose over the animal, drew it tight, and secured his enemy. M. Ionnes saw this negro twelve months afterwards, but he had not perfectly recovered the use of the bitten limbs. The negroes persecute these vipers with the greatest acrimony. When they have killed one, they cut off its head and bury it deep in the earth, that no mischief may be done by the fangs, which are dangerous even after the death of the animal. Men and beasts shun this formidable reptile; the birds manifest the same antipathy towards it as they do to hawks and owls in Europe, and a small one of the *loria* kind even gives warning, by its cry, that a viper is at hand.

THE SHARK.

There always follows, however, the most lively curiosity on the part of the sailors to learn what the shark has got stowed away in its inside; but they are often disappointed, for the stomach is generally empty. I remember one famous exception, indeed, when a very large fellow was caught on board the *Alceste*, in Anjeer Roads, at Java, when we were proceeding to China with the embassy under Lord Amherst. A number of ducks and hens, which had died in the night, were, as usual, thrown overboard in the morning, besides several baskets, and many other minor things, such as bundles of shavings and bits of cordage, all which things were found in this huge sea-monster's inside. But what excited most surprise and admiration was the hide of a buffalo, killed on board that day for the ship's company's dinner. The old sailor who had cut open the shark stood with a foot on each side, and drew up the articles one by one from the huge cavern into which they had been indiscriminately drawn. When the operator came at last to the buffalo's skin, he held it up before him like a curtain, and exclaimed, "There, my lads; d'ye see that! He has swallowed a buffalo, but he can't digest the hide."—*Captain Hall's Autobiography*.

POPULAR SUPERSTITIONS.

SPECKS ON THE FINGER NAILS.

"I myself," says Milton, in a treatise called *The Figure-caster*, "have known many old women who hold, that, if the nails of the hand grow yellow, it is a great sign of ill luck, and that specks are the true signs of ill luck." The reverse is at this day augured, in Scotland, from the appearance of white specks on the finger nails: they are called "gifts;" and it is said of the person who has them, that he may shortly expect presents, greater or smaller, fewer or more numerous, according to their size and quantity.

ORIGIN OF THE CUSTOM OF WATCHING THE DEAD.

If a corpse were left in a house with the door ajar, it was supposed to be at the hazard of its being carried off by malevolent sprights. The spiritual part being separated from the corporeal, and the latter no longer hallowed by the blessing pronounced at baptism, it was supposed to be incapable of invoking the aid of higher powers, and was, therefore, exposed to the machinations of the imps of darkness, unless carefully watched and guarded by the living. The custom, once established, continues, though people are no longer under the influence of the superstition from which it originated.

ACHES AND CORNS.

There is nothing superstitious in the prognostications of weather from aches and corns, for "aches and corns," says the great philosopher Bacon, "do en-grieve (*i. e.* afflict) either towards rain or frost. The one makes the humours to abound more, and the other makes them sharper."

HOUSE LECK.

It is common, in the north of England, to plant the herb house leek upon the tops of cottage houses. The learned author of the *Vulgar Errors* informs us, that it was an ancient superstition; and this herb was planted on the tops of houses as a defence against lightning and thunder.

SWALLOWS.

It is accounted unlucky to destroy swallows: this is probably a Pagan relic. We read, in Ælian, that these birds were sacred to the Penates, or household gods of the ancients, and therefore were preserved. They were honoured anciently as the nuncios of the spring. The Rhodians are said to have had a solemn anniversary song to welcome the swallow. Anacreon addressed his tenth ode to this bird, of which the following is the elegant translation by Mr Moore:—

Tell me how to punish thee
For the mischief done to me?
Silly swallow! prating thing,
Shall I clip that wheeling wing,
Or as Tereus did of old,
(So the fabled tale is told),
Shall I tear that tongue away—
Tongue that utter'd such a lay?
How unthinking hast thou been!
Long before the dawn was seen,
When I slumber'd in a dream,
(Love was the delicious theme!)
Just when I was nearly blest,
Ah! thy matin broke my rest.

ROSEMARY USED AT FUNERALS.

Rosemary, as are all evergreens, is an emblem of the soul's immortality. It is as much as to say, that though the body be dead, yet the soul is ever green, and always in life. It is not like the body, and those other greens, which die and revive again at their proper seasons. No autumn nor winter can make any change in it; but it is unalterably the same, perpetually in life, and never dying.

ROBIN REDBREAST.

Mr Addison supposes the popular ballad of the "Babes in the Wood" to have preserved the lives of many Robin Redbreasts. The subsequent stanza places them in a very favourable point of view:—

No burial this pretty pair
Of any man received,
Till Robin Redbreast, painfully,
Did cover them with leaves.

THE RING FINGER.

The particular regard to this finger is of high antiquity. It hath been honoured with the golden token and pledge of matrimony, preferable to any other finger, not, as Levinus Lemnius, in his "Occult Miracles of Nature," tells us, because there is a nerve,† as some have thought, but because a small artery runs from the heart to this finger, the motion of which, in portioners, women, &c., may be perceived by the touch of the finger index.

† Mr Whently tells us, that the rubrick of "Salisbury Manual" has these words: "It is because from hence there proceeds a particular vein to the heart. 'This, indeed,' he adds, 'is now contradicted by experience; but several eminent authors, as well Gentiles as Christians, as well physicians as divines, were formerly of this opinion; and, therefore, they thought this finger the properest to bear the pledge of love, that from thence it might be conveyed, as it were, to the heart.' This opinion has been exploded by later physicians; but it was from hence that antiquity judged it worthy, and selected it to be adorned with a circlet of gold. They called it also the medical finger, and were so superstitious as to mix up their medicines and potions with it."

SPITTING.

Spitting, according to Pliny, was superstitiously observed in averting witchcraft, and in giving a shrewder blow to an enemy. Hence seems to be derived the custom our bruisers have of spitting in their hands before they begin their unmanly barbarity. Several other vestiges of the superstition relative to fasting spittle (*Fasci nationes saliva jejuna repelle, veteri superstitione creditum est. Alex. ab Alex.*), mentioned also in Pliny, may yet be traced among our vulgar. Boys have a custom (*inter se*) of spitting their faith, when required to make asseverations in a matter of consequence. In combinations of colliers, &c. in the north, for the purpose of raising their wages, they are said to spit upon a stone together, by way of cementing their confederacy. We have, too, a kind of popular saying, when persons are of the same party, or agree in sentiments; "they spit upon the same stone."

WEATHERCOCKS.

Vanes on the tops of steeples were anciently in the form of a cock (called from hence weathercocks), and put up, in papal times, to remind the clergy of watchfulness. "In summite crucis, quæ campanario vulgo imponitur, galli gallinacea effingi solet figura, quæ Ecclesiæ Rectores Vigilantia admonet."

FORSPEAKING.

To gaze steadily into a dark house or room, or out upon a dark night, when we know that nothing can be seen, is dangerous; for, according to the superstitious, evil spirits often take the opportunity of presenting themselves at these times, in order that we may not look in vain. When the whole creation is hid from our view, they apprehend that they have a right to show themselves. It is also unsafe to look over one's shoulder in the night time, either from fear, or through any other cause. In the first case, we are expressly looking for objects of dread, and it is no wonder they appear to us. On the same principle, imprecations are, above all things, to be avoided, for demons are extremely attentive, and will come for the least hint. "Speak of the devil," says the proverb, "and he'll appear." The same evil genii, though they do not start up in person, are ever ready to hasten calamities; and if a man be of a querulous temper, and give vent to his peevishness in the anticipation of approaching misfortunes, they will visit him—he has forespoken them. In this point, superstition was made to supply the want of reflection, teaching men not to distrust the goodness of Providence, but to live quiet-minded, without the dread of future disaster. They had the maxim; and, perhaps, it often kept them right, though they were unable to appreciate the true spirit of it. It is thus, that if we could trace many superstitions to their sources, we should see them to have been deduced from very excellent rules of morality. Sometimes, also, they are connected with circumstances that may be accounted for from very sufficient natural causes, as in the following well known instance:—

RATS.

If a house is haunted by rats, it is accounted a presumption, that good fortune will attend the inmates, and that when the rats desert them, they will be exposed to want. This is nothing more than an *ex post facto* prophecy; for no rat will take up its abode where it does not find plenty to prey upon; and they will take their departure when they find provisions growing scarce. The same animals are believed to fly from a house about to fall, which may be true, because, having their roads and dwellings about the foundations of buildings, they may be apprised of the approaching catastrophe, by feeling them give way, or perceiving crevices forming in the hearts of walls. When, without reference to the reasons for them, these things come to be matter of belief in regard to a house, it was easy and natural to predicate the same thing concerning a ship; and, accordingly, instances have been known where sailors could not be procured to man a merchantman, when a rumour had gone abroad that the rats had abandoned her, that being considered a sure presage that she would be wrecked on the voyage. Many people forbear to use any means of destroying rats, believing that good luck would be banished along with them; whereas, if, in place of considering the superstition to be abstractedly true, they were to look to the facts it is founded upon, they would perceive the difference between an enemy flying from famine, and being driven back from abundant supplies.

ACCOUNT OF THE LADY WHO NURSED GEORGE THE FOURTH.

Previous to the year 1745, the Earl of Glencairn was governor of Dumbarton Castle. His Countess was sister or cousin of Murray of Broughton, superior of the parish of Annworth, in Galloway. At this time, the schoolmaster of Anaworth was Mr Andrew Waddel, A.M. (afterwards well known as the translator of Buchanan's Psalms), who, being a very learned man, was recommended by Broughton to Lord Glencairn, as tutor to his sons. In this way Mr Waddel was translated from Annworth to Dumbarton Castle. During Mr Waddel's residence with this noble family, a soldier in the garrison, called Sutherland, died. His death was very soon followed by that of his wife; and they left a son and daughter totally destitute. The boy, William, entered the army; and Mr Waddel, who was no less remarkable for his

humanity than his learning, though encumbered with a large family of his own, and having very slender means, adopted the soldier's daughter.

The little Margaret Sutherland, as she grew up, became a paragon of beauty, and was no less admired for the gracefulness of her appearance than she was beloved for her amiable dispositions. Such attractions were too well calculated to excite stronger feelings than those of mere admiration. Though no less virtuous than beautiful, this innocent creature became the victim of unlawful passions. A Captain Scott of the artillery betrayed her unsuspecting confidence, and clandestinely carried her off from under the care of her venerable protector. It may easily be conceived that the good old man was plunged into the deepest distress by this unprincipled act. For three long years, notwithstanding the most diligent and unceasing inquiries, he heard nothing of his much loved protégée. At last a letter came, addressed to him in characters which he himself had taught her to trace. The contents were most consolatory. The sweet girl, whose heart revolted at the idea of living with Captain Scott on the terms he proposed, had, with a degree of spirit for which he was not prepared, insisted on returning to the bosom of the family of her excellent friend in Scotland, from whom she never once doubted, even under such circumstances, of meeting with the most cordial reception. The Captain found, that to part with her was worse than death; and at last adopted the virtuous resolution of affording her the only adequate reparation in his power, by making her his lawful wife, which he had now done.

We here come to the most interesting part of our story. When it became necessary to find a nurse for the infant Prince of Wales, the now happy and respectable Mrs Captain Scott (who had by this time increased her family) was suggested, and accepted; and she had the distinguished honour of suckling our present most gracious sovereign. The person from whom we have derived our information is the grandson of Mr Waddel. He is himself an old soldier, and saw Mrs Scott in London about twelve years ago. At this time she was old and infirm, but still retained traces of her former beauty. In her elevation she did not forget her brother, who, having returned disabled from the wars, enjoyed, through her interest, a small pension.—*Edinburgh Literary Journal.*

AMERICAN HOUSE OF REPRESENTATIVES.

During the sitting of the House of Representatives, boys neatly dressed carry messages that may be required between the members, or from the clerks to the members, and deliver such letters or papers as may be necessary. They also supply the speakers with a glass of water, which is placed on their desk, in case of their requiring it while speaking. Speakers in the pulpit have generally a glass of water placed within their reach. The employment of little boys in the way I have mentioned is attended with this advantage, that they are much less in the way of the speakers or the members, and can move among the desks without disarranging the papers. The reporters are well accommodated in both Houses of Congress, having comfortable seats, and the best part of the house is allotted to them. Divine service is, during the sittings of Congress, performed every Sunday in the House of Representatives, the chaplain of the house preaching from the Speaker's chair. There is no restriction in the admission of persons on this occasion; but, as the house is reckoned a fashionable place of worship, it is necessary to go early, in order to procure a seat. I heard Mr Jones, the present chaplain to the Senate, preach, who is an Episcopalian; but there is no limitation in this respect. Clergymen, whom we should call in Britain sectarians, are all eligible, and have been elected chaplains. In point of fact, the chaplain to the Senate at the present moment is an Episcopalian, while the chaplain to the House of Representatives is a Presbyterian. Strangers are admitted every day before prayers, which last for about four minutes.—*Stuart's America.*

PITT.

He retained such an inclination for the classics, even amid the bustle of politics, in after life, that he was seldom without having a Virgil or a Horace, a Homer or a Demosthenes, at hand. He had been rather addicted, from his boyhood, to poetry, having, before he quitted home, been concerned with his brothers and sisters in composing a play in rhyme, which they afterwards performed before their parents, and a few friends. At college he wrote a tragedy, which, while he was at the head of public affairs, he calmly consigned to the flames, in the presence of a friend, who had just read and warmly admired it.—*Georgian Era*, vol. 1.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their house, every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

IN DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

PRICE THREE HALFPENCE.

CHILDREN.

Not in entire forgetfulness,
And not in utter nakedness,
But trailing clouds of glory, do we come,
From God, who is our home,
Heaven lies about us in our infancy!

WORDSWORTH.

I MAY begin with the question of Henry IV. of France, when found by an ambassador at romps with his children, "Are you a father?" If you are, we may go on with the game—if not, you must pass to the next article. A curious thing it is, this same fact, that children in general are only interesting in the eyes of those who are parents, while brats in particular are held as pests by all but their immediate father and mother. Some light-headed author has compared the rush of children which takes place at the conclusion of family dinners, to the incursion of the Goths and Vandals. Perhaps it is all true, that children out of place are not agreeable; but is any thing agreeable that is out of place? Children, abstracted from the homely details of their management, and the anxiety which they always occasion, are a delightful study—a study, I maintain, fitted alike to engage the speculations of the philosopher, and the affections of the benevolent mind. I cannot, I must say, form the idea of a man of extended views and sympathies, who does not like children.

Among the grown-up part of mankind, there is always abundance of envy, hatred, and all uncharitableness. This fact I consider with reference to the circumstances in which men are placed, and I plainly conceive that where existence is only to be supported by an unceasing struggle, and where self-love is so perpetually receiving injury, it is needless to expect that men should be much better than they are. In children, however, we see no possibility of any rivalry: they are a harmless little people at this moment, and we run no chance of being jostled by them in our course of life, for many years to come. There is therefore no reason for envy, hatred, or uncharitableness with them. On the contrary, in our intercourse with children, our self-love is undergoing a perpetual compliment. The appeal which they are constantly making from their own silently confessed weakness to our tacitly acknowledged strength, soothes and delights us. A fellow-creature lies unconsciously abandoned to our mercy—unconsciously unable to resist. It asks for nothing, for it cannot; but it does not expect harm: there is the charm. It imputes to us none of our original sins of envy, hatred, and uncharitableness, but seems to take it for granted that we are blanch and stainless like itself. It puts forth its little arms to us, with a perfect confidence in our gentler and better nature, and we feel it impossible to be evil when we are so sincerely understood to be good. We give, then, the love and faith that are demanded, and press the offenceless type of our original and perfect nature, with all the hues and all the odours of paradise rife around it, to our heart of hearts.

The whole external deportment of a child is delightful. Its smile—always so ready when there is no distress, and so soon recurring when that distress has passed away—is like an opening of the sky, showing heaven beyond. Tales are told of murderers, who, after revelling in the blood of many adults, were at length arrested by the smile of a child, and suddenly became innocent, because they were supposed to be so. The grasp of its little hand around one of our fingers—its mighty little crow when excited by the playfulness of its nurse—its manful spring upon the little woolpack legs that refuse to bear its weight—are all traits of more or less pleasantness. Then, the eye of a child—who can look unmoved into that "well undefiled," in which heaven itself seems to be reflected! Whether the gem be of sweet pellucid blue, or of the mysterious and unsearchable black, what meanings unexpressed, unintelligible, reside within; the germ of a whole life of feelings and ideas. Human nature is familiar in all its bearings to most men; yet how novel does every symptom of it appear, as first shown forth by a child! Every little imperfect function—every step in the attainment of physical power—every new trait of intelligence, as they one by one arise in the infantine intellect, like the glory of night, starting star by star into the sky—is hailed with a heart-burst of rapture and surprise, as if we had never known any thing so clever or so captivating before. The point thus gained is never lost. The darling child is

reminded perpetually of the idea he lately seemed to comprehend, or of the word he seemed nearly able to pronounce, or of the little action he attempted to perform; and thus the whole of his little stock of accomplishments is carefully kept together, liable to a constant increase. Hosannas of affection celebrate every step of his progress towards maturity, and fresh blessings are showered upon his holy and harmless head, for every manifestation of the presence of the god-like mind. Nor is this interest in his advance confined to those whose daily joy it is to fold him to the beatings of a kindred heart. Almost every one who has occasion to observe the march of infant intellect, feels an instinctive satisfaction in the contemplation. It seems, indeed, to be part of the grand and wise design, that all the mature of the human race should be concerned respecting the progress of the young: it is the silent working of nature towards the general good. Without a principle of this kind constantly at work—and it is always at work, in the attentions of the reflecting and grave, as well as in the apparently senseless prattle of the nurse—the moral world would be in danger of standing still.

The love of parents for their children—so far as it is not a sentiment arising from the contemplation of beauty, or innocence, or helplessness—is a kind of self-love. Yet no one ever thinks of imputing to a parent, as a fault, that he has a high appreciation of his children. The truth is, though in one sense self-love, it is, in another, the most generous and self-abandoning feeling in nature. The world is also aware instinctively, that the fondness of parents for their children is necessary for their protection and education; and, therefore, if there were no other palliation of the passion, it would at least be convenient. In virtue of these excuses, a parent can indulge in all the pleasures of the most intense, devoted, devouring, self-appreciation, and yet have none of the usual reproach attending it. He can admire himself in his children, to a greater extent than ever did Narcissus in the fountain, and yet there is no chance that he changes into a daffodil. He can call himself every pretty name in the nurse's vocabulary, and yet no one will ever accuse him of flattering his own person. He may fondle and hug himself, till his miniature counterpart loses both breath and patience; he may expend upon his little self a thousand compliments and praises; and yet it will never be insinuated that Mr — is on uncommonly good terms with Mr —. This, it must be remarked, is one of the compensations allowed by Providence for the anxiety and pains attendant upon the keeping of a child.

It is a very common impression, among those who are practically unacquainted with children, that there is an immense deal of trouble incurred in their management. There is, no doubt, much trouble; but there is also much to alleviate it. Women, to whom, as mothers or as nurses, this trouble chiefly falls, are rarely heard to complain of it. The labour is either kindly and agreeable in itself, or it is rewarded by the generous pleasure of knowing that those are helped who cannot help themselves. There are few duties, it may be said, by which women appear to feel less oppressed, than the labour of managing children. What is very strange, it seems equally lightsome to the hired attendant as to the mother herself. There appears to be a general feeling among women that the neglect of or the least cruelty to a child, is the most monstrous offence in nature: it is the high treason of the sex. In the more refined circles of society, where it is convenient to employ deputies, this certain kindness of every female heart towards a child is very fortunate: in the lower circles it is still more so. There many mothers are compelled to depend much upon the good-will of neighbours for the attentions necessary to their families. The infant is, indeed, in some measure, the protégé of a little vicinity, rather than of any individual. It is handed about from one hand to another, and kept for a little by each, so as to enable the mother to attend to other duties that are still more indispensable, such as the preparation of her family meals, or perhaps the work necessary for obtaining them. There is in this no danger for the child, and not much obligation for the parents. The poor are in the constant practice of performing acts of kindness to each other: they are their own best friends; and their condition would be quite insupportable if it were otherwise. The atten-

tions, therefore, which one neighbour bestows upon another's child, are felt as a very slight burden by the particular party obliging, while the aggregate of many such little favours forms an immense relief to the mother. Then, every one knows that if the case were her own, as it perhaps may be, the individual whom she now obliges would be ready and glad to oblige her in turn. If the trouble of managing children had in it any thing really disagreeable, this universal system of mutual serviceableness could never obtain among the poor. But there is, indeed, no trouble in it which is not amply repaid, as is shown in the most convincing and beautiful language by Allan Ramsay, in a passage of his *Gentle Shepherd* :—

Jenny. Oh, 'tis a pleasant thing to be a bride;
Synne winnigling gets* about the ingle side,[†]
Yelping for this or that wi' fabulous din;
To mak them brats! then ye maun toil and spin.
Ae wean's fa's sick, ane sea'ds itsell wi' broe,
Ane breaks his shin, an' other tynes || his shoe;
The De'il gae our Jock Wabster, ¶ hame grows hella,
And Pate misca's ye waur than tongue can tell.
Peggy. Yes, 'tis a heartsome thing to be a wife,
When round the ingle edge young sprouts are rife.
Gif I'm sae happy, I shall hae delight
To hear their little plaints, and keep them right.
Now, Jenny, can there greater pleasure be
Than see sic wee tots tooling at your knee,
When, a' they ettle at—their greatest wish,
Is to be made o', and obtain a kiss!
Can there be toil in tending day and night
The like o' them, when love makes care delight?

To this nothing can be added.

It is surprising how much children tend to humanise and soften the stern scene of general life. The man who is so fortunate as to possess one or more children, finds it less easy to be wicked than if he had none; and however evilly disposed any man may be, he will hardly give way to his wicked tendencies in the presence of his children. There is something holy in a child. Its innocence puts it in association with all gentle and devout feelings; and scarcely any parent will venture deliberately to contaminate the bright image of heavenly purity, which the father of heaven has himself placed under his charge. Even the infidel can never form the wish that his child should be the same; he may dare many things, upon the peril of his own soul, but he cannot dare to hazard the soul of his child. His own mind may be torn by the demons of doubt and error, but he will keep his child steadfast if he can, melting nightly at the infantine prayer, which he cannot offer up himself. If a parent has been imprudent, and now suffers the bitter effects of his folly, in misfortunes which have exposed him to the contempt of mankind, here still is a resource. He can steal by night to the couch of his children, and, beside the unconscious babes, whose fate hangs upon his, and who yet reprove not, in their silent innocence, the guilt which has exposed them to misery, weep himself into good resolutions, and into comfort.

One of the chief sources of a parent's pleasure in contemplating children, lies in the prospects which it is impossible to avoid forming regarding their future lives. No parent ever contemplates an unhappy fate for his child: all the look-forward is sunny as its own sweet eyes—stainless as its uncorrupted heart. There is even hardly any parent who rests content with hoping that his children will be as fortunate and as happy as himself. They must be much more so: they must reach heights of distinction far above any he had ever presumed to expect for himself. To the parent who has occasion to lament his unhappy circumstances in life, what treasured consolation there is in these fond imaginings! The father, as he broods moodily over enterprises blighted, and a spirit confined for immediate bread to some narrow scene of action unworthy of its energies—one casual glance alights upon the fair brow of his child, the bitter present gives way to the glorious future, and all his own griefs are repaid by the prospective happiness of his offspring. The mother, who looks back to the comforts of an early home, unhappily exchanged for a scene of care and woe, feels, as she bends over her unconscious infant, her former happiness arise in the prospects of that endeared being, and is for the time consoled. It is this habit of forming flattering anticipations respecting the fates of our children, that renders the loss of them in infancy so very severe a calamity. In reality, the life

* Querulous brats. † Fire-side. ‡ Clothes.
§ Child. || Losses.
¶ A proverbial expression to imply extreme confusion.

of a child is of little value : it has as yet cost little, either in care or expense ; and, unless in particular circumstances, it holds but an unimportant place in society. Yet it is in this very want of all probation of its value, that the poignancy of the loss chiefly lies. We lament it, not at all for what it was at the time of its death, but for what it might have been, if it had been spared. We often find that the loss of an infant is lamented with a more violent and unappeasable grief than that of an adult ; and this is simply because, in the one case, the damage is ascertained, and forms but one distinct idea ; while, in the other, it is arbitrary, vast, beyond imagination. A child, in one sense, a dangerous possession : it is apt to warp itself into the vitals of our very soul ; so that, when God rends it away, the whole mental fabric is shattered. It should always, then, be borne in mind, that life is the more uncertain the nearer its commencement, and that the beings we are disposed to appreciate most are just those whom we are most apt to lose.

The feelings of a parent, regarding a child in dangerous sickness, are beautifully expressed in the following poem, which will surprise many readers into tears :—

Send down thy winged angel, God !
Amidst this night so wild,
And bid him come, where now we watch,
And breathe upon our child.

She lies upon her pillow, pale,
And moans within her sleep,
Or wakeneth with a patient smile,
And striveth not to weep !

How gentle and how good a child
She is, we know too well,
And dearer to her parents' hearts
Than our weak words can tell.

We love—we watch throughout the night,
To aid, when need may be ;
We hope—and have despair'd at times,
But now we turn to Thee !

Send down thy sweet-soul'd angel, God !
Amidst the darkness wild,
And bid him soothe our souls to-night,
And heal our gentle child !*

When a scene like this is closed by death, what an extinction of hopes ! No parent, it may be remarked, ever thinks he can spare a child. Whatever be the number of his family, he is almost sure to be afflicted to exactly a certain degree by the loss of any individual infant ; for simply this reason, that every one has established its own claim to his affections, by some peculiar trait of its appearance or character. It is a lovely and admirable trait of human nature, that the parent is rather apt to appreciate the lost child above all the rest. The impossibility of a realisation of his hopes regarding that infant, just makes all those hopes the brighter, so that the twilight of the child's *dead existence* is more splendid than the broad day of its living life. The surviving babes are all more or less connected with the common-place of this world—the homeliness of nature ; but that fair-haired innocent, which went to its place in the blush and dawn of its faculties, what might it not have been ? Then, the stirring grief of parting with that face that was our own—that more than friend, though but an infant—to break off all the delightful ties of prattling tenderness, that had bound us, even in a few months, to that gentle form for ever ! A sorrow like this is long in being altogether quenched ; it comes in soft gushes into the heart for many future years, and subdues us in the midst of stronger and sterner feelings. The imagines always before us in unchanging infancy, and beauty, and innocence ; it ever seems to be walking in our eyes, as of yore, with its bright curling hair, and its lightsome carol ; and we long for heaven, that we may enjoy that no-small portion of its pleasures—a restoration to the company of that mortal angel which has been reft away.

* This exquisite little hymn is extracted from a volume of excellent, but, we fear, neglected, poetry, published under the title of "English Songs, and other Small Poems, by Barry Cornwall." The real name of the author, we understand, is Proctor, and in him much of the old pure spirit of poetry has revived—the poetry of nature and of the affections.

As a farther specimen of this delightful volume, and akin to the subject of the above, we extract

THE POET'S SONG TO HIS WIFE.

How many summers, love,
Have I been thine ?
How many days, thou dove,
Hast thou been mine ?
Time, like the winged wind,
When 't bends the flowers,
Hath left no mark behind,
To count the hours.

Some weight of thought, though loth,
On thee he leaves ;
Some lines of care round both
Perhaps he weaves ;
Some fears—a soft regret
For joys scarce known ;
Sweet looks he half forget—
All else is flown !

Ah, with what thankless heart
I mourn and sing !
Look, where our children start
Like sudden spring !
With tongues all sweet and low,
Like a pleasant rhyme,
They tell how much I owe
To thee and Time.

POPULAR INFORMATION ON SCIENCE.

SPONTANEOUS COMBUSTION OF THE HUMAN BODY.

In explaining the different sources of light and heat, we have already stated, that, during the decomposition of animal and vegetable matter at the bottom of standing pools, a certain gas is often generated, which ignites immediately on coming in contact with common atmospheric air. The *ignis fatuus*, known also by the names of the *Will o' the Wisp*, and *Jack o' Lantern*, is thus occasioned ; and the fact of its appearing in boggy or marshy districts has given rise to the popular superstition that it is an evil sprite endeavouring to beguile the traveller into some luckless ditch or pond. The aurora borealis, or northern lights, so often witnessed in this country, have been attributed to the same cause : but we may hereafter explain, that this theory does not satisfactorily account for the phenomenon. However, that a certain combination of a gas, called *hydrogen*, with a proportion of *phosphorus*, forms a compound which takes fire the moment it comes in contact with air, we can prove by direct experiment ;* and, strange to say, notwithstanding its apparent incredibility, it would seem that the human body itself may become so impregnated with these elements, or other inflammable matter, as to take fire spontaneously, and be almost entirely consumed. Human knowledge is so limited in its extent, that we should pause with great circumspection before we venture to deny the possibility of any thing ; for facts, which at first sight may appear difficult to believe, may become subsequently explained on very simple principles. Vulgar and ignorant persons can easily play the sceptic, and deny the possibility of every thing which extends beyond the sphere of their own narrow and limited experience ; but it remains for those who are possessed of higher philosophy, to receive, with a proper spirit, facts sufficiently attested by disinterested witnesses, and to explain them afterwards, according to the theories which may be suggested by the advancement of science. We shall here select a few instances of spontaneous combustion, which, we believe, have been recorded by witnesses whose veracity cannot fairly be impeached, and which remain recorded on the best authorities.

Cornelia Bandi, Countess of Cesina, an Italian lady, sixty-two years of age, having felt drowsy one evening, retired earlier than usual to bed, and was attended by her maid until she fell asleep. When the girl on the following morning entered her mistress's apartment, for the purpose of awakening her, a dreadful spectacle presented itself. At the distance of four feet from the bed there was a heap of ashes, in which the head, legs, and arms of the countess alone could be traced. The head lay between the legs, but the half of its posterior part, together with the brain and chin, were entirely consumed. The legs and arms were uninjured. This case was communicated to the public by Dr Cromwell Mortimer, in the *Philosophical Transactions*, in 1745. The following is another case, the authenticity of which cannot be doubted :—Don G. Maria Bertholi, a friar, who lived in Mount Volere, went to the fair of Filetto, and having walked about all day, retired in the evening to the house of a relation at Fenile, to spend the night. Upon his arrival, he went direct to his bedroom, and had a handkerchief placed between his shoulders, beneath his shirt. In a few minutes after having been left alone, a singular noise, mingled with cries, was heard from his room ; and when the people of the house rushed in, they found him on the floor, surrounded by a lambent flame. When visited next morning by Joseph Battaglia, a surgeon of Ponte Basco, the body was found much burned ; he lingered in pain and died the fourth day afterwards. The details of this case appeared at the time in a German periodical. Another instance worthy of notice, and the authenticity of which may be relied on, is the following :—Anne Nelis, wife of a wine and porter merchant, living in South Frederick Street, Dublin, let in her husband, who had been out at a party, between twelve and one o'clock on a Saturday night. After some altercation had taken place between them, both being in a state of intoxication, Mr Nelis went up stairs to bed, but in a few minutes came down, to request his wife to accompany him, an invitation which she positively declined, upon which he took with him her candle, observing, that if she was resolved to sit up, she should do so in the dark. Next morning the maid-servant having opened the windows of the back parlour, observed something in the arm chair in which Mrs Nelis usually sat, which she at first sight imagined to have been put there by young Nelis, who at the instant entered the room, for the purpose of frightening her. Upon examination, however, it turned out to be the remains of her mistress, which were found in the following state :

* To prepare this gas artificially, pour into a glass retort a little water, then add a small quantity of caustic potash, and, when this is dissolved, drop into the solution a few small pieces of phosphorus. Then place the beak of the retort under water, and apply to it the heat of a spirit lamp. The gas immediately appears rising in bubbles through the water, and the moment they reach its surface, and come in contact with the air, they burst into flame. The action which here takes place may easily be understood. The gas required is a combination of hydrogen gas, with a certain proportion of phosphorus, and is therefore called the *perphosphureted hydrogen*. In the experiment before us, we have in the retort, water, potash, and phosphorus. Now, water consists of two gases, oxygen and hydrogen, and when the heat of the lamp is applied to this mixture, the water is decomposed. Its oxygen goes to the formation of the phosphorus, forming phosphoric and hypophosphoric acids, which unite with the potash, and its hydrogen which remains then combines with another portion of the phosphorus, and so forms this, the *perphosphureted hydrogen gas*.

She was seated in the chair at a distance from the fire, which appeared to have burned out, with the head leaning upon her right hand, and bearing behind against the wall. The trunk of the body was burned to a cinder, as also the clothes which invested it ; but the region of the pelvis, and the upper and lower extremities of the body, had sustained no injury. Her face had a scorched appearance ; but her hair and the papers she had put it in, had escaped. The back and seat of the chair had not suffered, but its arms were charred on the inner side, where in contact with the body. With the exception of the arms of the chair, the surrounding bodies were not injured by the combustion. The room was filled with a penetrating and disagreeable odour, which lasted many days. Mr Wood also, a Wesleyan clergyman, residing in Limerick, relates the following case in the *Methodist's Magazine* for 1809 :—Mr O'Neill, keeper of the Life Pounds Alms-house in the city of Limerick, was awakened about two o'clock A. M. by a person knocking at his door, upon which he rose, and having inquired who knocked, he opened the door, and going with the person who called him into his apartment, which lay under Mrs Peacock's room, he found a dead body lying on the ground burning with fire, and red as copper, having dropped down from the loft ; he saw a large hole the size of the dead body burned through the boards and ceiling. He instantly ran up stairs, and having broken open Mrs Peacock's room-door, saw in the middle of the room the burned hole through which the body had fallen. Having, with assistance, quenched the fire about the hole, he examined by what means the body had taken fire, but could find no cause. There was no candle or candlestick near the place ; no fire in the grate but what was raked in the ashes, as is the manner of preserving fire by night ; the room was examined, and nothing had taken fire but that part of the floor through which she had fallen ; even a small basket made of twigs, and a small trunk of dry wood which lay near the hole, escaped, and were not so much as touched by the fire.—Here likewise we shall add another case on apparently good authority. Mrs Stout, widow of a watchmaker, and married a second time to a man of the name of Hanna, went to bed one evening in apparent health, and was found next morning burnt to a cinder, on the floor of her bedroom. When discovered, a vapour was still issuing from her mouth and nostrils, and those parts of the body, the form of which had not been altered, immediately crumbled down on being handled. Her chemise and nightcap remained uninjured. This case occurred in 1808, in a place called Coote Hill, in the county of Cavan. The subject was a woman about sixty years of age, and an inveterate dram-drinker. The Rev. Mr Ferguson, of Camden Street, Dublin, has also attested the following facts :—A woman of about sixty years of age, who lived with her brother in the county of Down, retired one evening to bed with her daughter, both being, as was their constant habit, in a state of intoxication. A little before day, some members of the family were awakened by an extremely offensive smoke which pervaded their apartment, and on going into the chamber where the old woman and her daughter slept, they found the smoke to proceed from the body of the former, which appeared to be burning with an internal fire. It was as black as coal, and the smoke issued from every part of it. The combustion having been arrested, which was effected with difficulty, life was found entirely extinct. Her daughter sustained no injury ; nor did the combustion extend to the bed or bed-clothes, which exhibited no other traces of fire than the stains produced by the smoke. According to the testimony of one of the relations, who is represented as a woman of the strictest veracity, there was no fire whatever in the room.

In Germany, France, and Great Britain, so many cases of a similar description have occurred, that we could easily lay before our readers the details of other analogous instances ; but the above are sufficient to show the curious and remarkable fact, that the human body is, in certain conditions, capable of generating a gas, which, the moment it comes in contact with air, takes fire. This has hitherto happened principally to those who have been addicted to ardent spirits ; that is, to those whose bodies have, from excessive drinking, become saturated with alcohol ; and it is well known, that, after death, the internal organs of such persons—even the brain—will give out the odour of spirits. The gas which is thus formed is a compound of hydrogen and phosphorus. Hydrogen is one of the principal constituents of water, and may, by the decomposition of water, be easily obtained. Now, the human body contains a great quantity of water ; and phosphorus also, in a certain combination with earthy matter, enters into the composition of bones, and other solids of the body. This being premised, it is not difficult to understand how in certain cases the phosphorus may be set free, so as to enter into combination with the hydrogen, producing this inflammable gas. Hence it is not necessary to apply a spark or flame to the body which becomes so ignited ; and only those parts may be destroyed which present the requisite proportion of phosphorus ; accordingly, the clothes of such persons are not destroyed, nor does water put out the flame ; because the water contains hydrogen, and, being immediately decomposed, its hydrogen unites with an additional proportion of phosphorus, and so renews the gas, which thus spontaneously inflames. Vic D'Azyr, Lecat, Lair,

Kopp, Dupuytren, and Marc, have, with many other celebrated men, paid particular attention to the phenomena exhibited during the spontaneous destruction by fire of the human body. Only recently, M. de Fontenelle read a paper to the French Academy, in which he draws the following general conclusions:—

1. Spontaneous combustion generally happens to those who are habitual drinkers.
2. Old women are most subject to this calamity.
3. The combustion is usually general, but sometimes very partial; the feet, hands, and the top of the head, are generally the only parts that have been preserved.
4. This kind of burning does not inflame the most combustible substances.
5. Water, instead of diminishing, increases the flame.

Such are the general facts which have been established on this interesting subject, and the moral we wish here to draw from their detail, is simply this—that we should all of us hesitate before we dogmatically assert any thing to be false, because it does not accord with our own experience; for the progress of sciences with which we are at present unacquainted, may explain, on very simple principles, the very facts which appear to us the most startling and incredible.

THE HAUNTED HEAD.

It was yet early in a May morning, in the year 1540, when two travellers alighted at the little cabaret, known by the sign of "Les quatre fils d'Aymon," at the entrance of the forest of Fontainebleau. They rode two very sorry horses, and each of them carried a package behind his saddle. These were the famous Benvenuto Cellini, as mad a man of genius as the sun of Italy, which has long been used to mad geniuses, ever looked on, and his handsome pupil Ascanio, who were carrying some works of art to the King of France at Fontainebleau. For particular reasons, Cellini set out by himself, leaving Ascanio; and he, getting tired towards evening, proposed to walk in the forest; but, before setting out, was specially warned to take care, in the first place, that the Gardes de Chasse did not shoot him instead of a buck; and in the next, that he did not stray too near a large house, which he would see at about a quarter of an hour's walk distant to the right of the path. This house, the host told him, belonged to the Chancellor Poyet, who said he did not choose to be disturbed in the meditations to which he devoted himself for the good of the state, by idle stragglers. To enforce his orders, too, he had an ugly raw-boned Swiss for a porter, who threatened to cudgel every one who walked too near his garden wall. There was also a hint of a poor young lady being shut up in this guarded mansion. A long garden, enclosed by a high wall, and thickly planted on both sides with trees, which entirely concealed its interior from view, was at the back; and it was this which Ascanio first approached.

He heard a low voice, which he thought was that of a woman in distress, and, listening more intently and approaching nearer, he was satisfied that his first impression was correct. He distinctly heard sobs, and such expressions of sorrow as convinced him that the person from whom they proceeded was indulging her grief alone. A large birch-tree grew against the garden wall near the place where he stood; he paused for a moment to deliberate whether he could justify the curiosity he felt, when the hint of the hostess that a lady was imprisoned there, came across his mind, and without farther hesitation he ascended the tree. Ascanio looked from the height he had gained, and saw a young female sitting on a low garden seat immediately below the bough on which he stood. She was weeping. At length, raising her head, she dried her eyes, and taking up a guitar which lay beside her, she struck some of the chords, and played the symphony to a plaintive air which was then well known. Ascanio gazed in breathless anxiety, and wondered that one so fair should have cause for so deep a sorrow as she was evidently suffering under. In a colloquy which ensued, she exhorted him to fly; told him she was an orphan whom Poyet wanted to force into marriage; and finally agreed to elope with her young lover.

Ascanio clasped the maiden in his arms, and once kissed her fair forehead, by way of binding the compact. He looked up to the wall to consider the best means of enabling the lady to scale it, when he saw above it a man's head looking at them. Ascanio at first thought they were betrayed, but the expression of the face, which he continued to look at, removed his alarm on this head. It was a very fine countenance, highly intelligent, and uncommonly good humoured. It seemed, as well as Ascanio could guess, by the thick beard and mustachios, to belong to a man of middle age. He had a long pointed nose, bright eyes, and very white teeth; a small cap, just stuck on the left side of his head, gave a knowing sort of look to his appearance, and added to the arch expression of his visage, as he put his finger on his lip to enjoin silence, when Ascanio looked up at him. "Hush," he said, "it is a very reasonable bargain on both sides, very disinterested, and strongly sworn to. And now, my children, as I have been a witness to it, although unintentionally, I feel bound to help your escape." Ascanio hardly knew what answer to make; but as he saw it was perfectly indifferent to the stranger, who knew the whole of his secret, whether he should trust him or not, he resolved to accept his offer, and they immediately set about getting the lady over the wall.

While employed on this, three fellows were seen stealing round the walls with their swords drawn. "By St Denis, we have been reckoning without our host," cried the stranger; "they don't mean to let us part thus. Come, my spunk," he said to Ascanio, "you will have some service for that sword you wear, and which, pray heaven, you know how to use. Do you stand on the other side of the tree, madam," he added, putting the lady, whose name was Beatrice, on his horse, "and if the worst should betide, gallop down the path, keeping the high road till you come to Paris; inquire for the nunnery of St Genevieve, and give this ring to the abbess, who is a relation of mine; she will ensure your protection." The lady received the ring, and half dead with horror, awaited the issue of the contest. The assailants came on with great fury; and as they were three to two, the odds were rather in their favour. They consisted of a Gascon, Captain Sangfieu, the porter, and a servant, who seemed to be in no great hurry to begin the fight: they appeared astonished at finding two opponents, having seen only Ascanio from the house. They fell on, however, in pretty good order. It happened to be the lot of the stranger, perhaps because he was the bigger man, to encounter the servant and the captain. Just as they came up, he loosened his cloak from his throat, and, twisting it very lightly round his arm, he made as serviceable a buckler as a man should wish to use. Upon this he caught the captain's first blow, and dealt in return so shrewd a cut on the serving man's head, as laid him on the forest turf without the least inclination to take any farther share in the combat. The fight was now nearly equal; and, to do him justice, the Gascon captain was a fair match for most men: the stranger, however, was one to whom fighting was evidently any thing but new; and in less than five minutes, the captain lay beside the servant, so dead, that if all the monks in Christendom had sung a mass in his ears, he would not have heard it.

"I have owed you this good turn a very long time, my gallant Captain Sangfieu. I have not forgotten an ill turn that you did me at Pavia, when you did not wear the rebel Bourbon's livery; but there's an end to all, and you die as a soldier should." And as the stranger muttered this, he wiped the blood-drops off his own sword, and looked at the fight which was continuing between the Swiss and Ascanio, but did not seem inclined to interfere. "Save him, for mercy's sake!" cried the lady. "By our Holy Lady," he replied, "I think he wants no aid. He is making gallant play with his slender rapier there against the large weapon of the Swiss. You shall see him win you, madam, or I have mistaken my man. Well evaded!—there he has it!" he shouted, as Ascanio's sword entered his antagonist's body, until the shell struck against his breast-bone, and the giant fell at the youth's feet. "The varlet may get over it," said the stranger, kicking the servant's body; "but for the other two, I'll be their gage they'll never come out to assassinate honest men on moonlight nights again. But away with you," turning to Ascanio; "we shall have the whole country up in five minutes; begone!" and he held the horse while Ascanio mounted. "But what will you do?" returned the youth. "I am not far from home; and if the hunt should become hot, I'll get up one of these trees; but take care of the horse; he'll carry you six leagues an hour. Goodbye, Rabican," he added, patting the steed's neck, who by his pawing seemed to know his master.

The lovers did indeed put the speed of this noble animal to the test, and his gallop was as wild as if it would never end. But on reaching Paris, Ascanio was at a loss how to dispose of his fair charge. Cellini was at this time living in an old castellated house on the left bank of the Seine, which had formed part of the Nesle Palace, and which Cellini had called "Il Piccol Nello." Almost all the chambers, excepting the few in which they dwelt, were occupied by the numerous works in which the artist was engaged. At length Ascanio's fertile invention suggested to him an expedient by which he might ensure an asylum for the lady for a short time, at least until he should be able to explain the whole affair to Cellini. Among the odd whims which from time to time reigned in the crazy brain of Cellini, that of making a colossal statue of Mars had for a long time been paramount, and he had proceeded so far as to make the head of the figure, when some other freak drew off his attention. This head was about as large as the cottage of a London ruralist, and occupied a large space in the courtyard of "Il Piccol Nello." The frame was made of solid timber, and the outside covered with a very thick plaster, which was moulded into the form of a gigantic face, representing the aspect of the God of Battles; and a very terrible affair to look upon it was. Ascanio, who had often been much annoyed by the discordant noises with which his master conducted his labours, and no less by the incessant talking of the old house-keeper Catharine, had found a refuge from both in the cavity of this head, where he had formed a very convenient, and not a very small apartment. Here he used to study painting and music, both of which he loved far better than either sculpture or working in gold; and he had been wise enough never to tell Cellini or any other person of this retreat. He entered it easily by a chasm from the ground; and a small ladder, which he had placed withinside, conducted him to his chamber.

Cellini's oddities, and the unceremonious method he had adopted of getting possession of the "Il Piccol

Nello," had made him many enemies. Among others, there was a wretched little tailor, who had the honour of being employed for some of the Conseillers du Parlement. This tailor became the implacable foe of Cellini. He took a garret directly opposite his house, where he used to watch the motions of the inhabitants of "Il Piccol Nello;" and to soften the exasperation of his mind, he bestowed on them from morning to night all the maledictions his ingenuity could invent. He had heard noises proceeding from the monstrous plaster head in the courtyard, and even sometimes in the dead of the night he had seen two streams of light issuing from the great eyes; but as he had no notion that Ascanio was then within the head, drawing by the light of a lamp, or playing on a guitar, which he accompanied with his voice, the little tailor's fears and malice induced him to spread a report that Cellini was an enchanter, and that the "Testa di Marti" he had made was some demoniacal contrivance which he had animated for the destruction of the good city of Paris. Not content with reporting this throughout the quarter in which he dwelt, he told it among all the laquies of all the conseillers he knew, until at length the story of the Devil's Head in "Il Piccol Nello" was as well known as any other current lie in the city. In this chamber Beatrice was placed.

Meanwhile, the chancellor had found his bullies where Ascanio left them, but could persuade none of the three to tell him what had brought them into so sad a plight; and for this reason—two of them were dead, and the other was so faint, from the loss of blood, that he could not speak, and seemed very likely to follow his companions. The chancellor, however, pursued the fugitives, resolved, in his rage, to devote the youth to utter ruin, as soon as he should catch him; and in the mean time he proposed to glut his rage by sacrificing Benvenuto Cellini, who, as we said before, had made himself many enemies. Aware of Cellini's favour with the king, he was obliged to tread warily; but the superstition of that age rendered a charge of sorcery too grave to be parried. The haunted head was therefore made the hinge on which the artist's ruin was to turn; and the Duchess d'Estampes, the king's mistress, and his majesty's confessor, both enemies of Cellini, entered into the confederacy against him. The confessor believed in all the legends of the Romish church, and thought it highly probable that a man who could execute such beautiful sculptures as Cellini had exhibited on the preceding day, must be in league with the devil. When, therefore, the chancellor began to tell his story, these two worthy personages chimed in, and backed his villainous project so well, that the good-natured king was diverted from his first intention, which had been to kick the chancellor, and to leave the confessor and the sultana (the only two persons in the world of whom he had ever been afraid) to themselves. He said he would see Cellini, who had staid all night in the palace by his orders; and the artist was accordingly sent for.

"How now, Cellini," said the monarch, as he approached, "did I send for you to Paris that you should bring with you troops of fiends and demons, who, it is said, help you in your works?" "I have no devils to help me in my work," said Cellini, "but your majesty's subjects; and if my great countryman, Alighieri, were to lead me through all the darkest places in the Inferno, I could not find worse fiends." "But here," said the king, holding out the papers, "two men swear that you have a head of the devil in 'Il Piccol Nello,' and that the whole of the neighbourhood is infested by his legions, to the disturbance of the public tranquillity, and the great scandal of our holy church." The confessor crossed himself. "I abjure the devil and his power," said Cellini, crossing himself with no less fervour; "and, next to them, I hate and abhor the villains who have thus slandered me to your gracious majesty. Give me to know their names, and I swear they shall be better acquainted with the real devil ere long." The king decided on examining into the matter personally; but Ascanio had married the fair Beatrice before the royal commission got to Paris, and was going to restore the stranger's horse, according to the directions he had received, at the time it arrived at the Testa di Marti, wherein the bride was lodged.

The consternation of Beatrice may be better imagined than described, when she heard the arrival of so many strangers; but it was increased to an almost intolerable degree as she listened to the conversation which ensued, and heard the odious voice of her oppressor the chancellor. She could not see any of the persons, unless she looked out at the eyes of the figure, and this she dared not do lest she should discover herself. "And this," said the king, "is what they call the Devil's Head?" "Who calls it so?" asked Cellini, fiercely; "it is the head of Mars, and whoever has called it the head of the devil, is an ass and a liar!" "Patience, good Benvenuto," said the king; "let us hear what they have to say against the head, which seems to be a very fine work of art, whether it has been wrought by man or demon." The chancellor, who had taken care on the journey to mature his plans, now produced the little tailor, who saw here a glorious opportunity of being revenged on his formidable antagonist. He therefore began a long story, every third word of which was a lie, about the sights he had seen, and the sounds he had heard, in and about this dreadful head. He had often seen the foul fiend himself go in and out, he said; he had heard the devils performing the sacred office of mass back-

wards; he had seen flames issue from the mouth; and no longer ago than last night, as he was a Christian and a tailor, he swore that he had seen two fiends enter the head, immediately after which it was seen to roll its fiery eyes in a manner truly horrible and awful.

It would be impossible to convey any adequate notion of the extravagances which Cellini committed, while this little idiot was uttering his lies. If he had not been restrained, he would have killed him on the spot; he roared all sorts of imprecations, he cursed every tailor that had been on the earth since the creation, and then adding all those curses together, he heaped them in a lump on the head of the particular tailor then before him: in short, he acted so whimsical a madness, that the king laughed until his sides ached. The chancellor, however, took up the matter in a much more serious light. He said it was evident, from the relation of the witness, that some foul deeds were practised, and that the head ought to be exorcised; never doubting, that if he could once gain the assistance of the clergy, they would invent some pretext on which Cellini might be sent to prison, knowing that their influence with the king was much greater than his own. The confessor fell into this scheme readily, and said he did not doubt that there was a spirit in the head, and repeated that it ought to be exorcised. The king had no objection to this; and as he had already enjoyed the farce so far, he wished to see it played out. Some of the brethren of the neighbouring Carmelite church were sent for, in all haste, and preparations made for the exorcising. The confessor directed a large stick of fagots, which stood in a corner of the yard, to be laid around the head; because, he said, the application of fire was always necessary to dislodge a spirit so malignant as that appeared to be which had taken up its abode in this structure. The preparations were soon made, and a torch applied, when a faint shriek was heard to issue from the head. All the bystanders looked aghast; the priests crossed themselves; even the king looked grave; Cellini's hair stood on end; and the tailor ran away. At this moment Ascanio had returned from the park, and learning from a bystander that they were about to exorcise the Magic Head, at the Italian sculptor's, because there was a spirit in it, he rushed in just time enough to dash the torch from the hand of the lay brother of the Carmelites, who was applying it, and whom he knocked down, at the same time tramping out the fire, which had begun to catch one of the fagots.

"Fiends! monsters!" he cried, "advance one step, and your lives shall be the forfeit!" Beatrice heard his voice, and, almost fainting with terror, she rushed out, and threw herself into his arms. Supporting her with his left arm, and holding out his sword with his right, he continued to menace all who should approach. "What means all this?" cried the king. But Ascanio was too much busied in encouraging the terrified girl, to listen to the question. The old chancellor, however, who recognised Beatrice instantly, now thought that his plan had succeeded even beyond his expectation. "My gracious liege," he cried, "this maiden is a ward of mine, whose person I require to be instantly restored to me; the youth I charge with having, in company with others, slain three of my household, and having carried off the maiden by force." "It is false," cried Beatrice, as she threw herself frantically at the king's feet; "they were killed in fair combat, and I went willingly with him to seek protection from the cruelty of that vicious tyrant. Here, at your majesty's knees, I implore your pity and protection." "But what says the youth?" asked the king of Ascanio, who had been gazing on him in almost stupefying astonishment. He saw before him, in the person of the gallant Francis, the stranger who had so generously aided him in the forest of Fontainebleau. "Has he any witness besides that maiden, who is too deeply interested in this matter, to prove that he killed his antagonist in fair fight?" "He is one of a band of murderers and ravishers," cried the chancellor in a rage; "he has no witness." "Thou art a liar, though thou wert a thousand chancellors," replied the youth; "and since peaceful men like thee do not make war but on weak maidens, I defy thee by thy champion. No, my liege," he added, turning to the king, and kneeling, "I have no witness save God and your majesty." "And may every honest man have witnesses as good in time of need, to oppose to perjurers and lawyers! He is no murderer, chancellor!—by my holy patron, Saint Dennis, I believe he could himself have killed those three murderous villains whom thou didst retain; but know, that I helped him—that I cut the throat of that traitor Sangien, whom, in spite of me, thou didst cherish, to do deeds which thy black heart planned, but dared not achieve. I helped him to carry off the maiden, thy dead friend's daughter, whom thou didst basely oppress; and if he had not been there, I had done it myself."

The king and his train then departed, leaving the young people with Cellini, whom the disgrace of the chancellor had put into mighty good humour. He made Ascanio tell him the story of the fight in the forest over and over again; he kissed Beatrice, and called her his child; he forbade all work in "Il Piccol Nello" for a week; had the wedding celebrated with great magnificence; and said, that of all the works he had ever produced, none had made him so happy as *LA TESTA DI MARTA—Homage aux Dames*.

THE ADMIRABLE CRICHTON.

TOWARDS the end of the sixteenth century, a young Scotsman travelled on the Continent, and appears to have possessed learning and accomplishments greater than might have been expected at his age; which were so well appreciated by his contemporaries, that he has ever since passed by the name of the Admirable Crichton. By this designation he is known to many who are wholly ignorant of the supposed excellent qualities on account of which he acquired it. His is a great name to boast of, but nobody can tell why. What great or meritorious action did he perform? what useful invention did he bequeath to his country? what valuable work did he compose? We ask in vain; for no one ever heard his name mentioned in connection with any of these things, nor indeed in connection with any thing else but the word Admirable.

It so happens that there is one point in which we can judge of the abilities of this wonderful person. He was as celebrated for his proficiency in the poetic art, as for his oratorical powers and his profound acquaintance with almost every branch of knowledge. Some fragments of his productions have been preserved, which are printed in the appendix to his life, written by Mr Tytler; and we are fairly entitled to suppose that these were the parts best worth preserving. What indications of extraordinary genius are to be discovered in these precious relics? Our readers shall have the opportunity of deciding for themselves. By the translation which we present of the Ode to Lorenzo Massa, it will be seen that it has no pretensions to any thing like poetical fire. Crichton's biographer has indeed pronounced it to be "a little lyric poem, which, for classic elegance, might do honour to any age of modern Latin poetry;" and Lord Woodhouselee has called it "a beautiful specimen of the lyric style of writing." But however willing to acquiesce in the decision of these critics, we have been unable to discover in this ode any of the glowing thoughts which might have been supposed necessary to prompt so high an eulogium. It appears merely a commonplace copy of verses, neatly enough expressed, addressed to a great man in order to bespeak his favour. In the original Latin, the use of which language, with its dignified and sonorous flow, has acquired the fame of inspiration for many a meagre grammarian, the want of the "living power" of poetry is not so easily detected, so much attention is required to ascertain, in the first place, the accuracy of the rhythm and the degree of felicity displayed in the use of idiomatic expressions. It is the characteristic of a certain species of spurious wit, that it cannot be transferred to another language; and perhaps no bad criterion of general excellence is, whether it will bear translation. Brought to this test, the ode to Massa is found greatly deficient; but it is worth perusing, for the satisfaction of knowing exactly what are the true merits of that man who has been elevated into so mysterious and unaccountable a reputation. The ode is such that it will be none the worse of a few words to explain the occasion of it. "Soon after his arrival in Venice, in 1580," says Mr Tytler, "Crichton was publicly introduced to the Doge and the Senate, in whose presence he made an oration, of which the eloquence was so brilliant, and the manner of delivery so perfectly graceful, that, in the words of Imperialis, he was esteemed a prodigy of nature. He afterwards disputed upon different subjects of theology, philosophy, and the mathematics, before the most eminent professors of the city, and an immense concourse of people, who, attracted by the high reputation which he had acquired, now flocked from all quarters to hear him. A great and general impression seems to have been made at Venice, by his uncommon learning, his engaging manners, and various accomplishments." It seems to have been after these public displays of his talents that he addressed the ode to Lorenzo Massa, secretary to the Venetian Republic, as in the sixth stanza there is an allusion to the favourable reception he experienced from the "cœtus," or assembly that attended his disputations, and to the numerous friends that these procured him. It was to bespeak the favour of the secretary, as an individual patron, that the following ode was written:—

TO LORENZO MASSA.

When I had left my Scottish home,
O'er seas and distant climes to roam,
Fired by a strong desire to view,
Unwonted scenes and cities new;
The Muses their blest guidance gave
Across the fiercely rushing wave,
Follow'd my devious footsteps still,
And keep me safe from every ill;
As did the Cyprian queen of yore
Attend her son by sea and shore,
His guide and solace still the same,
Through threats of hostile sword and flame.
Nor, should I scorching deserts brave,
Or farthest Gaditanian wave,
Or stray through savage Indian brake,
Would they their votary forsake.

But, the rough ocean's dangers o'er,
See me on friendly Adria's shore;
My home left, and its chilly sky,
To be the guest of Italy.
Nor did the assembly, learn'd and wise,
Me, a poor wanderer, despise;
The Muses still their care prolong,
And place me 'mid a generous throng—
My brethren in the love of song.

Massa, the glory of a famous line!
Sole sharer of the cares of state!
In thee the highest virtues shine,
And wealth combines to make thee great.
Since, then, thou art the muse's friend,
On whom their favours they bestow:
That favour which thou dost extend
To all who love them, to me show.

BIOGRAPHIC SKETCHES.

SIR HENRY RAEBURN.

THE subject of the present memoir may be considered as the founder of the resident school of Scottish painting. Scotland had not failed to produce artists of eminence, both in history and portrait. Among the latter, Jameson, called sometimes the Scottish Vandyke, and Allan Ramsay, son of the poet, hold most respectable places. Their country, however, did not afford patronage adequate to their merits; and they were obliged to seek employment and distinction in the sister metropolis. During the last half century, however, the progress of wealth and taste led to a sensible improvement in this particular; and during the early life of Mr Raeburn, David Martin, though an artist of only secondary talent, and not to be compared to his two predecessors in the art, had obtained very considerable employment in Edinburgh.

Henry Raeburn was born on the 4th of March 1756, and was the son of Mr William Raeburn, a respectable manufacturer at Stockbridge, then a village about a mile distant from Edinburgh, though, in consequence of the great extension of that city, it has now become a closely contiguous suburb. While yet a child, he had the misfortune to lose both his parents; but this want was supplied to him, as much as it could be, by his elder brother William, who succeeded to the business, and acted to him always the part of a father. We understand that Sir Henry, during his youthful education, did not discover any particular propensity to the art in which he was destined so remarkably to excel. It was only observed, at the class of arithmetic, when the boys were amusing themselves in drawing figures on their slates, that his displayed a very striking superiority to those of the other boys; but this did not lead any farther. In other respects, he was distinguished by the affection of his companions, and formed at that early period intimacies with some of those distinguished friends whose regard accompanied him through life. Amongst this number was the Lord Chief Commissioner Adam.

The circumstances of young Raeburn rendering it urgent that he should, as early as possible, be enabled to provide for his own support, he was accordingly, at the age of fifteen, apprenticed to an eminent goldsmith in Edinburgh. It was soon after this that he began to paint miniatures. In what manner this taste first showed itself, is not exactly known; but it certainly was altogether spontaneous, without lesson or example, and without even having ever seen a picture. His miniatures were executed, however, in such a manner as drew immediate attention among his acquaintances. His master then took him to see Martin's pictures, the view of which altogether astonished and delighted him, and made an impression which was never effaced. He continued to paint miniatures; they were much admired, and were soon in general demand. His time was fully occupied, and he generally painted two in the week. As this employment of course withdrew his time from the trade, an arrangement was made, by which his master received part of his earnings, and dispensed with his attendance.

In the course of his apprenticeship, young Raeburn began to paint in oil, and on a large scale. To aid him in this task, he obtained from Martin the loan of several pictures to copy; but that painter did not contribute advice or assistance in any other shape; and having once unjustly accused the young student of selling one of the copies, Raeburn indignantly refused any farther accommodation of this nature. Having begun, however, to paint large oil pictures, he soon adopted them in preference to miniatures, a style which he gradually gave up; nor did his after manner retain any trace of that mode of painting.

At the expiration of his apprenticeship, Mr Raeburn became professionally a portrait painter. At the age of twenty-two, he married a daughter of Peter Edgar, Esq. of Bridgelands, with whom he received some fortune. Ambitious still farther to improve in his art, he repaired to London, where he introduced himself and his works to the notice of Sir Joshua Reynolds. That great man instantly saw all that the young Scotsman was capable of, gave him the kindest reception, and earnestly advised him to enlarge his ideas by a visit to Italy. He even offered, had it been necessary, to supply him with money. Mr Raeburn accordingly set out for Rome, well furnished with introductions from Sir Joshua to the most eminent artists and men of science in that capital. He spent two years in Italy, assiduously employed in studying those great works of art with which that country abounds. He travelled with all practicable expedition to and from Italy, without stopping at Paris, or at any other place.

His powers now fully matured, Mr Raeburn returned, in 1787, to his native country, and immediately established himself at Edinburgh. Having taken apartments in George Street, he came at once into full employment as a portrait painter. Martin, who was still on the field, soon found himself eclipsed, and retired. Raeburn became the only portrait painter of eminence; and he continued always decidedly the first,

notwithstanding the able artists who have since risen in Edinburgh, to adorn both that and other branches of the art.

A life spent in one place, and in uniform application to professional pursuits, affords few materials for narrative. The real history of Mr Raeburn is that of his painting; but his, unfortunately, only himself could fully have given. Having stored his mind with ideas drawn from the purest school of modern art, he was indebted for his subsequent improvement solely to his own reflections, and the study of nature. He was never in the habit of repairing to London; and, indeed, he did not visit that metropolis above three times, nor did he reside in it altogether more than four months. He was thus neither in the habit of seeing the works of his contemporaries, nor the English collections of old pictures. Whatever disadvantage might attend this, it never stopped the career of his improvement. Probably, indeed, it had the effect of preserving that originality which formed always the decided character of his productions, and kept him free from being trammelled by the style of any class of artists. Perhaps, also, the elevation and dignity of style which he always maintained, might be greatly owing to his exclusive acquaintance with the works of the Italian masters. In English collections, the Dutch specimens are necessarily so prominent, both as to number and choice, that a familiar acquaintance with them must be apt to beget a taste for that homely truth and minute finishing in which their merit consists.

The first excellence of a portrait, and for the absence of which nothing can atone, must evidently be its resemblance. In this respect, Sir Henry's eminence was universally acknowledged. In the hands of the best artists, there must, in this part of their task, be something precarious; but in a vast majority of instances, his resemblances were most striking. They were also happily distinguished, by being always the most favourable that could be taken of the individual, and were usually expressive, as well of the character as of the features. This desirable object was effected, not by the introduction of any ideal touches, or any departure from the strictest truth, but by selecting and drawing out those aspects under which the features appeared most dignified and pleasing. He made it his peculiar study to bring out the mind of his subjects. His penetration quickly empowered him to discover their favourite pursuits and topics of conversation. Sir Henry's varied knowledge and agreeable manners then easily enabled him, in the course of the sitting, to lead them into an animated discussion on those ascertained subjects. As they spoke, he caught their features, enlivened by the strongest expression of which they were susceptible. While he thus made the portrait much more correct and animated, his sitters had a much more agreeable task than those who were pinned up for hours in a constrained and inanimate posture, and in a state of mental vacuity. So agreeable, indeed, did many of the most distinguished and intelligent among them find his society, that they courted it ever after, and studiously converted the artist into a friend and acquaintance.

Besides his excellence in this essential quality of portrait, Sir Henry possessed also, in an eminent degree, those secondary merits which are requisite to constitute a fine painting. His drawing was correct, his colouring rich and deep, and his lights well disposed. There was something bold, free, and open, in the whole style of his execution. The accessories, whether of drapery, furniture, or landscape, were treated with elegance and spirit, yet without that elaborate and brilliant finishing which makes them become principals. These parts were always kept in due subordination to the human figure; while of it, the head came always out as the prominent part. Animals, particularly that noble species the horse, were introduced with peculiar felicity; and Sir Henry's equestrian portraits are perhaps his very best performances. The able manner in which the animal itself was drawn, and in which it was combined with the human figure, were equally conspicuous.

Sir Henry painted portraits of most of the celebrated individuals by whom Scotland has been illustrated during the last forty years.

Sir Henry did not devote any part of his attention either to historical or to landscape painting. His employment as a portrait painter was constant, and his leisure hours were devoted to other pursuits. Although his pieces were carefully finished, yet he painted with uncommon expedition. His firm and sure touch enabled him to execute at once what others effected only by successive trials and operations. Even Sir Thomas Lawrence, we understand, has been heard to say, that though he received a higher price for his pictures, he was worse paid for his time than Raeburn. An advice which Sir Henry received at Rome from Mr Byers, a gentleman of great taste, and to which he invariably adhered, was, never to copy any object whatever from memory. Whether it was the principal figure or the minutest accessory, he had it always before him; and to the strict observance of this rule, he ascribed, in a great measure, his continued improvement, and the genuine and natural character which his pictures always preserved.

The active mind of Sir Henry was by no means confined within the circle of his profession. Indeed, those who best knew him, conceived that the eminence to which he attained in it was less the result of any exclusive propensity, than of those general powers of mind which would have led to excellence in any pur-

suit to which he had directed his attention. Though in a great degree self-taught, his knowledge was varied and extensive. His classical attainments were considerable; but mechanics and natural philosophy formed the favourite objects of his study. To these, in a particular manner, he devoted the leisure of his evenings, when not interrupted by the claims of society. Sculpture was also an object of his peculiar study; and so great was his taste for it, that at Rome he at one time entertained the idea of devoting himself to that noble art, as a profession, in preference to painting. A medalion of himself, which he afterwards executed, satisfied all men of taste who saw it that he would have attained to equal excellence in this art, had he made it the object of his choice.

Few men were better calculated to command respect in society than Sir Henry Raeburn. His varied knowledge, his gentlemanly and agreeable manners, an extensive command of anecdote, always well told and happily introduced, the general correctness and propriety of his whole deportment, made him be highly valued by many of the most distinguished individuals in Edinburgh, both as a companion and as a friend. His conversation might be said, in some degree, to resemble his style of painting—there was the same ease and simplicity, the same total absence of affectation of every kind, and the same manly turn of sense and genius. But we are not aware that the humorous gaiety and sense of the ludicrous, which often enlivened his conversation, ever guided his pencil.

Sir Henry Raeburn, like Raphael, Michael Angelo, and some other masters of the art, possessed the advantages of a tall and commanding person, and a noble and expressive countenance. He excelled at archery, golf, and other Scottish exercises; and it may be added, that, while engaged in painting, his step and attitudes were at once stately and graceful.

The mental qualities of this excellent man corresponded with the graces of his conversation and exterior. By those who most intimately knew him, he is described as uniting in an eminent degree the qualities which command genuine esteem. His attendance on the duties of religion was regular and exemplary. In domestic life, he appeared peculiarly amiable. Though so much courted in society, he seemed always happiest at home, in the bosom of his family and of his grandchildren; and he was sure to unbend himself by mingling in their youthful sports. To young men who were entering the arduous career of art, he showed himself always a most active and generous friend. Whether acquainted or not, they were welcome to come to him, and were sure of his best advice and assistance. Notwithstanding his extensive engagements and pursuits, a large proportion of his time was always spent in rendering these kind offices. When unable to command time during the day, he would engage them to come to him early in the morning. In passing sentence on the works of his brother artists, he evinced the most liberal candour, and, even where unable to bestow praise, was scarcely ever heard to blame.

The merit of Sir Henry was amply acknowledged, both by literary societies and by those formed for the promotion of art. He became a member of the Royal Society of Edinburgh, of the Imperial Academy of Florence, of the Academy of New York, and of the South Carolina Academy. On the 2d of November 1812, the Royal Academy of London elected him an associate; and on the 10th of February 1815, they named him an academician. This honour was conferred in a manner quite unprecedented, not having been preceded by any application whatever; while in general it is the result of a very keen canvass, and at that very time the candidates were particularly numerous.

The time was come, however, when the talents of the artist were to meet a still more brilliant and imposing homage. His Majesty, in the course of that visit which left so many grateful recollections in the mind of his Scottish subjects, determined to show his esteem for the fine arts by a special mark of honour conferred on the most distinguished of their professors. This view was happily fulfilled by conferring on Mr Raeburn the dignity of knighthood. So far was this from having been the result of any application, that Mr Raeburn had not the remotest idea of it till the evening before, when he received a letter from Mr Peel, announcing the royal intention, and requesting him to meet his Majesty next day at Hopetoun-house. The ceremony was performed in the great saloon, amid a numerous assemblage of company, and with the sword of Sir Alexander Hope.

The honour thus conferred on Sir Henry being completely sanctioned by public opinion, conferred equal credit on the bestower and receiver. His brother artists, instead of being moved with any feeling of envy, considered it as a noble tribute, which threw new lustre on themselves and their profession. These sentiments they expressed by a public dinner given to Sir Henry on the 6th of October.

Sir Henry received afterwards the appointment of portrait painter to his Majesty for Scotland; a nomination, however, which was not announced to him till the very day when he was seized with his last illness. The King, when conferring the dignity of knighthood, had expressed a wish to have a portrait of himself painted by this great artist; but Sir Henry's numerous engagements prevented him from visiting the metropolis for that purpose. It reflects great honour on the subject of this memoir, that he never

gave way to those secure and indolent habits which advanced age and established reputation are so apt to engender. He continued, with all the enthusiasm of a student, to seek and to attain farther improvement. The pictures of his two or three last years are unquestionably the best that he ever painted. But perhaps the most interesting part of his recent works consists in a series of half-length portraits of eminent Scotsmen, which, during this period, he executed for his private gratification.

This amiable and excellent man was suddenly affected with a general decay and debility, not accompanied by any visible complaint. This state of illness, after continuing for about a week to baffle all the efforts of medical skill, terminated fatally on the 8th July 1823, when he had reached the age of 67.

Public honours were rendered to his memory both in Edinburgh and London.

Sir Henry, as we already observed, married early in life, and Lady Raeburn survives him. He had two sons, the elder of whom, Peter, a most promising youth, who inherited his father's genius, died at the early age of nineteen. Henry, the second son, is married, and has a family. From his society his father always derived peculiar gratification, and with the affectionate disposition which distinguished him, had entirely adopted his family as his own. During the whole period of their joint lives, they lived under the same roof.—*Annual Obituary.*

VARIETIES OF THE HUMAN RACE.

In a certain point of view, man is one distinct creature; the rational sovereign of all other animals. It is found, however, that there are at least three kinds of men on the face of the earth; each of which kinds is different in many respects from the rest; and that even of these three kinds there are many subdivisions, and also some curious mixtures.

Upon the whole, the general tradition of Christendom, that the three departments of the old continent, Europe, Asia, and Africa, were divided among Noah's sons, Japhet, Shem, and Ham, gets some countenance from the scientific inquiries into this curious subject. The three races are called by learned men, Caucasians, Mongolians, and Negroes; and in general they are to this day respectively confined, with slight exceptions, to Europe, Asia, and Africa.

The Caucasians, who inhabit nearly the whole of Europe, may be called the *fair race*. They take their name from the mountains of Caucasus, which lie between the Caspian and the Black Sea, and where the very finest and most beautiful specimens of the human race are still to be found among the people called Circassians. Perhaps the name Caucasians was only applied by scientific men to the fair races of Europe, because the people about Caucasus appeared to be the perfection of that branch of mankind, and because every variety appeared to have been a departure from that standard. The general features of the Caucasian race are, an oval shape of the head, white skins, and hair of every shade of colour. In respect of mental power, they seem to have been intended to assert a mastery over all other races, for they have ever been in the front rank of civilisation. In the Caucasian mind, philosophy, science, and the arts, have found a genial home for upwards of thirty centuries; while the other races have remained in little better than their original barbarism. The Caucasians appear as if they had dispersed from their original country along both sides of the Mediterranean. On the southern shore of that sea, they are traced by analogies of language in the Assyrians, the Chaldeans, the Arabs; in the Phenicians, the Jews, and the Abyssinians, who were Arabian colonies; and probably in the ancient Egyptians. This last branch seems to have been inclined, in a remarkable degree, to mysticism: from it have sprung those religions, the influence of which has proved the most widely extended and most durable. Science and literature have flourished occasionally among these people, but always clothed in strange and mystic guise, and obscured by a highly figurative diction. Besides the shoot thus sent into Africa, another was sent into the large Asiatic peninsula of Hindostan, which has since been subdued by a totally different branch from the distant islands of Britain, so that, in all probability, these allied races of people will yet again mingle their blood, after having been apart for thousands of years. Part of the same great branch extended along the northern shores of the Mediterranean, into Greece, Italy, and Germany. Hence it is found that there is a likeness between the Hindostanee language and the classical tongues of ancient Greece and Rome, as also the German language, which now mixes so largely with that of Great Britain and other countries of the north of Europe. The German language is found in one variety (the Slavonian) in Poland, Russia, and Bohemia; and in another (the Teutonic), in modern Germany, Denmark, Holland, the British Isles, Sweden, &c.

Previous, however, to this general diffusion of the Caucasians over Europe, the country seems to have been partially peopled by an aboriginal race, whose origin is not to be traced. They are called Celts or Kelts; and it appears that the enlightened Caucasians dispelled them in all directions, to the extremities of the continent. They are now to be found, in a more or less mixed state, in the French province of Biscay (the Basques), in Wales, in Ireland, and in the High-

lands of Scotland. These original Europeans are perhaps nowhere so pure as in the last-mentioned district. The fastnesses of the northern part of the British isle afforded them protection for centuries, we may almost say for thousands of years, after they had been driven out of all the level countries of Europe. Within the recollection of people still alive, they hardly owned the nominal government of the country in which they lived, and on one occasion, acting for an exiled dynasty, had nearly revolutionised the state.

The origin of the ancient Persians is the same with that of the East Indians, and their descendants at the present day, with perhaps an admixture of the Mongol blood and complexion, bear the strongest marks of affinity to the European nations. By way of making this plain to our readers, it may be mentioned, that, even in familiar domestic words, there is a striking likeness between the terms used by the Persians and those used by the Lowland Scots, a limited and secluded race, situate at the opposite extremity of the older hemisphere. For instance, our word *fairy* is plausibly supposed to be the same with the Persian *peri*, which refers to a similar spiritual being. Another example is still more surprising: the word *goose*, as implying the hot iron of a tailor, is from *gahouse*, the Persian verb signifying to smooth. It may also be mentioned, that the word *erie*, which is used in Scotland to describe the peculiar feeling which arises in the mind in a solitary and dismal scene by night, is from the Hindostanee; though it is innumerable centuries since the two tribes could have used the words together, at the head-quarters of the race.

The Scythian or Tartarean branch of the Caucasian race, at first extended towards the north and north-west of Asia. Accustomed to a vagabond and predatory life in those immense tracts of country, these wandering tribes left them only for the purpose of devastating the inheritance, and subverting the establishments of their more fortunate brethren. The Scythians, who at a remote period made irruptions into Upper Asia; the Parthians, who there destroyed the dominion of the Greeks and Romans; the Turks, who overturned the Saracen empire in Asia, and subdued in Europe the unhappy remnant of the Grecian people—all sprung from this mighty branch of the Caucasian race.

The Finlanders and Hungarians are hordes of the same division, seemingly strayed, as it were, into the midst of the Slavonian and Teutonic nations. The north and west of the Caspian Sea are still inhabited by people of the same origin, and who speak similar languages, but intermixed with a variety of petty nations of different descent, and discordant tongues. The Tartar people have remained longer than the rest, in the region extending from the mouth of the Danube to the farther branch of the Irutich, where they long proved formidable to the Russian empire, though at length subjected to its sway. The Mongols, however, in their conquests, have mingled their blood with these nations; and we discover many traces of this intermixture, more especially among the nations of Lesser Tartary.

We now come to describe the Mongol race, which, as we have said in general terms, belongs to Asia. The personal characteristics of the Mongols are a half black or olive complexion; prominent cheek bones; flat visage; narrow and oblique eyes; hair straight and black, and scanty beard. To the eastward of the Tartar branch of Caucasians, the Mongols begin to be discovered; from which boundary they extend to the eastern ocean. This race has formed mighty empires in China and Japan, and occasionally extended its conquests on this side of the great central desert of Asia; but its civilisation has long appeared stationary. Its branches, the Calmucks, &c., are still wandering shepherds, perpetually traversing the Great Desert. Thrice did these nations—under Attila, under Gengis, and under Tamerlane—spread far and wide the terror of their names. The Chinese are thought, moreover, to have been the most early civilised, not only of this race, but of all the nations of the world. The Japanese, and the Coreans, and almost all the tribes which extend to the north-east of Siberia, under the dominion of Russia, are in a great measure to be ranked under this division of mankind. With the exception of a few Chinese literati, the Mongolian nations have but one religion, though in many sects—the superstition of Fo. The origin of the Mongolians seems to have been in the mountains of Altai, as that of ours was in the Caucasian. We cannot, however, trace the course and propagation of the branches of the one so well as those of the other. The history of these shepherd nations is as fugitive as their establishments. The records of the Chinese, confined to their own empire, throw but little light on the traditions of their neighbours; nor can the affinities of languages so little known lend much assistance to our researches.

The natives of the north of both Europe and Asia, such as the Laplanders and Esquimaux, spring, according to some authorities, from the Mongolian race. According to others, they are only degenerate offshoots from the Scythian branch of the Caucasian variety.

Lastly, the Negro, or fully black race, is chiefly confined to Africa, possessing the whole of that vast and little explored continent, except the northern extremities, which border on the Mediterranean. Its chief features, besides the coal black complexion, are crisp woolly hair, flat nose, and low cranium. In the

prominence of the lower part of the face, and thickness of the lips, it manifestly approaches to the monkey tribe. The hordes of which this race is composed have always remained in a state of barbarism, except where they have been transplanted as slaves into another soil, and partially illuminated by European masters; a process which is remarked to be very difficult, and not likely to make a great progress, till the negro race has been under cultivation for several generations.

In this segregation of mankind into three great flocks, no place or department has been found for the original Americans. The truth is, they cannot properly be referred to any of the three races, nor yet do they exhibit any peculiarities sufficient to constitute them a fourth variety. Their copper-coloured complexion is not sufficient. The lank black hair would seem to approximate them to the Mongols, if their well-defined features and prominent nose did not oppose such a classification. Their languages are likewise as innumerable as their tribes; and no mutual analogy has yet been ascertained between them, nor any affinity with the dialects of the ancient world.

The preceding paragraphs we have chiefly derived from the pages of the "*Regne Animal*" of M. Cuvier, who ranks as the greatest naturalist of modern times. It remains to be remarked, that modern navigation and commerce have produced many decisive alterations upon the ancient settlements of the human race. In the immense continent of America, we see, within the last three hundred years, hordes of Europeans spreading themselves inward, upon the grounds once occupied by the uncivilised races just alluded to, who are now, in South America, mixed, in a small proportion, with the intruding people, but, in North America, are regularly driven back as the Caucasians advance, so that they must at last hang in small remnants upon the coast of the Pacific Ocean, like our Celts in Biscay and the Scottish Highlands. This piling of Europeans upon Europeans, must produce at last strange mixtures. When we turn our eyes to the East Indies, we see another process of the same kind likely to commence immediately, the dominion of the ground having been already obtained.

VISIT TO TIBERIAS.

THE enterprising John Carne, whose visit to Jerusalem and the Dead Sea we have already noticed, thus describes Tiberias:—"Approaching this celebrated place, "we passed by a spot on the left (says he), on a gentle declivity, where, tradition says, the five thousand were miraculously fed. The town of Tiberias is surrounded by a wall, but is rather a wretched place within. No ancient remains of any interest are at present found here. On the shore of the lake Tiberias, at some distance to the south of the town, are warm mineral baths, which are much used and esteemed. At the extremity of the north-eastern shore, some remains are said still to exist where Capernaum formerly stood. The inhabitants of the town are chiefly Jews, with some Turks. We lodged in the house of one of the Jews, a wealthy old merchant of Aleppo, who had come hither in his old age, and built his house far from his native home, in order that he might die at the lake of Tiberias. The attachment of the Jews to the places of their ancient record and glory, is sometimes excessively strong. In walking along the shores, we met occasionally Jews from Poland, chiefly elderly men, who had come from their native country to this spot, from no other motive but to spend their last years round the lake.

On the night of our arrival, we walked on the terraced roof to enjoy the coolness of the air. It was moonlight, and the lake and its shores were as beautiful a scene as can be conceived. It brought to mind the night, though so different a one, when Christ walked on the surface of the waves to rescue his disciples. Yet Tiberias is a scene where nature seems still to wear as sublime and lovely an aspect as in the day when it drew the visitations and mercies of the Lord. No curse rests on its shores, as on those of the Dead Sea; but a hallowed calm, and a majestic beauty, that are irresistibly delightful. The length of the lake is about fourteen miles, and the breadth five. The fish it contains have a most delicious flavour, and are much the size and colour of a mullet. The boats used on it are, in some seasons of the year, much exposed from the sudden squalls of wind which issue from between the mountains. The water is perfectly sweet and clear. The Jordan is seen to enter it at its northern extremity, and its course is distinctly visible through the whole extent of the lake. The range of mountains forming its eastern shore is very lofty; their steep and rocky sides are barren, with a sprinkling of trees on a few of the summits. The western shore, where the town stands, is level, but its picturesque hills, divided by sweet valleys, are covered with a rich carpet of verdure, but almost destitute of trees. The side to the southern end of the lake is very pleasant, where the Jordan flows out of it. An ancient bridge, some of whose ruined and lofty arches still stand in the river, adds much to the beauty of the scene. We bathed here in the Jordan, which issues out in a stream of about fifty feet wide, and flows down a rich and deserted valley, enclosed by bare and lofty mountains. The stream was here clear and shallow, but it soon became deep and rapid. Little is said in the Scriptures respecting the extensive valley of the Jordan between Tiberias and Jericho. It must have

been thickly populated from its luxuriance, being watered throughout by the river. Yet, with all the charms of its situation, the air around the lake, during the summer, is close and sultry. Of all places in Palestine, however, a stranger would desire to fix his residence here; as a situation on any of the verdant hills around would be exempt from the often oppressive air on its banks."

CRIMINAL TRIALS.

MANY strange pictures of the manners of the people and of the practices of the courts of law, may be drawn from the criminal records of Scotland. We often shudder while we read, not so much because the crimes are greatly more atrocious than those perpetrated in our own day, as because they disclose to us a state of society to which crime was familiar. Revenge was a part of the business of life, in the prosecution of which abettors were easily found, and the bloody accomplishment of which might be punished indeed, but inferred not the slightest degree of disgrace. The law which had to struggle against these disorders, to be in any sort effectual, must be in many respects summary—even cruel; and we are not to wonder if the powers which it put into the hand of the magistrate were sometimes exerted with rigour when the offender was completely in his mercy; with apparent remissness where the delinquent belonged to an influential faction, whom to have set at defiance might have involved the peace of the kingdom; and too often with indecent severity or undisguised oppression where private interest was pursued under pretence of public justice. Yet we are apt to judge with too much harshness of the conduct of those who administered the law in former times. If their decisions do not correspond with what our modern notions tell us they ought to have been, we are filled with indignation, and inveigh against them as if they had been blameably remiss in their endeavours to ascertain the truth, or had wilfully closed their eyes against it. But if we could abstract ourselves from all the knowledge that has been gained since their time, and from the greater readiness with which longer experience has taught us to apply it—still more if we could assume the prejudices with which the age surrounded them—if, in short, we were to consider not only the shortcomings, but the circumstances that caused it, we should no longer wonder at the errors and imperfections which at first sight appeared to us so monstrous. It is not always safe to predicate that if more enlightened magistrates could have been found, the interests of society in its earlier stages would have been better promoted. It is perhaps more true that the progress of civilisation would have been retarded by the efforts of such men, instead of others who had a rougher edge, but were on that account better suited to the period when they lived. The carpenter who, in order to the construction of some useful article, should commence his labours upon a log of wood with his finer tools, would be derided by his fellow-workmen, and have but poor success besides in his undertaking. The axe must lop off the gnarled parts of a trunk, and the saw further reduce it to a manageable shape, before the plane can be applied with advantage: and it would be as reasonable in the tradesman to find fault with his hatchet because it did not cut as smoothly as the plane, or to imagine that the latter could have done the work of the axe better than the axe itself, as it is in the historian to censure the conduct of public men of former times, because they did not employ upon the rough elements with which they had to deal the silken policy of modern days. With these preliminary observations, we think it will be no unprofitable thing to submit to our readers from time to time an account of some of the trials which took place in the Court of Justiciary at an era preceding the modern more improved form of process; the materials for which have been supplied by Mr Pitcairn's laborious and most useful publication, the *Criminal Trials*.

HAMESUCKEN—ROBERT KENT.

This is one of the cases in which the parties concerned, who were neighbours, carried on hostilities, assaulting, retreating, and practising stratagems, in order to take each other at a disadvantage, more according to the usual system of prolonged warfare between contending powers, than under the temporary impulse of overpowering passion, which is seen to be the ordinary cause of bloodshed in the quarrels of individuals. The dissension arose from a very inconsiderable circumstance, namely, a cuff given by the lady of one house to a servant belonging to another. At the time when the indignity was offered, either

because the insult was not deemed to be very heinous, or because the opportunity was not favourable for revenge, Gabriel Montgomery retired with his man Kent to the house of his brother John at Thridpairt. This latter person, however, seems to have had a peculiar aptitude in discerning the niceties upon which a Scottish feud depended, and prevailed upon them to set out again that same night, with the intent of exacting a bloody vengeance from Hew Montgomery of Heselhead, by whose wife the slap had been given. They proceeded to the place accordingly, and remained all night in a house hard by; next morning, finding the gate open, they entered, and went up stairs to an apartment, where Marion Sempill, the mistress, was employed in some household affairs, with only a servant girl beside her. Kent seized her by the hair of the head, dragged her backward, struck her with his fists, and kicked her unmercifully, so that her bowels were broken, and she was disabled for life. His master, in the meantime, was stationed beside the door, with a pistol presented, hoping the screams of the lady would bring her husband to her assistance, and that he might shoot him as he entered. Hew Montgomery happened to be out of the way for the time; and the two unmanly assailants, perceiving the alarm to be given, and that the servants would soon assemble and overpower them, rushed out, locked the tower gate behind them, caught a horse, and fled to Thridpairt. As soon as the gate could be broken open, Heselhead followed with two servants, whom he dispatched to reconnoitre, and approached the entrance to Thridpairt by himself. John and Gabriel Montgomery, seeing him alone, came out armed, both set upon, and wounded him behind and before; and thinking their revenge now accomplished, left him for dead. Some friends, however, came and carried him home in plaids, and he recovered. This was in July 1576, and the same month, Gabriel Montgomery was killed by some of Heselhead's adherents. In August, John Montgomery, with his brother Walter and Kent, coming armed to Netherton of Heselhead, seized one of Hew's servants, and then letting him escape, pursued him in the expectation that his master would see his danger, and come out to the rescue. Their scheme failed, however; and for these various infractions of the peace, they were brought to trial in December. The facts charged against them being of a complicated nature, the jury, by the mouth of John Somervell of Cambusnethan, returned a verdict of acquittal. No sooner were the prisoners released than they made another attempt to gratify their revenge, for which they were indicted afresh in the January following. But the case was continued to the justice-air of Renfrew and Lanark, and we cannot trace the proceedings farther.

WILFUL ERROR IN ASSIZE—SOMERVELL OF CAMBUSNETHAN AND OTHERS.

The acquittal of Kent gave rise to the indictment of the jury by whom he was tried. At that time, after reading the indictment, it was a very common thing for the king's advocate to take a protest, that if the verdict did not accord with it, the jury should be liable to a prosecution for wilful perversion of justice. In the present case this course was adopted, but we do not know what penalty followed, the trial having been postponed from the day first appointed for its taking place, and no entry regarding it afterwards appearing in the record; but instances frequently occurred where a refractory jury were punished by heavy fines and imprisonment. This was complained of as an iniquitous interference with the independent exercise of opinion, but was not formally abolished till the reign of William and Mary.

It may seem unaccountable that any law should sanction a mode of trial so totally inefficient as that by a jury, who had not even the appearance of possessing the power of judging according to their consciences, but were told beforehand, that if they did not decide as the crown counsel wanted them, they should be condignly punished. But the case does not bear quite so flagrant an aspect when other circumstances, in which the ancient form of process differed from the present, are taken into consideration. It was customary for criminals to be pursued at the instance of private prosecutors, with concurrence of the king's advocate. These private prosecutors were commonly the next of kin to the sufferers by the crime, and therefore, very frequently, the most competent witnesses against the accused. Where a man had been murdered, for example, in his own house, the testimony of his wife, if she had been an eye-witness, was the most conclusive that could be had. According to the practice of the time, she appeared as a party against the murderers; but that her evidence might not be lost, she was required to make oath to the truth of the facts specified in the indictment; so that in many cases the crime charged might be considered to be established against the pannel by the indictment itself. The jury, too, where it was possible, were selected on account of their knowledge of the circumstances, and the advocate often referred to this knowledge as a proof of the crime. Sometimes we find a jury taking protest, that a verdict of acquittal should not subject them to prosecution for wilful error, "inasmuch as the indictment was not sworn, nor the facts notour, nor any evidence, written or oral, produced;" from which it would appear that the king's advocate had not the power of preferring a charge of that nature in the case of all acquittals indiscriminately, but only

where the verdict was at variance with such evidence as was at that time held to constitute a proof. Thus the practice of prosecuting jurors for wilful error, proves to have been by no means so monstrous as it might seem at first sight.

GUERNSEY.*

THE happiest community which it has ever been my lot to fall in with is to be found in the little island of Guernsey. The pictures of want, filth, and crime, which so frequently shock the eye of humanity in our own country, and which appear to a still greater extent in Ireland, and many parts of France, are not to be met with in Guernsey; but in their stead are to be seen the happy signs of abundance, comfort, and contentment. The poor man has his neat little house, is surrounded by his cheerful family, and is under no apprehension that he shall not be able, with moderate labour, to provide a full meal and a comfortable lodging for all who are dependent upon him.

What are the causes of this superior state of things in Guernsey? Why is it, that, within so short a distance of places where the pining labourer is but half fed and half clad, the man of Guernsey should have a well-stored board and abundance of clothing? The climate is not peculiar; the land is not remarkably fertile. The southern parts of England are quite equal to Guernsey in both these particulars. How is it then that Guernsey should be so much ahead in the career of happiness? *Guernsey has superior laws—superior institutions.* And the state of things in Guernsey is one among the thousand proofs that have been given, that the prosperity and happiness of a people are much more dependent on its laws, institutions, and the manner in which its government is carried on, than on climate and fertility of the soil.

I have twice visited the island of Guernsey under circumstances favourable for becoming acquainted with its condition; and in the hopes of directing general attention to a model from which much might with advantage be adopted, I will give a brief account of what fell under my observation.

One of the most striking changes which the visitor, whether from England or France, meets with on his landing in Guernsey, is the entire absence of beggars. That miserable compound of imposture and real distress—the wandering mendicant—is there unknown. A tradesman who has been established at St Peter's Port (the town of the island) for upwards of thirty years, assured me that during the whole period of his residence in the island he had never once seen a beggar. For myself, I neither saw nor heard of one: and I was satisfied, from all I learnt, that a beggar is in Guernsey a being of a past age—a creation of history—a fit subject for the speculations of the antiquary—but too completely covered with the dust of ancient times, for those of the present day to examine.

Not only is the island free from beggars, but it is free also from those debasing but unfortunate creatures whom the twilight of evening brings forth from their hiding places, like swarms of moths, to join the giddy dance round the flame that is soon to destroy them. Prostitution proceeds from the same sources as mendicancy—want and ignorance; and where the latter is not found, the former will rarely be met with. Be that as it may, however, the fact is, that the streets and roads of Guernsey are not disgraced by the appearance either of the prostitute or the beggar.

Two establishments, called the Town and Country Hospitals, exist in the island, to which all persons are sent, who, for any reasons whatever, are unable to obtain an honest livelihood. In these establishments are to be found females who would otherwise be living by prostitution—the habitual drunkard—the lunatic—the destitute orphan—all have here an asylum, and are removed from the temptation and misery to which they would otherwise be exposed.

I visited the town hospital, situated, not in the town itself, but in the outskirts, and I was very much

* Guernsey is one of the Norman Isles, which are near the north-western coast of France. These islands are in the possession of the English. They once formed part of the Duchy of Normandy, the whole of which was formerly under the dominion of England. When, happily for all parties, the English were compelled to abandon their claim to Normandy, the little islands, of which Guernsey forms one, remained attached to England. The extent of the island is about 25 square miles, and its population about 20,000. I have in most cases confined the following observations to Guernsey, because I can speak of what relates to that island from my own observation. The other islands I have not had an opportunity of examining. Much, however, which I may say respecting Guernsey, would apply equally to Jersey and the other Norman Isles.

gratified with what I saw. The scene was a busy one. The men were occupied, some in weaving cloth, some as tailors, others as shoemakers, &c. The women were engaged principally in washing. In addition to the washing for the hospital, a great deal is taken in from families living in the neighbourhood; and by this means the women do much towards paying the expense of their maintenance. The greater part of the cloth, shoes, &c. which the men manufacture, is sold. The men are also employed as scavengers.

By thus employing the men and women at profitable labour instead of setting them to turn a great stone, as is done in some of our parishes, the expense of the maintenance of the inmates of the hospital is greatly reduced. The average yearly expense of each inmate is not more than *seven pounds*, notwithstanding that at least half of those in the hospitals are boys and girls who produce but little, being the greater part of the day in school; and, notwithstanding, also, that there are many lunatics and infirm people, who are of course unable to do any thing towards their own support. The number of inmates in the town and country hospitals together is about three hundred, and their expense to the island is about *L.2000* a-year.

The arrangements of the hospitals, and the discipline maintained in them, are excellent; at the same time, the inmates are treated with great kindness, are allowed an abundance of good wholesome food, and are well clothed and lodged. Those whose conduct deserves reward are frequently allowed to visit their friends for a day or so: but if the privilege is abused, and, for instance, if any one returns to the hospital in a state of intoxication, he is not allowed to leave the hospital again for several months. On the whole, whether we regard these hospitals as asylums from misery, or as schools of morality, I must say that I have never yet seen any institutions in this country that would bear comparison with them.

There are many causes which co-operate in preventing any numerous class of the people of Guernsey from sinking into that state of poverty which leads to crime and misery. In the first place, all the necessities of life are exceedingly cheap. Wheat during the last twenty years has been about two-thirds of the price at which it has been sold in England. In the summer of 1830, when I last visited Guernsey, wheat was twenty shillings (Guernsey money) per quarter, in the measure of the island. This price is the same as forty-six shillings English money for an English quarter. The price of wheat in England, at the same time, was sixty or seventy shillings per quarter.

I need scarcely say, after mentioning the price of wheat, that our corn laws do not extend to Guernsey. Wheat, as indeed every thing else, with the single exception of tea, can be freely imported into Guernsey. In the year 1815, when the rigour of the English corn laws was greatly increased, it was intended to extend the corn laws to Guernsey, and the other Norman Isles; but the inhabitants bestirred themselves, and succeeded in warding off this terrible blow to their prosperity. For their success in this struggle, they were in a great measure indebted to the exertions of Mr Brock, the judge or bailiff, as he was termed, of Guernsey—a gentleman who appears on all occasions to have been the good genius of the island. The inhabitants of each of the islands presented Mr Brock with a piece of plate as a token of gratitude for his services on the occasion in question. The people of the Norman Isles are not only allowed to import corn for their own use from wheresoever they choose, but they are permitted to export all the corn they themselves can grow to England. This being the case, the people, of course, consume but very little of the wheat their own islands produce. This latter supply is kept for the English market; so that there is the singular anomaly constantly going on of corn from the Baltic actually sailing by the coasts of England to supply the people of the Norman Isles, and to enable them to send to England the wheat which is growing at their own doors.

Provisions of other kinds are at prices proportionately low with those of wheat. The ordinary price of good meat is fourpence per pound; that of moist sugar, from threepence to fourpence a pound; potatoes sell for threepence a peck; the price of butter varies from sevenpence to tenpence per pound. Tea, though cheap compared with the price in England (the price of the best black tea is from half-a-crown to three shil-

lings a pound) is dearer than it otherwise would be, did not the monopoly of the East India Company extend to the Norman Isles. The tea consumed in these islands is not subject to a farthing of king's tax, so that the sole cause which keeps up the price of tea in these islands, is, that the East India Company have a monopoly of the supply. So much dearer, however, does this make the tea, that it is a constant article of smuggling from France. With the exception of tea, of which I have just spoken, and spirits, on which there is an import duty of one shilling a gallon, a perfectly free and untaxed importation is allowed of every species of food, and, indeed, of produce of every kind. The consequence is, that as far as their limited demand will command a market, the inhabitants of the Norman Islands can select, from the whole world, the produce which each country is best able to furnish. Instead of using dear and bad Canadian timber, they employ good and cheap Baltic timber. Christiana deals, twelve feet long, nine inches broad, and three inches thick, sell for £1.15, 15s. 6d. per 120, or rather more than half-a-crown each deal.

Among other things which are cheap in Guernsey, in consequence of their being free from taxes, I may mention newspapers. With a population of only twenty thousand people, the inhabitants of Guernsey support five weekly newspapers. The usual price of a newspaper is sometimes a penny, sometimes twopence. The charge for a short advertisement is *sixpence*. The taxes collected in the islands are very light. A tax of a shilling per gallon on imported spirits is the only indirect tax of any kind whatever. The principal tax is a direct one, of a very fair kind. It is a property tax, averaging about sixpence in the pound, upon all existing property. Thus, a man pays this property tax, not only for his land and houses, but for money which he may have in the funds, for money lent on mortgage, &c. The produce of this tax is appropriated to the support of the two hospitals, and the paving and lighting of the town. In addition to this property tax, and the tax on spirits, the church receives a tithe on all kinds of corn, on fish, and on a few kinds of agricultural produce of small importance, but not upon hay. This tithe completes the list of taxes in the Norman Isles.

If it should be a matter of surprise that these islands should have been so highly favoured by those who have had the framing of laws, and imposing taxes, the explanation is readily given. The Norman Isles are so much nearer to the coast of France than to that of England, that it would not be a difficult matter for the inhabitants to transfer their allegiance from England to France. This would be a serious loss to England, as the islands are of great use as an asylum for English vessels, especially in time of war.

The importance which has been attached to the possession of these islands, and their peculiar situation, has no doubt been the principal reason for the considerate manner in which they have been treated.

Next to the blessings of light taxes and unrestricted importation of food, I may mention the state of the laws of inheritance as being very favourable to the happiness of the people living in the Norman Isles. In our own country, when a man dies, his estate, if consisting of freehold land, goes altogether to his eldest son, the other children being left to do as well as they can; at least this is the case if the man has not left a will to direct that his property shall be divided, which is seldom done. But in Guernsey and the other Norman Isles, a much fairer arrangement is adopted. Two-thirds of the estate are divided equally among the sons, however many there may be, and one-third among the daughters. This plan of division, though only an approach to perfect justice, is evidently much better than the one followed in this country.

In order to prevent an unnecessary splitting up of estates, it is provided that the eldest son shall, if he has it in his power, be allowed to pay to each of his brothers and sisters the value of their share of the property, and then retain possession of the whole himself.

The consequence of this state of the law of inheritance is, that instead of the property of the islands being held in huge masses, each acre of which is but of insignificant value to the owner, the islands are covered over with clusters of small estates of from four or five to forty or fifty acres, so that every person has a little plot of land which he can call his own. We all know how men's hearts are set upon this, and what a powerful stimulus it is to greater exertions, superior economy, and a love of independence.

Next to the equal division of property, which prevents waste and extravagance on the one hand, and extreme poverty on the other, I may mention the abundance of paper money in the island of Guernsey, as a great cause of the prosperity of the island. The paper money is issued by the government of the island, and in the following way:—When any great undertaking has been determined on by the states (as the representatives of the people are called), such, for instance, as the opening of new roads, there is, immediately, an issue of one pound notes by the government. These notes are sent out as the work proceeds, and as money is wanted. When the undertaking is completed, and begins to yield an income, the notes are gradually

bought in again, and new undertakings are commenced. The notes are not payable on demand: indeed the government has not even an office at which the notes can be presented. Nevertheless, the notes are never refused. The people find, by experience, that their representatives "the states" do not issue the notes in greater abundance than the demand for them justifies, and consequently no depreciation in their value is to be feared. Moreover, the purposes for which the notes are issued are of advantage to every man in the island; so that every one looks upon them as coming from the bank to which he is a partner. Here, then, in the little island of Guernsey, we have perhaps the only instance in the world of a really national bank; a bank in which the whole property of the state is the security, and the profit of which is shared by the people at large.

By means of this truly "healthy" currency, undertakings of great magnitude (considering the size of the island) have been executed during the last few years. One work alone, namely, the opening of a new street into the town, the erection of a market-house in it, and the purchase of the neighbouring land, cost eighty thousand pounds. The profits of this undertaking have enabled the states to erect another market-house, for the sale of fish. This building is really on a magnificent scale. I am quite sure there are towns in this country, containing four times the population of the whole island of Guernsey, that cannot boast of a market-house equal to it. A college for the education of the middle classes of the island has been erected at an expense of forty thousand pounds. A spacious court of justice has been built, and new and excellent roads have been made crossing the island in different directions.—*From the Examiner.*

A Boy's LETTER.—The following specimen of a boy's letter is from *Hood's Comic Annual* for 1833. There is such a truth of character in it—so much of that spirit of drollery, mixed with mischief, which often prevails in the young human being of the male sex—that we cannot help declaring it to be, in its own words, "capital fun." The letter proceeds from a country boy, to what the polite letter-writer would call "his friend in town." "Now, Bob, I'll tell you what I want. I want you to come down here for the holidays. Don't be afraid. Ask your sister to ask your mother to ask your father to let you come. It's only ninety mile. If you're out of pocket-money, you can walk, and beg a lift now and then, or swing by the diceys. Put on corduroys, and don't care for the cut behind. The two 'prentices, George and Will, are here to be made farmers of; and brother Nick is took home from school, to help in agriculture. We like farming very much; it's capital fun. Us four have got a gun, and go out shooting; it's a famous good 'un, and sure to go off if you don't full cock it. Tiger is to be our shooting dog, as soon as he has left off killing the sheep. He's a real savage, and worries cats beautiful. Before father comes down, we mean to bait our bull with him. There's plenty of New Rivers about, and we are going a-fishing as soon as we have mended our top joint. We've killed one of our sheep on the sly, to get gentles. We've a pony, too, to ride upon, when we can catch him; but he's loose in the paddock, and has neither mane nor tail to signify to lay hold of. Isn't it prime, Bob? You must come. If your mother won't give your father leave to allow you, run away. Remember, you turn up Goswell Street to go to Lincolnshire, and ask for Middlefen Hall. There's a pond full of frogs, but we won't pelt them till you come; but let it be before Sunday, as there's our own orchard to rob, and the fruit's to be gathered on Monday. If you like sucking raw eggs, we know where the hens lay, and mother don't; and I'm bound there's lots of birds' nests. Do come, Bob, and I'll show you the wasp's nest, and every thing that can make you comfortable. I dare say you could borrow your father's volunteer musket of him, without his knowing of it; but be sure any how to bring the ramrod, as we have mislaid ours by firing it off."

BOYS' MARBLES.—The games with marbles played by boys are of great antiquity, and originated in the imitation of the more manly games with bows. In early times, before the invention of grinding marbles, into a perfectly round form was known, boys used nuts in their stead. It is said of Augustus when young, that, by way of amusement, he spent many hours in playing with little Moorish boys, *cum nucibus*, with nuts. This trifling circumstance presents us with a pleasing trait in the juvenile character of the greatest of all the Roman emperors.

KINDNESS OF THE ASS.—The following anecdote of the sagacity of an ass, and the attachment displayed by the animal to his master, may help in some degree to redeem that ill-used race from a portion of the load of stupidity which is generally assigned to them, and which with so many other loads they bear with such exemplary patience. Thomas Brown, residing near Hawick, travelled the country as a higgler, having an ass the partner of his trade. From suffering under a paralytic affection, he was in the habit of assisting himself on the road by keeping hold of the crupper of the saddle, or more frequently the tail of the ass. During a severe winter some years ago, whilst on one of his journeys near Rule water, "the old man and his ass" were suddenly plunged into a

wreath of snow. There they lay long, far from help, and ready to perish. At length the poor ass, after a severe struggle, got out; but finding his unfortunate master absent, he eyed the wreath for some time with a wistful look, and at last forced his way through it to where his master still lay, when, placing his body in such a position as to afford a firm grasp of the tail, the honest higgler was thereby enabled to take his accustomed hold, and was actually dragged out by the faithful beast to a place of safety.

LONGEVITY.—The salubrity of England has considerably increased, and the mortality diminished, for many years past. The results of the population acts afford satisfactory evidence that our ancestors did not enjoy the same degree of health and longevity that we do at present. The annual mortality has decreased nearly one-third in forty years. In 1780, the rate of mortality was taken at one in forty; in 1795, at one in forty-five; in 1801, at one in forty-seven; in 1811, at one in fifty-two; and in 1821, the results of the census show a mortality of one in fifty-eight. The limits of human life are the same now as formerly, and will probably always continue the same; but more persons live now to an advanced age than in former times.—*Edin. Phil. Journal.*

BEES.—The Rev. Mr Dunbar, by a series of experiments in Scotland, ascertained, that, when a queen bee is wanting for a hive, her majesty can be, and is, produced from the egg of a working bee. In one experiment, having removed the queen, the bees set about constructing royal cells, and placing common larvae in them; in seven days two queens were formed. One of these killed the other, and, though, while in a virgin state, treated with no distinction whatever, she no sooner began to lay, than she became the object of constant solicitude and respect to crowds of her admiring subjects, who watched, fed, and waited upon her.

CATALANI.—It is little known, and can hardly be credited, that this great singer, with all her experience of public favour, and inevitable consciousness of her own genius, continued to the very end of her career to be exceedingly timid and irresolute on entering upon her theatrical duties. She generally carried a Bible upon the stage along with her, as a kind of charm to insure confidence, and always devoutly crossed herself, and prayed for support, as a soldier might do on going into battle.

APPELLATIONS.

At the institution of yeomen of the guards, they used to wait at table on all great solemnities, and were ranged near the buffets. This procured them the name of *buffetiers*, not very unlike in sound to the jocular appellation of *beef-eaters*, now given them; though probably it was rather the voluntary misnomer of some wit, than an accidental corruption arising from ignorance of the French language.

The opprobrious title of *bum bayliffe*, so constantly bestowed on the sheriff's officers, is, according to Judge Blackstone, only the corruption of *bound bayliffe*, every sheriff's officer being obliged to enter into bonds, and to give security for his good behaviour, previous to his appointment.—*Encyc. Brit. new ed.*

The *three blue balls* prefixed to the doors and windows of pawnbrokers' shops, by the vulgar humorously enough said to indicate that it is two to one that the things pledged are ever redeemed, were in reality the arms of a set of merchants from Lombardy, who were the first that publicly lent money on pledges. They dwelt together in a street, from them named Lombard Street, in London, and also gave their name to another at Paris.

The appellation of Lombard was formerly all over Europe considered as synonymous with that of usurer.

[Such is the popular account. But the question still remains to be answered.—How came these Lombard merchants to assume this sign? The real origin of the balls is as follows:—The arms of the Medici of Florence are seven balls, arranged by *three and seven* in the different compartments of the shield. Being for a long period the principal merchants in Italy, they hung over their houses of agency the arms of the family as a sign, and directed the same practice to be adopted in the different capitals of Europe where they had established connections. This came to be a distinction so well known, and so generally respected, that other merchants, not connected with the house of the Medici, adopted the practice still retained by the pawnbrokers. The first of the Medici was a celebrated physician at the court of the Greek emperors—hence the name, from the Latin *Medicus*. Upon being ennobled for his skill, this disciple of Galen, and destined founder of a race which has survived the double wreck of empire, resumed the name, and the most usual form of his prescriptions—pills, as the badges of his new dignity.]

EDINBURGH: Published weekly, by W. and R. CHAMBERS, 19, Waterloo Place; and G. & S. SAIN, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

No. 35.

SATURDAY, SEPTEMBER 29, 1832.

PRICE THREE HALFPENCE.

HUSBANDS AND WIVES.

WE meet with numerous rules for the conduct of young newly married women of all ranks; and if the world is not filled with good wives, it certainly is not because there is any want of matronly counsel for their guidance. But though the happiness of the conjugal state depends at least as much upon the behaviour of the husband as on that of the wife, there has not, as far as we are aware, been hitherto promulgated any code of instructions for the use of the former. Our literature abounds with narrations which exhibit the dutifulness and affection of women to husbands unworthy of them, who repaid tenderness with brutality, nor relented till those whose every amiable feeling they ought to have cherished and rewarded with their love, either sank broken-hearted, or, grown desperate, became even more abandoned and profligate than themselves. The man is to blame in nine cases out of ten where an alliance proves unhappy. In the lower ranks, especially, it is too often a want of prudence on his part that renders so many families wretched. *Of the multitudes of those who have wasted character, health, and means, in intemperance, there is but a small proportion who might not have preserved respectability by listening to the admonitions of their wives.* Yet, with these numerous and undeniable facts before the world, no writer thinks of preventing such evils by pointing out and enforcing the duties of the party from whose misconduct they chiefly spring. A small portion of our columns, therefore, will not be unprofitably bestowed on a subject of so much importance.

In order to secure the felicity of the married state, a husband must, in the first place, endeavour to secure the perfect confidence of his wife. He must banish every thing repulsive from his manner towards her, and live with her on such easy and friendly terms that she may never be discouraged from communicating with and consulting him on every affair, whether it be in the lesser or the greater concerns of life. If a wife do not find at home sympathy with her afflictions, cares, and anxieties, she will seek it abroad—she will detail her griefs to some acquaintance, to whom she will go for advice in matters of difficulty, and, perhaps, in matters of delicacy, which cannot properly be appreciated by a stranger, and therefore ought not to be entrusted to the ear of one. The happiness of the family will thus be made to depend in a great measure on a person not a member of it, who, whatever be her prudence, is not intimately interested in the preservation of its peace, and who is more likely to take a side and encourage feelings of animosity than to inculcate the duty of mutual forbearance.

The husband's duty must therefore be to establish in the mind of his partner an entire reliance on his affection, and a thorough persuasion that he is disposed to the full amount of his power to promote her comfort. Let him not think it beneath him to take an interest in her domestic arrangements; by showing that he does so, he will make her sensible that her efforts to render home pleasing are not unappreciated; her labour for that end will be redoubled, and yet prove more light to her. As he must be abroad the greater part of the day, let him not deprive her of his company in the hours of leisure that business leaves him. A man cannot altogether seclude himself from the world in the bosom of his family; neither can he always carry his wife along with him; but he must not for a light reason allow himself to be detained from her society. A woman's hours are often lonely; and after she has bestowed her whole cares for a day to set her house in order, and anxiously awaits her husband's return, in the hope of enjoying a few hours of mutually endearing converse by the cheerful hearth, if she have to watch every approaching footstep in vain, it is a cruel disappointment. One of the greatest sins which the husband can commit, is that of making a practice of staying out late at night, which, though not reckoned among the usual catalogue of crimes against social life, is one of those most worthy of reprobation. The mental anguish endured by many excellent wives from this infamous practice, no one can picture unless he have witnessed it. There, by the lonely hearth—the fire sunk to a cinder and a mass of ashes—the candle verging to its close in the socket—the dingy silent apartment strewn with the toys and furniture of the children, sent hours since to bed—there, in the midst of this domestic wilderness

sits the drooping, desponding, almost broken-hearted wife, counting the hours, and conning over in her wearied mind the numbers of times she has been so deserted, and foreseeing the still greater misery which awaits her by such a course of profligacy in her husband. And for what, may we ask, has the master of the household thus deserted his home?—the company of hollow friends, idle acquaintances, perhaps drunkards or gamblers, whose witless jocularly forms the temptation to abandon a good name, fortune, worldly respectability, and self-esteem. None but the wife who has endured trials of this nature can properly understand the horrors resulting from such a life of folly and dissipation.

Every reader must be delighted with the beautiful excuse, which, among others, Sir Thomas More makes why he did not publish his Utopia sooner. It shows us how important that great man considered an attentive performance of the minor duties of life to be. "Seeing that almost the whole of the day is devoted to business abroad, and the remainder of my time to domestic duties, there is none left for myself—that is, for my studies. For, on returning home, I have to talk with my wife, prattle with my children, and converse with my servants: all which things I number among the duties of life; since, if a man would not be a stranger in his own house, he must, by every means in his power, strive to render himself agreeable to those companions of his life whom nature has provided, chance thrown in his way, or that he has himself chosen."

The husband must not accustom himself to form resolutions, and, without previously consulting his wife, make a sudden declaration of his purposes, in the same way as he would casually mention to a neighbour a plan, the execution of which he is just on the point of commencing. Even although such resolutions may be come to in a spirit of wisdom, to determine upon any measure without her participation, argues a want of confidence in her affection and judgment, and cannot fail greatly to distress and discourage her. Granting that there are some matters of which the husband is the most competent judge, and that his wife cannot aid or improve his schemes, still she ought to be made acquainted with them, and the reasons for them as far as possible; for it is only proper that the wife should be admitted to the satisfaction of knowing what is expected to produce advantage to her husband. As to what some write, that women are not fit to be entrusted with great affairs, it may have been true in the cases which gave occasion to the remark, where the object involved a course of crooked policy, or where the ear to which the secret was committed was that of a female from whom fidelity was scarcely in any case to be expected. If a man's designs be bad, the best way for success in them is to make the disclosure to nobody—least of all to women; to whom, if they be depraved, how can he trust? and, if they be not thoroughly hardened in wickedness, how much less can he trust to them, seeing that, being of much tenderer consciences than men, they are always more ready to relent. But if he would make his way in the world by fair and honest practices, a husband can have no better counsellor than his wife: her stretch of understanding may not be so masculine as to embrace the subject in all its more important bearings, but, in the lesser details of management, her advice may prove invaluable.

Without a constant and unreserved interchange of sentiments, a constant and perfect cordiality cannot be maintained; and then, indeed, when things are communicated only by fits and starts, and perhaps never more than half explained, leaving an impression that her discretion is distrusted, the wife will be more apt to carry them abroad, to endeavour, by the help of other wits than her own, to penetrate what is concealed, and in the hope of finding, in the sympathy of others, consolation for the want of confidence with which she is treated at home. It is thus that a man becomes by degrees "a stranger in his own house." His domestic behaviour is observed with the same distant caution with which his conduct in public is scrutinised; and as in all likelihood he does not take the same pains to produce a favourable impression, and is not equally on his guard to obviate misinterpretations of what he says and does, he must appear proportionably less amiable; and, as the endearments of domestic life are in consequence withdrawn, the bad effects

of his unsocial humour are at last felt in his own discomfort.

"Those that are curious observers of mankind," says a Christian philosopher, who is not so generally known as might be expected from the excellence of his writings, "love to consider them in the most familiar lights. When men are abroad, they choose to appear (whatever they really are) to the best advantage; but at home, their minds, as well as their persons, are in a perfect undress and dishabille. The world is the great theatre on which they act a part; but, behind the scenes, they may be seen in their proper persons, without any studied appearances. Our domestic behaviour is therefore the main test of our virtue and good nature. In public, we may carry a fair outside; our love may be not without dissimulation, nor our hatred without disguise; but at home, Nature, left to itself, shows its true and genuine face, with an unreserved openness, and all the soul stands forth to view, without any veil thrown over it. There we see men in all the little and minute circumstances of life, which, however they may be overlooked by common observers, yet give a man of discernment a truer opening into a man's real character, than the more glaring and important transactions of it; because, as to these, they are more upon their guard—they act with more of caution and of art than of plain simple nature. In short, our good or ill breeding is chiefly seen abroad, or good or ill nature at home. It were to be wished that we had more family pieces preserved and transmitted down to us. The good public magistrate is of use to few only; but the prudent and affectionate father of a family is of a more general and extensive influence. For my part, I more admire Cornelius, the centurion, for that short sketch of his character, viz. that he was a devout man, and one that feared God, *with all his house*, than if he had been represented as the most victorious general that had enlarged the bounds of the Roman empire; for we learn from it this useful lesson—that the influence of a pious example, like the precious ointment from Aaron's beard, descends downwards from the head of the family, diffuses itself over the main body till it reaches the very skirts—the lowest members of it."

SCOTTISH DUKES.

ATHOLL,

A NOBLEMAN of great estates, and formerly of great feudal influence in the Highlands. The peerage is not ancient in the present family (Murray). Till the reign of Queen Mary, the ancestors of the present duke were only the undistinguished lairds of Tullibardine, an estate in the lower part of Perthshire. The Tullibardine of that day was a zealous reformer, and is noted for having challenged Bothwell to single combat at Carberry, in order to save farther dispute. Bothwell refused, on the plea of his antagonist's inferiority of rank; *tempora mutantur*. He seems to have been drawn into historical and political importance, in some measure, through his sister Annapel, who married the Earl of Mar, afterwards regent, and was the governess of the infant James VI. Sir John Murray of Tullibardine, the nephew of good Countess Annapel, was brought up with James, who, through mere youthful friendship, raised him to the peerage, under the title of Lord Murray of Tullibardine (1604), and afterwards (1606) elevated him to the rank of Earl of Tullibardine. The son of this peer, in 1629, obtained the ancient title of Earl of Atholl, through his wife, Lady Dorothea Stewart, in whose father it had become extinct. He was a zealous royalist, as was his son, the second earl, who, in 1676, was elevated to the rank of marquis. This personage added greatly to the power of his family by marrying Lady Amelia Sophia Stanley, daughter of the royalist Earl of Derby, who, through her mother, Charlotte de la Tremouille, was related to most of the principal families of Europe. Through the Marchioness Amelia, the family acquired the seignory of Man, and large property in that island. Notwithstanding the conspicuous loyalty of the Marquis of Atholl in the two last reigns of the Stuarts, it is said that he would have willingly joined the Prince of Orange, if he could have obtained any preferment under the new government. William, though related to the marchioness, did not receive him warmly, and he accordingly spent the rest of his life in the Jacobite

opposition. His son John, second marquis, was able to render himself more acceptable to King William, by whom he was created a peer in his father's lifetime, and appointed one of the secretaries of state for Scotland. In July 1704, immediately after his father's death, the marquise was exchanged by Queen Anne for the present dukedom. Some unfortunate circumstances afterwards threw him into the opposition, and so zealous was he against the Union, that he put 6000 highland followers into motion to oppose it. His eldest son, styled Earl of Tullibardine, appeared in both of the Scottish rebellions, for which he was forfeited. The second son, however, succeeded to the titles. A still younger brother, Lord George Murray, was Prince Charles's generalissimo in the last of those extraordinary movements. By a rather curious arrangement, the son of this gentleman, though attainted in blood, having married the daughter and heiress of his uncle, was allowed to take up the titles, which he transmitted to his son, the lately deceased duke, whose son now enjoys them.

HUMAN HAIR.

THE human form, when well proportioned, has ever been regarded as a model of the most exquisite symmetry and grace, whether contemplated in the joyous season of infancy, in the years of maturer and sterner manhood, or in the decline of life, when age has enfeebled the limbs, bent the body, and thrown its silver about the brow. No sooner does the mind become animated by any interesting or lofty emotion, than the features of the human countenance become lighted up, and beam with the beauty of expression; and this having been universally acknowledged, philosophers have busied themselves in estimating the forms and proportions of the features, with the view of explaining the secret of their influence. The line of the nose, the elevation or depression of the eye-brow, the contraction or expansion of the cheek, the colour of the eye, the parting smile of the lips—have all been duly estimated; but in addition to the importance attached to their several proportions, we cannot fail to observe here how much more effective and beautiful the expression of the whole countenance and figure is rendered by the addition of the hair. Poets and painters, who generally keep their attention steadily fixed on nature, have not failed to observe this;—hence Spenser, describing the beauty of a bride, speaks of

Her long loose yellow locks, like golden wire;
Sprinkled with pearl;

So, too, Milton, by introducing this feature, gives peculiar effect to his description of our first parents:

His fair large front and eye sublime declared
Absolute rule; and hyacinthine locks,
Clustering, but not beneath his shoulders broad;
She, as a veil, down to the slender waist,
Her unadorned golden tresses wore
Dishevel'd, but in wanton ringlets waved
As the vine curls her tendrils, which implied
Subjection.

By this description, the expression of the whole figure is rendered infinitely more effective than it otherwise could have been; and so likewise Ariosto, by introducing the same feature, gives a character, and, as it were, an additional shade to the grief of Angelica. "She stood on the desert shore stupid and immovable; her hair was loose and disordered; her hands were joined, and, with unmoving lips, she raised her languid eyes to heaven." We likewise find in Sir Walter Scott, that, as the beauty of Rebecca is enhanced by his description of the "profusion of her sable tresses, which, each arranged in its own little spiral of twisted curls, fell down upon as much of a lovely neck and bosom as a sarras of the richest Persian silk, exhibiting flowers in their natural colours, embossed on purple ground, permitted to be visible." So the anguish of the poor Jew in his dungeon cell, surrounded with chains and shackles, is aggravated, and his picture brought more effectively before us, when we read, that in a state of passive resistance, and with his garments collected beneath him to keep his limbs from the wet pavement, "he sat in one corner of his dungeon, where his folded hands, his dishevelled hair and beard, his furred cloak and high cap, seen by the wiry and broken light, would have afforded a study for Rembrandt." Since the hair, whether braided or dishevelled, adds so much to the character of the human figure, we need not wonder that peculiar fashions and customs respecting it have prevailed among all nations. The heathen priestesses, when under the influence of what they conceived inspiration, wore their hair dishevelled; for which reason St Paul forbade the Corinthian women, when at devotion, to wear it in this manner. Hence, in the earlier ages of Christianity, when its divine doctrines were struggling through the darkness, the clergy, both regular and secular, were obliged to have the crown of the head shaved as a signal of self-denial and mortification. The popes, indeed, denounced long hair, and Anselm, the archbishop of Canterbury, pronounced the sentence of excommunication on those who were guilty of so heathenish a fashion. Serlo, a Norman bishop, acquired great honour for a sermon he preached before Henry I., in the year 1104, on this subject, which had such an effect on the king and his courtiers, that they immediately consented to cut away their flowing ringlets. The Jewish and Grecian women generally wore the hair long, and ornamented with gold, silver, and pearls. The Roman women

ressed their hair in the form of a helmet, mixing false hair with it, which they contrived to fasten to the skin. They anointed it with rich perfumes, and, by the aid of curling irons, raised it to a great height by rows or stories of curls. They, too, adorned their hair with gold, pearls, and precious stones, sometimes with crowns or garlands, chaplets of flowers bound with fillets, or ribands of various colours. They used a certain plaster to pull off the small hairs from their cheeks, or plucked them up by the roots with tweezers, called *volvelles*. Among the ancient Gauls, long hair was esteemed an ornament: hence Julius Caesar, having subdued them, made them, in token of submission, cut off their hair. Among the Anglo-Saxons and Danes, young women, before marriage, wore their hair uncovered and untied; but after marriage, they cut it short, tied it up, and wore head-dresses of various fashions. Amongst the Greeks, both sexes, a few days before marriage, cut off and consecrated their hair to some particular deity. It was customary also to hang the hair of the dead on the doors of their houses previous to interment. The ancients imagined that no person could die until a lock of hair had been cut away, an act supposed to be performed by the invisible hand of Isis, and consecrated to the god into whose realms the soul departed.

Having premised this brief account of some of the more remarkable prejudices that have been entertained concerning the human hair, we shall explain its structure, which is very simple, and may be easily understood. Every individual hair may be regarded as a tube, which terminates in a root, or bulb. This root, or bulb, is situated below the skin, and consists of two coverings, an external and an internal. The external exhibits a vast number of bloodvessels, which supply nourishment, and probably secrete the colouring matter of the hair. The internal is a simple membrane within the other. It is hollow, and rises into the tube, which perforates the skin, and appears as the true hair externally. The tube arising from this bulb is filled with a soft matter, called the *medulla*, or *pith*, of the hair, and contains numerous vessels. In passing from the root, or bulb, through the skin, it often raises up small scales of the cuticle, which soon become dry and fall off, as almost every person, in brushing the hair, must have observed. Every hair, therefore, consists of an outer sheath, which embraces the internal substance, or *pith*, in the same way as the finger of a glove covers the finger—the end terminating below the skin in the bulb, or root. This sheath, which we feel in touching the hair, consists of several very fine filaments, which are laid together longitudinally. They are of unequal lengths; and the centre one being the longest, every hair is pointed at the end. Besides this, when laid together, they are found to possess many small eminences; whence, if we draw a hair between our fingers, from the root to the end, it will feel smooth and even; but if we reverse it, and draw it from the point to the root, the hair will feel distinctly rough to the touch. For this reason, cloths made of wool irritate the skin; and wool is so difficult to spin, that these eminences require to be previously overcome by the aid of oil. On this structure of hair, the operation of felting depends, in which the hairs are pressed down in different directions, and become so interwoven as to form a continuous mass. Such is the felt of which hats are made. Curled hairs entwine themselves more closely than those which are straight, though flexible; as they do not, like them, recede from the point of pressure in a straight line. Hence, hatters adopt various methods to produce curl in the short furs of the rabbit, hare, and mole. The colour of the hair is next to be considered. Already we have explained, that the hair, like a tube, contains a pulpy matter, through which vessels are distributed; and the probability is, that, by these bloodvessels, the oily colouring matter of the hair is secreted. The human hair is generally either black, brown, auburn, yellow, flaxen, or red; in addition to which, there is a white variety, which characterises the race of people known as Albinos. Black hair prevails most in the northern regions of Europe and Asia; but the fact is, that the brown, auburn, yellow, and red varieties, so often seem to arise out of the black, that neither can be sufficiently well localised. The Jews, like the Arabs, are generally a black-haired race; but are often seen with light hair and beards, and blue eyes. In some towns in Germany, red beards are considered characteristic of Jews. Among the ancient Egyptians, the red variety seems to have existed; but light brown hair has been found in Egyptian mummies. Black hair was by the Hebrews regarded as an emblem of beauty and vigour, and white has often been termed the "colour of defect," the reason of which is allied to the cause of that appearance. Already we understand that the colouring matter of the hair is secreted by the bloodvessels; and it is evident, therefore, that when this secretion is interrupted, it will cease to be deposited. Hence its absence is generally a sign of debility. Horses with white feet are thought to be tender, and more susceptible of disease, than those of a more uniform dark colour. The hoariness of age is likewise, from this want of secretion, connected with a defect of vigour. When the mind is agitated by any violent emotion, these vessels often suspend their functions, and the hair becomes very quickly grey. This happened to the unfortunate Marie Antoinette, the queen of France. "I was struck," says Madame de Campan, her attendant, "with the astonishing change

misfortune had wrought upon her features. Her whole head of hair had turned almost white; during her transit from Varennes to Paris." It also occurred to the unhappy Queen Mary. Her historian, describing her execution, says, "With calm but undaunted fortitude she laid her neck upon the block; and while one executioner held her hands, the other, at the second stroke, cut off her head, which, falling out of its attire, discovered her hair, already grown quite grey with cares and sorrows." Lord Byron, aware of this circumstance, makes Manfred exclaim, in the bitterness of his agony and remorse—

To be thus
Grey-haired with anguish, like these blasted pines,
Weeks of a single winter.

Every person, too, will remember the beautiful opening lines to the *Prisoner of Chillon*. When the bloodvessels which supply nutriment to the bulb of the hair, cease to do so, the hair necessarily falls off, which generally happens during the period of weakness succeeding to a protracted illness, and not unfrequently from some local cause. Sometimes it falls off irregularly and indiscriminately, producing a general thinness of hair; sometimes it falls off in patches from parts of the skin, and sometimes the disease is universal, and not a hair remains on any part of the body. The Chevalier d'Eperney, after assiduous application for the space of four months, without any previous illness, lost his beard, eyebrows, eyelashes, and all the hair of his head and body. Lavater relates the case of a person, who, after a violent mental commotion, became blind in the right eye; and the hair of that side of the body lost its colour, and fell from the eyebrows, eyelashes, and head. The Romans estimated slaves at a low price from whom the hair came easily away; and baldness was reckoned such a deformity among them, that of all the honours decreed to Caesar, none was more acceptable than that which was allowed him by the senate, of always wearing a laurel crown, which concealed this defect.

Some kinds of diet are said to produce baldness; hence it is reported to be more frequent in those islands where the inhabitants live much on fish. In the Shetland islands, so common was baldness formerly, that it was a familiar saying, that "there was not a hair between them and heaven." Tournefort relates also, that, in the island of Mycene, "the children are bald, or seldom arrive at the age of twenty without becoming so;" and although difficult to assign a reason for it, baldness is more common in Brighton than in many towns. The esteem in which a fine head of hair is held by the fortunate possessor, in this country at present, is not a whit less than it was formerly among the Anglo-Saxons; in illustration of which we may remark, that Dr Reid of London, a few summers ago, was attending a lady afflicted with typhus fever. She was yet sensible, when he informed her that he had no resource left excepting that of ordering her head to be shaved; whereupon she immediately replied, that to that she would never consent; she felt resigned, and would "leave it to Providence." Such being the case, our fair readers will certainly not excuse us from briefly stating the remedies devised by medical men to prevent the hair growing thin, or falling away. As this happens from a defect of the action of the vessels about the bulb of the hair, the object is in such cases to restore their action. This is done by stimulating them either by the application of volatile oils, camphor, turpentine, and resins, or by astringent solutions of alum, earth, or green vitriol; or by friction, no matter whether with the fat of the mole, snail, hedgehog, or bear. But sometimes, instead of from a want of action, the hair falls away from a preternatural action of the vessels, or an inflammation about the roots of the hair, in which case local depletions, leeches, purgatives, and low diet, must be had recourse to. The diseases to which the skin of the head is liable, are so numerous, that all persons should guard against them by the strictest cleanliness. The Poles, who are accustomed to wear the hair very long, are, from want of cleanliness, subject to a dreadful disease, known by the name of the Polish plait, or *Plica polonica*. It prevails principally among the lower classes, in whom the hair becomes matted together so that it is impossible to comb it out, and bleeds when it is cut. The hair, too, sometimes, though very rarely, becomes painfully sensitive. Baron Larrey attests a case which occurred in the hospital of the Royal Guards, at Paris. A private soldier, having received a violent kick on the back of the head from a horse, was afflicted with extreme cerebral excitement, and the sensibility acquired by the hairs was so great, that they could not be touched without aggravating considerably his sufferings. Hair is found on all parts of the body; and instances are recorded of its having occurred in places where it could never have been anticipated. Lusitani mentions a person who had hair upon his tongue. Pliny and Valerius Maximus concur, that the heart of Aristomenes was hairy. Schulterus, that hair is often found in the blood of those affected with Polish plait. It has been found in abscesses between the muscles, and most frequently in the breasts of women. Hair does not readily undergo decomposition; so that it will be found little altered in a corpse long after interment. When the coffin of Charles I. was opened, which was done in the year 1813, Sir Henry Hallford informs us that "the hair was thick at the back part of the head, and, in appearance, nearly black. A portion of it, which has been some time cleaned and dried, is of a beautiful brown colour. That of the beard was

a redder brown. On the back part of the head it was more than an inch in length, and had probably been cut so short for the convenience of the executioner, or perhaps by the piety of friends soon after death, in order to furnish memorials of the unhappy king."

In life, assuredly, the kindest thoughts and feelings are associated often with the hair; nor could Selim, addressing his beloved bride of Abydos, say any thing more affectionate than—

I would not wrong the tenderest hair
That clusters round thy forehead fair,
For all the treasures buried far,
Within the caves of Istar.

As a ringlet of hair has already been regarded as the most appropriate symbol of love, so, assuredly, no relic can be preserved after death, more touching to the affections. Every association connected with it must breathe of pure and holy affection. It is laid upon the bosom, to be there cherished as the last and the only remains on earth, of the being whom, perhaps, we most adore. How many of such memorials are worn in secret, and call forth heavy sighs, when there is none to overhear!

THE FAITHFUL WIFE.—A TALE.

In the Atlantic Ocean, near the eastern coast of New Hampshire, is situated a cluster of islands, called the Isles of Shoals. In the autumn of 1780, a small sloop was seen approaching one of these islands. It would have been a hazardous navigation for an unskilful seaman, for the rocks rose high, projecting far into the sea, and presented a thousand angles on every side. Yet the sloop moved majestically along, now riding on the billows, and now enveloped in their folds, and at every turn showing its white sail over the rocks. At length it moved round the point, and entered a little sandy cove, where a rude wharf had been constructed. Just on the edge of the beach were scattered a few miserable looking huts; some of them seemed but little more than a pile of stones, and lay half buried beneath the ridges of sand, which the winds and waves were continually throwing up. Behind this settlement, if it deserved the name, extended rows of dismal-looking fish-flakes, giving a still more barren appearance to the prospect, and tainting the air with their effluvia. It was towards night when the sloop anchored at the wharf. It was so uncommon for any but their own little fishing-boats to make for the cove, that an unusual excitement prevailed among the inhabitants. Men with torn red baize jackets and checked shirts, women with tattered petticoats and slipshod shoes, and barefooted children with scarcely any clothing, collected in a group, to discover the cause of this unusual visit. After waiting some time without being able to make any discoveries, one or two of the men approached the sloop, with the intention of boarding her. A man immediately made his appearance on deck; his look was fierce and commanding, and he wore pistols in a leathern belt, that was buckled round his short jacket. He stood in an attitude of defiance, and asked the men what they wanted. "We did not know," replied they, in a surly tone, "but you might be after a cargo of fish." He made no other answer than by lengthening the rope which fastened the sloop to the wharf, and it floated to a distance that precluded any attempt to come on board. There was a marked contempt in this action, that roused the indignation of the spectators. "Cheer him, my boys," said one of the men; and the little urchins threw up their tattered hats and red caps, and buzzed and shouted; and even the fair sex, to their shame be it spoken, joined in the chorus, which, it must be confessed, had nothing of the female cadence but its shrillness. After a few coarse jests and additional shouts, the attack ceased, from want of opposition, and the miniature mob dispersed. Though the vessel remained at the wharf several days, no new curiosity was excited. It had been a passing impulse, and was not supplied by that fuel which imagination successfully employs. There seemed to be but three occupants of the sloop; two, who were evidently subordinate, and one man in the vigour of life, and evidently used to command.

In all degrees and classes of life, nature selects her favourite; even on this desolate spot, there was one building, that apparently promised better for its inhabitants than any of the others. The stones that composed the walls of the house were well fitted and arranged, and a tolerably neat wood pile promised comfort for the approaching winter. It was at the door of this house, late one night, that a violent knocking was heard. The owner of it, John Boland, arose and opened it.

"What do you want?" said he; "can't you settle your own quarrels, without coming to disturb quiet, well-behaved people?"

"For God's sake, come to our assistance," said the man; "don't stop to ask questions, or it will be too late."

The voice of distress cannot be mistaken. John hurried on his clothes, and, accompanied by his wife and daughter, a girl of about fifteen (for the females of the Shoals did not dread the night air), they all followed the stranger; the women often stopping to recover a shoe they had dropped in the sand. When they reached the sloop, their entrance was no longer opposed; they made their way to the miserable hole dignified by the name of cabin. In a narrow berth, lay a young and delicate woman, apparently dying. The

man, who had before resisted any intrusion, hung over her with a fixed and anxious countenance.

"We can do no good to her," said John; "she is dying."

"What do you mean by that, John Boland?" said his wife, coming forward; "if she is dying, it is for want of air; if she had as many lives as a cat, it is enough to stifle her here. Let us take her to our house."

No one made any opposition, and the lady was wrapt in her bed clothes, and conveyed to her new residence. Both Mrs Boland and her daughter Susan fully justified Ledyard's testimony to the humanity of woman, for though they had none of that peculiar gentleness which belongs to the sex, they were active in kind services.

In a short time the lady began to revive, but she was too feeble for utterance, though her eyes followed with intense anxiety every movement of her companion, who left the vessel and remained with her. He announced himself by the name of Maitland. There was no one on the spot capable of observing the nice gradations of feeling which either of the parties might have discovered; but as the lady grew better, she had long private conversations with the gentleman, and frequently an agitation, which increased her disorder, was the consequence. At length he informed Mr and Mrs Boland that it was absolutely necessary for him to pursue his voyage—that he had only put in at the island on account of the indisposition of his wife—that she was still quite unable to go on board—and that there was no alternative but to leave her under their care for a month. They willingly consented. Every article that might conduce to her comfort was brought from the sloop, and the mariners once more set sail. Whatever had been the struggles of Maitland and his wife (whom he called Adela) at parting, and whatever was the grief she might feel, it was expressed to no one; nobody had witnessed their interviews, nor was it apparent that she had objected to his leaving her; yet it seemed as if an increase of sorrow weighed down her spirits after his departure. It might be, that the solitude in which she found herself, and the perfect uncongeniality of every thing around her, were more than her mind could support. The sea air, however, and the regularity of her mode of life, promoted her recovery, and she every day gained health. She soon became able to walk out, and found Susan not an unpleasant companion, who could scale the highest rocks, and assisted Adela to walk with more security. For the first three weeks the lady appeared tranquil, but when the fourth arrived, it was evident her mind was suffering under the greatest anxiety. She repeatedly questioned John, "Did he tell you it might be a month?" But even the month expired, and he did not arrive. She thought of the delays of a sea voyage, of possible detentions, and she reasoned herself into a momentary tranquillity; but this could not last. Frequently, when the moon shone bright, and the people of the house believed her asleep, she seated herself at the window that looked on the little cove, and gazed on the ocean. In the indistinctness of the moonlight prospect, sometimes she imagined she beheld figures at a distance; and then by their fixture discovered them to be merely projecting angles of the rocks. Then, again, a white sail appeared to be approaching the shore; but, alas! it came no nearer. Often morning dawned upon her sleepless eyes, and with the light of day came new hopes. "He will certainly be here before night," thought she; and in this hope would quit the house while all were still, and wander by the sea, and among the rocks. The scene was often a glorious one; the sun, just rising above the horizon, cast his broad red beam upon the ocean, which sparkled with a thousand colours. But such scenes brought no peace to her heart. "What am I," she would exclaim, "in this vast universe? Who cares for me, or will take thought of me? I might plunge into the ocean, and pass away unnoticed and forgotten like the sea-weed."

It would be wearisome to trace the emotions of this desolate being, as, hour after hour, and week after week, she gazed upon the ocean. Though many a sail rode proudly by, and sometimes, in tacking and veering, appeared making for the island, yet the beating of her heart was succeeded by the sickness of disappointment, for the keel rapidly cut the waters, and was soon lost in distance.

In this agitating and exhausting state of mind, November passed away, and December came on with all the rigours of winter. There is no desolation like that of the affections; it palsies youth and destroys hope. He who can lay his finger on one spot in the globe, and say, it is mine, has still something to love, to cling to; for there may cluster the sympathies of nature and the "endearing charities of life." But Adela felt that she had no such stronghold; and it was in vain that her kind though ignorant companions often tried to cheer her by pleasant anticipations.

It was after many gloomy weeks, that, with the view of amusing her, John one day called to her to come out to the point, and see a ship that was coming on in full sail. There is an exhilaration in the bright sun and the blue sky of a frosty morning. Adela felt it, as she stood and gazed at the swelling sails and the rapid movement of the vessel, as her keel divided the waters. All was brilliant and sparkling; the waves seemed rejoicing, like living beings, as they dashed against its sides. As she gazed upon the ship, mov-

ing proudly and majestically along, with its tall masts and snowy sails marking the swiftness of its progress, to her it appeared like a creature of life and happiness, exulting in its glory—the ocean, the wild and tumultuous ocean, ministering to its will, and the winds and waves subservient to its power. She gazed after it, as it proudly continued to divide the waters of the Atlantic, till it seemed like a speck upon the horizon. She was awakened from her reverie by the chillness of her feelings, and a sudden change in the atmosphere. The sky became darkened, the sea birds wheeled to and fro, and seemed uncertain which way to steer their course; before she reached the house, flakes of snow fell at intervals, and all betokened one of those sudden storms to which our climate is subject. John gave it as his opinion that the fine morning was a "weather breeder." The storm increased rapidly, the waves burst their natural limits, and rose high upon the island. The wind drove tempests of sleet and hail before it, and howled and shrieked in its fury. Adela thought of the noble vessel, and remembered how omnipotent she had believed it a few hours before; and she said to herself, "God help them, for no human being can!"

Night came on with tremendous darkness, and now, at intervals, they plainly distinguished minute guns. The men collected with torches of pitch and tar, and distributed themselves on the rocks; and the women, unrestrained by form, and guided only by their own impulses, were not less active. They supposed the vessel was dismasted and driven about by the fury of the elements, as the sound of the guns often changed its direction. It approached nearer and nearer. "It will be certain death," said one of the men, "if they can't keep off from the eastern breakers." At that moment it was evident the vessel had struck. Shrieks were heard mingling with the gale, and the crash was even louder than the billows. One hope remained, that the men had cut the boat from the stern, and their lives might yet be saved. This was the case; they had succeeded in getting into the boat, and, in the darkness and tempest, had reached a ledge of rocks connected with the island; but their situation was still desperate; heavy seas broke over it, and there seemed but a short respite from death. One after another were swept into the ocean from which they had just escaped, yet a few still clung to the ledge; but the rocks rose perpendicular above it, and presented no possibility of retreat. The people above discerned by their torches the situation of these unfortunate men. It was a long while before they could afford them any assistance; but by lowering torches and shouting, they at length made them comprehend that their situation was known; and finally succeeded in throwing ropes, which the men fastened round them. Of the fifteen who had taken to the boat, three were saved!

It proved to be the same ship that had passed in the morning with a fair wind; but a sudden squall came up, and in a short time increased to a hurricane, with constant rain and hail; she was driven back with fury, and at night had lost so much of her rigging as to be totally unmanageable, and had struck upon the breakers.

Such was the melancholy account given by the three men whose lives had been so wonderfully preserved; two of them belonged to the crew, and one was a passenger. Adela learned from inquiry, that this last was a man rather advanced in life, and unused to struggle with hardship.

Some days elapsed before the shipwrecked passenger was able to walk abroad. He had been sheltered in one of the miserable fishing huts, and Adela had kindly contributed from her superior stock of comforts to his wants.

He learnt from the inhabitants the little they knew of the lady, yet it seemed sufficient to rouse all his interest, and as soon as he was able, he requested to see her. She would gladly have excused herself, but there was no evading the request. The moment the stranger entered the room, she gave a loud shriek, and covered her face—it was her uncle! he who had supplied the place of a father, who had adopted her while she was almost an infant, and watched over her with unceasing tenderness. Her parents had left her to his protection, and, in the affection and caresses of the little girl, he had felt none of the weary void of a single life. Adela was petted, and introduced into company while she was yet a child; and the domestic, and even visitors, soon discovered that the way to the uncle's heart was through the child's favour. At the head of his table, she felt fully adequate to the direction of her own conduct, and for many years she apparently justified his confidence. She was frank, amiable, and affectionate. The fortune that she inherited from her parents was small, but by judicious management had been nearly doubled; but this was of little account; for Mr Leslie, her uncle, was wealthy, and no one doubted that Adela would be his heir. Probably this circumstance might have attracted some of her lovers. The young lady, however, showed no disposition to encourage any of them; and sometimes when her satisfied uncle pleasantly said, "Why, Adela, I believe you are going to be an old maid," she would reply, "To be sure I am, uncle; for who is so fit a companion for an old bachelor?"

It was at this crisis that a young man, who was a native of Great Britain, but who had passed the greater part of his life in the East Indies, arrived at the city. He brought letters from respectable mer-

cantile houses, which established his claims upon fashionable society. He became a frequent visitor at Mr Leslie's, and every one but the uncle perceived his object, and the probability of his success. It was not till it was too late to recall them, that he discovered that Adela's affections were engaged. It was a heavy blow to his hopes and plans; but still more so, when he learned that the young man was dissipated in his habits, and justly suspected of a fondness for play. It was in vain that he now represented to Adela the suspicions that rested on his character; with the favourite motto of inexperienced, headstrong young ladies in her mouth, that "she had rather be miserable with him, than without him," she adopted the resolution of marrying him. Mr Leslie found it was too late to impose restraint, where discipline had never been exerted. As a last effort of kindness, he advised her to secure the principal of her own little fortune to herself. But Adela spurned the idea of such selfish, calculating prudence, and answered him with another celebrated quotation, as judicious as the former, "that where she could trust herself, she could trust her fortune." Unwillingly he resigned it into her hands, and they parted. Adela shed tears at what she called the hard-heartedness and unkindness of her uncle; and became the wife of Maitland in the full zeal of confiding affection. For a few weeks she was convinced that she was the most fortunate of women, and "the world well lost." It was not long, however, before Adela was doomed to recollect the warnings she had received, and the reports she had heard; in the late hours of her husband, his bloodshot eyes, and his petulance, she saw a conscience ill at ease. One evening he returned home in apparent agitation, and told her that he had had an unfortunate dispute with a young man—they had fought, and he had wounded his antagonist; that it was necessary for him to escape, or he should be immediately arrested; that a vessel was waiting at the wharf, which was bound for Halifax, where he should be safe, and might remain concealed till the danger or excitement was over. Adela calmly acquiesced, but told him it was her fixed purpose to accompany him. It was in vain that he opposed her determination; she could not brook opposition, for she had been unused to it. "I have given up all for your sake," she said, "and if I give up you, nothing remains to me!" Maitland in his turn was obliged to submit. It was a dreary prospect, and a voyage of hardship, for a young lady accustomed to every luxury; but she bore it without complaining, till sea-sickness, and the want of proper accommodation, had reduced her almost to death. It was then that they put in at one of the Shoal Islands. When he found her unable to proceed, he alarmed her with fears for his own safety. "It is only now that there is danger," said he; "when the circumstances are known, I shall be permitted to return without fear of arrest." Adela became eager for his departure; and he quitted her in the full assurance that he would return in a few weeks.

It was now that Mr Leslie informed her that the story of the duel was a fabrication; that, after losing her little fortune at play, Maitland had forged a cheque in his name, to a large amount, on one of the principal banks, withdrawn the money, and absconded with it; that his own object in this voyage had been to follow and arrest him; that he knew from authentic sources that he was still at Halifax, and, though he did not appear during the day, was every night at the gaming table. "Providence," he continued, "has restored you to me in a manner that marks out to us both our proper course. You shall return with me; we will forget all that has passed; and I will receive you again as my child, on condition that you give up Maitland." The tears of Adela were her only reply; at length she said, "And if I reject this offer, what are the consequences?" "Adela," replied he, "I feel no spirit of revenge: I was following Maitland to arrest him, in the hope of opening your eyes, and redeeming you. I will, for your sake, withdraw my prosecution, and leave him in possession of the sum he has fraudulently obtained. If you return with me, not a reproach shall ever meet your ear; you shall be, as you once were, my comfort and my solace, and we will only feel that disappointment has more closely united us. If you still cling to your husband, my offer of kindness shall not be by halves; I will see that you are properly conveyed to him at Halifax. But I warn you, that he has been long a notorious gambler; since your marriage he has thrown off the mask; he has now been guilty of a crime that would condemn him to a prison for life: do not suppose this will be his last; his habits lead to death. I give you till to-morrow, to weigh the subject and determine."

When Adela was left alone, she endeavoured to think and reason, but her mind was too much agitated to do either. When her uncle came in the morning, she threw herself upon his neck, as she was wont to do in happier days; he pressed her closely to his heart. "Have you decided, Adela?" said he. "I have," she replied, in a low voice; "all you say is true, but he is my husband!" The uncle loosened his hold, and turned mournfully away. In one hour from that time, he was borne in a little fishing-boat far beyond her sight. Two days after, a vessel, with a comfortable cabin and good accommodations, anchored at the little wharf, the captain of which sent notice to Mrs Maitland that he was to convey her to Halifax. She took an affectionate leave of John and

his family, and liberally rewarded their kindness. Mr Leslie returned to the south; he spoke not of his niece, and no one presumed to mention her name in his presence; years passed by, and her memory seemed to have vanished from the face of the earth.

In the year 1790, a gentleman was visiting one of our state prisons; an interesting woman caught his attention as she passed into one of the cells. "Is it possible," said he, "that woman can be a convict?" "O no, sir," replied the keeper, "she is willing to remain here as an assistant, for the sake of attending her husband, who was sentenced here for life for forgery, but will soon be released by death." The gentleman's curiosity was awakened; he requested to be admitted to the cell. The wife supported the head of the husband, and administered to his wants. As the gentleman gazed upon her, his heart became softened; the recollection of former times returned, and he said, in an impressive tone, "Adela!" She looked up, recognised her uncle, and fainted. When she recovered, he said, "O my child, go home with me!" She looked steadfastly at him, and replied, in the same tone in which she had spoken ten years before, "*He is my husband.*" Every alleviation that money could procure was supplied to the dying man; and when he had breathed his last, Mr Leslie took Adela home. But she came not alone; she brought with her a little boy named Leslie, and a second Adela. To these children she never spoke of their father; but she strove to instil into their minds principles of religion and virtue. The old age of Mr Leslie was cheered by gratitude and affection.*

THE PROPER SITTING POSTURE FOR FEMALES.

THIS question has been disputed; one party insisting that girls should always sit erect, while others are advocates for a lounging position. It is not difficult to show that both are wrong. When a delicately formed girl is supposed to be sitting erect, she is generally sitting crooked; to a superficial observer she may appear quite straight; but any one who will sit on a music stool, and endeavour to keep his body in a perpendicular line for ten minutes, will be convinced that it is difficult for even a strong man to sit as long as a delicate girl is expected to do, without allowing the spine to sink to one side or to fall forwards.

The attempt to sit erect beyond a certain time is injurious; for although bending the spine occasionally is useful rather than hurtful, yet when it is done involuntarily, and when the bend is attempted to be concealed by an endeavour to keep the head straight, there is danger of the spine becoming twisted. Indeed, a double curve is generally the consequence; there is first a bend to one side, to give ease to the fatigued muscles; and then, to conceal this, there is a second curve that is necessarily accompanied by a slight twist in the vertical line of the whole column.

The proposal to allow children to sit in a crooked or lounging position, seems to have been founded on the idea that all the muscles are more relaxed in this way than even when the child lies at full length on its back. This notion is certainly incorrect, and such a mode of sitting is injurious; for even were the muscles more relaxed by it, the bones and ligaments acquire such a shape as necessarily produces distortion.

It may naturally be asked how a girl should sit, since it would appear, that, whether she is in an erect or stooping position, she is equally in danger of becoming crooked. As sitting, in the manner generally recommended, affords little or no support to one who is weak, the safest answer would be, that a delicate girl should not sit for even more than five or ten minutes without having some support to her back, and when she is fatigued, that she should lie down or recline on a couch. But as it would be very annoying to a girl not to be allowed to sit up except for so short a time, and as a couch is not always at hand, we must endeavour to show how a delicate girl may remain in an upright posture for a reasonable time, without incurring any risk of becoming crooked. This leads to an inquiry into the merits of the chairs which are at present generally used by children.

Young ladies are often obliged, while at their music lessons, to sit upon those chairs which have high backs, long legs, and small seats. These chairs are said to have been invented by a very eminent surgeon, and are intended, either to prevent distortion, by some supposed operation on the spine, or as the most effectual means of supporting the body. It is difficult to imagine how a chair of this description can effect the first purpose; and to discover how far it is calculated for the second, the reader should make the experiment on a chair of the same proportion to his figure, as the chair in question is to that of a little girl. He will find that if the seat or surface on which he rests is small in proportion to his body, the chest will, after a time, either fall forward or on one side, unless he exert himself to a degree that is very fatiguing. Indeed, if the seat be at the same time so high that the feet do not rest fairly on the ground, but dangle under the chair, a forward position of the head is almost necessary to preserve the balance of the figure.†

* From "Stories of American Life," edited by Mary Russell Mitford.

† It must be also unnecessary to remind the reader, that, if the knees are bent in standing or walking, there is a curve in the spine at the same time.

The objection to such chairs has been met with the assertion that girls feel remarkably comfortable in them. This is no argument in favour of their use; for it is not uncommon for a girl who has seven or eight pounds of iron strapped upon her body, and next to her skin, to say the machine annoys her so little, that she does not care how long she wears it.

But whether this chair is agreeable or not, it is easy to show that it is not calculated to give much proper support to the body, and that it is almost impossible for a delicate girl to sit long in a natural or easy position upon it.

It may be allowed that the chair which we consider the most comfortable, that is, the chair which affords the most support to the body, should, if made in proper proportions, be the best for a delicate girl. In such a chair, the seat should be scarcely higher than the knees (thus permitting the whole of the foot to rest upon the floor), and of such a size, that, on sitting back, the upper part of the calves nearly touch it. This form of seat is very different from that of the chair alluded to, the back of which is also equally objectionable, for, instead of being in some degree shaped to the natural curves of the spine, it is made nearly straight, and projects so as to push the head forwards. A delicate girl should always sit so as to rest against the back of the chair; and if the lower part of her spine is weak, a small cushion will afford great relief. As it is quite a mistake to suppose that the shoulders, if raised in any other way than by the action of the muscles, or by the curvature of the spine and ribs, will continue high, there is no real objection to a girl who is delicate being supported by an arm-chair; for occasionally resting on the elbows, a considerable weight is taken off from that part of the spine which is the most likely to yield.

These observations refer only to the manner in which delicate girls, whose spines are still straight, should sit; when the spine is actually distorted, it will be necessary to use other means.—*Quarterly Journal of Science, Literature, and Arts*, 1827.

CUSTOMER-WARK.

In former times it was the custom all over Scotland for the housewife, assisted by her servants, and, in the case of a laird, by the wives and daughters of the tenantry, to spin as much woollen and linen yarn as sufficed to furnish clothes for her family, and nappery for bed and board; a weaver being alone employed, besides, to put her handwork into proper shape. Not long ago, a humble street in Edinburgh, called the Netherbow, was full of weavers of this kind, and as a proof of the extent to which the system was carried two hundred years ago, even in the capital, we may mention that, when the Scottish Covenanters were about to invade England in 1640, the pious "wives" of Edinburgh supplied them at a day's notice with a sufficient quantity of *harden* (a species of linen cloth), to furnish the whole army, amounting to twenty thousand men, with tents. In the present improved state of Scotland, the division of labour system has in a great measure banished both the "big" and the "little" wheel; and, accordingly, there are not nearly so many weavers employed throughout the country, as used to be, in preparing the cloth. Still, however, where such an individual is found, he is generally a more comfortable person than the muslin or cotton weaver, who, in his labour, has to compete against the enormous odds of machinery, and is therefore perpetually the most patient and industrious man in the empire. Unfortunately, there are now very few *customer weavers*, as they are called, who can obtain full employment, and therefore their existence is generally found to be one of comfort, chequered with intervals of penury.

In the year 1824, one of the editors of the *Journal* happened to enter the cottage of a customer weaver in the vale of Ettrick, and had the curiosity to make him acquainted with all the poor man's domestic and operative system, as well as his feelings respecting various external things. According to his own account of his affairs, he "daikered on here in a very sma' way." In one end of his cottage was his loom, half embedded in the damp black earth; while in the other end, separated by two wooden beds, was his domestic establishment, consisting kitchen, parlour, and hall, into about ten feet square. He was engaged on a piece of coarse woollen cloth, the property of a customer; and by that, he said, he could make eighteenpence a day. When customer work failed, he was fain to work a piece upon speculation, by which he realised no immediate profit; and it was, therefore, only while the eighteenpence a day lasted that he enjoyed any kind of comfort. On being asked if he had not better employ himself regularly for Glasgow, he declared all the work that came from all that city—jacketnets, blunks, gingham, and cambrics—to be stale, flat, and unprofitable, compared with "customer work." It was evident, from his conversation, that "customer work" was the only earthly thing that the weaver was interested in. Customer work was not only superior to every other kind of work, but it was a more blessed and excellent thing than any other he knew of in this world. He then gave a strong character to his conversation, for the phrase was generally introduced three or four times into, and formed the termination of, every sentence. When he paused for breath, he re-commenced with "customer work"; and this ludicrous phrase accented every cadence. It was the alpha and omega of his mind.

The observations made at this time upon the habits and feelings of the poor weaver, being afterwards detailed to another of the editors of this paper, were by him thrown into a poem in the Scottish dialect, which was published, as a kind of episode, in a volume entitled "Illustrations of the Author of Waverley, being Notices and Anecdotes of real Characters, Scenes, and Incidents, supposed to be described in his works." As a picture of a certain condition of human life, it is here re-produced, with some amendments.]

In Ettrick's old vale, where the heather grows green,
Wi' aye here and there a bit plantin' between,
There lives an auld wabster, within an auld shiel,
As lang, and unchancy, and black as the deil.
He works e'en and morn for his wife and his weans,
Till the very flesh seems to be wrought frae his banes;
Yet canty's the wabster, and blyth as a lark,
Whene'er he gets what he ca's customer-wark!

This customer-wark's the delight o' his soul,
Whether blanket, or sheetin, or sarkin, or towel.
Nae trashtirrie o' cottons frae Glasgow he cares for—
Their trippence the ell is a very good wherefore;
But God bless the wives, wi' their wheels and their thrift,
That help the puir wabster to fend and mak shift;
Himsel, and his wife, and his weans might been stark,
An it hadna been them and their customer-wark.

The wabster's auld house, it's an uco like den,
Though, atweel, like its neebors, it has a ben-en;
It's roof's just a hotter o' divots and thack,
Wi' a chimley dress'd up maist as big's a wheat-stack.

There's a peat-ruck behind, and a midden before,
And a jaw-hole would tak a mile-race to jump o'er !
Ye may think him neglectfu' and lazy—but, hark,
He's better employed on his customer-wark !

What'er ye may think him—the wabster's auld but
Has twa looms i' the ben, and twa beds i' the but,
A table, twa creepies, three chayres, and a kist,
And a settle to rest on whene'er that ye list ;
The ben has a winnock, the but has a bole,
Where the bairns' parritch-luggies are set out to cool,
In providin' o' whilk he has mony a day's dark,
O' sixteen lang hours, at the customer-wark !

The wabster's auld madam—her name it is Bell—
Lang, ill-faured, and black, like the wabster himsel—
She does naught the hail day but keeps skelpin' the bairns,
And hauds three or four o' them tight at the pins.
Her tongue is as gleg and as sharp as a shuttle,
Whilk seldom but gies her the best o' the battle ;
And sometimes her neive lends the wabster a yerik,
That he likesna sae weel as his customer-wark !

The black cutty-pipe that lies by the fire-side,
Weel kens it the day when a wab has been paid,
For then wi' tobacco it's filled to the ee,
And the wabster sits happy as happy can be ;
For hours at a time it's ne'er out o' his cheek,
Till maist feck o' his winnings hae vanished in reek :
He says that o' life he could ne'er keep the spark,
An it werena the pipe and the customer-wark !

Then the wife, that's as fond o' her pleasure as he,
Brings out a black tea-pot and masks a drap tea ;
And they sit, and they soss, and they haud a cabal,
And ye'd think that their slairistie wad never divaul.
By their wee spunk o' ingle they keep up the bother,
Each jeerin', misca'in', and scaldin' the tother ;
While the bairns sit out by, wi' could kale, i' the dark—
Nae gude comes to them o' the customer-wark !

When the siller grows scarce, and the spleuchan gets
toom,

The wabster gangs back to his treddles and loom,
Where he jows the day lang on some wab o' his ain,
That'll bring in nae cash for a twalmouth or twain ;
Then the pipe is exhaustit and laid on the sill,
Though the fumes o' its sweetness will hang round it still,
And the tea-pot maun lie like a yaud in a park,
Till Heaven shall neist send some customer-wark !

Then the puir starvin' wabster grows thinner and thinner,
On a 'tatoe for breakfast, a 'tatoe for dinner,
And vanishes veseibly, day after day,
Just like the auld moon when she eelies away.
Clean purged out he looks, like a worm among fog,
And his face like a clatch o' auld weens in a cogue.
At last, when grown hungry and gaunt as a shark,
He revives wi' a mouthfu' o' customer-wark !

A branksome gudewife, frae the neist farmer toon,
Comes in wi' a bundle, and clanks hersel down,
" How's a' wi' ye the day, Bell ? Ha' ye ought i' the pipe ?
Come, rax me a stapper ; the cutty I'll rype !
I maun see the gudeman—bring him ben, hinney Jess !
Tut ! the pipe's fu' o' naithing but fusionless aze !"
The wife ne'er lets on that she hears the remark,
But cries, " Jess ! do ye hear, deme ?—It's customer-
wark !"

Having gotten her lick i' the lug, Jess gangs ben,
And tells her toom father about the God-sen ;
Transported, he through the shop-door pops his head,
Like a ghaist glowrin' out frae the gates o' the dead.
Then, wi' a great fraise he salutes the gudewife,
Says he ne'er saw her lookin' sae weel i' his life,
Spiers for the gudeman and the bairns at Glendeark,
While his thoughts a' the time are on customer-wark !

Then, wi' the gudewife, he claps down on the floor,
And they turn and they count the hale yarn o'er and o'er :
He rooses her spinning, but canyells like daft
Bout the length o' her warp and the scrimp o' her waft.
At last it's a' settled, and promised beeden
To be ready on Friday or Fairsday at e'en ;
And the bairns they rin out, wi' a great skilin' bark,
To tell that their dad's got some customer-wark !

Then it's pleasant to see, by the vera neist cut
How the wabster thowes out to his natural book,
How he freshens a thought on his diet o' brose,
And a wee tait o' colour comes back to his nose !
The cutty's new mountit, and every thing's snug,
And Bell's tongue disna sing half sae loud i' his lug ;
Abstracted, and happy, and jum as a Turk,
He sits thinking on nothing but customer-wark !

Oh, customer-wark ! thou sublime moving spring !
It's you gars the heart o' the wabster to sing !
An' twerna for you, how puir were his cheer,
Ae meltith a-day, and twa blasts i' the year !
It's you that provides him the bit, brat, and beet,
And maks the twa ends o' the year sweetly meet,
That pits meat in his barrel and meal in his ark—
My blessings gang wi' ye, dear customer-wark !

POETRY OF THE HEBREWS.—The character of every nation is perhaps best indicated by the nature of its poetry. The national characters of the French and English people are not more dissimilar than is that of their poetry ; in the wild and energetic productions of the German muse, the German character is reflected as from a mirror. The Jewish people have left to us, in the Bible, a body of song characteristic of themselves, and worthy of that sublime Theocracy which principally constituted their government, and under the influence of which issued every poetic emanation. *The poetry of no other nation is so elevated and sublime ; sublimity, pure, simple, unproped, and unencumbered by any fictitious aids of sounding and ostentatious language, is its great imperial characteristic.* Greece, which, perhaps stands in this regard

next to Judea, stands next only by a long interval. Neither Homer, Hesiod, nor Æschylus, the sublimest Greek writers, copious and animated as they are in their sentiments and their descriptions of conflicts of gods and men, can enter into competition with the Hebrew poets. The works of Isaiah, Ezekiel, and Jeremiah, contain more sublimity than is to be found in the productions of the poets of all other countries taken together. Of these, Isaiah stands supreme, unique, and unapproachable. *His* is indeed the tongue " touched with live coal from the hand of Seraphim." The sublimity of Homer appears but a temporary and impetuous flight, ever tending inevitably earthwards ; that of Isaiah is a self-sustained, continued, and majestic soaring, most at home in heaven. His exultation over the fallen glory of the king of Babylon—his description of the power and majestic operations of the Almighty—his burdens of Egypt, Tyre, and Damascus, exceed in power all the finest passages of Homer and Æschylus. His sublime, yet satirical, contrast of the God of Jacob with the idols of the heathen (in chap. 44), exhibits the noblest piece of satire on record. Nor is Jeremiah less pre-eminent over the Greeks in pathos—a quality of writing, though inferior to and of less dignity than sublimity, yet entitling the writer to at least the second rank. The lyric poetry of the Hebrews is excellent. The classic reader is disappointed in his perusal of the writings of Pindar : the Roman language possesses no sublime lyric poetry. In David we have beauty of sentiments, tenderness, sublimity ; and these are at times mixed up (as in Psalms 8th and 19th) with a divine spirit of philosophy peculiar to himself, and of which no traces are to be found in any ethical poet. In short, the Bible, considered as a body of writing, will ever be regarded as the greatest and best treasure of poetic literature ; and it may be deemed a good test of taste and sound canon of criticism, that in proportion as a man possesses a true relish for the higher beauties of writing, and has endeavoured to gratify and refine that taste by extensive reading, in the same proportion will he praise, and the more frequently recur to, that Book, wherein, above all other books, is to be found most *simplicity and sublimity.*—*Literary Journal.*

THE EFFORTS OF GENIUS.

It is found, on examining a Biographical Dictionary of distinguished individuals in all ages and countries, amounting to about five thousand in number, that the largest proportion are Frenchmen, next the English, Scotch, and Germans, and next the Italians, Dutch, and other nations. How it happens that there have been more men in France than in England who have arrived at distinction, is accounted for, not by the comparative largeness of the country, but by the circumstance that the French make a point of patronising men of genius, whether they be poor or otherwise ; while, in England, few persons of talent, if they be not rich or well dressed, have the chance of receiving any patronage from the great. Out of the five thousand individuals, about a sixth have been descended from the upper classes, and there are not more than a dozen kings ; another sixth are of unknown origin, but may be presumed to belong to the middle ranks, of which there is distinctly about another sixth ; the remaining three-sixths, or the one-half, have been either descended from the trading or poorer classes, and have personally undergone severe struggles with poverty in elevating themselves to distinction. It is also found that many men, who have arrived at eminence, began by studying mathematics, to which they voluntarily attached themselves.

The most curious branch of this inquiry is that relative to the original condition of those who have risen from the lower ranks. Strangely enough, some trades seem to have produced more men of genius than others. For example, there are many instances of shoemakers rising to great eminence in literary and other pursuits. There have been also various learned men who began life as tailors, various as weavers, and a number as gardeners and stone-masons. More remarkable still, many eminent men, in ancient times, were originally slaves, or common soldiers. There have been some striking instances of men of genius being the sons of watchmakers. The following list of distinguished men who have in this manner risen from the humbler ranks, will be perused with some degree of interest.

Æsop, Publius Syrus, Terence, and Epictetus, all distinguished men in ancient times, were slaves at their outset in life. Protagoras, a Greek philosopher, was at first a common porter : Cleanthes, another philosopher, was a pugilist, and also supported himself at first by drawing water and carrying burdens. The late Professor Heyne of Gottingen, one of the greatest classical scholars of his own or any other age, was the son of a poor weaver, and for many years had to struggle with the most depressing poverty. The efforts of this excellent man of genius appear to have been greater and more protracted than those of any other on record, but he was finally rewarded with the highest honours. Bandoccin, one of the learned men of the sixteenth century, was the son of a shoemaker, and worked for many years at the same business. Gelli, a celebrated Italian writer, began life as a tailor ; and although he rose to eminence in literature, never forgot his original profession, which he took pleasure in mentioning in his lectures. The elder Opie, whose talent for painting was well appreciated,

was originally a working carpenter in Cornwall, and was discovered by Dr Wolcott (otherwise Peter Pindar) working as a sawyer at the bottom of a saw-pit. Abbot, Archbishop of Canterbury, who flourished in the sixteenth century, and distinguished himself by opposing the schemes of Charles I. was the son of a cloth worker at Guildford. Akenside, the author of *Pleasures of Imagination*, was the son of a butcher in Newcastle-upon-Tyne. D'Alembert, the French mathematician, was left at the steps of a church by his parents, and brought up by a poor woman as a foundling, yet arrived at great celebrity, and never forgot or abandoned his nurse. Ammenius Saccophorus, founder of the mystic philosophy at Alexandria, was born in poverty, and originally earned his subsistence by carrying sacks of wheat, whence the latter part of his name. Amyot, a French author of some celebrity for his version of Plutarch, lived in the sixteenth century, and was at first so poor as to be unable to afford oil or candles to assist his studies, which he had to carry on by fire light ; and all the sustenance his parents could afford him was a loaf of bread weekly. George Anderson, the translator of a treatise of Archimedes, and author of a *General View of the East India Company's affairs*, who died in 1796, was originally a day-labourer. Masaniello, who headed a successful revolt against the tyranny of the Austrian government at Naples, was a poor seller of fish. Sir Richard Arkwright, the ingenious inventor of the machinery for spinning cotton, was originally a country barber, or dealer in hair. Arne, an eminent English composer of music, who died in 1778, was the only son of an upholsterer, and was himself brought up as an attorney's clerk. Astle, the archaeologist, and author of a work on the origin and progress of writing, was the son of the keeper of Needwood forest. Augereau, marshal of France, and Duke de Castiglione, under Bonaparte, was originally a private soldier in the French and Neapolitan ranks. John Bacon, an eminent sculptor of last century, was originally a painter of porcelain for potters. Baillet, a laborious and learned French writer, was born of poor parents at Neuville, in Picardy, but he extricated and raised himself by his genius. Ballard, the author of *Memoirs of British Ladies*, was originally a stay and habit maker, but being patronised for his acquisitions, he was educated at Oxford, and made beadle of that university. Barker, the inventor of pictorial representation by panorama, having failed in business, became a miniature painter, and settled at Edinburgh ; and it was while resident here, and taking a view from the Calton Hill, that the idea of forming a panorama entered his mind. His invention realised him a fortune. Beattie, the author of the *Minstrel*, and professor of moral philosophy in Aberdeen University, was originally a parish schoolmaster at Fordun. Belzoni, one of the most eminent travellers in Egypt, at one period, when in pecuniary difficulties, supported himself by exhibiting feats of strength in different towns in Great Britain. The famous Admiral Bembow served at first as a common sailor in a merchant vessel. Miss Benger, the authoress of the *Life of Mary Queen of Scots*, and many other productions of merit, was so very poor in early life, that, for the sake of reading, she used to peruse the pages of books in a bookseller's window, in a little town in Wiltshire, where she resided, and returned day after day, in the hope of finding another page turned over. She afterwards obtained friends who assisted her. Sebastian Castalio, the elegant Latin translator of the Bible, was born of poor peasants, who lived among the mountains of Dauphiny. The Abbé Hautefeuille, who distinguished himself in the seventeenth century by his inventions in clock and watch making, was the son of a baker. The eminent Prideaux, who rose to be Bishop of Winchester, was born of such poor parents, that they could with difficulty keep him at school, and he acquired the rudiments of his education by acting as an assistant in the kitchen of Exeter College, Oxford. The father of the famous Inigo Jones was a cloth maker. Sir Edmund Saunders, chief justice of the King's Bench in the reign of Charles II., was originally an errand boy to the young lawyers. Linnaeus was apprenticed to a shoemaker, with whom he wrought for some time, till rescued by a generous patron, who saw his genius for learning. Lomonossow, one of the most celebrated Russian poets of last century, began life as a poor fisher boy. The famous Ben Jonson worked for some years as a bricklayer, but while he had a trowel in his hand, he had a book in his pocket. Peter Ramus, a celebrated writer of the sixteenth century, was at first a shepherd boy, and obtained his education by serving as a lacquey to the college of Navarre. Longomontanus, the Danish astronomer, was the son of a labourer. Parens, professor of theology at Heidelberg, and an eminent divine, was at first an apprentice to a shoemaker. Hans Sacho, an eminent German poet and scholar, was the son of a tailor, and he himself wrought as a shoemaker for many years. John Folz, an old German poet, was a barber. Lucas Cornelisz, a Dutch painter of the sixteenth century, had occasionally to support his family as a cook in gentlemen's kitchens. The illustrious Kepler spent his life in poverty, but in apparent contentment. Winckelman was so poor while a student, that he sung ballads through the streets at night for his support. Wolfgang Musculus commenced his career in a similar manner, having for some time sung ballads through the country, and begged from door to door, in order to obtain

a pittance wherewith to put himself to school. Pope Adrian VI., one of the most eminent scholars of his time, began life in great poverty, and as he could not afford candles, often read by the light of street lamps, or in the church porches where lights are kept burning; his eminent acquirements, and unimpeachable character, led him successively through different preferments in the church, till he was elected Pope. Claud Lorraine is said to have been originally apprenticed to a pastry cook. Marmontel was born of poor parents, and was indebted for the elements of education to the charity of a priest. Lagrange, the French translator of Lucretius, was brought up in extreme poverty. Spagnolettu began his career in great indigence. Miles Davies, a writer on antiquities in the early part of last century, hawked his productions from door to door. James Tytler, a person of great genius in Edinburgh in last century, lived in the greatest indigence, composing some of his works in types, without the intervention of manuscripts. Parkes, the author of some celebrated works on chemistry, was originally an apprentice to a grocer, and underwent many difficulties before he was ultimately successful as a practical chemist. Sir Humphry Davy was the son of a carver on wood, and he himself began as an apprentice to an apothecary.

Such brilliant instances as these might well serve to stimulate the virtuous efforts of youth to better their condition—but I forbear all remarks on the subject, till a few more cases have been laid before them.

PRINTING AND STEREOTYPING.

THE art of printing, the origin of which has been detailed in the early numbers of the Journal, is one of the most extraordinary results of human ingenuity, and is certainly the very noblest of all the known handicrafts. Yet, important as it is acknowledged to be, three centuries elapsed from the date of the invention before it was perfected in many of its most necessary details. At first, the art was entirely in the hands of learned men, the greatest scholars often glorying in affixing their names to the works as correctors of the press, and giving names to the various parts of the mechanism of the printing-office, as is testified by the classical technicalities still in use among the workmen. It was formerly mentioned that Gutenberg, the inventor, did not go the length of casting types from moulds: that great improvement is said to have been effected by Peter Schœffer, the companion of Faust: and from that event till the invention of italic letters by Aldus Manutius, to whom learning is much indebted, no other improvement took place. It does not appear that mechanical ingenuity was at any time directed to the improvement of the presses, or any other parts of the machinery used in printing, and the consequence was, that till far on in the eighteenth century, the clumsy instruments of Gutenberg, Faust, and Caxton, continued in universal use. The presses were composed of wood and iron, and were slow and heavy in working, while the ink continued to be applied by two stuffed balls or cushions, at a great expense of time and trouble.

At length an almost entire revolution was effected in the printing-office, both in the appearance of the typography and the working of the presses. About the same period, the art of stereotyping was discovered, and developed a completely new feature in the invention of printing. One of the chief improvements in the typography was the discarding of the long s, and every description of contractions, and, at the same time, the cutting of the letters was executed with greater neatness and regularity. Among the first improvers of the printing-press, the most honourable place may be given to the Earl of Stanhope, a nobleman remembered for his mechanical genius, who applied certain lever powers to the screw and handle of the old press, thereby diminishing the labour of the operative, and producing finer work. Since the beginning of the present century, and more especially within the last twenty years, presses wholly composed of iron, on the nicest scientific principles, have been invented by different men of mechanical genius in Great Britain and America, so as to simplify the process of printing in an extraordinary degree; and the invention of presses composed of cylinders, and wrought by steam-power, has triumphantly crowned the improvements in the art. The introduction of steam-presses has been furthered by another invention of an accessory nature, now of great value to the printer. Allusion is here made to the invention of the roller for applying the ink, instead of the old unwieldy and insufficient balls. The roller, which is a composition of a glutinous nature, cast upon a wooden centre-piece, was invented by a journeyman printer in Edinburgh, and was so much appreciated, as at once to spread over the whole of Britain.

It is our chief object, in this sketch, to give a brief explanation of the process of stereotyping—a process without the aid of which the present, as well as many other works, could not be so extensively nor so cheaply circulated through the country. Stereotyping seems to have been invented simultaneously by different persons in various parts of England and Scotland during last century. When properly made known, it was hailed with acclamation by the printing and publishing world, but as experience developed its powers, it was found to be strictly applicable only to a particular kind of work. In putting up types, they are lifted one by one, and built into a little case held in the hand

of the compositor, who, by the accumulation of handfuls, makes up a page, and lays it, with the face uppermost, on a stone table. After being wedged at the foot and side into an iron frame, and corrected, the page is carried to the press for working; and when the whole of the impression is off, it is brought back to the table, and the types distributed into their places. When the page has to be stereotyped, the same process of putting up is gone through, but instead of being carried to the press, the page is plastered over with liquid stucco, to the thickness of about half an inch, so that a level cake is formed on the surface of the types. As soon as the stucco hardens, which it does almost immediately, the cake is separated from the types, and on being turned up, shows a complete hollow or mould-like representation of the faces of the types and every thing else in the page. There being no longer any use for the types, they are carried off and distributed. As for the cake, it is put into an oven and baked to a certain degree of heat and hardness, like a piece of pottery. It is next laid in a square iron pan, having a lid of the same metal, with holes at the corners. The pan is now immersed in a pot of molten lead, and being allowed to fill by means of the holes, it is at length taken out and put aside till it cool. On opening the pan, a curious appearance is presented. The lead has run into the mould side of the cake and formed a thin plate all over, exhibiting the perfect appearance of the faces of the types on which the stucco was plastered. Thus is produced a fictitious page of types, not thicker than the sixth of an inch, and which can be printed from in the same manner as in the case of a real page. Such is the process of stereotyping, or making *fixed* or *stationary* types:—and now for the utility of the invention.

In all cases of common bookwork it is best to print from types to the amount of the copies required, and then distribute the types; but in most cases of books published in parts, sheets, or numbers, stereotyping becomes absolutely necessary. It is easy to perceive the reason for this. When books are published in numbers, it often happens that many more copies are sold of one number than of another; and unless the types be kept up to complete sets in the hands of the publisher, or to print copies according to the increased demand, a serious loss is sustained. The manufacture of stereotype plates is, therefore, simply a means of keeping up fictitious types to answer future demands, at an expense greatly inferior to that of keeping the actual pages standing. For example, one hundred pounds' worth of types are employed in setting up a single sheet of this journal, while a set of stereotype plates, which answer the same purpose, costs only forty-five shillings. There being now thirty-four numbers of the Journal printed, a capital of £3400 would require to be sunk to keep all the pages of the work standing in types, whereas the stereotype plates for the same quantity of numbers has cost between seventy and eighty pounds only. As the Journal is stereotyped weekly, there has perhaps never yet occurred such a remarkable instance of the value of this vast improvement in the typographic art. The very manner in which the work is effected furnishes matter for surprise. Two sets of plates are moulded, one of which is kept for use in Edinburgh, and the other sent in a box by the royal mail to London, where it is immediately subjected to a steam-press, and, in a few hours, made to produce twenty thousand or more printed sheets. By this wonderful process, the expense of setting up the types in London is avoided, and the publisher thereby permitted to extend the circulation of the work on the most liberal principles, and in a very quick manner, all over the country, both to the benefit of the booksellers and the public. At the outset of the Journal, stereotyping, most unfortunately, was not resorted to; in consequence of this oversight, some of the numbers were put up in types four and five times, to print off additional supplies; and it has only been since the whole were regularly stereotyped that the work has produced any profit commensurate with the exertions bestowed upon it, or been conducted with satisfaction to the parties concerned.

THE LAST OF THE SARPINTS.

"THE sarpint, is it?" said Picket in reply. "Sure, every body has heard tell of the blessed Saint Patrick, and how he *druve* the *sarpints*, and all manner of venomous things, out of Ireland—how he bothered all the *sarpint* entirely; but for all that, there was one *ould sarpint* left, who was too cunning to be talked out of the country, and made to drown himself. Saint Patrick didn't well know how to manage this fellow, who was doing great havoc; till at long last he be-thought himself, and got a strong iron chest made with nine *bouls* upon it.

"So, one fine morning he takes a walk to where the *sarpint* used to keep; and the *sarpint*, who didn't like the Saint in the least—and small blame to him for that—began to hiss and show his teeth at him like any thing. 'Oh,' says St Patrick, says he, 'where's the use of making such a piece of work about a gentleman like myself coming to see you?—'tis a nice house I have got made for you *agin* the winter; for I am going to civilise the whole country, man and beast,' says he, 'and you can come and look at it whenever you please, and 'tis myself will be glad to see you.'

"The *sarpint*, hearing such smooth words, thought that though Saint Patrick had *druve* all the rest of

the *sarpints* into the sea, he meant no harm to himself; so the *sarpint* walks fair and easy up to see him, and the house he was speaking about. But when the *sarpint* saw the nine great *bouls* upon the chest, he thought he was *sould*, and was for making off with himself as fast as ever he could.

"'Tis a nice warm house, you see," says Saint Patrick, 'and 'tis a good friend I am to you.'

"I thank you kindly, Saint Patrick, for your civility," says the *sarpint*, 'but I think it's too small it is for me;' meaning it for an excuse, and away he was going.

"Too small!" says Saint Patrick; 'stop, if you please,' says he; 'you're out in that, my boy, any how—I am sure 'twill fit you completely; and, I'll tell you what,' says he, 'I'll bet you a gallon of porter,' says he, 'that if you'll only try and get in, there 'll be plenty of room for you.'

"The *sarpint* was as thirsty as could be with his walk, and 'twas great joy to him the thoughts of doing Saint Patrick out of the gallon of porter; so, swelling himself up as big as he could, in he got to the chest, all but a little bit of his tail. 'There now,' says he, 'I've won the gallon, for you see the house is too small for me, for I can't get in my tail.' When, what does Saint Patrick do, but he comes behind the great heavy lid of the chest, and, putting his two hands to it, down he slaps it with a bang like thunder. When the rogue of a *sarpint* saw the lid coming down, in went his tail like a shot, for fear of being whipped off him, and Saint Patrick began at once to *boul* the nine iron *bouls*.

"Oh! murder! Won't you let me out, Saint Patrick?" says the *sarpint*; 'I've lost the bet fairly, and I'll pay you the gallon like a man.'

"Let you out, my darling?" says Saint Patrick, 'to be sure I will, by all manner of manes; but, you see, I haven't time now, so you must wait till to-morrow.' And so he took the iron chest, with the *sarpint* in it, and pitches it into the lake here, where it is to this hour, for certain; and 'tis the *sarpint* struggling down at the bottom that makes the waves upon it. Many is the living man," continued Picket, "besides myself, has *hard* the *sarpint* crying out, from within the chest under the water, 'Is it to-morrow yet?—Is it to-morrow yet?' which, to be sure, it never can be: And that's the way Saint Patrick settled the last of the *sarpints*, sir."—*Crocker's Legends of Killybegny.*

THE DEAR YEARS.

IN former times, when Scotland was a poor, "half-fed, half-clad, half-sarkit" country at the very best, and ere the maxims of political economy, and the wealth introduced by commerce, had as yet provided men with the means of obviating the effects of bad seasons, our population was subject to the most awful visitations of famine, which sometimes lasted, with more or less virulence, for a course of years. The most severe calamity of this kind on record occurred at the meeting of the seventeenth and eighteenth centuries, when a series of bad crops, commencing in 1697, and not ending till 1704, reduced the people to a state of privation and suffering quite unexampled. The earlier of the winters of those years were so intensely cold, that the unhouseled children of nature died in the fields; the birds dropped from the trees; and the smaller insects, such as flies, were nearly exterminated. The meagre crops of those years had to be rescued from the snows of November and December—a species of labour which deprived many of the poor working people of the use of their hands and feet. The scarcity was at its height in 1700. The meal was then sold at two shillings a-peck, a price which placed it almost beyond the reach of the common people. And not only was this great cardinal necessity of Scottish domestic life elevated to such an exorbitant price, but it was sometimes difficult to procure it at all. It is related, traditionally, that when women sometimes came to market, and found that the whole disposable grain of the place had been already sold off, they would be seen clapping their hands, and tearing off their head-gear, with the most heart-rending exclamations of despair, knowing that they would have nothing to put into the mouths of their children for a number of days, unless succoured by the charity of their neighbours.

Under such distressing circumstances, the affections of domestic life were very apt to disappear in the selfishness of individual misery. Honest Patrick Walker, the pious pamphleteer so much quoted in the "Heart of Mid-Lothian," relates, that some declared they "could mind nothing but food, and were utterly unconcerned about their souls, whether they went to heaven or hell." Yet there were no doubt many instances, also, of mothers tearing the bite from their own disinterested mouths, to give it to their offspring—of good hearts which could succour the deeper distress of friends, at the risk of their own destruction—and of Christians who, regarding every evil in life as

the infliction of an all-wise and unchallengeable Deity, would bear their pains with unbroken minds, and fulfil, till the very last, all the duties of a good life.

There lived in those days a certain bailie, in the town of Coldstream, whose descendant, in 1826, related to me the following anecdotes, which had been handed down by family tradition:—

At one particular crisis of the famine, this good man, though one of the wealthiest in the place, found it quite impossible to produce a meal for his children. The day had been spent entirely without food, and towards night the youngsters were getting so clamorous, that the parents despaired of seeing them fall asleep without something in the shape of supper. In this emergency, the bailie bethought him of a barrel of ale which had long lain in his cellar. But, in the first place, he called in the town-piper with his bagpipes. Having set this official to play a few merry tunes, the children all fell a-dancing, and he then supplied them each with a little of the ale, the piper included. Under this double influence of music and drink, the poor things danced still more energetically, till at length they became so overpowered by fatigue and the fumes of the liquor, as to fall into a profound sleep, from which they only awoke next morning to a meal which had in the meantime been provided.

During the famine, four bolls of oatmeal were sent to Coldstream market to be sold, and were consigned to the care of the bailie. His wife took him aside, and, directed by the feelings of a mother, counselled him to secure one of the bolls for the use of his own family. But he kindly rebuked her for her selfishness, and said he would perform what he considered his duty, by dealing out the meal to the inhabitants in general, in portions corresponding to the extent of their families, ranking himself among the rest. He did so most scrupulously; and it was remarked, as a token of the favour of heaven for such humane and just conduct, that the little quota he thus reserved for his own use served to sustain his family exactly till another supply was procured.

The mortality occasioned by this famine was very great. The people, by way of making their little occasional supplies of meal go as far as possible, used to grind it up with a large proportion of wayside herbs and seeds of an unhealthy character, which were almost as fatal as absolute want. Patrick Walker tells us that deaths and burials at length grew so frequent, that the living were wearied with taking care of the dead; it was found difficult to raise a sufficient company to inter a neighbour decently; and many corpses got neither coffin nor winding-sheet, but were drawn to the grave upon sledges, as is done upon occasions of pestilence abroad. It was quite a customary sight in Ayrshire, according to a traditional source of intelligence, to see the bodies of people who had died of starvation, lying under the high thorn hedges, which then formed the only boundaries of roads and fields throughout the country. Many of these were never buried; but after lying above ground till the return of better times re-awakened natural feelings in the breasts of the people, were put out of sight by a covering of earth.

It is said that the famine was fatal, to a remarkable degree, in the northern province of Moray; inasmuch, that in the parish of Kilmorie, only three smoking cottages were left, all the inhabitants of the others having died during that heavy visitation. "From poverty and the awful prevalence of mortality," says a provincial chronicler (the Inverness Courier), "the ordinary rites of Christian burial were denied to the poor, and large holes were dug in many places, into which their bodies were consigned. One maiden lady in Garmouth, whose memory is still gratefully embalmed in the recollections of the peasantry, provided shrouds and coffins for such as wandered to her door to die; and so anxious were the poor to avail themselves of this last privilege, that they would husband their little stock, and journey far and near, that they might close their eyes secure of decent interment!" In the Highlands, hunger pinched the people as hard as any where else. There used long to be a traditional recollection at Inverness, of a vision of poor famished wretches, who came out like spectres from the glens and woods, and set up a wail of misery before the town, that pierced the very hearts of the honest burghers, themselves very nearly as necessitous and as miserable.

The following little tale of human ignominy and wretchedness, connected with the famine of 1700, is from the recollection of an aged gentleman, to whom it was related by his grandmother, the date of whose birth was 1704. For many years before the famine, a poor old woman, belonging to the tribe of *gentle beggars*, as they are called in Scotland—that is, persons originally of good condition, but who have been reduced to beggary—used to wander about Ayrshire, living chiefly in the houses of the farmers, to whom her company was acceptable, on account of her having "a wonderful gift of prayer." About the year 1695, this sanctimonious person, though she had partaken of the family supper, was detected one night, at a

farm-house where she lodged, licking the cream off one of the best boynees in the dairy. Such a failing in a woman of her character was very shocking to the religious feelings of the community, and accordingly the poor woman was now so much despised and reviled, that she found it necessary to disappear from that district of the country, and try her fortune in a scene where she was less known. In time, the people almost forgot the very existence of such a person; the waves of society closed over her, and she was the same to Ayrshire as if she had never lived. But it would appear that the unhappy wretch did not find it possible to obtain a proper settlement any where else, owing, perhaps, to her not being any where else "the accustomed beggar." Thus, when the famine began, like a dejected bark driven back by storms to its own little haven, she found it necessary to seek a shelter and sustenance, every where else denied, in the circle of country where she was alone known either for good or evil. Previous to the unfortunate exposure which drove her from Ayrshire, she had been a decent-looking, neatly dressed woman, with a trace of the gentility of better days; but now misery had pinched her hard; her clothes were the most wretched that could be conceived, and, to use the expressive phrase in which her tale was related, it was possible to trace her path by the vermin which she dropped in her progress. The last circumstance was a sufficient cause, if no other had existed, for denying a lodging to the poor wretch, while the famine of the time afforded an equally good reason for refusing to extend to her the means of supporting life. Thus circumstanced—an outcast, starved, diseased, loathsome to herself and all the world—this miserable creature dragged her living corpse to the banks of the water of Annick (a rivulet which runs through the parish of Stewarton, and discharges itself into the sea at Irvine), and there upon a little hillock lay down to die. Through the kindness of a neighbouring farmer, the great-grandfather of my informant, who every day came out to the place where she was lying, and threw her a bannock and a piece of cheese, she survived nine days, but died upon the tenth, as striking a picture of human misery as ever cumbered the earth. The time was one of horrible sights, and accordingly no one stirred to offer her corpse the rites of burial, or even to fling a stone or a handful of earth upon it, for many months after.

LONDON AND THE GAMING HOUSES.

In perambulating the streets of London, the stranger invariably strolls in a westerly direction, gradually leaving behind him the closely packed houses, streets, and alleys of the city, and at every step approaching that part of the metropolis where the air seems freer, the buildings more elegant and spacious, the thoroughfares wider, and the passengers more tastefully and fashionably dressed. Temple Bar was long esteemed the line of demarcation betwixt traffic and gentility, inasmuch as it separates London from Westminster; but trade has for many years been creeping beyond this huge barrier—has filled the Strand with shops—turned to the right and gone up Haymarket and Regent Street—is fast pushing on its way towards Windsor—and there is no saying where it may finally stop. Charing Cross, a spot where a number of streets diverge in different directions, at the western extremity of the Strand, is now the proper boundary betwixt the residence of the fashionable and unfashionable world. When you have walked westwards as far as this radiating point, you begin to be struck with the magnificent proportions of the edifices: and as you penetrate onwards, you feel yourself the more astonished and pleased with the elegance of the architecture (even though you may perhaps know that it is only brick disguised in plaster), the beauty of the large plate-glass windows, and the great degree of opulence which the whole outline so significantly displays. If you have any town cousin with you, who has volunteered to show the wonders of the place, you most likely ask what description of persons inhabit houses of such grandeur; and he answers, that many are the residences of the nobility and members of the government, many are occupied as public offices and club-houses, and not a few are devoted to purposes of gaming.

The gaming houses of London—at least those on a great scale—are all situated in this modern and elegant quarter of the town, and are among the greatest wonders of this world of houses and human beings. In the slang of the town, such dens of vice and plunder are designated *Hells*—a name too applicable to the nature of the business transacted within them. We are credibly informed by the author of *Life in the West*—a recent production—that these houses are fitted up in a style of extraordinary splendour, and that their expenses are enormous, though nothing in comparison to the profits realised. One house is supported at an expense of a thousand pounds a-week. The next in eminence costs a hundred and fifty pounds

a-week, and the minor ones vary from fifty to eighty pounds. Each house has a regular complement of officials, who are paid extravagant salaries. The inspectors, or overlookers, are paid from six to eight pounds a-week each; the "croupiers," or dealers, three to six pounds; the waiters and porters, two pounds; and a person who keeps a look-out after the police officers, to give warning of their approach, two pounds. The money disbursed for secret information, wines, &c. cannot be easily ascertained, but must be very large.

Every thing in the interior of these mansions is elegant, but certain things betoken the dreadful and hazardous nature of the establishment. The doors and window shutters are fortified with strong iron plates, so that an ingress by violence is a tardy and difficult matter. There is one of these iron doors at the bottom of the stairs, one near the top, and a third at the entrance into the gaming room. These are opened and closed one after the other, as the person ascends or descends. In each of the doors there is a little round glass peep-hole, for the porter to take a deliberate view of all persons desirous of admittance, in order to keep out or let in whom they choose.

An unsophisticated person would naturally enough suppose from this account, that none but those of great courage would dare to penetrate into the heart of these establishments; but it must be explained that there is nothing like gruffness or jailorism in the keepers of the mansion. The whole is placed on an easy genteel footing. No civility can equal that of the waiters, while the condescension of the proprietors, or *bankers*, the refreshments and wine, all combined, have an interesting and deceptive influence upon the inexperienced and unreflecting mind. But what kind of people are they who keep such houses? are they born a particular class? By no means. In London there is always a large number of individuals, the refuse of every rank, and the natives of every country, floating on the surface of society, and ready to engage in any desperate undertaking, provided it can bring money into the pocket, and indulgence to the passions. "The proprietors of these houses are composed of a heterogeneous mass of worn-out gamblers, black-legs, horse-dealers, jockeys, valets, pettifogging lawyers, low tradesmen, men in business who have failed through their debauchery, and others of a similar stamp. They dress in the first style of fashion, keep country houses, carriages, horses, and fare sumptuously; bedizen themselves out with valuable gold watches, chains, seals, diamond and other rings, costly snuff-boxes, &c.—property, with but little exception, originally belonging to unfortunates who had been fleeced of every thing, and who, in a moment of distress, parted with them for a mere trifle. Some have got into large private mansions, and keep first-rate establishments. Persons with a very superficial knowledge of the world can easily discern through the thin disguise of gentlemen they assume."—*Life in the West*, vol. ii. p. 93.

One of these infamous establishments, which obtains more plunder than all the others put together, has been fitted up at an expense of £40,000, and has been set up as a bait for the fortunes of the great. "Invitations to dinner are sent to noblemen and gentlemen, at which they are treated with every delicacy, and the most intoxicating wines. After such liberal entertainment, a visit to the French hazard-table in the adjoining room is a matter of course, when the consequences are easily divined. A man thus allured to the den may determine not to lose more than the few pounds he has about him; but in the intoxication of the moment, and the delirium of play, it frequently happens, that, notwithstanding the best resolves, he borrows money upon his checks, which being known to be good, are readily cashed to very considerable amounts. In this manner, £10,000, £20,000, £30,000, or more, have often been swept away." The profits thus gained are almost incalculable; for such is the gross stupidity of men of fortune, that they persist in entering and "trying their luck," either at games with cards or dice, although perfectly well aware of the almost certain chance of losing. The house just alluded to lately realised in one season £150,000, over and above expenses, which could not be less than £100,000 a-day. "Some idea can be formed," (says the author we have quoted) of what has been sacked, by the simple fact, that one thousand pounds was given at the close of the season to be divided among the waiters alone; a head servant having half that sum presented to him as a new-year's gift."

The degree of blackguardism, villany, and wasteful profusion which characterise these infamous establishments, will doubtless appal the minds of thousands of our respectable and industrious readers; but there is a use in thus unfolding scenes capable of scaring the unwary man of property, or those in desperate circumstances, from the gaming table, while the virtuous portion of the community, in reading such accounts of what is hourly transacting—night and day, Sunday as well as every other day in the week—in the metropolis, will draw closer together, and learn to be thankful that their simple and honest occupations do not lead them into the way of such unhallowed temptations.

A DAY BETWEEN THE TROPICS.

ON the 15th of June, in lat. $14^{\circ} 6' 45''$, we beheld, for the first time, that glorious constellation of the southern heavens, the cross, which is to navigators a token of peace, and, according to its position, indicates the hours of the night. We had long wished for this constellation, as a guide to the other hemisphere; we therefore felt inexpressible pleasure when we perceived it in the resplendent firmament. We all contemplated it with feelings of profound devotion as a type of salvation; but the mind was especially elevated at the sight of it, by the reflection, that even into this region, which this beautiful constellation illumines, under the significant name of the Cross, the European has carried the noblest attributes of humanity, science, and Christianity; and, impelled by the most exalted feelings, endeavours to spread them more and more extensively in the remotest regions.

In proportion as the southern firmament rose above our horizon, that of the northern hemisphere sank below it. Those who considered Europe exclusively as their country, looked with painful sensations on the polar star as it sank lower and lower, till at length it vanished in the thick mists of the horizon.

In these seas the sun rises from the ocean with great splendour, and gilds the clouds accumulated in the horizon, which, in grand and various groups, seem to present to the eye of the spectator continents with high mountains and valleys, with volcanoes and seas, mythological and other strange creations of fancy. The lamp of day gradually mounts in the transparent blue sky; the damp grey fogs subside; the sea is calm, or gently rises and falls, with a surface smooth as a mirror, in a regular motion. At noon a pale, faintly shining cloud rises, the herald of a sudden tempest, which at once disturbs the tranquillity of the sea. Thunder and lightning seem as if they would split our planet; but a heavy rain, of a saltish taste, pouring down in the midst of roaring whirlwinds, puts an end to the raging of the elements; and several semicircular rainbows, extended over the ocean like gay triumphal arches, and multiplied in the wrinkled surface of the water, announce the termination of the great natural phenomenon. As soon as the air and sea have recovered their repose and equilibrium, the sky again shows its transparent azure; swarms of flying-fish leap sporting over the surface of the water, and the many-coloured natives of the ocean, among which is the shark with his two inseparable companions, *Casterosteus dactor* and *Echeneis remora*, come up from the bottom of the element, which is translucent to the depth of a hundred fathoms. Singularly formed Meduse, the bladder-shaped Physalis, with its blue pungent filaments, serpent-like streaks of Salpæ, joined together, float carelessly along, and many other little marine animals, of the most various kinds, pass slowly, the sport of the waves, by the motionless vessel. As the sun gradually sinks in the clouded horizon, sea and sky assume a new dress, which is, beyond description, sublime and magnificent; the most brilliant red, yellow, and violet, in infinite shades and contrast, are poured out in profusion over the azure of the firmament, and are reflected in still gayer variety from the surface of the water. The day departs amidst continual lightnings in the dusky horizon; while the moon, in silent majesty, rises from the unbounded ocean, into the cloudless upper regions. Variable winds cool the atmosphere; numerous falling stars, coming particularly from the south, shed a magic light; the dark blue firmament, reflected with the constellations on the untroubled bosom of the water, represents the image of the whole starry hemisphere; and the ocean, agitated even by the faintest breeze of the night, is changed into a sea of waving fire.—*Drs Von Spiz and Martin's Travels in Brazil.*

MRS MARGARET LAUDER.

A SONG has long been popular in Scotland under the name of "Maggy Lauder," being the composition, we believe, of Robert Semple, a Renfrewshire bard of the reign of Charles II. The following note is given in "Chambers's Collection of Scottish Songs" (from a genealogical manuscript in the Advocates' Library), as probably referring to the heroine of the ditty:—

"NOTE.—There hath been a tradition in the burgh of North Berwick and country about, handed down to this time from father to son, that when Oliver Cromwell, that grand usurper, hypocrite, and great wicked man, lay with his army encamped about Dunbar, before the battle of Downhill, that he had sent a party to North Berwick, where Sir Robert Lauder, then of Bass, had his house, with barnyard, and other office houses. The party entered the barn, where the corn was sacked up, ready to be carried out to be sown; the party having offered to carry off the corn for the use of their master, the Lord Protector (as they called him) his army, Sir Robert's servant went into the house and acquainted Mrs Margaret, alias Maggy Lauder, Sir Robert's sister, who had the management of his family and affairs. She immediately ordered the sharpest knife and flail to be brought to her, and went into the barn, where, after upbraiding the party, she ripped up the sacks, and managed the flail with such dexterity, that she beat off the party;

for which she most deservedly may be accounted amongst the greatest and most glorious heroines of that age. Sir Robert was obliged at that time to abscond, because he was a loyalist, as all of that and other families of that name have almost always been and still continue."

THE CAVERN TEMPLES OF ELORA.

THE seven wonders of the world seem all to sink into insignificance, as stupendous instances of human exertion, compared with the cavern temples of Elora in Hindostan, which have only of late been made known to the enlightened part of mankind. Elora is situated 260 miles from Bombay, 650 from Madras, and above 1000 from Calcutta. Some years ago, soon after the place had been added to the British empire, it was visited by Captain J. B. Seely, who published an account of it in an octavo volume. From that work we shall extract enough to give the reader some faint notion of the mighty wonders of the place.

"Bruce's emotions were not more vivid or tumultuous on first beholding the springs of the Nile, than mine were on reaching the temples of Elora. I at once rushed into the wonders and glories of these immortal works; but it is totally impossible to describe the feelings of admiration and awe excited on the mind upon first beholding these stupendous excavations.

On a close approach to the temples, the eye and imagination are bewildered with the variety of interesting objects that present themselves on every side. The feelings are interested to a degree of awe, wonder, and delight, that at first is painful; and it is a long time before they become sufficiently sobered and calm to contemplate with any attention the surrounding wonders. The death-like stillness of the place, the solitude of the adjoining plains, the romantic beauty of the country, and the mountain itself, perforated in every part, all tend to impress the mind of the stranger with feelings quite new, and far different from those felt in viewing magnificent edifices amidst the busy haunts of man. Every thing here invites the mind to contemplation, and every surrounding object reminds it of a remote period, and a mighty people, who were in a state of high civilisation whilst the natives of our own land were barbarians, living in woods and wilds.

Conceive the burst of surprise at suddenly coming upon a stupendous temple, within a large open court, hewn out of the solid rock, with all its parts perfect and beautiful, standing proudly alone upon its native bed, and detached from the neighbouring mountain by a spacious area all round, nearly 250 feet deep, and 150 feet broad: this unrivalled fane rearing its rocky head to a height of nearly 100 feet—its length about 145 feet, by 62 broad—having well-formed doorways, windows, staircases to its upper floor, containing fine large rooms of a smooth and polished surface, regularly divided by rows of pillars; the whole bulk of this immense block of isolated excavation being upwards of 500 feet in circumference, and extraordinary as it may appear, having beyond its areas three handsome figure galleries, or virandas, supported by regular pillars, with compartments hewn out of the boundary scarp, containing forty-two curious gigantic figures of the Hindoo mythology—the whole three galleries in continuity, enclosing the areas, and occupying the almost incredible space of nearly 420 feet of excavated rock; being, upon the average, about 13 feet 2 inches broad all round, and in height 14 feet and a half; while positively, above these again are excavated fine large rooms. Within the court, and opposite these galleries, or virandas, stands Keylas the Proud, wonderfully towering in hoary majesty—a mighty fabric of rock, surpassed by no relic of antiquity in the known world.

Nothing can be more romantic and interesting than the view down the great hall, or into the large rooms, excavated in the northern and southern sides of the mountain facing you; or, if you wish to quit this gloomy grandeur, only cross the bridges through the small rooms, to the balcony over the gateway, and there is the open country, with beautiful nature robed in all the luxuriance and richness of oriental verdure.

At the time these astonishing works were begun, the country, far and wide, must have enjoyed a profound peace; its resources, too, must have been great to have permitted such vast undertakings; and the people happy and contented, who could, for purposes of religion, labour unremittingly for a series of years in the completion of these temples. It is, indeed, not unreasonable to conclude they had their origin before the followers of Mahomet ravaged and disturbed the tranquillity of India, then inhabited by a race purely Hindoo, long, probably, antecedent to the invasion by Alexander or Seleucus."

LATITUDE OF THE CALTON HILL.—As the Calton Hill is one of our most interesting mineralogical and geological points, we are happy, says the editor of the Edinburgh New Philosophical Journal, in having an opportunity of giving the precise position of the Observatory placed upon it. The latitude of this Obser-

vatory, as determined by Mr Henderson, from the data of the trigonometrical survey, is 55 degrees, 57 minutes, 19.5 seconds north.

THE CONDOR.—The habits of the condor partake of the bold ferocity of the eagle, and of the disgusting filthiness of the vulture. Although, like the latter, it appears to prefer the dead carcass, it frequently makes war upon a living prey; but the gripe of its talons is not sufficiently firm to enable it to carry off its victim through the air. Two of these birds, acting in concert, will frequently attack a puma, a lama, a calf, or even a full-grown cow. They will pursue the poor animal with unwearied pertinacity, lacerating it incessantly with their beaks and talons, until it falls exhausted with fatigue and loss of blood. Then, having first seized upon its tongue, they proceed to tear out its eyes, and commence their feast with these favourite morsels. The intestines form the second course of their banquet, which is usually continued until the birds have gorged themselves so fully as to render them incapable of using their wings in flight. The Indians, who are well acquainted with this effect of their voracity, are in the habit of turning it to account for their amusement in the chase. For this purpose they expose the dead body of a horse or a cow, by which some of the condors, which are generally hovering in the air in search of food, are speedily attracted. As soon as the birds have glutted themselves on the carcass, the Indians make their appearance, armed with the lasso, and the condors, being unable to escape by flight, are pursued and caught by means of these singular weapons with the greatest certainty. This sport is a peculiar favourite in the country, where it is held in a degree of estimation second to that of a bull-fight alone.—*Gardens and Menagerie of the Zoological Society.*

TOMB OF MOHAMMED AT MEDINA.—The famous sepulchre of Mohammed is detached from the walls of the mosque so as to leave a space of about twenty-five feet on the one side and fifteen on the other. To defend its hallowed contents from the approach of the impure, or the superstitious adoration of the visitor, it is surrounded by an enclosure called *El Hejra*, in the form of an irregular square of nearly twenty paces, arched overhead and supported by columns. This space is encircled by an iron railing about thirty feet high, of good workmanship, painted green, which fills up the intervals between the pillars, and rises to about two-thirds of their height, leaving the upper part entirely open. The railing is an imitation of filigree, interwoven with inscriptions of yellow bronze, supposed by the vulgar to be of gold, and of so close a texture that no view can be gained into the interior, except through several very small windows, which are placed on each of the four sides, about five feet above the ground. The two principal windows, before which visitors stand when they pray, are on the south side, where the iron fence is thinly plated over with silver, having the often-repeated inscription of "La Illha" carried across it in silver letters. Four gates lead into this cage-like enclosure, three of which are kept continually shut—one only being opened night and morning to admit the eunuchs, whose office is to clean the floor and light the lamps. What appears of the interior is merely a curtain carried round on all sides, resembling a bed, which is of the same height as the railing, and fills nearly the whole space, leaving only an open walk between of a few paces in breadth. This veil is a rich silk brocade of various colours, interwoven with silver flowers and arabesques; with a band of inscriptions in gold characters running across the middle, like that on the covering of the Kaaba. Within its holy precincts no person is allowed to enter except the chief eunuchs, who take care of it, and whose business it is to put on during the night the fresh curtain, which is sent from Constantinople whenever the old one is decayed, or when a new sultan ascends the throne. The venerable remnants of this sacred brocade are sent back to the Turkish capital, and serve to cover the tombs of the sovereigns and princes of the empire. It is within this double frame of silk and rails that the ashes of the Prophet repose, along with the remains of his two earliest friends and immediate successors, Abu Bekr and Omar. Authors differ as to the respective position of the three tombs; but they are said to be of plain masonry, in the form of a chest, and covered with precious stuffs. The historian of Medina, Samhoudi, says that the coffin which contains the dust of Mohammed is cased with silver and overlaid with a marble slab, inscribed, *Bismillai Allahuma Salli alei* (In the name of God bestow thy mercy upon him.) Glass lamps are suspended all round the curtain, which are kept burning every night: the floor of this part of the mosque is paved with various-coloured marbles in mosaic. The whole of this enclosure is surmounted by a fine lofty cupola, rising far above the domes on the roof of the colonnades, and visible at a great distance from the town; it is covered with lead, and has on the top a globe of considerable size and a crescent, both glittering with gold.—*Edinburgh Cabinet Library.*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agent in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," &c., AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "PICTURE OF SCOTLAND," &c.

No. 36.

SATURDAY, OCTOBER 6, 1832.

PRICE THREE HALFPENCE.

CLEVER WOMEN.

THERE is an unaccountable antipathy to clever women. Almost all men profess to be afraid of blue-stockings—that is, of women who have cultivated their minds; and hold up as a maxim, that there is no safety in matrimony, or even in the ordinary intercourse of society, except with females of plain understandings. The general idea seems to be, that a dull ordinary woman, or even a fool, is more easily managed than a woman of spirit and sense, and that the acquirements of the husband ought never to be obviously inferior to those of his wife. If these propositions were true, there would be some show of reason for avoiding clever women. But I am afraid they rest on no good grounds. Hardly any kind of fool can be so easily managed, as a person of even first-rate intellect; while the most of the species are much more untractable. A dull fool is sure to be obstinate—obstinate in error as well as in propriety; so that the husband is every day provoked to find that she wilfully withholds him from acting rightly in the most trifling, and perhaps also the most important, things. Then the volatile fool is full of whim and caprice, and utterly defies every attempt that may be made by her husband to guide her aright. In the one case, his life is embittered for days, perhaps, by the sulkiness of his partner: in the other, he is chagrined by the fatal consequences of her levity. Are these results so much to be desired, that a man should marry beneath the rank of his own understanding, in order to secure them? I rather apprehend that cowardice, in this case, as in most others, is only the readiest way to danger. As for the rest of the argument, I would be far from saying, that to marry a woman much superior to one's self in intellect, is a direct way to happiness. I must insist, however, that there is more safety for a man of well-regulated feelings, in the partnership of a superior than of an inferior woman. In the former case, I verily believe, his own understanding is likely to be more highly estimated than in the other. In the first place, he is allowed the credit of having had the sense at least to choose a good wife. In the second, he has counsel and example always at hand, for the improvement of his own appearances before society. The very superiority, however, of his wife, ensures that she will be above showing off to the disadvantage of her husband: she will rather seek to conceal his faults, and supply his deficiencies, for her own credit. Now, what sense a fool has, she must always show it, even though sure to excite ridicule from its being so little.

These arguments, which every reflecting person will be able to confirm by examples within his own range of observation, refer only to the immediate comfort of the husband. There are, however, other considerations. Will any man say that a woman of plain or inferior understanding is likely to educate her children as well as a person of superior intellect? He must be fond of dullness, indeed, who will advance such a proposition. The truth is, that, for the sake of her children alone, a woman can hardly be too well informed, or possessed of too much talent. The whole formation of the mental character of the family, and consequently their interests in future life, depend upon her; and it is therefore perhaps of more importance that she should possess a cultivated understanding, than that her husband should be so gifted—and this both to the husband himself, whose interests are identified with those of his children, and to the world at large.

This argument derives great force from the observations that have been made upon what I will call the *descent of intellect*. It is the most trite of all proverbs, that a "wise father may have a foolish son;" and nothing can be more obvious than the fact, that men of distinguished ability rarely find a match in their representative. On the other hand, the mothers of distinguished men are almost universally found to have been women of a superior order, either in natural or acquired gifts. To explain this, some philosophic minds have suggested, that talent is inherited exclusively from the mother, and temper only from the father. Besides the specific facts which might be advanced in support of this theory, there is one strong general argument in favour of it. Talent, if of natural descent, would remain continually fixed in certain families, so as to give them a greater ascendancy over their fellows than what is consistent with the general

comfort of mankind. But, by descending through females, it is carried from one family into another, remaining no long period in any; so that all have a chance in the course of a few generations. In short, by this means talent acquires a dispersive or diffusive property, which it could not have if limited to heirs-male.

Now, whether the mother gives inherent ability, or only good nurture, it is obvious that her talents must be a matter of infinite importance to her husband, and that, the greater they are, so much the more certain are his welfare and happiness. If the reader will accept of opinion instead of argument, I will tell him exactly what I think upon the subject. Intellect being, in my opinion, a decided good, and the want of it an evil, I think that its existence in woman makes her just so much the more valuable, both in respect of general society, and in regard to the advantage of her children. Folly and dullness are less negative properties than some people suppose, and tend, in my opinion, to have an active and positive effect in diminishing the comfort of existence; therefore they ought to be avoided in women. Let no man tell me that a very clever woman may be too good for her business, or above grappling with it. Depend upon it, excess of ability is the safe side of the question. Neither let me be told that a plain man is in danger of not showing off well beside his clever wife. He will find, on trying, that it takes a great deal of cleverness in a woman to match with the same *apparent* degree of it in a man, and that, in the long-run, he is not nearly so far behind as he at first supposed. By pitching, on the other hand, only a little beneath his own supposed intellect, he is apt to discover that his partner is in reality an immense distance in the rear.

It is a lamentable truth, that far more things are laughed at, in this world, than what are really ridiculous. It is so easy to laugh at any thing, that there is no wonder that some things are mistreated in this respect. Among the number of respectable things which the world has agreed to laugh at, are *blue-stockings*—such is the silly name given to women who aim at cultivating their intellects in a manner superior to their neighbours. Now, for my part, I cannot see that women, in the middle and upper ranks of life, can be a whit the worse for general information. The intellects of women are not so much inferior, naturally, to those of the male sex, as they are rendered inferior by neglected education, and by the weaknesses to which they are liable, in consequence of being called upon so imperatively to cultivate personal graces. If these intellects, then, can be reclaimed from trifles, and directed to solidly useful pursuits, I cannot see what evil can flow from it. Perhaps, in a very humble rank, any thing that would make a wife less willing to perform servile drudgery would be a decided evil. But what is there in the duties of women in the middle and upper ranks, that can be supposed incompatible with the cultivation of the intellect? It rather appears to me, that, in these ranks of life, every hour spent by women in mental exercise, is just so much waste time redeemed from idleness or folly.

NATURAL HISTORY.

"HE," says the great Linnæus, "who does not make himself acquainted with God from the consideration of Nature, will scarcely acquire knowledge of him from any other source; for if we have no faith in the things which are seen, how shall we believe those things which are not seen?"

One of the most useful lessons we derive from the study of Nature, is to know and acknowledge the Author of Nature, which is inculcated by the religion and morality of every civilised people. The history of the world shows that most nations have had some method of—what they considered—knowing the great Author of the Universe, and have had some particular reasons which they assigned for loving and reverencing him. In short, natural history, or the study of nature, may be reckoned as the parent of natural religion.

Without any consideration for that knowledge of the ALL-WISE which we derive from revelation, the study and reflection which arise from seeking after the wonders of what are termed *natural objects*, lead us to a knowledge of the Author of Nature. Every

step we advance in pursuit of these inquiries, the astonishing skill and contrivance manifested in his works, call forth our wonder and admiration of the superhuman power and wisdom displayed in the general system and particular contrivance of the world, and its various details.

For this reason, the knowledge of the Author of Nature, through his works, may be designated the universal religion, as the love of fitness, induced by a taste for facts, may be termed the universal morality. Neither of these interfere with the religion or morality of any particular country.

This, then, is the first and chief use of the study of Nature, which teaches us to look from Nature up to HIM who formed the universe, and who imparts the living principle to the lowest degree of animal existence.

An extensive knowledge of natural objects, either in individuals or in a nation, cannot exist without producing great and corresponding improvements in taste, literature, and in the elegant arts. A correct knowledge of natural objects will elicit greater accuracy in the delineation of them, both in the artist and the man of letters. It is well known that the public taste is gradually, nay rapidly improving as regards painting, sculpture, and architecture; and no inconsiderable portion of the improvement will be found to be attributable to the more correct representation of natural objects. This improvement has also extended itself to our manufactures, more especially to the figures printed on cotton, paper, and earthenware; the great superiority in these is acknowledged chiefly to consist in the more correct imitation of plants, animals, and general scenery.

What utility, pleasure, or instruction, can a reflecting people derive from the representations of beings which never had an existence—the imaginings of the heathens? It is indisputable, that no solid use is to accrue from beholding a hippogriff, a pegasus, a phoenix, a griffin, a dragon, and fifty more such fictitious animals, which have so long held sway in the ornamental parts of architecture. To the classical student, who knows nothing of the beauties of creation, these may call up certain associations, but they are looked at, thrown aside, and treated with contempt by the lover of nature. As natural history consists in an accumulation of facts, and to trace the *true character* of every object in Nature is the province and the delight of the disciples of Nature; so every thing which is detected as departing from the truth, must create rather disgust than pleasure in those who are accustomed to search after it.

The study of mineral substances is of the greatest importance, for we are by means of them led to the improvement of all the useful arts. What would civilised man be without iron? An acquaintance with the different strata which compose the earth's crust, enables us to detect the localities of coal and other useful minerals. Hence the importance of this species of knowledge in working mines and quarries; and an acquaintance with geology adds greatly to the interest of the traveller in passing through a country. It besides enables us to draw some deductions from the changes which have evidently taken place on the earth's surface.

Having said thus much of the utility of the study of Nature, we now turn to the pleasure to be derived from a pursuit of it. We must in the first place premise, that we consider all knowledge to be pleasure, as well as power, and that in the pursuit of pleasure, the reward obtained will be commensurate with the labour bestowed. These are facts which the reason and experience of ages have incontrovertibly established, and ought to be treasured up in the mind of every young person, as perpetual incitements to exertion.

From this, however, we would not wish the young student to imagine that very great mental exertion is required in the study of natural history; for the very reverse is the fact. The principal thing required is a good memory and a correct eye, both of which can be wonderfully improved by practice. It is the want of attention alone which makes the discrimination of objects *appear* a difficult task; for no sooner do we become acquainted with the trivial distinctions, than we are surprised to find how easy it is to recollect them; and things which appeared wrapt in mystery, now be-

come obvious and familiar to us. It is the mere want of knowledge of the plain and simple means pursued by the naturalist, that has all along prevented thousands from following this, one of the most delightful and instructive exercises of the reasoning faculties; and such are the charms which it carries along with it, that almost all who once enter upon the study become zealots.

It is our intention to introduce a series of essays containing elementary instruction in the different departments of the system of Nature, and rendered in language which can be understood by every body. A certain number of technical terms are, however, indispensable; but these can easily be acquired.

We have said, that want of attention alone makes the task of discriminating natural objects difficult, and we shall beg to be indulged in a very simple and familiar illustration of this fact.

There is scarcely a human being who is not acquainted with the general appearance of a sheep. We have looked upon hundreds of them hundreds of times, and yet, strange to tell, we have not acquired an intimate knowledge of their appearance; nor can we discriminate one from another, although they are as unlike each other as are individuals of the human race. Let one be picked out from a flock of five hundred, nay, even one hundred, and let us examine it for half an hour most attentively, and then set it at liberty again amongst its fellows; the chances are five hundred to one against us that we shall never be able again to find out the identical sheep. But let the experiment be tried with a shepherd, and he will, in a few minutes, detect the sheep, although set at liberty amongst thousands. And the shepherd requires no uncommon sagacity to be able to do so; for, on the contrary, there is scarcely a man exercising the calling who will not readily perform this easy task. So is it with the study of Nature; a little attention and experience will soon render any object familiar and comparatively simple.

The young student, who aspires to become a zoologist, a botanist, or a geologist, need not therefore be discouraged from attempting to obtain his share of the superior delight which scientific knowledge can afford, by the obstacles which, only in *appearance*, oppose the acquirement.

Every step in the pursuit produces a reward and gratification in exact proportion to the difficulty, and each advantage thus gained produces fresh excitement to proceed in the path of science. Let us draw our illustration from the vegetable kingdom. For example, every plant of which we acquire a knowledge by sight and name, so as to be able to recognise it in another locality, not only gives a distinct pleasure at first, but the pleasure is renewed and increased, when we meet it for the second and third time, probably under very different circumstances, either as relate to ourselves or to the plants. Thus, even the simple knowledge of their names, which enables us to communicate our ideas, although in an indistinct manner, brings with it sensations of a pleasurable kind, and often proves a source of the most interesting associations. But the pleasure we derive from a knowledge of the trivial names of plants, becomes greatly enhanced by more extended views regarding them, which are not strictly botanical. We are astonished when we study their geological relation in any particular district or country; their geographical distribution, relatively to the world itself, or their migration from one country to another; their connection with climate; their being domestic plants, which follow man in his improvement and change of soil, or wanderers seeking to inhabit distant and before uninhabited regions by their kinds, or by their being social, living, like man, in large communities; their abundance or rarity; their mode of propagation; their natural enemies or more kindly friends; and, lastly, their properties, functions, uses, and culture. It is in a knowledge of all these that real pleasure is experienced; and, as we acquire this knowledge, our desire to become still farther acquainted with them increases.

To know any natural object, however, does not merely consist in having seen it, or in recollecting its name. For we cannot be justly said to be acquainted with a plant till we know its rank in the vegetable kingdom, its structure and habits, with all the other circumstances above hinted at.

There is hardly a child who cannot at once name a ranunculus or tulip; but how few, even, who cultivate these deservedly admired productions of the garden, are aware that these two plants, however nearly they may be allied as fine flowers, are very different in point of rank in the scale of vegetable creation! They belong to separate fundamental divisions of plants, and the organisation of the one is much more perfect than that of the other. They display totally different characters of structure and physiological economy, from the seminal embryo through every stage to the perfect plant. The ranunculus belongs to a division of plants characterised by a reticulated or net-like structure in their parts. It will admit of portions of its leaves being broken, or cut off without impeding the remainder of the leaf in the performance of its functions; or, in other words, the leaf will continue to grow and arrive at a state of maturity, although deprived of a portion or limb. Now, the tulip belongs to a division, the structure of whose fibres are parallel, and will not admit of part of the leaves, more particularly their extremities, being cut off without impeding their functions, and, consequently, injuring the

present health of the plant, and affecting its vigour for the following year. Here, then, we have another example of the utility of natural knowledge; for any one who has paid the slightest attention to the anatomy or physiology of plants, will at once be able to know the distinctive structures of these two divisions; and if only a part of a leaf is presented to him, the division to which it belongs will immediately be detected by him, and, by consequence, the culture and general management of the plant, so far as regards its most important organs; for leaves are analogous to the lungs of animals. Thus we have the increased pleasure of not only knowing the plant by its name, but also its rank in vegetable physiology, and the manner in which its various functions are exercised.

One of the most extraordinary phenomena in nature is the endless variety of forms in the distinct species of animals, plants, and minerals; and still more wonderful are the infinite modifications of form in the same species. For it is our conviction, that, since the creation of the world down to the present time, there never have been two individuals of the same kind formed exactly alike in all their parts. This leads us naturally to an expression of our admiration of the works of Providence, in the words of the Psalmist, "O Lord, how manifold are thy works! in wisdom hast thou made them all!"

This idea is sublime, and however erroneous it may appear to those who have not deeply studied Nature, we firmly believe that it is nevertheless true. Let us illustrate this by another example from the vegetable kingdom. Behold the stately oak of the forest, spreading his branches afar on every side, who has reared and shed his millions of leaves for a series of hundreds of years, but never has produced two leaves exactly alike; and yet a general similarity of form has been and will be maintained to the end of time! Let any one who is sceptical on this point repair to the forest, and patiently examine every leaf which has clothed one of its largest oaks, and he will never be able to find two of them perfectly alike in size, shape, and particular structure; nay, he may extend his search to all the oaks of a forest, and he will discover that he has been seeking for that which, like the philosopher's stone, will never be found. So it is with all the works of creation, whether animate or inanimate, which strongly manifests the profound wisdom of the Creator and Preserver of the universe. One uniform and fundamental plan has been established, alike in its grand leading principles, but exceedingly varied in its detail. Let us for a moment suppose that all mankind were formed exactly similar. What would be the consequence? Endless monotony, confusion, and crime. The variety of form and intellect in the human species creates in us those varied sensations of pleasure which are derived from the admiration and love of one object beyond that of another for some real or fancied quality. If all were alike, the love of one particular object could not exist, and a disgusting monotony would every where surround us, and man would not know his own wife nor the child its parent; perpetual scenes of confusion would prevail, and crime could not be traced to its perpetrators. There would be a total want of those varied sentiments which hold their sway over the human heart, and from which emanates every thing that is pleasurable in existence. It has, however, pleased the Dispenser of good to order every thing otherwise; and we now behold the world one vast machine, infinitely varied in its parts, but all of them tending to the furtherance of one mighty design.

The study of Nature teaches us to discover, that, in the animal kingdom, there seems to be one great chain of being, from man down to the lowest scale of animated existence; and it is not impossible but this may prevail even through the vegetable and mineral kingdoms, although man has been hitherto unable to detect the connecting links.

Each shell, each crawling insect holds a rank
Important in the plan of Him who form'd
This scale of beings; holds a rank, which lost,
Would break the chain, and leave behind a gap
Which Nature's self would rue.—STILLINGFLEET.

Natural history is a study calculated in an especial manner for elevating the character of the labouring classes of society. Indeed it may be said to be a study which most labourers and mechanics are already engaged in, for their implements, and the material which they manufacture, are all derived from the field of Nature, and only modified by the experience of man from his knowledge of several qualities which appertain to each. Besides, it requires less preliminary information than almost any other branch of study; and even the humblest individual has within his reach the means of contemplating Nature in one form or another; and it is a much more rational manner of spending time than in dissipation, which debases the mind and undermines the constitution. While other branches of study have the effect of improving the reasoning powers of the mind, natural history may be said to improve and humanise the whole man. The intimate connection betwixt moral conduct and the love of animals and plants, will be thought intimate or remote according to the ideas of different individuals; but the more we consider and trace the design and purpose of the works of creation, shall we not sympathise the more with the fitness of man to the ends of human conduct? The deeper we enter into the details of nature, shall we not increase our relish for facts? which is nothing less than laying the foundation of justice and honesty.

Even those who have no knowledge of scientific zoology, derive great pleasure from their observations on the manifold variety in the forms, habits, and instincts of animals. And mankind are accustomed from these observations to transfer to some of the higher quadrupeds many of the virtues of humanity. We speak of the courage of the horse, the generosity of the lion, the sagacity of the dog, and the innocence of the lamb; we are delighted with the melody of the songsters of the grove; the industry of the bee holds up to man a useful lesson; the gay attire of the butterfly pleases us; and the noxious and disgusting appearance of various reptiles excites in us varied emotions. But all these are nothing when put in comparison with the pleasure derived by the scientific zoologist. He who can trace the varied degrees of power and intelligence imparted by the Supreme Being to animals, from intellectual man down to the lowest animalcule, and who knows scientifically that man is the most perfect of all animals, enjoys a degree of exalted pleasure which scientific knowledge alone can impart.

WILLIE OF WESTBURNFLAT.

ONE of the last border reivers of whom tradition preserves any account, was a personage of the clan Armstrong, who flourished within the beginning of the last century. After having made himself dreaded over the whole country, he at last came to the following end:—One —, a man of large property, having lost twelve cows in one night, raised the district of Teviotdale, and traced the robbers into Liddesdale, as far as the house of this Armstrong, commonly called *Willie of Westburnflat*, from the place of his residence, on the banks of the Liddell water. Fortunately for the pursuers, he was then asleep; so that he was secured, along with nine of his friends, without much resistance. He was brought to trial at Selkirk; and although no precise evidence was adduced to convict him of the special fact (the cattle never having been recovered), yet the jury brought him in guilty on his general character; or, as it is called in our law, habit and repute. When sentence was pronounced, Willie arose; and, seizing the oaken chair in which he was placed, broke it into pieces by main strength, and offered to his companions, who were involved in the same doom, that, if they would stand behind him, he would fight his way out of Selkirk with these weapons. But they held his hands, and besought him to let them *die like Christians*. They were accordingly executed in form of law. This was the last trial at Selkirk. The people of Liddesdale, who, perhaps not erroneously, still consider the sentence as iniquitous, remarked, that —, the prosecutor, never thrived afterwards, but came to beggary and ruin, with his whole family.

GRAMMACHREE MOLLY.

THE following note, containing evidence to prove that the celebrated air called "GRAMMACHREE MOLLY" was composed in Scotland, was drawn up in 1819, by the Right Hon. Sir John Sinclair, from the information of the aged individual alluded to, and who died in 1827, above a hundred years of age.

From the very style of the music, there is every reason to believe that this celebrated air was composed in Scotland; for it possesses all that tenderness and simplicity by which the Scottish songs are so peculiarly distinguished. That point, however, seems now to be established beyond the possibility of doubt, by the evidence that was given by a very old man, John Macdonald, who was born near Kingsburgh, in the Isle of Skye, in the year 1726, and who, on the 20th December 1819, was about ninety-three years of age when he gave the following evidence:—

John Macdonald remembers, when he was about twelve years old, having learnt that air, which, in Gaelic, is called "*Mhalic Cheag og*," from a native of Breadalbane, who went about singing songs; and he recollects distinctly having heard that air sung by him in the year 1738. The tune, he was informed, was owing to the following incident:—

During King William's wars on the Continent, soon after the Revolution, it was usual, at the end of the campaign, for both armies to retire into winter quarters; and numbers, both of the men and officers, got leave of absence to go home and see their friends. Among others who availed themselves of this privilege, was a young Highland officer, whose relations lived in the upper parts of Perthshire. He visited about in that district, and entertained his friends by talking of the battles in which he had fought, and the wonderful events he had witnessed; and he every where met with the most cordial reception. He was at last invited to the house of a gentleman who had an only daughter, whose beauty was the universal theme of admiration. He there, as usual, recited his martial feats, till, like Othello, he made an impression on the young lady, which the gallant soldier soon perceived, and he contrived to settle a plan with her for their eloping together at midnight. They got off unperceived; and having travelled several miles, they at last came to an inn, where they thought they might refresh themselves in safety. The enraged father, however, as soon as he had discovered his daughter's flight, assembled his men, and pursued them with such speed and eagerness, that he overtook them soon after they got into the inn. The lover, though he had nobody to support him, yet was determined not to yield up his

mistress; and being well armed, and an excellent swordsman, he resolved to resist any attack made upon him. When the party pursuing entered the inn, his mistress ran for protection behind him; and when he was defending himself and her with his sword, which was a very heavy one, and loaded with what is called a steel-apple (in Gaelic, *Uaghal an a-chlaibh**), in preparing for giving a deadly stroke, the point of the sword accidentally struck his mistress, then behind him, so violent a blow, that she instantly expired at his feet.

Upon seeing what had happened, he immediately surrendered himself, saying, "*That he did not wish to live, his earthly treasure being gone.*" When in prison, he composed both the air and the words; and the dreadful scene he had just witnessed, and of which he was the sole cause, would naturally call forth the most melancholy effusions of music and of poetry. He was executed the next day.

These events happened a number of years before John Macdonald first heard the air sung in the Isle of Skye, which was in the year 1738. It is also said that the loves of the unfortunate officer and his mistress are alluded to in the well-known song, "Will you go to Flanders, my Mally, O?"

THE RED MANTLE.—A PALE.

FROM THE GERMAN.

MANY years before the beginning of the thirty years' war, a young artizan of Bremen, travelling to perfect himself in his trade, entered a little market town not far distant from the frontiers of the Netherlands, one evening after a long day's journey. Every corner of the inn was already taken possession of by a caravan of waggoners; and the landlord, who thought, perhaps, he discovered something of the *landlouper* in his frank care-defying countenance, advised him, without much circumspection, to walk on to the next village. Our weary traveller had nothing for it but to take his bundle on his back again, muttering all the while curses on this hard-hearted publican between his teeth.

All of a sudden the host seemed to be seized with a fit of compassion. "Hark ye, my lad," he cried, "upon second thoughts, I think I can stow ye away for the night. There is room enough in the castle there; it is not inhabited, and I have the key." In this offer, which Frank (that was our hero's name) gladly accepted, there was, however, more of the show than the substance of kindness. The knavish host had suspected the nature of the stranger's complimentary expressions, and resolved to revenge himself by the agency of a roistering spirit which haunted the castle.

The residence of which he spoke stood upon an abrupt hill which overhung the town, straight before the door of the inn, from which it was separated only by the road and a small trouting stream. On account of its pleasant situation, it was still kept in repair and well furnished, and employed by its owner as a hunting-box. He used it, however, only in the day-time. As soon as the stars showed themselves, he marched out with all his attendants, to avoid the tricks played upon them at night by the ghost; for by day it was quiet enough.

The sun had gone down, and a dark night set in, when Frank reached the door of the old building under the guidance of mine host, who carried a good supper and a bottle of wine in a basket. He had also brought along with him two candlesticks and a pair of wax tapers; for as no one dared to await the approach of twilight in the castle, all such moveables had been discarded as useless. By the way, Frank cast more than one anxious glance at these costly preparations, for he remembered the low state of his finances. "The light in the lantern is enough to show me to bed, and I am too sleepy to be long of finding my way thither. By the time I awake, the sun will be up."

"I will not conceal from you," replied the host, "that there is a report of the castle's being haunted. But never fear; you see we are within call if any thing should happen. The household will be astir this whole blessed night; and, after all, I have lived in the place for thirty years, and never seen any thing. I have heard noises to be sure, but they must have come from the cats and mice in the granary. In case of the worst, however, I have brought these lights, for we know that ghosts always shun them."

It was no lie that he had never seen a ghost in the castle; for he had taken precious care never to set a foot in it after sunset. Even on this occasion, he kept on the safe side of the door, handing the victuals to his guest, describing the way to the state apartments, and galloping down hill to the imminent hazard of his neck. Frank stepped fearlessly into the deserted abode, firmly convinced that the story of the ghost was mere nonsense. He had been advised by a wise man, when he set out on his journey, never to believe more than one-half of what he heard, and experience had taught him to disbelieve the other.

Following the landlord's directions, he mounted a spiral staircase, and reached a door which he opened

with the key. A long sombre gallery, which echoed again to his sounding steps, brought him to a stately hall, out of which he passed by a side door into a suite of apartments, furnished with the utmost luxury and elegance. He selected for his bedroom the most cheerful, from the windows of which he looked down upon the inn, and could hear every word that was spoken there. He lighted his wax candles, set himself to supper, and ate with the relish and composure of a nobleman of Otaheite. The big-bellied bottle guaranteed him against thirst. As long as his teeth were busied, he never once thought of the ghost. If at some distant noise Timidity would cry "There it comes!" Courage instantly answered, "Nonsense! it's the cats and rats battling." But, during the half hour of digestion, Terror whispered three anxious suggestions in his ear, for one answer that Courage was able to frame.

He took care to shut and bolt the door before fear had completely mastered him, and sat down upon a seat in the bow-window. He opened the lattice, and in order to dissipate the thick-coming fancies that were creeping over him, he looked to the skies, examined the physiognomy of the moon, and counted how often the stars were snuffed.* The street beneath him was deserted, and, notwithstanding mine host's story of the nightly bustle in his inn, the door was shut, the lights were extinguished, and every thing was quiet as a churchyard. The night-watch blew his horn, and filled the whole air with his sonorous voice as he announced the hour—so directly under the window, that Frank might have held a conversation with him, for company's sake, if there had been any chance of the dignitary's venturing to abide a challenge from so suspicious a locality.

It may be a pleasing recreation to philosophise on the pleasures of solitude in a populous city, full of bustle as a bee-hive, to represent her as the loveliest playmate of man, exaggerate all her most winning features, and sigh for her embrace. But in her native home, in some deep wood, or old deserted castle, where desolate walls and vaults awaken horror, and nothing breathes the breath of life save the melancholy owl, she is by no means the most agreeable companion for the timid night-wanderer, especially if he is in momentary expectation of a visit from a ghost. In such a situation, a conversation with the watchman from the window may have more attractions than the perusal of the most pathetic eulogy of solitude. Had Mr Zimmerman chanced to find himself in our hero's situation, in Castle Rummelsburg, on the Westphalian frontier, he would have gained excellent hints for a much more interesting treatise on Sociality than that which, in all probability, some tiresome assembly set him to write about Solitude.

Midnight is the name of the hour at which the spiritual world awakes to life and activity, when grosser animal nature lies buried in deep slumber. Frank naturally preferred getting over that anxious period in his sleep; so he shut the window, made once more the round of the apartment, peeped into every nook and corner, snuffed the candles that they might give more light, and stretched himself upon the bed, which felt extremely soft to his weary limbs. He could not, however, fall asleep so soon as he wished. A slight palpitation of the heart, which he attributed to a degree of feverishness caused by the extreme heat of the day, kept him awake for a short time, which he employed in uttering a more earnest prayer than he had said for a long time. This exercise had its usual effect; it was followed by a sweet sleep. An hour might have elapsed, when he awoke with a sudden fright—nothing uncommon when the blood is fevered. He heard the clock strike twelve—an event which was immediately announced by the watchman to the whole town. Frank listened for a while, then turned himself warmly in bed, and was about to address himself again to sleep, when he heard, in the distance as it were, the creaking of a door, and immediately thereafter a heavy sound, as if it had been violently banged to. "O mercy, mercy!" thought he, "here comes the ghost. Pooh! it is only the wind." But the sound came nearer and nearer like the heavy tread of a man. There was a jingling accompaniment, as from a convict's chain or a porter's bunch of keys. It was no passing gust of wind; the blood rushed to his heart till it thumped like a smith's hammer.

The affair was now past a joke. Had terror allowed the poor terrified youth to recollect his treaty with the innkeeper, he would have rushed to the window and bawled lustily for assistance. As he was, however, too irresolute for such a decided measure, he betook himself to the mattress—the last refuge of the terrified—on the same principle that the ostrich thrusts its head into some thicket when it can no longer fly before the huntsman. But without, one door after another was opened and shut with a dreadful clatter. At last it came to the sleeping apartment. There was rattling and shaking at the door, many keys were tried; at last the right one was found, but still the bolt held; so a sturdy kick, which resounded in Frank's ears like a clap of thunder, was applied—away crashed the bolt, and the door flew wide to the wall. A tall thin man, with a black beard, in an antique costume, and with a gloomy expression of countenance, entered. His eyebrows were contracted into

an expression of sullen solemnity. He wore a scarlet mantle depending over his left shoulder, and a high peaked hat on his head. He crossed the chamber three times with a slow heavy tread, looked at the candles, and snuffed them. He then threw off his mantle, took from his side a barber's pouch, laid out the shaving apparatus, and drew his glittering razor busily along the strap he carried at his girdle.

Frank lay all this while sweating under the mattress, recommending himself to the Virgin's protection, and speculating regarding the comparative probability of this manœuvre having reference to his beard or his throat. To his unspeakable consolation, the spectre, having poured water out of a silver flask into a silver basin, whisked up a lather with his skinny hand, placed a chair, and solemnly beckoned the trembling spy upon his actions to come from his hiding place.

It was as impossible to remonstrate against this hint as for an exiled vizier to resist the angel of death, which the sultan sends after him in the shape of a bowstring. In such extreme cases, the most rational line of conduct is, of course, to yield to necessity, smile at the disagreeable joke, and acquiesce in the operation of strangling. Frank honoured the draft upon his obedience, threw away the mattress, sprang from the bed, and took his place upon the chair. Wonderful as this sudden transition from terror to resolution may appear, the editor of the Psychological Journal will no doubt be able to explain it in the turning of a straw.

The spectral barber tied a cloth round the neck of his trembling customer, seized comb and scissors, and clipped away at his hair and beard. He then soaped in the most scientific manner, first his chin, then his eyebrows, and finally the whole head, after which he shaved him from the crown to the throat, as bare as a skull. Having finished the job, he washed the head, dried it carefully, made his bow, tied up his apparatus, wrapped himself up in his cloak, and prepared to depart. Frank was not a little annoyed at the loss of his flowing locks, nevertheless he breathed more freely, for he felt as if the incubus had done all he was permitted to do.

It was so, indeed. Redmantle retired, dumb as he had approached—a most perfect contrast to his professional brethren of our day. He had not, however, advanced three steps towards the door, when he stopped, looked round with a woeful gesture at him he had shaved so well, and stroked his long black beard. He repeated the pantomime when he had reached the door. It now struck Frank that the poor ghost wished a favour at his hands, and a rapid association of ideas suggested that it might wish to be paid in kind.

As the ghost, notwithstanding his woe-begone expression of countenance, appeared more inclined for a jest than any thing serious, all fear had now left its victim. He resolved to obey the suggestion of his fancy, and beckoned to the spectre to assume the seat from which he had just arisen. It obeyed instantly, threw off its red mantle, placed the shaving apparatus on the table, and seated itself in the attitude of a man who wishes to get quit of his beard. Frank followed exactly the routine which had been observed in his case, clipped the beard and hair, lathered the whole head, his ghostship sitting the whole time as steady as a barber's block. The awkward wight was but a bad hand at the razor (he never before had touched one), so he shaved the beard against the hair, whereat the ghost made as strange grimaces as the ape of Erasmus, when he emulated his master in the self-infliction of the same delicate operation. The inexperienced blunderer began to feel strange, and thought of the proverb, "Let the shoemaker stick to his last." He put, however, a good countenance on the matter, and shaved the spectre as bald as himself.

Up to this moment the business had been conducted on the footing of a pantomime. "Stranger," said the unearthly being, with a graceful and cordial bow, "accept my best thanks for the service you have done me. Through your means am I at least freed from the long imprisonment within this withered and marrowless frame, to which my soul has been doomed on account of my misdeeds.

"Know that these walls were once inhabited by a reckless lord, who gratified his whims alike at the expense of clergy and laity. Count Hartmann was his name; he was no man's friend, acknowledged no law, no master, and was unrestrained in his humours even by the sacred laws of hospitality. He allowed no stranger, who sought the shelter of his roof, no beggar who came for charity, to depart without playing them some ill-natured trick. I was his barber, and the creature of his moods. It was my custom to inveigle every pious pilgrim who passed into the castle, and when he expected princely treatment, to shave him bald, and turn him with mockery from the door. Then Count Hartmann would look from his window, and see with delight how the viper's brood of village boys mocked the abused saint, calling him bald head. Then the old practical joker laughed till his huge belly shook again, and his eyes swam in tears.

One day there came a holy man from far away countries: he carried a heavy cross on his shoulder, and had, out of devotion, pierced his feet and hands with nails; his hair was trimmed so as to resemble the crown of thorns. He begged, in passing, for some water to his feet, and a bit of bread. I led him in, and, profane wretch that I was, shaved away his sacred circlet of hair. Then the pious pilgrim spoke

* The steel-apple was a piece of steel that ran on a wheel from the hilt to the top of the sword, and gave great additional force to the stroke. John Macdonald, many years ago, saw one of these at Lord Macdonald's house at Magstedt. The circumstance of the steel apple is a strong proof of the authenticity of the story, as it must have greatly added to the weight of the blow given by the sword, and consequently accounts for the fatal catastrophe.

* The meteors called shooting stars are, in the popular mythology of some districts of Germany, believed to be the snuff of the bright candles of the firmament, thrown away instead of being put into a pair of snuffers.

heavy curse over me. 'Know, evil doer, that after death, heaven and hell, and purgatory itself, shall alike be shut against thy soul. It shall haunt these walls, teasing every one as in life was thy pleasure, until some wanderer, more bold than his fellows, shall dare, undesired, to retaliate.'

I fell sick immediately, the marrow dried in my bones, and I withered away to the shadow you see. In vain did I wait for relief; for know, when the bond between life and the soul has been snapped, it longs, with a lover's longing, for the place of rest; and this intense passion turns its years to eternities. To my own torture was I now obliged to carry on the joke, which during my life was a source of pleasure to me. Alas! my mischievous pranks soon drove every human being from the house. At long intervals only some stray pilgrim would pass the night here. I served them all exactly as I have done you, but none of them dared return the compliment, and free me from my slavery. The castle is now freed from my nightly pranks—What a sleep I shall have! Again receive my thanks, young stranger. Were I the guardian of concealed treasures, I would freely yield them all to thee, but I was in my life nothing more than a poor harber. But listen to my prayer, and when you return to your home, get a couple of masses read for my soul's sake."

With these words he disappeared, having fully vindicated by his talkativeness his claim to the title of *ci-devant* barber to the noble master of Castle Rummelsburg. His liberator remained full of wonder at the strange adventure. He tried to persuade himself it was all a dream, but his bald pate was too decisive an argument to be called in question. Having made up his mind on this weighty matter, he crept back to bed, and, fatigued by his terror yet more than by his journey, slept like a top till next mid-day.

The treacherous landlord was stirring with the dawn, that he might not miss his opportunity of laughing in his sleeve at the stranger, under the pretence of condoling with him. By the time mid-day had arrived, he began to feel anxious; the ghost might have strangled the poor youth, or frightened him to death, and Boniface had never dreamt of stretching his revenge so far. He assembled the *posse comitatus* of his household, marched up to the castle, and made straight for the chamber, in the window of which he had observed the stranger's light burning. He found a strange old-fashioned key in the lock, but the door was barred within; this Frank had taken care to do immediately after the ghost's departure. Mine host drummed on the door with a hubbub of feet, hands, head and shoulders, that might have awakened the seven sleepers. Frank's first idea, which crossed him as he rubbed his eyes, was, that the barber had returned. As soon, however, as he heard the landlord's whimpering entreaty, that his guest would condescend to give a sign that he was alive, he collected himself, and opened the door.

The landlord clasped his hands above his head, with an affectation of astonishment. "By the whole regiment of saints! Redmantle" (the spectre was known among the inhabitants by this name) "has been here, and made a bald pate of you. I see now that the old story is no fable. Now, tell me, how did he look? what said he? and what has he done?" Frank, who saw through the speaker, replied: "The ghost resembled a man in a red mantle; what he has done, you see; and what he said, that I remember well. 'Stranger,' said he to me, 'trust no knavish landlord—the rascal down the way knew right well what was awaiting you. Farewell, I am quitting these quarters, for my time is out. I am now to change my character for that of a noiseless mischief-maker; and as for the landlord, I will tease him incessantly, nip his nose, pull his hair, sit on his breast like a night-mare, if he do not, in return for his treatment of you, allow free roof-field, and the run of his larder, until brown ringlets again twine themselves round your temples.'"

The host trembled at these words, made the sign of the cross in double quick time, and swore by the Virgin, to say nothing of a round dozen of saints whom he threw into the bargain, that he would board and feed our adventurer for nothing, so long as he chose to remain. He would have conducted him immediately to the inn, but Frank preferred the baronial apartments. A dare-devil from the town ventured to keep him company over night, and escaped the shaving, which in former days would have been his reward. The owner of the castle, rejoiced to find it once more inhabitable, gave directions that the stranger should be well cared for.

When the grapes began to colour, and the apples to blush, Frank's brown locks were again in a condition to be seen. He packed up his knapsack, and prepared for his departure. When he took leave of the landlord, that worthy led from the stable a stout roadster, duly caparisoned, which the lord of the manor presented to him, out of gratitude that he had driven the devil from his house. The gift was accompanied by a good fat purse, and, by their united aid, our hero in a short time reached his native town in good condition.—*Edinburgh Literary Journal.*

A SET-DOWN FOR CIGAR SMOKERS.—M'Nish, in his Anatomy of Drunkenness, has the following good remark:—"At the present moment smoking is fashionable, and crowds of young men are to be seen at all hours walking the streets with cigars in their mouths, annoying

the passengers. They seem to consider it to be manly to be able to smoke a certain number, without reflecting that there is scarcely an old woman in the country who could not beat them to nought with their own weapons, and that they would gain no sort of honour were they able to outsmoke all the burgomasters of Amsterdam. As the practice, however, seems more resorted to by these young gentlemen, for the sake of effect, and of exhibiting a little of the *haut ton*, than for any thing else, it is likely soon to die a natural death among them, particularly as jockeys and porters have lately taken the field in the same way, being determined that no class of the community shall enjoy the exclusive monopoly of street smoking."

SCOTTISH DUKES.

BUCCLEUCH.

THIS, though a most respectable, has no claim to be considered as an ancient family; nor has it figured much in history. Its first man of the least note was Sir Walter Scott, laird of Branksholm, and some other lands in Roxburghshire, in the middle of the fifteenth century. Previously, their principal estate was Murieston, in Lanarkshire; but Inglis of Branksholm having one day complained of the inroads of the English upon that border property, Scott offered him his Clydesdale estate in exchange, which was instantly agreed to. It is said, that, when the bargain was completed, Sir Walter drily remarked, that the Cumberland cattle were as good as those of Teviotdale, and instantly commenced a system of reprisals upon the English, which we shrewdly suspect to have been more than duly consolatory. Sir Walter Scott of Branksholm was one of the many gentlemen who rose upon the ruins of the Douglasses. He died about 1470, possessed of a great part of those pastoral lands in Selkirkshire and Roxburghshire, which still form the best part of the family property. His descendants, for several generations, were little better than *rovers*. The Sir Walter of Queen Mary's time was a zealous and conspicuous adherent of her interests. The day after the regent Morton was killed, he, and Kerr of Fernyherst, before they could have learned the fact by ordinary means, broke into the English border upon an expedition of reprisal. On being asked how he could venture upon such an outrage, so long as the Earl of Murray was regent, he said, "Tush, the regent is as cold as my bride-bit." It thus appears, that, like the Hamiltons and other partisans of Mary, he must have been privy to the design of assassinating Murray. His wife, who was reputed a witch, is the heroine of the Lay of the Last Minstrel. Their son, Sir Walter Scott of Buccleuch, performed the singularly perilous exploit of liberating a predatory dependent, of the name of Kinmont Willie, from Carlisle Castle, during the night. Being afterwards sent, by James VI., to make his peace with Queen Elizabeth, and asked by that princess how he could dare to do such an action, he answered, over his shoulder, drawing himself up haughtily, "Dare! what is there, madam, that a man may not dare?" The queen, who delighted in the exhibition of manly character, was much pleased with the reply. "With ten thousand such men," she said to a lord in waiting, "our brother of Scotland might shake the firmest throne in Europe." This bold baron was very active in quieting the borders after the union of the crowns. He draughted off a regiment of desperate outlaws, and carried them over to fight in the wars of Holland. For his services in this way, he received the first peerage of the family—that of Lord Scott of Buccleuch—in 1606. The locality of the title is a small recess in one of the minor vales of Selkirkshire, in which, according to tradition, the *vir primus* of family, a mere peasant, first won distinction by helping the king to kill a buck. Walter, the son of the first lord, became Earl of Buccleuch, in 1619, by the favour of James VI. Francis, the second earl, who added Dalkeith to the family property, was a zealous royalist, and, on that account, fined by Cromwell in no less than £15,000. At his death, in 1651, he left two daughters, Mary and Anne. The former, being one of the greatest matches in the country, instantly became the object of deep matrimonial intrigues. At the early age of eleven, she was united to Walter Scott, the son of a small border laird, and who afterwards became conspicuous, as Earl of Tarras, in the affair of Russell and Sydney. The event caused what would now be called a *great sensation*. The young countess, however, died in 1661, without issue, and the peerage descended to her sister Anne, who, at twelve years of age, was married (1663) to the Duke of Monmouth, the natural son of Charles II., who was then fourteen. Monmouth, on the day of his marriage, was created Duke of Buccleuch. Duchess Anne had six children by her husband. The affecting scene between her and the unhappy Monmouth, previous to his execution, is well known. It is said that James II., while he rigorously condemned his nephew to the scaffold, entertained, nevertheless, a strong degree of favour for the duchess, who, being very plain, has almost been suspected of a rather scandalous intimacy with that monarch. [James, it is well known, was said, by his brother, to select his mistresses for penance.] His majesty certainly restored all her estates. The widow of Monmouth died so lately as 1732. She had married a second husband; but, nevertheless, continued, to the day of her death, to keep up the state of a princess of the blood, being attended with

pages, served on the knee, and covered with a canopy in her room, where no one was allowed to sit in her presence. The late Duke Henry, grandfather to the present duke, was only second in succession from Duchess Anne. The family has not, during the last century, been in the least degree distinguished historically. It bears, however, a long descended character of true goodness and beneficence, which endears it to the bosoms of the common people. On the death of the Duke of Queensberry, in 1810, that title devolved upon the family of Buccleuch, through an ancestress, and both titles are now enjoyed by one person.

COMPULSIVE HOSPITALITY.—Mr Logan, in his work called "the Scottish Gael," treating of Highland hospitality, tells us of a chief who used to lie in watch at his house for travellers, with the purpose of entertaining them, and who, on finding any one unwilling to come in and be refreshed, used to say, that the fellow "must be a scrub at home himself!" As a still more striking exemplification of this extreme species of kindness, we mention that the lairds of Newtyle, in Forfarshire, used to keep cannon pointed to the road near by their old castle, so as to *compel* the wayfarers to come in and be regaled. It is also worth telling, that the lairds of Hangingshaw, in Selkirkshire, kept a large goblet, known far and wide as "the Hangingshaw Ladle," which they administered full of reaming ale to every person, of whatever degree, whether willing or unwilling, who entered the house. A circumstance still more in point is related regarding a former proprietor of Crichton Castle, in Edinburghshire. A stout baron with a goodly retinue having presumed to pass this person's gates without the usual homage of stopping to take refreshment, the Laird of Crichton mounted horse, with all his merry men, and, overtaking the recreant traveller, brought him back, and threw him, with all his attendants, into the massy mure of the castle. Afterwards, taking fear to himself for the result of such a strange exploit, he liberated the baron, and, planting him at table, endeavoured to restore him to good humour, by formally waiting upon him at meat.

A MARVELOUS STORY.—I was bred up in a dislike of the marvellous, or the stupid wonderful, as my uncle called it. I must relate an anecdote in point. Some gentlemen were dining together, and relating their travelling adventures; one of them dealt so much in the marvellous, that it induced another to give him a lesson. "I was once," said he, "engaged in a skirmishing party in America; I advanced too far, was separated from my friends, and saw three Indians in pursuit of me. The horrors of the tomahawk in the hands of angry savages took possession of my mind; I considered for a moment what was to be done; most of us love life, and mine was both precious and useful to my family; I was swift of foot, and fear added to my speed. After looking back—for the country was an open one—I at length perceived that one of my enemies had outrun the others, and the well-known saying of 'Divide and conquer' occurring to me, I slackened my speed, and allowed him to come up; we engaged with mutual fury—I hope none here (bowing to his auditors) will doubt the result—in a few minutes he lay a corpse at my feet. In this short space of time, the two Indians had advanced upon me, so I took again to my heels—not from cowardice, I can in truth declare, but with the hope of reaching a neighbouring wood, where I knew dwelt a tribe friendly to the English. This hope, however, I was forced to give up; for, on looking back, I saw one of my pursuers far before the other. I waited for him, recovering my almost exhausted breath, and soon this Indian shared the fate of the first. I had now only one enemy to deal with; but I felt fatigued, and being near the wood, I was more desirous to save my own life than to destroy another of my fellow-creatures. I plainly perceived smoke curling up amongst the trees; I redoubled my speed; I prayed to heaven; I felt assured my prayer would be granted; but at this moment the yell of the Indian's voice sounded in my ears—I even thought I felt his warm breath—there was no choice—I turned round—Here the gentleman who had related the wonderful stories at first grew impatient past his endurance; he called out, 'Well, sir, and you killed him also?' "No, sir—he killed me."—*Memoirs of a Gentleman of the Old School.*

SUPPLY OF WATER IN LONDON.—When men gather together in large bodies, and inhabit towns or cities, a plentiful supply of water is the first thing to which they direct their attention. If towns are built in situations where pure water cannot be readily obtained, the inhabitants, and especially the poorer sort, suffer even more misery than results from the want of bread or clothes. In some cities of Spain, for instance, where the people understand very little about machinery, water, at particular periods of the year, is as dear as wine; and the labouring classes are consequently in a most miserable condition. In London, on the contrary, water is so plentiful, that twenty-nine millions of gallons are daily supplied to the inhabitants; which quantity, distributed to about one hundred and twenty-five thousand houses and other buildings, is at the rate of above two hundred gallons every day to each house. To many of the houses this water is, by the aid of machinery, not only delivered to the kitchens and wash-houses on the ground floors, where it is most wanted, but is sent up to the very tops of the houses, to save even the comparatively little labour of fetching it from the bottom. All this is done at an average cost to each house of about twopence a-day; which is a less price than the labour of an able-bodied man would be worth to fetch a single bucket from a spring half a mile from his own dwelling. And how did the inhabitants of London set about getting this great supply of water, and, by so doing, render this vast place one of the most healthful cities in the world? As long ago as the year 1236, when a great want of water was felt in London, the little springs being blocked up and covered over by buildings, the ruling men of the city caused water to be brought from Tyburn, which was then a distant village, by means of pipes; and they laid a tax upon particular

branches of trade to pay the expense of this great blessing to all. In succeeding times more pipes and conduits, that is, more machinery, was established for the same good purpose; and two centuries afterwards, King Henry VI. gave his aid to the same sort of works, in granting particular advantages in obtaining lead for making the pipes. As this great town more and more increased, more water-works were found necessary; till, at last, in the reign of James I., which was nearly two hundred years after that of Henry VI., a most ingenious and enterprising man, and a great benefactor to his country, Hugh Myddelton, undertook to bring a river of pure water above thirty-eight miles out of its natural course for the supply of London. He persevered in this immense undertaking, in spite of every difficulty, till he at last accomplished that great good which he had proposed, of bringing wholesome water to every man's door. At the present time, the New River, which was the work of Hugh Myddelton, supplies thirteen millions of gallons of water every day; and though the original projector was ruined by the undertaking, in consequence of the difficulty which he had in procuring proper support, such is now the general advantage of the benefit which he procured for his fellow citizens, and so desirous are the people to possess that advantage, that a share in the New River Company, which was at first sold at one hundred pounds, is now worth fifteen thousand pounds.—*Results of Machinery.*

ERTHERS.—The meaning of the word *Wretch* is one not generally understood. It was originally, and is now in some parts of England, used as a term of the softest and fondest tenderness. This is not the only instance in which words in their present general acceptance bear a very opposite meaning to what they did in Shakespeare's time. The word *Wench*, formerly, was not used in that low and vulgar acceptance it is at present. *Damsel* was the appellation of young ladies of quality, and *Dame* a title of distinction. *Knave* once signified a servant; and in an early translation of the New Testament, instead of "Paul the servant," we read "Paul the knave of Jesus Christ." On the other hand, the word *Companion*, instead of being the honourable synonyme of Associate, occurs in the play of *Othello*, with the same contemptuous meaning which we now affix, in its abusive sense, to the word "Fellow;" for Emilia, perceiving that some secret villain had aspersed the character of the virtuous Desdemona, thus indignantly exclaims—

O Heaven! that such *Companions* thou'dst unfold
And put in every honest hand a whip,
To lash the rascal through the world!

WEAVING.—The vestments of the early inhabitants of the world discovered neither art nor industry. They made use of such as nature presented and needed the least preparation. Some nations covered themselves with the bark of trees, others with leaves, or bulrushes, rudely interwoven. The skins of animals were also universally used as garments, worn without preparation, and in the same state as they came from the bodies of the animals.* In process of time recourse was had to the wool of animals,† and this led to the further discovery of the art of uniting the separate parts into one continued thread, by means of the spindle; and this would consequently lead to the next step, the invention of weaving, which, according to Democritus, who flourished 400 years before Christ, arose from the art of the spider, who guides and manages the threads by the weight of her own body. That the invention of weaving was long prior to the time of Democritus, appears from the sacred writings.‡ This is evident also, from the answer which Abraham gave to the king of Sodom:—"I will not," said he, "take from a thread of the woof, even to a shoe-latchet, lest thou shouldst say, I have made Abraham rich."

Investress of the woof, fair Lina flings
The flying shuttle through the dancing strings,
Inlays the broider'd welt with flowery dyes,
Quick beat the reeds, the pedals fall and rise;
Slow from the beam the lengths of warp unwind,
And dance and nod the massy weights behind.

Chronology informs us, linen was first made in England, 1233. "Now began the luxurious to wear linen, but the generality woollen shirts." Table linen was very scarce in England, in 1386. A company of linen weavers, however, came over from the Netherlands in that year, after which it became more abundant.

BIOGRAPHIC SKETCHES.

SIR HUMPHRY DAVY.

HUMPHRY DAVY was born at Penzance, in Cornwall, on the 17th of December 1778. From his earliest years he evinced the possession of uncommon endowments. He was passionately enamoured of the muses; and at twelve years of age had actually completed an epic poem. Several of his poetical productions, which are still extant, and bear a later date, display rare fancy and surprising maturity of intellect. It is not at all to be wondered at, that the discoverer of the Safety Lamp should have been a poet in his youth. His splendid achievements in science were not more the result of a penetrating intellect, than a discursive imagination. It is pleasing to know, that in after years his first love was not forgotten, but that at intervals, when his mind relaxed from abstruse research, fancy, like the daughter of Ceres, was sometimes permitted to revisit her native bowers.

In 1795, Davy was articled to a surgeon and apothecary in Penzance. One of his first experiments, as far as can now be ascertained, was for the purpose of discovering the quality of the air contained in the bladders of sea-weed. His instruments were supplied by his own ingenuity. In the contrivance of apparatus and invention of expedients, he thus early evinced great proficiency; and in after years, it is allowed by the scientific world, that in this respect, as well as in

others, he stood altogether unrivalled. The most fortunate occurrence of his novitiate was his introduction to Mr Davies Giddy (afterwards Mr Gilbert), late president of the Royal Society. This worthy individual early appreciated the genius of Davy; and besides many other services which, at this period of the young philosopher's career, were of great importance to him, he procured his admission into the Pneumatic Institution of Bristol, as an assistant to Dr Beddoes, in the experiments of the laboratory.

In October 1798, Davy quitted Penzance for Bristol, having then scarcely attained his twentieth year. It was during his connection with Dr Beddoes that Davy pursued a series of the most hazardous experiments on record—those upon nitrous oxide.* He inhaled this gas literally at the risk of filling his lungs with aqua fortis. It was discovered that it acted in the first instance as a stimulus, giving rise to highly pleasurable sensations analogous to those experienced in the first stage of intoxication. Muscular power was increased, and an irresistible propensity to action was indulged in. Amongst those who were favoured with a draught of this "empyrean air," were the poets Southey and Coleridge, who have both described their sensations in glowing terms. An almost invariable effect of inspiring this gas, is a propensity to loud laughter. Mr Tobin, the brother of the dramatist, after inhaling it, started from his chair, struck, in good humour however, at those around him, and then ran wildly through the different apartments of the house. Like the wit of Sir John Falstaff, the laughter of these philosophers is the cause of laughter in others. There is something irresistibly ludicrous in the exhibition of a number of grave and gifted men, with silk bags (in which was contained the inspiring fluid), tied to their mouths, bellowing, stamping, and flying round the apartment, as if "all Bedlam or Parnassus were let out."

Davy, however, pushed his researches to extremity; and in breathing the gas in a concentrated state, aqua fortis was actually formed in his mouth! His attempts to breathe carburetted hydrogen (the gas used in lighting the streets), and also carbonic acid gas, or fixed, were equally daring and terrific. The eclat which followed the publication of these investigations spread the fame of the young philosopher. At this period the Royal Institution had just been formed; and Davy was invited to take the situation of assistant professor of chemistry, and director of the laboratory. He accepted that offer; and on the 11th of March 1801, entered upon the scene of his future glory and triumph.

Only a few weeks had elapsed in this new sphere of exertion, when he was appointed by the managers lecturer in chemistry, instead of assistant. His first lecture was delivered in 1802, and from this period we may date the commencement of his splendid career. He at once succeeded in making a strong impression upon the public mind, and by a series of brilliant and unrivalled discoveries he was enabled to maintain it to the hour of his death. His discourses were admirably adapted to fascinate his audience, which was composed, not of philosophers alone, but the gay and fashionable of the city, a considerable proportion of whom were ladies in the highest walks of life. His experience, particularly with the voltaic battery, an instrument with which he was destined to work such miracles, rivetted universal attention; philosophers admired and applauded, and the softer sex were involved in the most agreeable terrors. His style was highly florid. It largely partook of that poetical inspiration, which, as has been already stated, he so early evinced the possession of. Coleridge the poet was a constant attendant on the lectures, and has himself declared it was to increase the stock of his metaphors. The goddess of science was divested of all austerity of aspect, and arrayed in the smiles and fascinating attire of the graces. So great was Davy's popularity, that duchesses vied in doing homage to the young scientific Hercules; compliments, invitations, and presents, were showered upon him from all quarters, and no entertainment was considered complete without the presence of the chemical lecturer. All this adulation had its usual effect upon the mind of Davy: his devoted love of science remained unabated to the day of his death; but that simplicity of manners, which he brought with him from the country, and which so endeared him to his friends, was lost to himself and them for ever.

In 1803 he commenced a series of lectures on agriculture, which were continued for several years. These were afterwards published in a collected form, and they are considered as forming the most philosophical and valuable work upon the subject which has ever appeared. In the same year he was elected a fellow of the Royal Society. From this period until 1807, he continued to increase in popularity, making at intervals discoveries which would entitle humbler investigators to an honourable place in the annals of science, but need scarcely be noticed in a life of Davy. His leisure months were spent in the country, sometimes encircled by his relations in the bosom of his native hills, at other times at the seats of noblemen and others; for all ranks delighted to honour him; but wherever he went, angling was his amusement. Of this humble recreation he was as passionately attached as Isaac Walton himself; and frequently in

* To those unacquainted with chemistry, it is necessary to explain, that nitrous oxide is a gas, which, when breathed by animals, destroys life in a short time, and that it is nearly the same as aqua fortis.

company he would, with more satisfaction, boast of his triumph over a large salmon, than of having discovered the safety lamp.

We have now arrived at that period of his brilliant career when he effected those sublime discoveries which have crowned his name with a "peculiar diadem," and associated it with the great master-spirits of every age and country. We allude to his development of the *Laws of Voltaic Electricity*. At the time when Davy delivered his celebrated Bakerian lecture, the subject was involved in great confusion. The most contradictory theories had been repeatedly proposed, and as often abandoned, both in England and on the Continent. The phenomena exhibited by the operation of galvanic agency were certainly most perplexing; and hence the greater honour is due to the powerful genius who called from the chaos of isolated facts a system of beauty and order. But in a limited biography like the present, it is impossible to give a detail of the exact situation in which affairs stood at this eventful period. It is sufficient to say, that Davy brought this department of science to a state of almost absolute perfection. Nay, he may be said to have created, in the same way as Newton is allowed to have explained, the true theory of the universe. Previous philosophers had cleared the way for both—had even obtained a glimpse of the promised land; but it was not their destiny to reach it. Davy opened up a new path for the enterprise of philosophers—a new method of philosophising. He had extorted from reluctant nature the magic word—the sesame—at the mention of which her long-cherished secrets were to be revealed; and the illustrious chemist himself was the first to profit by it, and enrich science with the discovery of new treasures.

Great as was the effect produced in England by this astounding lecture, it was not equal to the impression which it made upon the savans in Paris. Some idea of this may be formed from the circumstance, that it was crowned by the Institute of France with the prize of the First Consul, and that at a time when the nations mutually entertained the bitterest hostility towards each other, and were at open war. The prize here awarded was one founded by Napoleon, when First Consul, for important discoveries in electricity and galvanism.

Having discovered the general principle of voltaic electricity, he proceeded in his investigation of phenomena; and the result was the brilliant and startling discovery that the fixed alkalies have metallic bases. It is well known, that, amongst other substances, potash and soda are in chemical language called alkalies. The former of these substances was submitted to the agency of a galvanic battery, and, by a variety of ingenious expedients, he succeeded in decomposing it, and obtaining as one of its constituents small globules of metal resembling quicksilver. Some of these no sooner appeared than they burned with an explosion of bright flame. The difficulty of collecting this new and singular metal was great, from the strong attraction it has for oxygen, one of the gases of which air and water are composed; but, after various trials, he ultimately accomplished his object. Its external character is that of a white metal, instantly tarnishing by exposure to air. It received from its discoverer the appropriate name of *potassium*. When thrown upon water, it decomposes that fluid, combining with its oxygen, and an explosion is produced, accompanied with a vehement flame. If ice be substituted for water, potassium burns with a bright rose-coloured flame, and a deep hole is made in the ice, which is found to contain a solution of potash. The latter substance, then, is a metallic oxide. Soda, and other alkalies, underwent the same rigorous investigation, and with a similar result. Thus, then, the genius of Davy had accomplished what had long baffled the ingenuity of all the philosophers in Europe. The alkalies had been tortured in every possible manner, but in vain. The English philosopher, like his illustrious countryman Newton, called in new powers and new resources to his aid when the old failed, and Nature, thus cross-examined, at once revealed the truth.

It may easily be conceived with what astonishment and delight these extraordinary discoveries were received. The laboratory of the Institution was continually crowded with persons of every rank. All parties contended for the honour of his company at dinner, and the voice of the siren he had not philosophy enough to resist. On his return in the evening, his labours were resumed, and continued till three o'clock in the morning. The consequence of such application was a severe fever, which nearly proved fatal. Fortunately for the world, he at last recovered, and set off with renovated vigour, in his career of discovery. His attention was next directed to the earths, and while in the midst of his investigations, he received a communication from the chemist Berzelius, of Stockholm, informing him of a method of decomposing them. He repeated the experiments with complete success, and embodied them in a Bakerian lecture.

Let us pause a moment, and contemplate the value of such discoveries as the decomposition of the alkalies and earths. They have changed the history of the science, and opened up to our admiration new and important views of the secret workings of Nature. From a more lofty elevation the philosopher can now embrace in his glance a wider horizon, diversified with new and wonderful phenomena. It is

* Lucræti, lib. vi. 1011.

† Genesis, xxxi. 19, and xxxviii. 12, 14.

‡ Ibid. xiv. 23.

probable that they may ultimately lead to a new theory of geology. A flood of light has been reflected upon that science, inasmuch as it has been shown that agents hitherto unknown may have operated in the formation of the rocks and earths. That the phenomena of volcanoes, lavas, and subterranean heat, have also been placed in a clearer point of view, it is only necessary to introduce an account of an artificial volcano constructed by Davy. "A mountain," says an eye-witness, "had been modelled in clay, and a quantity of the metallic bases introduced into its interior: on water being poured upon it, the metals were soon thrown into violent action—successive explosions followed—red-hot lava was seen flowing down its sides from a crater in miniature—mimic lightnings played around—and, in the instant of dramatic illusion, the tumultuous applause and continued cheering of the audience might almost have been regarded as the shouts of the alarmed fugitives of Herculaneum or Pompeii."

Various other investigations engaged his attention, the principal of which was regarding the nature of chlorine, and this he determined was a simple gas, by a variety of admirable experiments. In the years 1810 and 1811, he was invited to Dublin to deliver lectures on chemistry, and other scientific subjects. In 1812 he published his *Elements of Chemical Philosophy*, the most valuable record of discovery which has ever appeared since the *Principia* of Newton. The same year he married Mrs Apreece, who brought him a large fortune. A day or two previous to this event he was knighted, the first who received the honour from the Prince Regent.

We must pass over his visit to the Continent, and other matters of comparatively trifling moment, and hasten to give an account of the safety lamp—one of the most important benefits that ever science bequeathed to humanity.

A few months after Sir Humphry Davy's return to England, his attention was called to the subject of those terrible explosions of inflammable air, or fire-damp, in coal mines, which were then of frequent occurrence. He accordingly, with great alacrity, commenced an investigation into the nature of this gas, and in an incredibly short space of time he had invented no less than four different kinds of lamps, all of which might be used with impunity in the foulest atmosphere. To explain the subject simply, it may be stated, that in the course of his researches upon the subject, he made the following discovery—that if a lamp or candle is surrounded with wire gauze, or metallic plates, perforated with numerous small holes, though the gas or fire-damp may explode within, it will not inflame the surrounding atmosphere without. Upon this principle, accordingly, the safety lamp was formed; and it is needless to say, that it has completely answered the purposes for which it was invented. Sir Humphry also discovered, that if a coil of platinum wire be suspended over the wick of the lamp, although the latter should be extinguished, the former will glow with a light sufficiently strong to guide the miner through the darkness of his perilous employment, and that when he reaches a purer atmosphere, the heat will be sometimes sufficient to rekindle his lamp! He was led by these researches into some important results regarding the nature of flame; but they are of too abstruse a character to be here introduced.

In the year 1818, Sir Humphry took his departure for Naples, in order to examine the papyri of Herculaneum, and, if possible, discover some method of separating the leaves from each other. His efforts, however, failed, not from want of zeal or ingenuity on his part, but from the state in which the manuscripts were found. He returned to England, and was elected president of the Royal Society. On the 30th November 1820, he took his seat in the chair of Newton.

It will be impossible to enumerate all the objects of inquiry which attracted the attention of this indefatigable philosopher during the remainder of his life. The most important was that regarding the corrosive action of sea-water upon copper. He commenced his investigations in 1823, and prosecuted them for a considerable period. The truth of his beautiful theory was established; but, strange to say, the remedy failed. There can be little doubt, however, that, had his health continued, he would ultimately have succeeded. But disease began to set its seal upon his frame, and distract his attention from grave studies. He had recourse to his favourite piscatory pursuits, and published a work upon the subject, entitled, "*Salmonia*," one of the most agreeable books ever written, combining profound philosophical reflection with beautiful description and interesting anecdote.

In 1828, he took his departure for the Continent, in hopes that a milder climate would have some favourable effect upon him; but health was petitioned in vain—he was destined never to return. The lamp of genius, however, burned bright to the last, as his "*Consolations in Travel, or Last Days of a Philosopher*," amply evince. This is an extraordinary production, notwithstanding a certain wild extravagance of fancy. It has been truly said by a great poet, that, had not Davy been the first philosopher, he would have been the first poet of his day. He continued for some time at Rome, and afterwards proceeded to Geneva, where he expired, on the 29th of May 1829. He died without issue.

The benefits which science and mankind at large have derived from the labours of Davy, it is impossible to calculate, or to speak of in the cold language of

philosophy. He is not only the greatest chemist that ever appeared in the world, but, in importance and practical utility, as well as in splendour, his discoveries probably surpass those of all preceding investigators in this branch of science. In proof of this, we need do no more than simply allude to his researches with regard to voltaic electricity and the safety lamp. In investigating both these subjects, he not only displays an ingenuity and tact which appears able to meet every exigency, but a sagacity which seems infallible—an instinct for truth which cannot err. To all who are in the pursuit of science, his works should form a *vade mecum*, not only for the discoveries they contain, but for learning the true method of interpreting Nature.

THE SCENERY OF THE OHIO.

THE heart must indeed be cold that would not glow among scenes like these. Rightly did the French call this stream *La Belle Rivière* (the beautiful river). The sprightly Canadian, plying his oar in cadence with the wild notes of the boat-song, could not fail to find his heart enlivened by the beautiful symmetry of the Ohio. Its current is always graceful, and its shores every where romantic. Every thing is here on a large scale. The eye of the traveller is continually regaled with magnificent scenes. Here are no pigmy mounds dignified with the name of mountains; no rivulets swelled into rivers. Nature has worked with a rapid but masterly hand; every touch is bold, and the whole is grand as well as beautiful; while room is left for art to embellish and fertilise that which nature has created with a thousand capabilities. There is much sameness in the character of the scenery; but that sameness is in itself delightful, as it consists in the recurrence of noble traits, which are too pleasing ever to be viewed with indifference; like the regular features which we sometimes find in the face of a beautiful woman, their charm consists in their own intrinsic gracefulness, rather than in the variety of their expressions. The Ohio has not the sprightly, fanciful wildness of the Niagara, the St Lawrence, or the Susquehanna, whose impetuous torrents, rushing over beds of rocks, or dashing against the jutting cliffs, arrest the ear by their murmurs, and delight the eye with their eccentric wanderings. Neither is it like the Hudson, margined at one spot by the meadow and the village, and overhung at another by threatening precipices and stupendous mountains. It has a wild, solemn, silent sweetness, peculiar to itself. The noble stream, clear, smooth, and unruffled, sweeps onward with regular majestic force. Continually changing its course, as it rolls from vale to vale, it always winds with dignity, and, avoiding those acute angles which are observable in less powerful streams, sweeps round in graceful bends, as if disdaining the opposition to which Nature forces it to submit. On each side rise the romantic hills, piled on each other to a tremendous height; and between them are deep, abrupt, silent glens, which at a distance seem inaccessible to the human foot; while the whole is covered with timber of a gigantic size, and a luxuriant foliage of the deepest hues. Throughout this scene there is a pleasing solitariness, that speaks peace to the mind, and invites the fancy to soar abroad among the tranquil haunts of meditation. Sometimes the splashing of the oar is heard, and the boatman's song awakens the surrounding echoes; but the most usual music is that of the native songsters, whose melody steals pleasantly on the ear, with every modulation, at all hours, and in every change of situation. The poet, in sketching these solitudes, might, by throwing his scene a few years back, add the light canoe, and war-song of the Indian; but the peaceful traveller rejoices in the absence of that which would bring danger, as well as variety, within his reach.—*Hall's Letters from the West.*

MILITARY PUNISHMENTS.—With respect again to the modes of enforcing discipline in our standing armies, we would willingly draw a veil over them, which no hand should be permitted to raise till it could be lifted on the system recently introduced. There is no gratification in describing such punishments as picketing, riding the wooden horse, flogging till the wretched criminal almost died under the lash, or any other of the barbarous inflictions which our English soldiers owed to the tyranny of their German masters. Far more satisfactory is it to learn that the wisdom and good feeling of later times have laboured to infuse among soldiers a sense of honour, which renders 100 lashes more painful to the prisoner than 1000 were to his precursor in crime.—*Lardner's Cyclopædia.*

MOURNING.—Mourning among the ancients was expressed by very different signs, as by tearing their clothes, wearing sackcloth, laying aside crowns and other ensigns of honour. Thus Plutarch, in his life of Cato, relates, that, from the time of his leaving the city with Pompey, he neither shaved his head, nor, as usual, wore the crown or garland. A public grief was sometimes testified by a general fast. Among the Romans, a year of mourning was ordained, by law, for women who had lost their husbands. In public mourning, the shops of Rome were shut up; the senators laid aside their laticlavian robes, the consuls sat in a lower seat than usual, and the women put aside all their ornaments.—The colours of the dress, or habit, worn to signify grief, are different in different countries. In Europe, the ordinary colour for mourning is black; in China it is white, a colour that was the mourning of the ancient Spartan and Roman ladies; in Turkey, it is blue, or violet; in Egypt, yellow; in Ethiopia, brown; and kings and cardinals mourn in purple.

—Every nation and country gave a reason for their wearing the particular colour of their mourning: black, which is the privation of light, is supposed to denote the privation of life; white is an emblem of purity; yellow is to represent, that death is the end of all human hopes, because this is the colour of leaves when they fall, and flowers when they fade; brown denotes the earth, to which the dead return; blue is an emblem of the happiness which it is hoped the deceased enjoys; and purple, or violet, is supposed to express a mixture of sorrow and hope.—The custom of mourning for the dead in shrieks and howlings, is of great antiquity, and prevails almost universally among the followers of Mahomet.

THE AYRSHIRE SCULPTOR.

It is universally agreed upon among men of taste that sculpture is only calculated for the representation of some precise object or objects, which, in themselves (that is, without any accompanying objects), produce an effect upon the mind of the spectator. It is also asserted that no object is worthy of being thus copied in its external form, unless it be of a highly sentimental character, either in point of beauty, or heroic manliness, or some other, and perhaps severer, grace. Dr Adam Smith discusses this subject in his "*Theory of Moral Sentiments*," and instances, by way of illustration, that a kitchen-dresser, covered with dead game and fish and flesh, though it might make a capital picture, is an unfit subject for sculpture.

This theory is perhaps not to be controverted, but yet it is liable to some occasional exceptions. In the year 1828, a stone-mason in Ayrshire, without any education in the art of sculpture, produced two figures of a homely character, which, though thus totally different from the usual subjects of the art, were very generally admired. His figures, which were of the size of life, represented two characters in Burns's poems—*Tam o' Shanter* and *Souter Johnnie*; and they have since been exhibited with applause, not only in Scotland, where they were apt to be most appreciated, but in every quarter of the United Kingdom. As some notice of this untaught artist and his works may be useful in encouraging the efforts of native and untutored genius in other minds, we reprint the following article from a late periodical work, by permission of its author—a gentleman who has made sculpture and painting his particular study for many years.

James Thom, the sculptor of these wonderful figures, is a native of Ayrshire, and of respectable parentage, near Tarbolton. Although, like those of his countryman and inspirer, his relatives were all engaged in agricultural pursuits (his brothers, we understand, possess large farms), the young man himself preferred the occupation of a mason, and was accordingly apprenticed to a craftsman in Kilmarnock. This profession was probably selected as offering the nearest approach to the undefined workings and predilections of his own inexperienced mind, since he was not, as in the instance of several sculptors of eminence, thrown first into the trade of a stone-mason by the force of circumstances. This would appear from his showing little attachment to the drudgery of the art: accordingly, his first master is understood to have pronounced him rather a dull apprentice. From the beginning, he seems to have looked forward to the ornamental part of his calling; and in a country town where there was little or no opportunity of employment in that line, to those more immediately concerned he might appear not so useful as a less aspiring workman. The evidences of young Thom's diligence and talent at this time, however, still remain in numerous specimens of carving in stone, which he himself considers, we are told, as superior to any thing he has yet done. The seeming errors which even the greatest men have made in the estimate of their own powers, have been commented upon as proverbial truisms. The causes of these apparent miscalculations have, however, not been taken into account. The artist or the author alone fully knows the difficulties encountered in the execution of any design—the triumphs he achieved over his own mind and means—the obstacles, both external and intellectual, which he had to remove.

His term of apprenticeship being expired, Mr Thom repaired to Glasgow in pursuit of better employment. Here his merits were immediately perceived, and so well rewarded, that his wages were considerably higher than the ordinary rate.

In his present profession, Mr Thom's career may be dated from the commencement of the winter of 1827. Being employed at this time in the immediate neighbourhood, he applied to Mr Auld of Ayr, who afterwards proved his steady and judicious friend, for permission to take a sketch from a portrait of Burns, with the intention of executing a bust of the poet. This is a good copy of the original picture by Mr Nasmyth, and is suspended in the very elegant and classical monument, from a design by Mr Hamilton, erected to the memory of the bard on the banks of the Doon, near "Alloway's auld haunted kirk." The permission was kindly granted; doubts, however, being at the same time expressed, how far the attempt was likely to prove successful, Mr Thom not being then known in Ayr. These doubts seemed to be confirmed, on the latter returning with a very imperfect sketch, taken by placing transparent paper on the picture. These occurrences happened on the Wednesday, consequently nothing could be done till Thursday, when materials were to be procured, and other

arrangements made, before the work was absolutely begun. The surprise then may be conceived, on the artist returning on the Monday following with the finished bust. In this work, though somewhat defective as a likeness, the execution, the mechanical details, and the general effect, were wonderful, especially when viewed in connection with the shortness of the time, and the disadvantage of being finished almost from memory—the very imperfect outline already mentioned being the only external guide. It was this general excellence that encouraged the proposal of a full-length figure—a proposal to which the artist gave his ready assent, stating that he had wished to undertake something of the kind, but did not consider it prudent, without any prospect of remuneration, to hazard the expense both of the block of stone and the loss of time. On this, Mr Auld offered to procure any stone from the neighbouring quarries which the artist might judge fit for his purpose. Several days elapsed in this search; in the meantime, the matter was rather laughed at than encouraged; and some apprehensions of failure and exposure to consequent comments being expressed, "Perhaps," said the artist, endeavouring to re-assure his friends, "I had just better try my hand at a head, as a specimen o' Tam." This being agreed to, he returned to Crosby churchyard, where he was then employed upon a gravestone. The day following happened to be one of continued rain; and finding that the water filled up his lines—probably, too, thinking more on "Glorious Tam" than on the *memento mori* he was attempting to engrave—our artist resolved to take time by the forelock, and to set about the "specimen head" directly. Accordingly, pulling from the ruins of the church of Crosby a rabat of the doorway, as a proper material for his purpose, he set himself down among the long rank grass covering the graves, and in that situation actually finished the head before rising. Nay, more, although the day has been described to us "as a downright pour," so total was his absorption in the work—so complete his insensibility to every thing else, that he declares himself to have been unconscious of the "rattling showers," from the moment he commenced. Such is the power of genuine and natural enthusiasm in a favourite pursuit. This head, which contained, perhaps, more expression than even that of the present figure, decided the matter. Next day, the block requisite for a full-length of Tam o' Shanter was brought into Ayr, a load for four stout horses, and placed in a proper workshop, within Cromwell's fort.

It may be interesting to mention a few particulars of the manner in which these figures have been composed and finished. "Tam" was selected by the artist as a subject for his chisel. The figure is understood to bear a strong traditional resemblance to the well-known Douglas Graham, some forty years ago a renowned specimen of a Carrick farmer, and who, residing at Shanter, furnished to Burns the prototype of his hero.

—Souter Johnnie,
His ancient, trusty, drouthie cronie,

is said to be a striking likeness of a living wight—a cobbler near Maybole; not that this individual sat for his portraiture, but that the artist appears to have wrought from the reminiscences of two interviews with which he was favoured, after twice travelling "some lang Scots miles," in order to persuade the said "souter" to transfer his body, by means of his pair of soles, from his own to the artist's studio. The bribe of two guineas a-week, exclusive of "half-mutchkins withouten score," proved, however, unavailing, and the cobbler remained firm to the last. By this refusal, "the birkie" has only become poorer by the said couple of guineas, and certain "half-mutchkins drouthier," for so true has the eye of the sculptor proved, that every one is said instantly to recognise the cobbler's phiz and person. A strange perverseness, indeed, or fatality, or what you will, seems to have seized upon all the favoured few selected as fitting archetypes for these admirable figures. For Tam's "nether man" occasioning some anxiety in the perfecting of its sturdy symmetry, a carter was laid hold of, and the *gamashins* being pulled on for half an hour, Tam's right leg was finished in rivalry of the said carter's supporter. It appears to have been agreed upon that he should return at a fitting opportunity, having thus left Tam "hippling;" but, in the interval, the story of the sitting unfortunately taking air, and the soubriquet of "Tam o' Shanter" threatening to attach to the lawful and Christian appellations of the man of carts, no inducement could again bring him within the unhallowed precincts of our sculptor's workshop. In like manner, though at a somewhat later period, while the artist was engaged upon the figure of the landlady, no persuasion could prevail upon one of the many "bonny lasses" who have given such celebrity to Ayr, to exhibit even the "fitting of their pearlins" to Mr Thom's gaze. One sony damsel, on being hard pressed to grant a sitting, replied, "Na, na, I dinna want to be nicknamed 'landlady'; and as for gudewife, twa speerings maun gang to that name."

It will doubtless excite the admiration of every one in the slightest degree conversant with the arts, that these figures, so full of life, ease, and character, were thus actually executed without model, or drawing, or palpable archetype whatsoever. The artist, indeed, knows nothing of modelling; and so little of drawing, that we question if he would not find difficulty in making even a tolerable sketch of his own work. The

chisel is his modelling-tool—his pencil—the only instrument of his art, in short, with which he is acquainted, but which he handles in a manner, we may say, almost unprecedented in the history of sculpture. This, however, is yet the minor part; for we think, nay, are sure, we discover in this dexterity of hand, in this unerring precision of eye, in this strong though still untutored conception of form and character, the native elements of the highest art. These primordial attributes of genius, by proper culture, may do honour to the country and to their possessor. At all events, instruction will refine and improve attempts in the present walk of art, even should study be unable to elevate attainment to a higher. Now, however, it would be not only premature, but unjust, to criticise these statues as regular labours of sculpture. They are to be regarded as wonderful, nay, almost miraculous, efforts of native, unaided, unlearned talent—as an approach to truth almost in spite of nature and of science; but they do not hold with respect to legitimate sculpture—the high-souled, the noblest, the severest of all arts—the same rank as, in painting, the works of the Dutch masters do as compared with the lofty spirits of the Romans; precisely for this reason, that while similar subjects are not only fit, but often felicitous, subjects for the pencil, they are altogether improper objects of sculptural representation.

[During nearly four years which have elapsed since these remarks were written, Mr Thom has diligently applied himself to drawing, modelling, and other requisites of his art, having settled in Ayr as a professional stonecutter. Here his studio is the resort of all intelligent strangers who visit this ancient and beautiful burgh; while his modest manners and moral worth have conciliated the respect of every one. The works executed during this period consist of numerous sculptures, from a "head-stane" upwards; but his fame rests chiefly upon the group of "Tam" and his associates. The character of the landlady is well sustained, as the buxom bustling head of a well-frequented "changehouse." Her lord and master, on the other hand, is represented as one who has little to say in his own house, and better qualified to drink, than to earn his pint. The former seems by no means disinclined to reciprocate glances with Tam; while the latter is so convulsed with laughter at the souter's stories, as to be hardly capable of maintaining the equipoise of the foaming tankard in his hand. Neither, however, is equal in graphic truth and humour to their two companions. A more gigantic, but by no means so happy a work, is the statue of the Scottish Patriot, lately placed in a niche of the New Tower, just erected in Ayr, on the site of the ancient "Wallace Tower" of Burns. In fact, we regard this figure as nearly a failure. It possesses neither the truth of nature, nor the dignity of ideal representation. Omitting others of less moment, we shall pass to the most perfect of all Mr Thom's works—the figure of "Old Mortality." This, though only a model, and not yet, we believe, even commissioned in stone, offers by far the most striking evidence of genius in its author. The costume, attitude, and expression of the old man, as he is represented sitting upon a gravestone, which he has been occupied in cleaning, are most admirable; and perhaps no artist ever more completely realised the exquisite conception of the original mind. The history of this composition supplies a striking instance of the power of genius over spirits of a congenial stamp, and of the singular coincidences which sometimes take place in its manner of conceiving the same sentiment. During a voyage to London, in a Leith steam-packet, Mr Thom one day found in the cabin Sir Walter's delightful tale of Old Mortality, which he had never read. Taking it up, he quickly became entirely engrossed in the narrative. The description of the old man, to whom posterity is indebted for many a record, else lost, of our single-minded sufferers for conscience sake, so fixed itself upon the artist's imagination, that he instantly conceived the idea of representing him in sculpture. By way of concentrating his thoughts, he sketched a figure in the imagined attitude, on one of the boards of the book he had been reading. Pleased with the design, he transferred it to his pocket-book. A few days after his arrival in London, he was introduced to our celebrated countryman, Wilkie, who, with his accustomed kindness, showed his portfolios. Mr Thom's surprise may be imagined, when in one of these he found a sketch of Old Mortality, almost identical with his own, executed by Wilkie several years before. The same thought had struck both, and almost in the same manner, and from the same great archetype, whose glorious mind is now for ever closed to all terrestrial conceptions.—Sept. 22, 1832.]

THE DEAF POSTILION.

In the month of January 1804, Joey Duddle, a well-known postilion on the north road, caught a cold through sleeping without his nightcap; deafness was eventually the consequence; and, as it will presently appear, a young fortune-hunter lost twenty thousand pounds and a handsome wife, through Joey Duddle's indiscretion, in omitting, on one fatal occasion, to wear his sixpenny woollen nightcap.

Joey did not discontinue driving after his misfortune; his eyes and his spurs were, generally speaking, of more utility in his monotonous avocation than his ears. His stage was, invariably, nine miles up the road, or "a long fifteen" down towards Gretna; and he had repeated his two rides so often, that he could have gone over the ground blindfold. People in chaises are rarely given to talking with their postilions. Joey knew, by experience, what were the two or three important questions in posting, and the usual times and places when and where they were asked; and he was always prepared with the proper answers. At those parts of the road where objects of interest to strangers occurred, Joey faced about in his saddle, and if he perceived the eyes of his passengers fixed upon him, their lips in motion, and their fingers pointing towards a gentleman's seat, a fertile valley, a beautiful stream, or a fine wood, he naturally enough presumed that they were in the act of inquiring what the seat, the valley, the stream, or the wood, was called; and he replied according to the fact. The noise of the wheels was a very good excuse for such trifling blunders as Joey occasionally made; and whenever he found himself progressing towards a dilemma, he very dexterously contrived, by means of a sly poke with his spur, to make his hand-horse evidently require the whole of his attention. At the journey's end, when the gentleman he had driven produced a purse, Joey, without looking at his lips, knew that he was asking a question, to which it was his duty to reply, "Nineteen and sixpence," or "two-and-twenty shillings," according as the job had been the "short up" or the "long down." If any more questions were asked, Joey suddenly recollected something that demanded his more immediate attention, begged pardon, promised to be back in a moment, and disappeared, never to return. The natural expression of his features indicated a remarkably taciturn disposition: almost every one with whom he came in contact was deterred by his physiognomy from asking him any but necessary questions, and as he was experienced enough to answer, or cunning enough to evade these, when he thought fit, but few travellers ever discovered that Joey Duddle was deaf. So blind is man in some cases, even to his bodily defects, that Joey, judging from his general success in giving correct replies to the queries propounded to him, almost doubted his own infirmity, and never would admit that he was above one point beyond "a little hard of hearing."

On the first of June, in the year 1806, about nine o'clock in the morning, a chaise and four was perceived approaching towards the inn kept by Joey's master, at a first-rate Gretna Green gallop. As it dashed up to the door, the postboys vociferated the usual call for two pair of horses in a hurry; but, unfortunately, the innkeeper had only Joey and his tits at home; and as the four horses which brought the chaise from the last posting-house had already done a double job that day, the lads would not ride them on through so heavy a stage as the "long down."

"How excessively provoking!" exclaimed one of the passengers; "I am certain that our pursuers are not far behind us. The idea of having the cup of bliss dashed from my very lips—of such beauty and affluence being snatched from me for want of a second pair of paltry posters, drives me frantic!"

"A Gretna Green affair, I presume, sir?" observed the inquisitive landlord.

The gentleman made no scruple of admitting that he had run away with the fair young creature who accompanied him, and that she was entitled to a fortune of twenty thousand pounds, "one half of which," continued the gentleman, "I would freely give, if I had it, to be at this instant behind four horses, scampering away, due north, at full speed."

"I can assure you, sir," said the landlord, "that fresh pair of such animals as I offer you, will carry you over the ground as quick as if you had ten dozen of the regular road-hacks. No man keeps better cattle than I do, and this pair beats all the others in my stables by two miles an hour. But in ten minutes, perhaps, and certainly within half an hour—"

"Half an hour! half a minute's delay might ruin me," replied the gentleman; "I hope I shall find the character you have given your cattle a correct one:—dash on, postilion!"

Before this short conversation between the innkeeper was concluded, Joey Duddle had put to his horses—which were of course kept harnessed—and taken his seat, prepared to start at a moment's notice. He kept his eye upon the innkeeper, who gave the usual signal of a rapid wave of the hand, as soon as the gentleman ceased speaking; and Joey Duddle's cattle, in obedience to the whip and spur, hobbled off at that awkward and evidently painful pace, which is, perforce, adopted by the most praiseworthy post-horses for the first ten minutes or so of their journey. But the pair over which Joey presided were, as the innkeeper had asserted, very speedy; and the gentleman soon felt satisfied that it would take an extraordinary quadruple team to overtake them. His hopes rose at the sight of each succeeding

milestone; he ceased to put his head out of the window every five minutes, and gaze anxiously up the road; he already anticipated a triumph—when a crack, a crash, a shriek from the lady, a jolt, an instant change of position, and a positive pause, occurred, in the order in which these are stated, with such suddenness and relative rapidity, that the gentleman was for a moment or two utterly deprived of his presence of mind by alarm and astonishment. The bolt which connects the fore-wheels, splinter-bar, springs, fore-bed, axletree, &c. &c., with the perch that passes under the body of the chaise to the hind-wheel-springs and carriage, had snapped asunder; the whole of the fore-parts were instantly dragged onwards by the horses; the traces by which the body was attached to the fore-springs gave way; the chaise fell forward, and, of course, remained stationary with its contents in the middle of the road; while the deaf postilion rode on, with his eyes intently fixed on vacancy before him, as though nothing whatever had happened.

Alarmed and indignant in the highest degree at the postilion's conduct, the gentleman shouted with all his might such exclamations as any man would naturally use on such an occasion; but Joey, although still but a little distance, took no notice of what had occurred behind his back, and very complacently trotted his horses on at the rate of eleven or twelve miles an hour. He thought the cattle went better than ever; his mind was occupied with the prospect of a speedy termination to his journey; he felt elated at the idea of outstripping the pursuers—for Joey had discrimination enough to perceive at a glance that his passengers were runaway lovers—and he went on very much to his own satisfaction. As he approached the inn which terminated the "long down," Joey, as usual, put his horses upon their mettle, and they, having nothing but a fore carriage and a young lady's trunk behind them, rattled up to the door at a rate unexampled in the annals of posting, with all the little boys and girls in the neighbourhood hallooing in their rear.

It was not until he drew up to the inn door and alighted from his saddle, that Joey discovered his disaster; and nothing could equal the utter astonishment which his features then displayed. He gazed at the place where the body of his chaise, his passengers, and hind-wheels, ought to have been for above a minute, and then suddenly started down the road on foot, under an idea that he must very recently have dropped them. On nearing a little elevation which commanded above two miles of the ground over which he had come, he found, to his utter dismay, that no traces of the main body of his chaise were perceptible; nor could he discover his passengers, who had, as it appeared in the sequel, been overtaken by the young lady's friends. Poor Joey immediately ran into a neighbouring hay-loft, where he hid himself in despair for three days; and when discovered, he was with great difficulty persuaded by his master, who highly esteemed him, to resume his whip, and return to his saddle.—*Three Courses and a Dessert.*

CRIMINAL TRIALS.

ALISON PEIRSON—WITCHCRAFT AND SORCERY.

AT the period when this trial took place (May 1588), the jury had only the power of deciding upon the facts of the case; it remained with the judge to determine the degree of criminality incurred. Thus, if one man killed another in a fray, the jury could only go the length of finding that he did so; and it was then for the bench to settle whether the guilt was that of murder, slaughter, or homicide. The verdicts, therefore, instead of a simple declaration of the prisoner's guilt or innocence, frequently contain a recapitulation of those particulars in the indictment which the jury held to be established by the evidence. In the case of Alison Peirson, the verdict is the only part of the proceedings recorded at any length, and it offers a pretty full detail of her alleged dealings with the evil powers. It is probably the substance of the poor wretch's confessions, elicited by the usual system of torture.

Happening once to fall sick on the Moor of Grange, Alison lay down alone, when there came a man dressed in green clothes, and said to her, "that if she would be faithful, he wad do her good." Being greatly alarmed, she cried aloud for help; but no one hearing her, she charged him in heaven's name to tell her if he came for the weal of her soul. To this adjuration he made no answer, but went away and left her. He appeared to her afterwards with a large company of men and women, who, with piping and mirth, made excellent cheer, which appears to have produced a favourable impression on Alison's mind; for she was now prevailed on to join the cavalcade, and to accompany them from Fife to Lothian, where the means of mending their cheer was afforded, by the appearance of puncheons of wine with the necessary "tasses" or drinking cups. Their joviality seems not to have been bounded by discretion, but to have ended in a brawl, in which Alison got a blow from one of the party, which "tuke all the poistie of her near syde fra her," that is, deprived her of the power of her left side. The place remained "blae and evil faurrit" (discoloured and unsightly), though there was no pain in the particular spot where the stroke was inflicted.

After this, Alison had various encounters with the fairies, who were exceedingly variable in their conduct

towards her. She was allowed to see them gather herbs before sunrise, which they converted into salves; and by the knowledge thus acquired, she was enabled to effect many cures in the neighbourhood of St Andrews during a course of sixteen years. But, on the other hand, they handled her roughly at times, especially if she disclosed any of her meetings with them. She was sometimes well and sometimes ill; one while with them and another while away; she would go to bed "hail and feir" overnight, and not know whether she might be hurried before the morning. "When we hear the whirlwind blaw in the sea," says she, "they will be commonly with it, or coming soon thereafter." She dreaded their approach, and often shrieked with terror when they came.

What served to reconcile her in some degree to her intercourse with these fickle beings, was her intimacy with one Mr William Simpson, an uncle of her own, "a great scholar and doctor of medicine," who must have received his learning and taken his degrees in Fairyland; for, according to his niece, when he was a child "ane man of Egypt, anegyant," carried him off, and he subsequently rose to be of much esteem and influence in the court of Elifame. His protection was of considerable advantage to Alison, whom he warned when the "good neighbours" intended to surprise her with a visit, instructing her how to behave towards them. He also initiated her into the mysteries of his art, describing every kind of sickness, the herbs proper for the cure of each, and the mode of using them, besides giving her directions for the treatment of particular cases.

It was with the assistance of this familiar that Alison furnished prescriptions to Patrick Adamson, archbishop of St Andrews, whose application to this source for the removal of his ailments was eagerly seized upon as a ground of censure by those to whom he was opposed in matters of church government. By the exertions of this church judicatory, Alison Peirson had been apprehended, examined, and committed prisoner to the castle of St Andrews, from which she escaped; it was alleged, with the connivance of the archbishop; and it was not till four years afterwards that she again fell into the hands of the administrators of the law, and was tried before the court of judicatory. Adamson was a man of sound learning, a poet of no mean pretensions, and so skillful in the management of affairs, as to have been the churchman upon whom King James principally depended for forwarding his views in regard to the establishment of episcopacy in Scotland. It has been made ground of reproach against this prelate that he should have been so weak as to repose confidence in the charmed remedies with which this woman supplied him. But in as far as mere faith in her supernatural powers goes, his credulity was no greater than that of his opponents, who brought her to trial for the supposed exercise of those powers, for which she in the end suffered death. The only difference was, that they stood upon the illegality of such practices, which he overlooked in consideration of the advantage he expected to derive from them. Whether there were any virtue in the incantations employed in the preparation, the medicines were of no watery and weakening consistence, for she caused him to eat a stewed fowl, and used to medicate a quart of claret with certain herbs, which the archbishop drank at two meals, a single draught at each. The use of ewe-milk was also enjoined, but in what manner is not mentioned, and his cheeks, neck, breast, stomach, and sides, were rubbed with an ointment compounded according to the directions of Alison's familiar, Mr William Simpson. In consequence of this treatment, the disease, according to the belief of the time, was removed to a palfrey, which died by way of substitute for the archbishop.

A satire of the period exposed the archbishop's traffickings with the witches; but Alison Peirson was more severely dealt with, having suffered the fate indicated by the words "convicta et combusta." If we include in what is expressed by "convicta," the torments inflicted to produce a confession upon which the witch might be found guilty, they were often still more unendurable than the consequences of conviction—strangling and burning—which in these cases was implied by "combusta." There does not seem to have been any display of the malignant passions on the part of this poor woman. If she herself believed that she possessed supernatural power, she did not try to exert it for the destruction or injury of her kind, but rather with a view to produce good by the cure of diseases. If the confession was wrung from her in the moment of extreme torture, and was merely a declaration made by her in the hope that it would procure a cessation of the cruelty of her prosecutors, still it shows that her temper was mild and inoffensive; for even in the fictions of a morose person, the native severity may be traced in the darker colouring with which it invests the story. The confessions of witches, though they cannot be received as proofs that the transactions they narrate actually happened, may in general be relied upon as evidencing the manner in which the wretched creatures would have employed the assistance of the spiritual world, could they have commanded it.

JOHN SEMPILL OF BELTREIS—TREASON.

The official statement of this gentleman's trial con-

tains a recapitulation of the indictment, which is vague and general in its terms. Without condescending upon any overt act or specific treasonable speeches, it accuses him of devising "to sla, schwt, and cruellie murder" the Regent Morton; of "plainly concerting and conceiving the samin murder and slaughter, most treasonably and deceitfully in his heart and mind, ordaining the same to have been suddenly committed; doing what was in him to have performed the samin, conform to his deliberate intention, treasonably devised and precogitate, as said is." It mentions his having confessed the crime, and concludes with the sentence, "that he should be taken to the market cross of Edinburgh, and there demeaned as ane traitor; and all his lands, tacks, steadings, rowms, possessions, and goods, to be forfeited and escheat to our sovereign lord's use."

On looking to other sources to supply the meagreness of this very unsatisfactory record, we find a disclosure of the most detestable oppression and cruelty on the part of the regent. At the same time we must remark, that the confessions dictated to the accused seem to have been constructed in a very inartificial manner, as if from a consciousness that even an ordinary nicety was needless where the government, eager to convict, would be contented with a few declamatory generalities, which are much more easily thrown together than a well-compacted tissue of particular facts. Sempill had married one of the queen's Maies (Mary Livingstone), on whom her royal mistress had bestowed a small portion of ground. Morton, desirous of reducing this grant (in order, Crawford alleges, that he might appropriate the piece of land which lay contiguous to a part of his estate), brought the business before the Court of Session, contending that the crown lands could not be alienated. Beltreis in vain answered, "that it was a plain deed of gift under the great and privy seals, and therefore could not be recalled." Morton sat in person to browbeat the judges. This exasperated the defendant, and seeing the cause about to be decided against him, he protested with incautious vehemence, "that if he lost the suit, he should lose his life too." Whiteford, younger of Milneton, a near relative of Beltreis, was not more circumspect, and gave vent to his indignation in an expression having a double allusion—to the regent's lowness of stature, and to his tyrannical conduct; "Nero," he said, "was a dwarf to Morton." Both were instantly imprisoned, and it was given out that they had a plot to murder the regent. On examination they denied the fact; but there was a method of subjecting every kind of contumacy not supported by uncommon physical firmness, as well as moral courage. The poor extorted from Beltreis an acquiescence in all that his examiners suggested; but Milneton was not to be so overcome—he endured the torture and confessed nothing. Such, unhappily, was the nature of the *precognitions* in the earlier practice of the Scottish courts. If an acknowledgment of guilt could have been wrung from both these gentlemen, their fate would have been sealed; but the constancy of the one was held to prove the weakness of the other, in a case not strengthened by the smallest vestige of other evidence. Milneton was discharged, and his nephew, though sentenced to be hanged, was ultimately dismissed also. The trial of Beltreis took place on the 15th June 1577.

PINS.—The pin was not known in England till towards the middle or latter end of the reign of Henry VIII.; the ladies until then using ribbands, loops, skewers made of wood, of brass, silver, or gold. At first the pin was so ill made, that in the thirty-fourth year of the king, parliament enacted that none should be sold unless they be "double-headed, and have the headdes soldered faste to the shanke of the pyne," &c. But this interference had such an influence on the manufacture, that the public could obtain no supply until the obnoxious act was repealed. On referring to the statute-book, the act of repeal, which passed in the thirty-seventh year of the same reign, contains the following clauses, which tend to show how cautious the legislature ought to be not to interfere with any manufactory which they do not perfectly understand. The act of repeal having recited the former act, it then goes on to say, "At which tyme the pyners playnly promised to serve the kynges liege people wel and sufficiently, and at a reasonable price. And for as much sens the making of the saide act, there hath ben scarcitie of pynes within this realme, that the kynges liege people have not ben wel nor completely served of such pynes, nor are like to be served, nor the pyners of this realme (as it doeth nowe manifestly appere), be hable to serve the people of this realme according to their said promise. In consideration whereof, it maie please the king, &c. that it maie be adjudged and demed from hensforth frustrated and nihilated, and to be repealed for ever."—*Stat. Henrici, Octavo, xxviii. cap. 13.*

RAPID GROWTH OF FISH.—The rapid growth of some fish is very extraordinary. I saw three pike taken out of a pond in Staffordshire belonging to the present Sir Jervoise Clark Jervoise, two of which weighed 36lb. each, and the other 35lb. The pond was fished every seven years, and, supposing that store pike of 6 or 8 lb. weight were left in it, the growth of the pike in question must have been at the rate of at least 4lb. a year. Salmon, however, grow much faster. It is now ascertained that grise, or young salmon, of from 2½ to 3lb. weight, have been sent to the London markets in the month of May, the spawn from which they came having only been deposited in the preceding October or November, and the ova taking three months of the time to quicken. It has also been ascertained by experiment that a grise which weighed 6lb. in February, after spawning, has, on its return from the sea in September, weighed 13lb.; and a salmon fry of April will in June weigh 4lb. and in August 6lb.—*Gleanings of Natural History.*

EDINBURGH: Published, weekly, by W. and R. CHAMBERS, 19, Waterloo Place; ORR & SMITH, Paternoster-row, London; and GEORGE YOUNG, Dublin. Agents in Glasgow, JOHN MACLEOD, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-Press of W. and R. CHAMBERS.

PRICE THREE HALFPENCE.

RELATIONS.

OWING to the different merits of the different members of a family, and in some measure, also, to the various chances which are vouchsafed to them of bettering their circumstances, we generally see that though they all begin alike, some go up and some go down in life, so that in the long-run the family, or at least its second generation, is scattered over nearly the whole surface of society—from its top to its bottom. The case may seem startling: but it is our belief that there is hardly any person, be his own situation ever so exalted, who has not relations, and near relations too, in the very lowest walks of life—not only in the condition of servants, perhaps, for that is decent, and in its way respectable, but in the most degraded state to which human nature can well be reduced.

In the same way almost all of us have kinsfolk a little higher in the scale than ourselves, or whom we think so—it is all one. Now, it is quite amazing how accurate our genealogical knowledge becomes respecting one of these individuals, compared with its equally surprising ignorance regarding those who have not been so fortunate. When a cousin or half grand-uncle rises above our level, he rises into a blaze of light, which enables us to trace our connection with him as plainly as we run our eye along the string of a boy's kite. But when a poor nephew or grand-nephew descends into poverty and contempt, he seems like a plummet submersed in the ocean, where, though we may occasionally feel him tugging at the bottom of the line, we are totally unable to trace the line itself. We are always most laudably ready to exchange the civilities of life and the affections of kindred with the cousin who has, in the first place, convinced us of his merit by thatching himself well over with bank notes. It is pleasant to go and dine at a kinsman's house, where we know our entertainment can be furnished without any distress to our worthy host. But really it is a totally different case to intrude upon a scene where our poor friend is doing his best, with the tears in his eyes, to satisfy the cravings of his family with perhaps a very homely meal. Humanity in that case demands that we should rather stay away, for we know he does not like to be seen in his poor state. And then, too, how easily we can put up with the eccentricities of a wealthy relation, even though they may sometimes gall our pride a little; how strangely liable, on the other hand, are we to fall out with the poor unfortunates below us! On the day after having been regaled to the uttermost excess by our wealthy friend, we will quarrel with the poor one for having drunk a single glass of some plebeian fluid. With the former, nothing—with the latter, every thing, is a fault. The imperfections of the poor are yawning and palpable as their own rags—those of the rich as smooth as broad-cloth can make them. The truth is, our senses can tolerate almost any odious or improper thing that is found in a scene above our usual grade in the world. We never know enough of it to be able to measure its real odiousness, or it is disguised by the cordial appliances which we always have ready for the sores of the great. But the vices, nay, the smallest foibles of the lowly, come before our senses so bare, so beggarly, so unannealed, and, moreover, they are so immediately followed by that additional wretchedness which wealthy error escapes, that we have no excuse for them. Hence we generally find that we have shaken off the most of our poor relations on account of some trivial cause of offence, which we find it necessary, however, to be always nursing in our minds, in order to sustain us in the conviction that the breach of treaty—the *casus fœderis*—was sufficient.

There is one very obvious mark in the individual who despises poor relations—a perpetual reference to rich ones. Some people are constantly bringing in allusions to "my cousin Mr. This," and "my uncle Mr. That," and even to more remote relations, such as "my great-grandmother the Countess of Somewhere." A few are so very silly as to tell in their newspaper announcement of their marriage, that their bride, besides being daughter to this or that plain esquire, is "grand-niece to General So-and-Su," or "cousin to Mr. Such-a-Thing, Secretary of State." These announcements are an impertinence fit for the interference of the legislature—or the police. If people have exalted relations, let them enjoy them as much as they can within themselves, but do not let them be perpetually presenting this odious little piece of vanity before

others, who not only are not interested in it, but are perhaps reminded by it that they have no fine relations themselves. To be always thus singling out a relation from all the rest, and holding him up in connection with ourselves, is a direct injury to him, in so far that we are thus trying to exalt ourselves at his expense; an indirect insult to our kindred in general, whom we leave out of view, and a nuisance to all before whom we thus exhibit our own poverty of soul. It is a cultivation of the most odious character, and necessarily suggests to every thinking person, that, in exact proportion to our homage to the great persons of our family, must be our haughtiness and severity to the humble. The people addicted to this vice of conversation are evidently satisfied in their own minds that they are talking very fine, and exciting no feeling in their hearers but admiration and respect; but in reality they are always scouted and ridiculed, even to the degree of being honoured with a nickname, carved, perhaps, out of the favourite phrase.

A really good and philosophical spirit will neither plume himself upon his more fortunate, nor despise his less fortunate, relations. He will modestly rejoice on the success of the former, and take care, by avoiding the appearance of intrusiveness on the one hand, and a pettish and splenetic jealousy on the other, to afford no reason for the fortunate individual to feel incommoded by the connection, and consequently endeavour to shake it off. To those who are less fortunate than himself, he will be as encouraging and kind as circumstances render prudent or decent, neither manifesting that vulgar pride which tries needlessly to make a kind of virtue out of a low origin, nor that still more vulgar and pitiable vanity, which denies all inferior kindred, and seeks, at the expense of true dignity, the éclat of a few "great friends." We allow there is a general difficulty in the case. Friends in different worldly circumstances are like positive and negative clouds in electricity; there is a constant tendency to equalisation, which is not relished by the parties whose purses are charged positively.* But human nature should be always contending with its weaknesses; and though full confiding friendship is not perhaps to be expected, there may still be a sufficient interchange of kindness to lighten, in no small degree, the general burden of life.

POPULAR INFORMATION ON SCIENCE.

THE ATMOSPHERE.

THE earth—the surface of which is so beautifully diversified by water and dry land, mountains and valleys, extensive forests and tracts of open and bare country—is on all sides surrounded with air, without the presence of which, not even the humblest being in the scale of organisation could support its own existence. The ancients were not unacquainted, at the earliest period, with the vast importance of this agent in the great economy of Nature; and in their rude cosmogonies, or attempts to explain the history of the creation, they argued that it was one of the four elements whence all things originated. Nay, they even attached to it a species of idolatry; for Anaximenes believed it to be the principal Deity, and St. Augustine esteemed it the second parent of all earthly objects. But the age of such idle reveries and blind adorations has now passed away; and happily the human mind has emancipated itself from the monkish superstitions by which it was once encumbered; so that now the door of the Inquisition no longer threatens to close with all its horrors on the humble votary of science. The light that surrounds us—the air we breathe—the dust on which we tread—every object, animate or inanimate, that can be approached by the hand of man, has been carefully, and with impunity, investigated; nor need any person in quest of knowledge, like Hassan in the wilderness, now sit down and lament the dreariness of the prospect around him. Here, then, in continuation of our popular notices on science, we proceed to the subject of atmospheric air: and it will assuredly not be uninteresting to examine what is known concerning its height, density, humidity, electrical state, colour, composition, and its effects on the animate and inanimate creation.

* Thunder is produced by the passing of electric fluid from a full to an empty cloud; in other words, from one charged positively, to one charged in a negative condition—there being no possibility of two clouds, in such circumstances, remaining near each other without this phenomenon.

The air is generally described as a fluid, because all bodies move through it with facility; and, in a state of rest, it does not oppose the passage of the minutest winged insect, or the transmission of the most delicate odour. Its whole mass, surrounding the earth, may be regarded as a great aerial ocean, at the bottom of which, man and a vast variety of animals live; while winged tribes alone rise into its higher regions. How high it extends has not been yet satisfactorily determined; but from the length of time during which the sun's rays continue to be reflected from its upper regions back to the earth, after its orb has sunk below the horizon, there is reason to infer that it extends, in a state of extreme tenuity, to a very considerable height—nay, it has been conjectured that in this attenuated condition it may pervade all space, accumulating round the sun, moon, and stars, and forming an atmosphere round each of them, of greater or lesser density, according to their respective powers of attraction. This notion, however, has been materially shaken by the observations of the late Dr. Wollaston, who, in conjunction with Captain Kater, observed, in the year 1822, that, in the motion of the planet Venus towards the sun, her progress and position did not seem affected by any solar atmosphere. Also it was observed, that the approach of the satellites to Jupiter did not seem affected by the existence of any atmosphere round that planet; which astronomical observation, if correct, must subvert the idea of our atmosphere being infinite in its extent, and surrounding the numerous other worlds of this magnificent universe. From calculations founded on the rarefaction of air and the duration of twilight, it has been concluded that the atmosphere of our earth extends to the height of forty or forty-five miles; beyond which it is supposed not to extend, on account of the great tenuity of its particles, and the extreme cold there diminishing its elasticity, so as to prevent any additional extension. But it must be confessed, that on this subject we have not yet come to any satisfactory conclusion; and thus too often it happens that Science, in her proudest flights, is compelled to drop her pinions, and return dissatisfied to earth.

Whatever be the height to which the atmosphere extends, it is evident that the air in immediate contact with the surface of the earth must have to support the weight of the mass immediately above, whereby its particles must be forced nearer together; in the same way, that if a number of layers of wool were placed one above another, the undermost, from the pressure of those above, would have its fibres more closely approximated and massed together. The ancients—Aristotle, Socrates, and Plato—were aware that the air exerted a pressure on the earth; but it remained for Galileo, who suffered persecution under the unhalloved edicts of the Inquisition, to show philosophers that the pressure of the air is sufficient to support a column of mercury thirty inches high. If we take a glass tube closed at one end, and pour into it mercury to that height, and if we then close the open end with our finger, invert it into a basin of the same fluid, and withdraw the finger, we shall find that the mercury in the tube will remain at the height of thirty inches; the reason of which is, that it cannot fall lower without raising the mercury in the basin, which, being pressed down by the weight of the atmosphere above, cannot give way. Toricellus, the pupil of Galileo, extended the experiment to other fluids, and discovered, that, in the same way, the pressure of the atmosphere will support a column of thirty-four feet of water, that fluid being three or four times lighter than mercury. Accordingly, the pressure of the atmosphere is the same as if the earth were covered with mercury to the depth of thirty inches, or with water to the depth of thirty-four feet. This being understood, we may add, that the air near the earth's surface having to support this superincumbent weight, has a density indicated by about an ounce Troy to a cubic foot; but the higher we ascend, the more this pressure and density must be diminished. On these facts rests the principle on which the barometer is constructed, which is nothing more than a tube containing mercury, which indicates, by its rise or fall, the greater or lesser weight of the air immediately above it. At the level of the sea, the column of air being longer, the mercury is forced high up the tube; but on the tops of high mountains, the column of air being shorter, the pressure is diminished, and the mercury then

falls. When the barometer is carried from the level of the Thames to the top of St Paul's Church, in London, the mercury falls about an inch, indicating an ascent of about five hundred feet; when to the top of Mont Blanc, it sinks half of its entire height, marking an elevation of fifteen thousand feet; and in Du Luc's balloon ascent, it fell to below twelve inches, indicating a height of twenty-one thousand feet above the surface of the earth. Hence the barometer is used as a convenient instrument for measuring the elevations of different places. But this is not all: every person must be familiar with it as a monitor of the weather. When the water which has been suspended in the air separates as rain, the weight of the air diminishes, and consequently the mercury in the barometer sinks. On the contrary, the more serene and settled is the weather, the higher the barometer ranges. Approaching high winds, from disturbing the equilibrium of the atmosphere, are often indicated by a sudden sinking of the mercury in the barometer; hence is constructed the instrument known as the marine barometer, which differs from that used on shore only in having its tube contracted in one place, to prevent the rising and falling of the mercury with every motion of the ship, and which gives almost providential warning of approaching tempest. "The marine barometer," says Mr Arnot, "has not yet been in general use for many years, and the author was one of a numerous crew who probably owed their preservation to its almost miraculous warning. It was in a southern latitude—the sun had just set with placid appearance, closing a beautiful afternoon, and the usual mirth of the evening watch was proceeding, when the captain's order came to prepare with all haste for a storm. The barometer had begun to fall with appalling rapidity. As yet, the oldest sailors had not perceived a threatening in the sky, and were surprised at the extent and hurry of the preparations; but the required measures were not completed, when a more awful hurricane burst upon them than the most experienced had ever braved. Nothing could withstand it; the sails, already furled and closely bound to the yards, were riven away in tatters: even the bare yards and masts were in great part disabled; and at one time the whole rigging had nearly fallen by the board. Such for a few moments was the mingled roar of the hurricane above, of the waves around, and of the incessant peals of thunder, that no human voice could be heard; and amidst the general consternation, even the trumpet sounded in vain. In that awful night, but for the little tube of mercury which had given the warning, neither the strength of the noble ship, nor the skill and energies of the commander, could have saved one man to tell the tale. On the following morning, the wind was again at rest; but the ship lay on the yet heaving waves, an unsightly wreck."

The pressure of the atmosphere being so considerable, how happens it that such a weight can be supported by living animals, for it is calculated that on an average its pressure amounts to fourteen pounds and a half on every square inch of the earth's surface, so that the human body must sustain a weight of from fifteen to twenty tons? This query, which has challenged the ingenuity of some of the most celebrated men who have distinguished themselves in the annals of science, has recently claimed the attention of the ingenious Dr Dalton of Manchester, whose discoveries have already done so much to advance the progress of chemistry. He has explained what by experience is proved to be the actual weight of the human body; he has then, by adding together the calculated weight of its solid and fluid parts, and the air which enters into it, allowing a surplus for that which permeates the bones and muscles, &c. found that the weight of the living body, as proved by experiment, is less than the calculated weight. Whence this discrepancy? "Upon the whole (says he), I am inclined to believe the true explanation of the difficulty will be found in this, that the substance of the body is pervious to air, and that a considerable portion of it constantly exists in the body during life, subject to increase and diminution according to the pressure of the atmosphere, in the same manner as it exists in water; and further, that when life is extinct, this air in some degree escapes, and renders the parts specifically heavier than when the vital functions were in a state of activity."* The human body, then, is to be regarded as being throughout pervious to air, and as the elasticity and pressure within corresponds with that without, no weight is imposed on any part of it until the balance is destroyed; it is therefore a fallacy to speak of the human body having to support any such weight. When we place our hand over the glass of an air-pump, and withdraw the air below, the pressure of the atmosphere on the outside of the hand is scarcely felt, but the inside is swollen, rendered painful, and feels drawn in to the receiver. When we ascend a mountain, and arrive at a region where the surrounding air is much rarified, the air within the substance of the body in like manner opposing an unequal pressure against that without, gives rise also to painful sensations, fulness and throbbing of the temples, and the most distressing lassitude. Dr Clarke, in describing his ascent to the summit of Mont Blanc, observes, "Every two or three minutes we all sunk down in the snow quite breathless, and scarcely able to utter a word. One of the guides had some bleeding from an accidental blow, not from simple rarification

of the air. The blood appeared to me decidedly of a darker colour than natural; our lips were quite blue; our faces extremely contracted and pale, and the eyes very much sunk, with a deep dark zone beneath the lower eyelids; but no one had the least spontaneous hæmorrhage from the gums or eyes. Every start we cast a longing, lingering look at the summit, and then holding our heads low, pressed onwards till the feeling of exhaustion became irresistible, and we sunk again quite flat on the snow." Another traveller, Mr Auldjo, who ascended Mont Blanc in 1827, thus describes the effect of the highly rarified air when near the summit:—"It was with some difficulty that I could be persuaded to leave the rocks, for all my enthusiasm was at an end; the lassitude and exhaustion had completely subdued my spirits. I was anxious to get to the summit, but I felt as if I should never accomplish it, the weariness and weakness increasing the moment I attempted to ascend a few steps, and I was convinced that in a few minutes I should be completely overcome. I was induced to proceed by the exhortations of the guides. We had to climb about one hour to get to the summit; but this part of the undertaking required most extraordinary exertion, and severe labour it was. From the place where the rarity of the air was first felt, we had been able to proceed fifteen or twenty steps without halting to take breath; but now, after every third or fourth, the stoutest, strongest guide became exhausted; and it was only by lying down or resting on the baton some seconds, and turning the face to the north wind, which blew strong and cold, that sufficient strength could be regained to take the next two or three paces." He further adds, "The earnest solicitude which my guests showed, much to their own discomfort and annoyance, to keep my spirits up, was in vain; I was exhausted; the sensation of weakness in the legs had become excessive; I was nearly choking from the dryness of my throat and the difficulty of breathing, and my head was almost bursting with pain. My eyes were smarting from inflammation, the reflection from the snow nearly blinding me, at the same time burning and blistering my face. I had, during the morning, as a protection, occasionally worn a leather mask, with green eye-glasses, but latterly I found it oppressive, and wore a veil instead; that also I was now obliged to discard. I besought the guides to leave me. I prayed Julian Devouassoud to go to the summit with them, and allow me to remain where I was, that by the time they returned I might be refreshed to commence the descent. I told them I had seen enough. I used every argument in my power to induce them to grant my request. Their only answer was, that they would carry me, exhausted as they were, to the summit, rather than that I should not get to it; that if they could not carry, they would drag me. Being unable to resist, I became passive, and two of the least exhausted forced me up some short distance, each taking an arm." Having at length attained the object of his painful expedition, our traveller remarks, "I had taken very little notice of the progress we were making, when I suddenly found myself on the summit. The object of my ambition and my toil was gained; yet the rewards of my danger and fatigues could hardly produce enjoyment enough to gratify me for a few moments. The mind was as exhausted as the body; and I turned with indifference from the view which I had endured so much to behold; and, throwing myself on the snow behind a small mound which formed the highest point, and sheltered me from the wind, in a few seconds I was soundly buried in sleep, surrounded by the guides, who were all seeking repose, which neither the burning rays of the sun nor the piercing cold of the snow could prevent or disturb." These distressing sensations at such elevations arise not only from the increased rarity of the air demanding a more rapid respiration, in order that the necessary quantity of air should traverse the lungs, which is always accompanied by an accelerated circulation, but, as above explained, from the air within the body being denser and more elastic, and exerting a greater pressure, than is met by any counterpoise without. As in the case of the hand over the partly exhausted air-pump, the vessels are distended. Thence arises a sense of extreme uneasiness; and the more delicate bloodvessels in the eyes, mouth, and lungs, are occasionally ruptured. If the transition were more gradual, so as to allow time for the air within the body to acquire the same condition as the air without, such a loss of balance would not ensue. Indeed, there is reason to believe that we might accustom ourselves to live under a much lighter pressure of atmosphere than we do, even under the weight of half an atmosphere. Mexico is 7775, and Quito 9550 feet above the level of the sea; yet in neither of these places do the inhabitants complain of the rarity of the atmosphere. In this country, winds, heat, the quantity of vapour suspended in the air, and other causes, many of them little known, cause sudden variations in its pressure; on which occasions, many of us experience a difficulty in moving, and feel indolent, and accuse the weather of being heavy—whereas in fact it is lighter than it was before; and our uneasiness arises from the balance of the aerial pressure within not corresponding precisely to that which is without the body. Another effect of the rarification of the air in these higher regions, may here be noticed, viz. its effect on the transmission of sounds. It is well known that sound is transmitted by the undulation of the air; but the density of the air may be so diminished as no longer to permit the transmission of sounds of

ordinary intensity. "The most peculiar sensations," observes Mr Auldjo, which all have felt who have gained this great height, the summit of Mont Blanc, "arises from the awful stillness which reigns, almost unbroken even by the voices of those speaking to one another; for its feeble sound can hardly be heard." On one occasion, the party, in ascending this mountain, attempted to sing a Swiss chant, but found they could not modulate their voices. The report of a pistol on the top of Mont Blanc sounded no louder than that of an Indian cracker. Almost every person must have observed the variations which occur in the transmission of sounds through the air, even in its ordinary state. The sound of distant church bells, when the air is perfectly calm, will often appear at a singular distance from, and often at a singular proximity to, the listener. The sportsman on the open heath will often notice the unaccountable variety of sounds produced by the discharge of his gun; all which must depend on the state of the surrounding air, on its density, the quantity of vapour suspended in it, and the clouds that extend above it. When the air is foggy, its undulations are interrupted, and the sound is dull and prolonged. When it is overarched with clouds, its undulations return back, producing a succession of echoes. And when, after nightfall, the heat from the ground has been uniformly diffused, and the air is of an equal density, every sound is transmitted with peculiar intensity, whether we listen to the rippling of a distant stream, or the buzzing of some minute and unseen insect. Hence, Shakspeare, who may be said to have been one of the familiars of Nature, makes his Romeo not inapudly observe, "How silver sweet sound lovers' tongues by night;" and independent of all other accompanying associations, there are few of us who have not been sensible of the more exquisite effects of music heard in the open air, amidst that peculiar stillness which characterises this season of repose.

(This article will be completed in the ensuing number.)

THE AMERICAN SAILOR'S STORY.

"COME, spin us a yarn, Jack, my boy," said a curly-headed, rosy-cheeked young midshipman, to old Jack Palmer, one evening, as we were running down the Spanish Main, before as sweet a breeze as ever filled a to-gallant-sail. Jack Palmer was an old sea-dog, and a clever fellow, at least in the Yankee sense of the word. He had seen all sorts of service, and knew all sorts of stories, which were perhaps not the less amusing for their want of grammar, and their abundance of sea phrases. He was master's mate of the gundeck; but when called upon for a story by Rosy Willy (the name of the little reefer that had asked Jack for a yarn), his business for the day was finished; the grog had been served; the bull stowed away in the spirit-room, and the key of the hatch returned to the master. It was a pleasant evening, too; and as it was only three bells of the second dogwatch, and of course too early to turn in, Jack sat down on the fo'castle chest, and signified his willingness to comply. He was immediately surrounded by a knot of midshipmen, eager to listen, and, after the usual preliminary of a fresh quid, he began as follows:—

Merriville Terry, or, as they used to call him for shortness, Merry Terry—and a right good name it was, for he was as gay a lark as ever gave life and animation to a steerage mess-table—was one of the noblest middies that I ever knew. He was as full of rigs and jokes as a French man-of-war is of music, and they were quite as harmless, too; for Merry never said any thing to hurt a shipmate's feelings, and no one ever thought of getting angry at his fun. There wasn't a reefer in the whole fleet that didn't love him like a brother; nor a luff that, when there was hard duty to do, didn't favour him all he could; for Merry had a delicate constitution, and couldn't stand the rough and tumble of the service as well as some. But he was no skulk, and blow high or blow low, Merry never shrank from his watch. When the relief was called at night, whether it was calm or storm, all sail or close-reefed topsail and foresail, it made no difference; on deck he always was before the sound would be out of the bell. He didn't tumble up the hatchway either, as some of you reefers do, with your hands in your becketts, and your bow-ports half shut, or fumbling at your buttonholes, like a green-horn at a gasket; but up he sprang, wide awake, and rigged from clue to earing, as if all dressed to go ashore on liberty. As I said afore, every body from stem to stern liked Merry Terry, or for the matter of that, from one end of the navy list to the other—all except one man. As for the sailors, it would have done your heart good to see how they watched his eye when he had charge of the deck, as if they wanted to spell out his orders before he had time to speak 'em. They would do more for a single look of Merry, than for all the curses of the skipper, though backed by the boatswain's mate with the cats in his hand. It wasn't from any fear of him, you may be sure, for I don't b'lieve Merry ever stopped a man's grog, or as much as gave him a cross word in his life; but it was from pure love and respect. When he spoke, to be sure, there was something in his tone and manner that seemed to say he must be obeyed; and when he looked at a man who had been cutting up rustics, though he didn't frown, or swell, or try to look big, as I have seen some officers do, yet there was that in his eye that made the stoutest quail. It was just so among the reefers at the mess-table. If two of them was sky-larking or quar-

* Edinburgh New Philosophical Journal, No. 25, p. 92.

relling, or doing any thing ungently, Merry would just look at them, and they would leave off at once, and droop their heads like a dog-vane in a calm. I said every body loved him. I remember once, when we were beating up the Straits with a Levanter dead ahead, and blowing so heavy that it almost took the very buttons off our jackets, that Merry, some how or other, happened to fall overboard. He had been standing on the taffarel, with his quadrant in his hand, trying to get a chance at a lunar, when all of a sudden the old hulk made a heavy lee-lurch, and away he went splash into the water. Though there was a sea running like so many mountains chasing each other, yet, before you could say Jack Robinson, no less than four stout fellows were overboard after him. It liked to have gone hard with the whole five, for it was more than the stoutest swimmer could do to keep his head above board, and before we could clear away the stern boat, though we didn't stop to cast off the gripes, but cut and slashed away, they were almost out of sight to leeward. Old Tom Bowman, the quarter-gunner, and Bill Williams, the captain of the fo'castle, made out to reach Merry just as he was going down the last time; and though it was as much as their own lives were worth, they held him up till the boat came to their assistance. I well remember the joy of all hands when the boat pulled up under the stern, near enough for 'em to see that Merry was in it; and when they hooked on the tackles, I don't b'lieve that ever a ship's crew ran away with the falls with as much good will as ours did that evening in running up the jolly-boat that had saved Merry Terry.

It was a long cruise that we were together, and Merry got to be as much of a man in size and appearance as any of us before it was over, though he couldn't have been more than eighteen then. On our arrival in New York, the most of the middies got their walking papers as soon as they could, and made sail each for his own home. Merry's connections, who were of Irish descent, lived in Virginia, and it was that way he laid his course, you may be sure. I remember very well the morning when I had the third cutter called away and manned for him; and as we wrung each other's hand at the gangway, neither of us had voice enough to say good-bye. My stomach felt all that day as empty as a midshipman's locker, and the ship seemed as lonesome to me as the old brig Nancy did once, when all hands died off of the yellow fever, and left me and the old tomcat the only living souls aboard of her.

For about two years after Merriville and me parted, I lost the run of my old shipmate. He continued ashore, but I soon got tired of being cooped up in the narrow streets, with no chance of seeing more of the sky than chose to shine between the tops of the dingy houses. Happening to hear that some of my acquaintances were going aboard a ship then fitting out at Boston, I applied for orders myself, and was soon once more where I had a little sea-room to ware and haul upon. That was a short cruise, and by the time twenty months were up, we were all home again, the crew discharged, and I, with my hands in my becketts, spinning street yarn, and having nothing in the world to do.

The next ship I was ordered to was my own namesake, old Jack Adams; she was lying in Hampton Roads, ready for sea. The first man I met, as I went up the accommodation ladder, was Merry Terry himself, who stood upon the gangway-sill to receive me. I knew him at a glance, though he was a good deal altered; and he knew me, too, as soon as his eye rested on my face. Merry was by this time about twenty years of age, or thereabouts, and a finer looking fellow never trod the quarterdeck. He had lately lost both his parents, and this had given a sort of sad expression to his countenance, that made him appear handsomer than ever. I soon found that he was the general favourite on board the ship, as indeed he always was, go where he would; and it was expected that before we sailed he would get his parchment from Washington, and mount a swab. An elegant luff he would have made, too; for if ever man knew how to work a ship, it was Merry Terry. When he had the deck, the old craft herself seemed to know it; and no matter what kind of weather we had, she was sure to behave as obedient as a side-boy. I have seen him put her in stays where there wasn't a breaker of water to spare, with rocks both ahead and astern, and the wind whizzing round and round, like a bee in a bucket of tar. But when it was "helm's a-lee," and Merry had the trumpet, there was no such thing as missing stays.

I mind I told you a while ago that every body liked Merry Terry, except one man—that man was the skipper. Somehow or other he hated him worse than the devil hates a marine. He used to ride him down like a main-tack, would row him on all occasions, and put him on all kinds of disagreeable duty. It was even thought he had clapped a stopper on his promotion. The story among the reefers went, that Merry had come athwart captain's hawse in some love affair; but whether that was so or not, was mere dead-reckoning; for Merry was as close as an oyster, and never spoke a disrespectful word of his commander. In return for all the abuse he received, he would only curl his lip a little, and look at him dead in the eyes—but such a look as he would sometimes give him! I would rather, for my part, have been on short allowance of grog for a month. Well, things went on in this way for some weeks, till at last sailing orders were given out, and of course there was no more going ashore for

the middies. The boats were run up and stowed, the pole to gallant-mast struck, and storm stumps sent up in their place; all hands were called to unmoor, and we even hove short, so as to be ready to trip and be off, whenever word should come from the cabin to that effect. When all this was done, the captain sent up an order to have his gig lowered away and manned, and directly after came on deck himself, in a full rig of citizen's togs. Merry Terry stood in the gangway, leaning over the hammock cloth, when he heard the boatswain's mate pipe away the gig; and as the familiar sound struck his ear, I noticed that he started and turned pale. It was a glorious night—much such an evening as this, only later, about two or three bells in the first watch, I think. As the captain passed over the gangway, he gave a peculiar kind of look at Merry—something like what a monkey would at a marine after stealing his pipeclay—and then, turning round to the first luff, he said, "Remember, Mr Orlop, that you are under sailing orders, and that no one must leave the ship on any pretence." As he spoke this, he turned another malicious glance at Merry out of the corner of his eye, and jumping into the stern sheets of the gig, ordered the men to let fall and give way.

As long as the sound of the oars in the rowlocks could be heard, Merry stood as still as a stock-fish, his eye following the wake of the boat till it was lost in the haze of distance. When he could neither hear nor see it any longer, he began to walk about as wild as the devil in a gale of wind; and the reefers, who would gladly have done any thing they could to soothe him, saw clear enough that it wasn't a matter for them to meddle with. In the midst of his agitation, a shore-boat came alongside, the waterman in which handed a note up to the middy that went to the gangway to receive it, and immediately shoved off again. The note, of course, was given to the officer of the deck, according to man-of-war fashion, and he being a stately pompous sort of fellow, took his own time to send one of the side-boys for a lantern. When the glim came up, he walked to the fire-rail, and looking at the superscription, discovered that the note was for Merry Terry. The latter, on learning this, eagerly extended his hand for it, and, tearing it open, rapidly devoured its contents; then rushing to the gangway, he would have sprung into the shore-boat, which he hoped was still alongside; but during the officer of the deck's delay, it had already got far beyond hailing distance. Three or four times Merry paced up and down the deck in violent agitation, his lip as white and quivering as a jib in the wind, and his eyes shining like the top-glim of a commodore's ship. All at once he walked right up to the first luff, who was standing abaft, leaning on the taffarel, and, in a voice that seemed to come from the cable tier, it was so hoarse and deep, he said, "Mr Orlop, I must go ashore to-night." "You cannot, Mr Terry; you heard the captain's orders." "Curse the captain!" (It was the first word I ever heard Merry swear, though he and I had been messmates going on five years.) "Mr Terry, you forget yourself," answered the first luff, in a firm yet mild tone. "If you use such language, sir, you will force me to a disagreeable exercise of my duty." "I mean no disrespect to you, Mr Orlop," said Merry, partly recollecting himself; "but I am half distracted. If you will lend me your ear, sir, in a more private part of the ship, I will relate to you what may perhaps change your notions of duty."

Mr Orlop was one of that class of officers, who, to the knowledge and skill of an able seaman, added the feelings and address of a perfect gentleman. He, as well as every body else on board, had seen, and felt indignant at the treatment Merry received at the captain's hands; and some of the whispers respecting the cause had also reached him. Perceiving that poor Merry was now uncommonly agitated, and fearing that he might commit some indiscretion which would oblige him to exert unpleasant authority, he readily complied with his request, and led the way to his own state-room.

The conference, whatever was its nature, was of short duration; but while it lasted, many a curious glance was cast towards the state-room door, and— I'm 'most ashamed to own it—many a listening ear was inclined towards the bulk-head. There was little satisfaction got that way, howsoever, for nothing was heard but a low humming sound, now and then broken by a muttered curse in Mr Orlop's voice; and terminated at last by a sudden exclamation of that gentleman, loud enough for the whole steerage, and berth-deck into the bargain, to hear—"Enough, Mr Terry, enough!" cried he; "you shall have it—if it costs me my commission, you shall have it! There is a point where obedience becomes a crime. When military discipline conflicts with the principles of honour, I will be the first to set an example of insubordination."

As he spoke thus, the door of the state-room was thrown violently open, and the two officers issued suddenly to view. The cheek and lips of Merry were still pale and quivering, while the face of the other was flushed with a deep red. They both ran rapidly up the companion-ladder, Mr Orlop at the same moment calling out to me, "Mr Palmer," said he, "call the boatswain, and order him to get out the first cutter immediately. Do you attend yourself, sir, on the berth-deck, and start up all the men!"

By this time his foot was on the top-step of the

ladder. As soon as his head was fairly above the combings of the hatch, he began again—"Boatswain's mate!" "Sir!" sung out old Reuben James, in his peculiar drawl. "Call away the first cutters, and do you stand by and see to getting up the yard-tackles. Captain of the fo'castle, there!" "Sir!" bawled the captain of both starboard and larboard watch at once, startled at the loud earnestness of the first lieutenant's voice. "Lay aloft, and stand by to get your yard-tackles on the fore-yard! Quarter gunners, do you hear? do you do the same on the main! Foretop, there! out on the yard with you, and send down a whip for the yard-tackle block!" "Ay, ay, sir!" promptly responded a voice from the foretop; and with these and similar orders and replies, intermixed with the shrill pipings of the boatswain and his mates, the spar-deck now resounded for several minutes. By the end of that time the cutter was hoisted out, and brought to at the gangway. She was no sooner there than Merry Terry sprang down the side, and the crew after, who, though they wondered as much as all the rest of us, officers and men, how all this was going to end, yet, seeing they would oblige their favourite by moving lively, shoved off, and had up their oars in the crossing of a royal. "Mr Terry," cried the first lieutenant, "remember your word of honour that you will return to-night, provided you find or make all safe!" "Upon my honour," answered Merry, laying his hand on his heart: then turning quickly to the men, "give way!" and as long as we could hear him, he kept saying every now and then, "give way, my hearties, give way—pull with a will," and such like.

And they did give way too. They were a set of as stout oarsmen as ever manned a frigate's first cutter; but they never showed themselves ashore as they did that night. The boat fairly jumped out of the water every clip, and the foam that she dashed off from her bows formed a long white streak in her wake, as bright and dazzling as the trail of a Congreve rocket. You may think it wasn't many minutes before they reached the shore, going at that rate as if the devil had sent 'em an end. Merry steered her right head on, and never cried "rowed of all," till she struck the sandy beach with such force that she ran up high and dry, pitching the two bow oarsmen, who had got up to fend off, about half a cable's length from her. At the first grating of the keel upon the gravel, he leaped ashore, and, without stopping to say one word to the men, darted off like a wounded porpoise, running with all speed up the bank. For two or three minutes, the boat's crew looked at each other with their eyes stretched wide open, like the mouth of a dying fish, as much as to say, what the devil's all this! At length they began to consult together in a low grumbling tone, as they were afraid to hear themselves speak, and Bill Williams, who was coxswain of the cutter, was the first to offer a suggestion that met the approval of the rest. "Only hark," said he, "how his feet go clatter-clatter-clatter, as fast as the flapping of a jib-sheet in the wind. I'm fear'd, my hearties, that Mr Terry's runnin' 'mongst the breakers, and if you'll stay by the boat, I'll give chase—and, if so needs be, lend him a lift."

The proposal of the honest coxswain was relished by all, and he accordingly set off in the same direction that his young officer had taken. But Bill Williams, though he could run about a ship's rigging like a monkey in mischief, was no match for Merry in a land chase. His sea legs wasn't used to such business, and he went pitching and heaving ahead like a Dutch lugger afore the wind, and seemed at every step to be watching for the weather roll.

In the meantime, Merry linked it off like a Baltimore clipper going large. He had proceeded perhaps about a mile from the boat, along the road which he had struck into directly after leaving the beach, and instead of shortening sail, appeared to be crowding more and more canvass all the time, when all of a sudden he luffed up and hove to, on hearing the clatter of an approaching carriage. The noise of the wheels sounded nearer and nearer, as they came rattling along over the rough road, and it wasn't long before the quick trampling of the horses' feet, and the clicking of their shoes against the stones, indicated that they were near at hand. The place where Merry had paused was about midway up a steep hill; and if he had chosen a spot, it couldn't have been better suited to his purpose. The road, which had been rough and uneven from the first, was at this point broken into deep gullies by recent heavy rains, rendering, apart from the difficulty of the ascent, extreme caution necessary in passing with a vehicle. On one side, a steep wooded bank rose to a considerable height; and on the other, the surface of the ground gradually descended to the water, which was not quite excluded from view by a few scattering trees that occupied the immediate space. Behind one of these trees that grew close to the road-side, and threw a deep shadow over it, Merry, gritting and grinding his teeth, crouched down, like a young shark watching for his prey. The carriage had already gained the foot of the hill, and was slowly labouring up, when a deep gruff voice cried out to the driver from within, bidding him drive faster. At the sound of that voice, Merry's eyes fairly flashed fire. The black, with instinctive obedience, cracked his whip, and was about to make a more effectual application of it, when a figure suddenly sprang from the road-side, and, seizing the reins, commanded him to halt. The command, however, was scarcely necessary. The jaded horses

had reached a short level stage in the ascent, and not even the sound of the whip had elicited any indication that they intended shortly to leave it. Merry, with a sailor's quick eye, perceiving this favourable circumstance, in an instant was at the side of the carriage, within which, a voice of a very different tone from that which last issued thence, was earnestly beseeching succour.

"Help! for heaven's sake, help!—save me from a ruffian!" cried a female in imploring accents. The last words were scarcely articulate, and were uttered with a smothered sound, accompanied with a noise of struggling, as if the ruffian was endeavouring to hold the lady still, and to silence her cries by pressing his hand upon her mouth.

The incentive of this well-known voice seemed hardly wanting to add more fury to the rage of Merriville. Choking with mingled emotions, he called to the ruffian to hold off his hand, and, with an effort of desperate strength, tearing open the door, the fastenings of which he did not understand, he seized the inmate by the collar, and dragged him to the ground.

"Scoundrel!—ruffian!" he cried, "I have you in the toils, and dearly you shall rue this night's violence."

"Mr Terry!—I command—you shall suffer for this—a court martial!" and various similar broken ejaculations, were uttered by the wretch, who violently struggled to get loose from the strong grasp in which he was held. Merriville, though not of a robust constitution, yet possessed much muscular strength. In the present contest, every fibre received tenfold vigour from the energy of the feelings that raged within him, and made him an overmatch for the guilty being who writhed within his arms. The faces of both were inflamed and convulsed with mighty passions, though of a widely and obviously different character; for the rage of the one, though fierce as ten furies, had yet something noble and commanding in it, while that of the other seemed kindled by a demon. The captain (for it's useless to tell you that it was he) struggled hard, but was evidently becoming exhausted. In the excess of his emotion, he had bitten his lip nearly in twain; and the blood which, in their tossing to and fro, had been smeared over the faces and clothes of both, gave additional wildness to their appearance.

The female, who by this time had recovered from the swoon into which she fell when the voice of Merriville first reached her ear, now screamed as she saw the blood with which he was so profusely stained, and imagining him to be mortally wounded, she sprang from the carriage, and tottered towards him across the road. A sudden movement of the combatants, at the same moment, changed their position in such a way as to bring the back of Merriville towards the approaching figure, and at this instant, his antagonist, having succeeded in releasing his arm from his grasp, hastily drew a pistol from his pocket, cocked, and fired it. The ball whizzed through the air, only slightly grazing the neck of the intended victim; but a piercing shriek from the lips of the female, heard above the loud report, announced that it had done more fatal execution in another quarter. As if by mutual consent, both parties ceased from their struggle for a moment, and rushed towards her. She staggered two or three steps forward, mumbled a few scarcely audible words, among which the name of Merriville was the only intelligible sound, and fell bleeding to the earth. In the meanwhile, the horses, which had been scared by the near and loud report of the pistol, pranced suddenly round, and dashing down the hill, were soon lost to sight. Poor Merriville, with a groan of agony which he could not, which he did not, seek to repress, bent over the form which lay stretched and pale before him, and raising it partly from the ground, gazed for a stupid moment, in utter unconsciousness of all things else, upon the features of her still lovely face. The ball had passed directly through the heart, from which life had already bubbled out in a crimson tide, though a few darker drops continued to ooze from the livid orifice of the wound. Merriville whispered her name, but she answered not. In vain he leaned his ear to her lips, or bent his eyes upon them, till the hot tearless balls seemed bursting from their sockets—no sound, no motion, made reply. He laid his hand upon her heart—but its pulse was still. He looked into her eyes—but they returned not, as they were wont, an answering look; their light had gone out—the spirit had departed from its house of clay—she was dead, quite dead! As this fact impressed itself upon his brain, a maddening consciousness of the cause seemed slowly to return; his eyes rolled up till the balls were nearly hid, his face became of a livid darkness, and his teeth were clenched together, like those of one in mortal agony. Suddenly starting up, he turned quickly round, and with his arms extended, and his fingers curved like the talons of an eagle, he sprang wildly towards his guilty commander. The motion seemed to have been anticipated, for the wretch had prepared himself with a second pistol, which, as his antagonist approached, he deliberately aimed at him, and fired. Whether the ball took effect or not, it did not defeat poor Merry's object. He darted like a hungry tiger on the wretch, and with both hands, seizing him round the throat, he dragged him down to the earth. In vain his victim struggled—the sinews of his antagonist seemed hardened into steel. He tried to shriek for aid, but the

grasp around his neck choked his utterance, and his words died away in a rattling sound, like the gurgling in the throat of a drowning man. With a strength that seemed supernatural, Merriville raised him from the earth, and dragged him along the road. The struggling of the wretched man grew fainter and fainter, but still an occasional convulsive quivering of the limbs told that he yet lived. His face was almost black, his tongue lolled out of his mouth like a dog's, and his eyes, bloodshot and glassy, were protruded a full inch from their sockets. Blood had started from his nostrils in his mortal agony, and a thick wreath of mingled blood and foam stood upon his lips, which, wide distended, seemed stretched in a horrid laugh.

In silence, and with a strength that seemed more than human, Merriville continued to drag his victim along, till he reached the boat. He had been met by Williams not far from the scene of the first part of the contest, but he appeared not to see him. Williams, on his part, was too much awed to speak. The firing of the pistols had prepared him for some fatal event; for he had a dim and dark suspicion of the object of Merriville's errand, inasmuch as he had been the bearer of several notes between him and his betrothed; and had heard, also, that his captain was a rejected suitor for the same hand. One glance at the group served to show him the dreadful nature of the burden Merriville dragged along with him; he saw that his commander was already a corpse, and besides, he was too much intimidated by the unnatural lustre of Merriville's eye, by his pallid and unearthly hue, and by his still and terrible bearing, to interrupt the silence with a word. As they approached the boat, Williams waved his hand to the crew, who were anxiously waiting on the beach, and signified by an expressive nod that they must not speak. Silently and sorrowfully they followed their young officer to the water's edge, entered after him the boat, and commenced rowing back to the ship. Poor Terry, still holding the body by the throat, took his seat in the stern-sheets, and leaned his head down on the gunwale in such a way that his garments concealed his face. The face of the corpse, however, was exposed in the broad moonlight: and as the head hung partly over the seat, with its features distorted and bloody, its hair matted with clots of blood and earth, and its glassy eyeballs apparently staring at the men, a superstitious shudder crept over them, which with all their manhood they could scarcely repress.

In this way, and in silence, they drew near the ship. The sentinel hailed them, but no answer was returned. As they came to the gangway, the officer of the deck called Mr Terry by name; but still no reply. He saw by the terror painted on the countenances of the crew, that something dreadful had occurred, and descended quickly into the boat, where the whole terrible truth was soon ascertained. They were both dead! By the discharge of the second pistol, Merry had been mortally wounded, and his life had oozed away while his hands were still clasped with desperate energy around the throat of his victim. Even after death his fingers did not lose their tenacity. The officer tried to unlock the death-grasp, but without effect; and the two bodies, locked in an embrace, which, stronger than that of love, had outlasted life, were obliged to be hoisted up together.—*From the New York Mirror.*

EFFORTS OF GENIUS.

SECOND ARTICLE.

To continue our former list of distinguished men, who, by the efforts of their genius and perseverance, rose from the lowest stations in society: Dr Isaac Maddox, Bishop of Worcester, and known for his writings in defence of the church, was the son of a pastry-cook. The late Dr Isaac Milner, Dean of Carlisle, and Lucasian professor of mathematics at Cambridge, was at first a weaver. Dr White, professor of Arabic at Oxford, was also a weaver in his youth. Thedem, the chief surgeon of Frederick the Great, had in his youth been apprenticed to a tailor. The celebrated John Hunter, the anatomist, was originally apprentice to a cabinetmaker. William Kent and Francis Towne, landscape-painters of eminence, began as apprentices to coach-painters. The famous Hogarth raised himself from the condition of a working engraver on silver. Edmund Stone, the eminent mathematician, was originally a boy who wrought in the garden of the Duke of Argyle, at Inverary, and who taught himself to read. Buchanan, the Scottish historian, was born of poor parents, and being sent by an uncle to Paris for his education, he was there so neglected, that, in order to get back to his own country, he enlisted as a private soldier in a corps leaving France for Scotland: Buchanan had to undergo many difficulties before his learning was appreciated. Cervantes, the author of Don Quixote, commenced life as a soldier, lost his left hand in battle, and was a captive in Algiers for five years, during which period he wrote part of his celebrated work. Giordani, an Italian engineer and mathematician of the seventeenth century, was originally a common soldier on board of one of the Pope's galleys. William Hutton, the eminent historian, of Birmingham, and the author of some miscellaneous pieces, was the son of a poor woolcomber, and suffered the severest pangs of poverty in his early years. Joly, the French dramatist, was the son of the keeper of a cof-

fee-house. Erasmus endured great poverty while a student. Blacklock, a Scottish poet, was blind from his infancy, and in early life was in a distressing state of poverty; yet he rose to a respectable station in society, and acquired considerable learning in scientific and theological branches of education. Boydell, one of the most eminent printers in Europe, and at one time Lord Mayor of London, was originally a working engraver. Breguet, a celebrated maker of chronometers at Paris, and who has never been surpassed in this line of trade, was originally a poor Swiss boy, who went through some extraordinary difficulties at his outset, but surmounted the whole by perseverance and talent. Britton, a singular proficient in chemistry and music, and a collector of books and curiosities, cried small coal for sale about the streets. Michael Bruce, a Scottish poet of great merit, was a village schoolmaster at Kinneswood, in Kinross-shire, and contended long with poverty and sickness. Bunyan, the author of the Pilgrim's Progress, was the son of a tinker, and followed that profession himself for some time. Having been imprisoned for preaching, he supported himself and his family by toggling laces, and in his leisure hours in his dungeon he composed the work which has immortalised his name. The Scottish poet Burns, as is well known, was born a peasant, and his early life was spent as a ploughman; yet what fame did he not acquire! Cæcilius Statius, a celebrated dramatic writer in ancient Rome, was originally a slave, but was emancipated in consequence of his talents. Caslon, an eminent typefounder in London, was originally an engraver of ornaments on gun-barrels, but being noticed by some printers for the elegance of his lettering, he was induced to become a cutter of types, in which he acquired a handsome fortune. Cavalier, the famous leader and protector of the Camisards, or Protestants of Languedoc, when an attempt was made to exterminate them by Louis XIV., was the son of a peasant, and was bred a journeyman baker: he afterwards distinguished himself in the English service, in which he died, 1740. Ephraim Chambers, the compiler of a well-known dictionary of arts and sciences, was the apprentice of a mathematical instrument maker, and it was while in this occupation he projected his dictionary, some of the articles of which he wrote behind the counter. Captain Cook, the eminent circumnavigator, was born of humble parents in Yorkshire, and began his career as a cabinboy in the merchant service. Cullen, who rose to such eminence as a physician, was originally apprentice to a surgeon and apothecary in Glasgow, and supported himself in early life by making several voyages, as surgeon, to the West Indies. Curran, the eminent Irish barrister, was born of humble parents, and had to struggle with want of practice, and consequent penury, before he became known, and rose to such splendid forensic fame. Sir William Davenant, an eminent dramatic writer, and partisan of Charles I., was the son of an innkeeper at Oxford. Daniel Defoe, the author of Robinson Crusoe, and other works, was the son of a London butcher, and had to struggle with many misfortunes. Demosthenes, one of the greatest orators of antiquity, was the son of a sword-blade manufacturer at Athens, and was left an orphan at seven years of age; and it was with incredible perseverance and labour that he brought himself into notice. James Dickson, the author of some eminent works on botany, and one of the founders of the Linnaean Society in London, was originally a working gardener, and rose by his own exertions. Dodsley, the publisher of the Annual Register, and the author of the Economy of Human Life, and other pieces, was originally a stocking-weaver, and afterwards a footman. Having while in this situation published a poem, entitled the Muse in Livery, he came into notice, was patronised by Pope, and enabled to commence as a bookseller in London, where he rose to fortune by his industry and merit. Falconer, the author of "The Shipwreck," was the son of a barber at Edinburgh (by others he is said to have been a native of Fife), and entered the merchant service when young: he underwent many difficulties, and was at last drowned in a voyage to India. James Ferguson, the astronomer and experimental philosopher, as already noticed in this publication, was the son of a poor labourer in Banffshire, served at first as a shepherd, and rose to eminence entirely by his force of genius and application. George Fox, the founder of the Society of Friends, or Quakers, was the son of a weaver, and he himself served an apprenticeship to a grazer, and was employed in keeping sheep; the silence and solitude of which occupation produced a zealous religious feeling, which led to the propagation of his new scheme of human society. Benjamin Franklin, who rose to eminence as a philosopher and statesman, was originally, as is well known, a journeyman printer, and it was only by unremitting industry, and the exercise of his genius, that he rose to the enviable situation in which he closed his career. Andrew Fuller, a celebrated Baptist minister, and author of some works of merit, in the last century, wrought as a peasant till he was twenty years of age. Madame de Genlis, whose maiden name was Ducrest de St Aubin, felt the stings of adversity and poverty in her youth, and depended on her musical abilities for support, till married to the Count de Genlis. Gifford, the late distinguished editor of the Quarterly Review, was left an orphan at thirteen; was put to sea as a cabinboy; was afterwards bound to be a shoemaker, and was rescued from his humble fate at twenty years of age, by the kindness of Mr Cook-

ley, a surgeon: Gifford was so utterly poor while a shoemaker, that he could not buy paper, and used to work algebraical questions with a blunted awl on fragments of leather. The life of this meritorious man has been already given in the *Journal*. Gray the poet was brought up in great poverty, and supported in his education entirely through the extraordinary exertions of his mother. John Harrison, who received the reward of £20,000 from Parliament, for his famous timekeeper to determine the longitude at sea, was the son of a carpenter, and instructed himself in mechanics.—*To be continued.*

THE PASSING SEASON.

THE active duties of the husbandman in bringing the fruits of the earth to maturity, are now over; and if he have been diligent, and been favoured with a beneficent climate, success will have crowned his exertions. The end of September and the beginning of October form the most delightful season of the whole year in Great Britain, and embrace a happy mixture of the pleasures of summer and winter. The air is clear and bracing; the heat of the sun is tempered by a cool breeze proceeding out of the west, and sweeping with gentle force over the new-shorn and deserted fields. The new sweet-scented clover (I speak of Scotland) is perceived to have risen above the stubble; and along the long stretching hollows of the furrows, the hare and its leverets are seen scampering on the approach of the sportsman or idle passenger. This is the season in which dog and gun are peculiarly busy in the copses, or on the sides of the swelling upland and hills, where

The moorcock springs on whirling wings,
Amang the blooming heather.

To me, the country never possesses such charms as during the fall of the leaf. Neither the freshness of spring, nor the warm glow of summer, with its prospect of plenty for man and beast, furnish the same feeling of satisfactory pleasure to the mind as the close of autumn. Then there were hopes and fears; now, the great object of universal expectation is accomplished. The earth has yielded her increase; the homestead of the farmer is thickly surrounded with substantial stacks of grain, towering, with their pointed peaks, aloft, like so many wigmans. Every thing betokens rest, and the surface of nature bespeaks the plenty which lies in store for the consumption of animated beings. The rural population wear, also, an air of settled comfort, as if reflecting with gratitude on the bounties of Providence brought to their very doors, or within their dwellings. The juvenile peasantry have not been idle in their vocation. Such happy days of gleaming have there been for these few weeks! As you walk, of an evening, along the highways, or pursue your way through the intersecting pathways, you meet troops of youngsters, with perhaps some aged females of the hamlet, loaded with neatly arranged bunches of stalks of grain, gathered from the shorn fields. And how satisfied are these gleaners with a sheaf or two of corn; how thankful they are if they can realise but as much as will furnish a homely daily meal for the space of a single week! The cottagers, you may likewise notice, have already dug up the most of their vegetables, leaving only their winter pot-herbs; and in a month more, you may see their hillocks of potato-pits, neatly built and thatched for future use. There is certainly a pleasure in casting the eye over these signs of rustic wealth; and when the shades of evening fall around, in seeing, within the lowly cottage window, the lighted hearth and the blazing fire giving token that the evening meal is in the act of preparation.

But in these rambling observations on "Autumn's pleasant weather," I am forgetting my usual directions to the horticulturist. Let us see what that capital authority, "Lindley's Guide to the Orchard and Kitchen Garden," says on the subject:—

GARDENING FOR OCTOBER.

Trench and prepare borders and quarters, and transplant fruit-trees against the walls, and standards and dwarfs in orchards; open-quarters and borders in the fruit garden. Plums and cherries, planted out at this time, will make fresh roots during the autumn and milder part of the winter, and grow with much more vigour when headed down in the spring, than those planted out a month or more afterwards. Plant out cuttings of gooseberries and currants. In order to keep some of the more valuable apples in a perfect state to a late period of the season, they should hang till they can be readily detached from the tree. They should then be placed in casks or boxes, as they are gathered, beginning with a layer of thoroughly dry pit sand in the bottom, then a layer of apples, placed close to each other, then another layer of sand, just sufficient to cover the fruit, and no more; and so continuing alternately, till the cask or box is full, finishing with a covering of sand. These should be placed in the fruit-room, where they may remain undisturbed till the others of the same kind, kept on the shelves, are nearly done. This method has been practised many years ago. I have myself, as well as several of my friends, adopted it for several years, and found it an excellent one. The windows of the fruit-room should be furnished with inside shutters, and kept closed, as it is found fruit keeps longer and better thus than when exposed to the light. Plant out strawberries where they are finally to remain."

In the kitchen garden, transplant cauliflowers and

early purple broccoli under frames and hand-glasses. Plant out cabbages, garlic, rommbole, and shallots. Tie up endive, and earth up cardoons and celery. Lay up carrots, potatoes, and red beet, for winter use. Make up mushroom beds, which have been omitted the last month. Clear the beds of aromatic plants from weeds, and let them have the winter's dressing. Where forced asparagus is required for use in winter, hotbeds may now begin to be made for gathering the first crop in November or December.

DREAMING.

THE full operation of a gloomy temperament is now to be perceived only by looking back to the ages when no such correctives as the influence of general intelligence and public opinion existed. Men then regulated their conduct wholly in conformity to portents, dreams, and other supposed indications of the will of the gods. They did not consider whether their enterprises were such as entitled them to the favourable regard of a just Deity, but strove, by rivaling each other in the magnificence of their offerings and sacrifices, to bribe over to their side the rulers of mortal destiny. This is the point to which all superstition tends. When a fanatical gloom has diffused itself over the whole face of society, the notions of right and wrong are lost in the paramount doctrine of fatalism; the fear of retribution is next thrown off, and by degrees men come to believe that even their gods are venal. In our own times, though the stream of civilisation flows pure and strong, there are many portions of society which, like the lagoons of a river, are not kept in motion at all, or but in a lesser degree, by the energy which pours along in the main current. There—among isolated individuals and communities—gloomy ideas are cherished. There the hypochondriac fancies, that are kept in restraint by intercourse with the world, and the disposition to which it is even of use to society, as tending to moderate the opposite extreme of reckless levity, luxuriate in their growth, and by degrees overshadow the whole faculties of the mind. Regulated only by the impulses of a dark superstition, the temper becomes at least variable—often habitually sullen; if bad passions are not in every case engendered, the equable flow of the benevolent affections is disturbed, and social life is either entirely embittered, or its enjoyments are rendered casual and precarious.

It is wisely ordered that abrupt turns should sometimes occur in human affairs, to remind us that they are under divine government. But the lessons thus conveyed have often been perverted by enthusiasts, ever upon the watch to discover what they term particular providences, thereby encouraging the unreflecting to believe that the Creator bestows upon his works only an occasional superintendence. Unusual occurrences, in place of affording examples of deviation from the laws of nature, would, if calmly inquired into, and properly understood, only bring the unerring regularity of these laws more distinctly into view. The law of gravity acts with more obvious force in precipitating water over the face of a rock, than in making the stream glide smoothly down a gentle slope; but it is, nevertheless, the same law. The power of the Governor of the universe is displayed as much in the regulation of its minutest, as of its most magnificent arrangements—as well in things which fall under our daily observation, as in those which we witness only once in our lives. But we have become familiar with some of the modes in which His power is manifested, and these we ascribe to the common course of nature; while unusual phenomena strike us with astonishment, the first impulse of which is to invest them with a miraculous character. In walking across the fields, we have been so much accustomed to contemplate the harvest as in some way indebted to man for the aspect it wears, that our thoughts seldom revert to the Prime Mover of all; the wild plants, also, that are well known, attract little attention; but if our walk stretch beyond its usual limits, the simplest herb catches our eye: we stop, call our companions to admire it, and exclaim, "How strange it is!" Yet a little reflection should teach us that it is not more strange than those others which, but a short time before, we carelessly pronounced to have sprung up according to the common course of nature—it draws its nourishment from the soil by a process not more minutely adapted to its necessities. Our admiration becomes awe when we meet with a production not analogous to any with which we were before acquainted—we call it not only strange, but miraculous. Thus many of the appearances of nature, now understood to proceed from established laws, were in former times viewed with fear and trembling, as instances in which the Divine Being interrupted the laws of nature, in order to give a demonstration of his power independent of these laws. Hence the manifold prodigies that appalled the heathen, and that long continued to appal Christians.

But it is not concerning physical objects alone that we argue in this incongruous way: A man shall jog on in the ordinary routine of life for years, and though he acknowledges in general a superintending providence, yet he still looks upon himself as the principal disposer of the affairs around him; but when some sudden and unexpected change comes, that interrupts his plans, and makes it undeniably plain to him that he has not the complete control of his own fortunes, he says "The hand of God is here!" as if that thing, and no other, happened under the superintendence of

the Deity. Another man shall go on forming schemes and pursuing trains of reasoning from day to day, and never think more of the matter than if he were driving round a wheel framed by his own hands; while, if he be agitated by a nightly vision, he employs much consideration to determine by intercourse with what angel, malignant or benign, his sleep was troubled; he takes to himself the whole credit of the sound and perfect exercise of his faculties; but when their operations are irregular and inefficient, he must needs have it that a being of greater power and knowledge than himself has had the management of them—into conclusions so contradictory are we betrayed by the propensity to wonder, which saves the trouble of reflection and examination in the meantime, but surrounds simple things with an entrenchment of perplexities, which it takes many ages for the slow axe of reason to clear away.

Persons truly devout, perhaps, but deficient in sound judgment, have contributed not a little to bring to full growth the seeds of superstition, for which, as we have just seen, the human mind affords a soil so favourable. If the detection of a crime follow a dream, for example, such persons are fond of remarking, that though the guilty may escape for a time, the eye of a just God is upon him, and where human means fail, will bring the wickedness to light in his own good time and way; and if an explanation be offered which does away with the idea of supernatural interpositions, they call it an attempt to weaken the force of the warning. So far, however, is this from being the case, that the warning is greatly strengthened when it can be shown that guilt has been discovered without any departure from the usual course of events. There are not so many instances of crimes brought to light by what appeared to be supernatural means as to produce a salutary fear in the vicious; and if any single instance were added to the rest, it would not much increase their weight: but when we see it ordered, in the common course of human affairs, that vice almost invariably draws after it its own punishment, the effect of such a conviction in repressing crime must be very powerful. Here, then, is an arrangement which imposes a continual check upon the evil passions—a check which must be weakened as often as the arrangement is represented to be ineffectual, while the occasional instances of direct vengeance from heaven would only substitute an occasional restraint. It is as if a peaceful nation were separated from a predatory tribe by a river known to be unfordable, and some persons, not thinking this protection sufficient, were to propose to turn its waters from this course, and to supply their place by a stream not so large, but with which they might frighten their warlike neighbours, by telling them that it was liable now and then to overwhelming floods. The following is an instance of a crime brought to light by a dream—a particular examination of which will more fully elucidate the opinion above expressed:—

Maria Marten, aged twenty-five, daughter of a molecatcher at Polstead, Suffolk, formed an imprudent connection with William Corder, son of a neighbouring farmer; he frequently visited her at her father's, and at last persuaded her to leave home with him, on the 19th of May 1827, to go to Ipswich to be married. To deceive the neighbours, she put on a man's dress, intending to resume her own at a place called the Red Barn, on the farm belonging to Corder's mother. It was about twelve o'clock at noon when they left her father's, Maria going out by one door and Corder by another, to avoid attracting attention; and having met some distance off, they proceeded together towards the barn. Corder had a gun with him, and, before leaving the cottage, Maria asked, in the hearing of her mother, "Is this gun loaded, William?" to which he replied, "Yes." Some days after, Corder came to Polstead alone, and, when questioned by the girl's parents, said the marriage had not yet taken place, because he could not bring her home without displeasing his relations, but that he had left her in a place of safety, and hoped to make an arrangement for the wedding, and for bringing her home in six weeks; he added, that Maria's sister might wear her clothes, for she would not want them again. On the mother's inquiring, some time after, why her daughter never wrote, he made the excuse that she was unaccustomed to use the pen, and delayed a task which was irksome. To the neighbours, who asked what he had done with his partner, he answered, that she was in a place where he could go to her whenever he liked. In a short time, Corder's health became impaired, and, in accordance with real or pretended medical advice, he expressed an intention of going abroad. Accordingly, he left home in September, having previously shown great anxiety to have the Red Barn well filled, and himself assisted to store grain into it. Subsequently to this, letters from him were received, both by his own relations and the Martens. In one to the girl's father, he said she was now his wife, and complained, as if by her desire, that a letter of her's had not been answered; in another letter, he gave an account of having made at the post-office an investigation concerning the miscarriage of Maria's letter. These letters of Corder's showed that, in place of going to the Continent, he had remained in London. In the meantime, suspicions began to be entertained by the young woman's parents—Corder's conduct was so variable, and he made so many pretexts without substantiating them. Strange surmises

also ran among the neighbours. Thomas Marten, Maria's brother, recollected as an unaccountable circumstance, that about three o'clock in the afternoon of the day when his sister went off, he had seen Corder walking across a field in the direction of the Red Barn, with a pickaxe over his shoulder, when it was reasonable to suppose he should have been at a distance from that neighbourhood. All these things concurred to disturb the family; and their alarm was brought to its height by the mother dreaming three successive nights that her daughter had been murdered, and buried in the Red Barn. Upon this, she insisted that the floor should be taken up, and search made. This was done by the father and others on the 19th of April 1828, and a sack was discovered containing a female corpse, not so much decayed but that marks of violence were perceptible. The body was identified as that of Maria Marten, by the want of two teeth, one on the left side of the upper jaw, and the other on the right side of the lower jaw. Corder had married in the interval, and lived apparently happy. He was apprehended at Ealing, in Essex, condemned upon circumstantial evidence, confessed the murder while in prison under sentence, and was executed in August 1828.

When a story like this is told, the multitude take hold of only a part of it. "Here was a horrible murder," they say, "disclosed in a wonderful manner. A mother dreamt that her daughter had been made away with, and buried in a particular spot; and search being made, the remains were found in the exact situation pointed out in the vision." This part of the facts passes from mouth to mouth, and is heard every where with superstitious amazement. It is true as far as it goes, but is propagated with a false inference; for to say that Corder was brought to punishment by supernatural means, presupposes an absence of all the circumstances which might have led to the discovery of his crime in an ordinary way. Now, the narrative has purposely been given at considerable length, to show that they were all present: there were strong grounds for suspicion, so strong that the suspicion was not confined to the girl's own family, but was common to them with the neighbours; and the dream was nothing else than a repetition of the mother's waking fears. The circumstance of Corder being the young woman's second seducer—the dissatisfaction of his friends with the proposed match—his being above her rank—were all antecedent presumptions that he would avoid the connection if he could; next followed a train of direct presumptions that he had rid himself of her claims upon him by desperate means. He conducted her to a lonely place, the fit scene of a murder, having with him a loaded gun, the ready means of perpetrating it; he was seen afterwards, when he ought to have been at a great distance off, proceeding towards the Red Barn, with a spade, the necessary implement for concealing a deed of blood. And his subsequent conduct added a series of accessory presumptions; his return to the village without his companion; the vague manner in which he accounted for her absence; his departure from the neighbourhood; the precaution of filling the barn with grain; the inconsistency of his remaining in London after pretending that it was necessary for his health to proceed to the Continent; the pretences by which he endeavoured, when the parents were not pressing him, to make them believe he was married to their daughter, while if it had been the case, the proof might have been given without any effort. All this formed a body of evidence so conclusive, that a magistrate, if it had been laid before him, would immediately have issued a warrant for the apprehension of Corder. It may appear surprising that the parents should have so long remained insensible to the force of such pregnant suspicions; but some are so little accustomed to exercise their judgment, that conviction cannot be produced in their minds, until impressed by the vivid touches of imagination. Where the obtuseness of the one faculty, however, is extreme, the operation of the other is proportionately active—a law of nature which leaves the evil-doer no security from protection, whether his practices be carried on against the intelligent or the ignorant portion of the community.

The dream just detailed was without doubt the immediate cause of the murder being discovered; but then the dream, instead of having a miraculous origin, was the natural consequence of the mother's fears: the discovery therefore took place as much according to the ordinary course of events as if no dream had intervened. The same sort of explanation is applicable to another set of dreams, through which it is sometimes alleged that innocent persons have been miraculously rescued from impending danger, though the parties might, for the most part, have hit upon the necessary precautions equally well without a dream, if they had attended to the suggestions of ordinary prudence. This will be made sufficiently obvious by the following instance:—

In Queen Mary's time, Mr John Rough, a Scotsman, the minister, and Cutbert Symson, the deacon, of a secret congregation of Protestants in London, were burnt in Smithfield, Rough on the 22d of December 1557, and Symson on the 28th of March 1558, both having been apprehended, in consequence of the information of a pretended friend, on the third Sunday of Advent, in the first mentioned year. "The Friday, at night," says Fox, in his *Acts and Monuments of Martyrs*, vol. ii. p. 1843, edit. 1610, "before

Maister Rough was taken, being in his bed, he dreamt that he saw two of the guard leading Cutbert Symson, and that he had the book about him wherein were written the names of all them which were of the congregation; whereupon, being sore troubled, he awaked, and called his wife, saying, 'Kate, strike light; for I am much troubled with my brother Cutbert this night.' When she had so done, he gave himself to read in his book awhile, and then, feeling sleep to come upon him, he put out the candle, and so gave himself again to rest. Being asleep, he dreamt the like dream again, and, awaked therewith, he said, 'Oh, Kate, my brother Cutbert is gone!'—so they lighted a candle again, and rose. And as the said Mr Rough was making him ready to go to Cutbert to see how he did, in the meantime the said Cutbert came in, with the book containing the names and accounts of the congregation. Whom when Maister Rough had seen, he said, 'Brother Cutbert, ye are welcome, for I have been sore with you this night;' and so told him his dream. After he had done so, he willed him to lay the book away from him, and to carry it no more about him: unto which Cutbert answered he would not so do; for dreams, he said, were but phantasies, and not to be credited. Then Mr Rough straitly charged him in the name of the Lord to do it; whereupon the said Cutbert took such notes out of the book as he had willed him to do, and immediately left the book with Mr Rough's wife."

If there had been no reason to fear either that Symson might be apprehended, or that the book, if found upon him, would involve others in his misfortune, it might have been plausibly alleged that Mr Rough's dream was a miraculous warning from heaven; but when the Protestants daily saw victims dragged to the stake, and lived in constant alarm on their own account, not much reflection was necessary to show the danger of any one of them, but especially an office-bearer, so much more exposed than others to the risk of being seized, keeping in his house, or carrying about his person, a list of his brethren. The only matter of surprise in this case is, not that the dream took place, but that a practice so unadvised as that which caused the dream should have been persisted in by persons whom, from the situation they occupied, and the difficulty of the times, one would expect to have been not deficient in discretion.

In both of these instances the dream was evidently suggested by a train of thought which the circumstances in which the parties were placed unavoidably forced upon them. They were no further miraculous, therefore, than any of the other ordinary operations of the mind. Let us not, however, be misunderstood on this subject. So far from refusing to admit that human affairs are controlled by a superintending Providence, we would have people acknowledge its CONSTANT presence in ALL, and not by describing a few PARTICULAR cases as miraculous induce a belief that it is only CASUAL. Nor, by limiting the number of miracles to those that are undeniably such, do we apprehend that the evidences of divine power are in the least diminished. On the contrary, the maintenance of the laws which regulate the universe, demonstrate the presence of all-sufficient wisdom much more clearly than an occasional interruption of these laws, or deviation from them. The feeding of the Israelites in the wilderness with manna from heaven was a great and undoubted act of benevolent omnipotence; but how much greater is the sustaining of the myriads of human beings who have existed upon the face of the globe before and after that time, by a system ensuring the periodical renewal of the fruits of the earth, so that a few handfuls of scattered seed multiply to an extraordinary degree, and the "fields stand so thick with corn that they laugh and sing!"

FIGHTING FITZGERALD.

THE way in which this noted bully forced his way into Brookes's Club was truly ludicrous. He applied to Admiral Keith Stewart to propose him as a candidate; and the worthy admiral well knowing that he must fight or comply with his request, chose the latter alternative. Accordingly, on the night in which the balloting was to take place (which was only a mere form in this case, for even Keith Stewart himself had resolved to *blackball* him), the duellist accompanied the admiral to St James's Street, and waited in the room below whilst the suffrages were taken, in order to know the issue.

The ballot was soon over; for without hesitation each member threw a *black ball*: and when the scrutiny took place, the company were not a little amazed to find not even one white one among the number. However, the point of rejection being carried *nem. con.*, the grand affair now was, as to which of the members had the hardihood to announce the same to the expectant candidate. No one would undertake the office, for the announcement was sure to produce a challenge; and a duel with Fighting Fitzgerald had in almost every case been fatal to his opponent. The general opinion, however, was, that the proposer, Admiral Stewart, should convey the intelligence, and that in as polite terms as possible; but the admiral, who was certainly on all occasions a very gallant officer, was not inclined to go on any such embassy.

"No, gentlemen," said he; "I proposed the fellow, because I knew you would not admit him; but I have no inclination to risk my life against that of a mad-man."

"But, admiral," replied the Duke of Devonshire, "there being no *white ball* in the box, he must know that you have blackballed him as well as the rest; and he is sure to call you out, at all events."

This was a poser for the poor admiral, who sat silent for a few seconds, amidst the half-suppressed titter of the members. At length, joining in the laugh against himself, he exclaimed, "Upon my soul, a pleasant joke I've got into. Hang the fellow. No matter. I won't go. Let the waiter tell him there was *one black ball*, and that his name must be put up again, if he wishes it." This plan appeared so judicious, that all concurred in its propriety. Accordingly, the waiter was in a few minutes after dispatched on the mission. In the meantime, Mr Fitzgerald showed evident symptoms of impatience at being kept so long from his "dear friends" above stairs, and frequently rang the bell to know the *state of the poll*. On the first occasion, he thus addressed the waiter who answered his summons—"Come here, my tight little fellow: Do you know if I am *chosed* yet?"

"I really can't say, sir," replied the young man; "but I'll see." "There's a nice little man. Be quick, d'ye see; and I'll give you sixpence when you come with the good news."

Away went the *little man*, but he was in no hurry to come back; for he, as well as his fellows, were sufficiently aware of Fitzgerald's violent temper, and wished to come in contact with him as seldom as possible. The bell rang again; and to another waiter the impatient candidate put the same question—"Am I *chosed* yet, waiter?" "The balloting is not over yet, sir," replied the man. "Not over yet!" exclaimed Fitzgerald; "but, sure, there is no use for balloting at all, when my dear friends are all unanimous for me to come in. Run, my man, and let me know how they are getting on."

After the lapse of another quarter of an hour, the bell was rung so violently as to produce a contest among the poor servants as to whose turn it was next to visit the lion in his den; and Mr Brookes, seeing no alternative but resolution, took the message from the waiter, who was descending the staircase, and boldly entered the room, with a coffee equipage in his hand. "Did you call for coffee, sir?" said Mr Brookes smartly.

"Confound your coffee, sir! and you too," answered Mr Fitzgerald, in a voice which made the host's blood curdle in his veins. "I want to know, sir, and that without one moment's delay, sir, if I am *chosed* yet?"

"Oh, sir," replied Mr Brookes, who trembled from head to foot, but attempted to smile away the appearance of fear, "I beg your pardon, sir; but I was just coming to announce to you, sir—with Admiral Stewart's compliments, sir—that unfortunately there was one *black ball* in the box, sir; and, consequently, by the rules of the club, sir, no candidate can be admitted without a new election, sir, which cannot take place, by the standing regulations of the club, sir, until one month from this time, sir."

During this address, Fitzgerald's irascibility appeared to undergo considerable *mollification*; and at its conclusion, the terrified landlord was not a little surprised and pleased to find his guest shake him by the hand, which he squeezed heartily between his two, saying, "My dear Mr Brookes, I'm *chosed*! and I give you much joy; for I warrant ye'll find me the best customer in your house. But there must be a small matter of mistake in my *election*; and as I should not wish to be so ungenteel as to take my *sate* among my dear friends above stairs, until that mistake is rectified, you'll just step up and make my compliments to the gentlemen, and say, as it is only a mistake of *one black ball*, they will be so good as to waive all ceremony on my account, and proceed to *re-elect* their humble servant without any more delay at all. So now, my dear Mr Brookes, you may put down the coffee; and I'll be drinking it while the new *election* is going on."

Away went Mr Brookes, glad enough to escape with whole bones, for this time at least. On announcing the purport of his errand to the assembly above stairs, many of the members were panic-struck; for they clearly foresaw that some disagreeable circumstance was likely to be the finale of the farce which they had been playing. Mr Brookes stood silent for some minutes waiting for an answer, while several of the members whispered and laughed in groups, at the ludicrous figure which they all cut. At length the Earl of March (afterwards Duke of Queensberry) said aloud, "Try the effect of two *black balls*. D—n his Irish impudence; if two balls don't take effect upon him, I don't know what will." This proposition met with unanimous approbation, and Mr Brookes was ordered to communicate accordingly.

On re-entering the waiting-room, Mr Fitzgerald rose hastily from his chair, and seizing him by the hand, eagerly inquired, "Have they *elected* me right now, Mr Brookes?" "I hope no offence, Mr Fitzgerald," said the landlord; "but I am sorry to inform you that the result of the second balloting is, that *two blackballs* were dropped in, sir."

"Oh, then," exclaimed Fitzgerald, "there's now *two mistakes*, instead of one. Go back, my dear friend, and tell the honourable members that it is a very uncivil thing to keep a gentleman waiting below stairs, with no one to keep him company but himself, whilst they are enjoying themselves with their champagne, and their cards, and their tokay, up above."

Tell them to try again, and I hope they will have better luck this time, and make no more mistakes, because it's getting late, and I *won't be chose* to-night at all. So now, Mr Brookes, be off with yourself, and leave the door open till I see what dispatch you'll make."

Away went Mr Brookes for the last time. On announcing his unwelcome errand, every one saw that palliative measures only prolonged the dilemma; and General Fitzpatrick proposed that Brookes should tell him, "His cause was hopeless, for that he was *black-balled* all over from head to foot, and it was hoped by all the members that Mr Fitzgerald would not persist in thrusting himself into society where his company was declined." This message, it was generally believed, would prove a sickener, as it certainly would have done to any other candidate under similar circumstances. Not so, however, to Fitzgerald, who no sooner heard the purport of it than he exclaimed, "Oh, I perceive it is a *mistake altogether*, Mr Brookes, and I must see to the rectifying of it myself; there's nothing like *daling* with principals, and so I'll step up at once, and put the thing to rights without any more unnecessary delay."

In spite of Mr Brookes's remonstrance that his entrance into the clubroom was against all rule and etiquette, Fitzgerald found his way up stairs, threatening to throw the landlord over the banister for endeavouring to stop him. He entered the room without any farther ceremony than a bow, saying to the members, who indignantly rose up at this most unexpected intrusion, "Your servant, gentlemen; I beg you will be seated."

Walking up to the fireplace, he thus addressed Admiral Stewart:—"So, my dear Admiral, Mr Brookes informs me that I have been *elected* three times." "You have been balloted for, Mr Fitzgerald; but I am sorry to say you have not been chosen," said Stewart. "Well, then," replied the duellist, "*did you blackball me?*" "Why, good sir," answered the admiral, "how could you suppose such a thing?" "Oh, I supposed no such thing, my dear fellow; I only want to know who it was that dropped the blackballs in by accident, as it were."

Fitzgerald now went up to each individual member, and put the question *seriatim*. "Did you blackball me, sir?" until he made the round of the whole club; and it may well be supposed that in every case he obtained a similar answer to that of the admiral. When he had finished his inquisition, he thus addressed the whole body, who preserved as dead and dread a silence as the urchins at a parish school do on a Saturday, when the pedagogue orders half a score of them to be *horsed* for neglecting their catechism, which they have to repeat to the parson on Sunday:—"You see, gentlemen, that as none of ye have blackballed me, I *must be chose*; and it is Mister Brookes that has made the mistake. But I was convinced of it from the beginning; and I am only sorry that so much time has been lost as to prevent honourable gentlemen from enjoying each other's good company sooner. Waither! come here, you *raskal*, and bring me a bottle of champagne, till I drink long life to the club, and wish them joy of their unanimous election of a *rael* gentleman by father and mother, and—" This part of Fitzgerald's address excited the risible muscles of every one present; but he soon restored them to their former lugubrious position, by casting around him a ferocious look, and saying in a voice like thunder, "*And who never missed his man!* Go for the champagne, waither; and, d'y'e hear, sur, tell your *mashtur*—Masthur Brookes that is—not to make any more mistakes about *black balls*; for though it is below a gentleman to call him out, I will find other *manes* of giving him a bagful of broken bones!"

The members now saw there was nothing for it but to send the intruder to Coventry, which they appeared to do by tacit agreement; for when Admiral Stewart departed, which he did almost immediately, Mr Fitzgerald found himself completely cut by all "his dear friends." The gentlemen now formed themselves into groups at the several whist-tables; and no one chose to reply to his observations, nor to return even a nod to the toasts and healths which he drank whilst discussing bottles of the sparkling liquor, which the terrified waiter placed before him in succession. At length, finding that no one would *communicate* with him in *either kind*—either for drinking or for fighting—he arose, and making a low bow, took his leave as follows:—"Gentlemen, I bid you all good night; and I am very glad to find ye so *sociable*; I'll take care to come earlier next night, and we'll have a little more of it."

The departure of this bully was a great relief to every one present, for the restraint caused by his vapouring and insolent behaviour was most intolerable. The conversation immediately became general; and it was unanimously agreed that half-a-dozen stout constables should be in waiting the next evening to lay him by the heels, and bear him off to the watch-house, if he attempted again to intrude. Of some such measure Fitzgerald seemed to be aware; for he never showed himself at Brookes's again, though he boasted every where that he had been unanimously chosen a member of the club!

The writer trusts that none of his readers are impressed with the idea that want of personal courage on the part of any member contributed in the smallest degree to prevent Fitzgerald from being kicked out of the society into which he had so unwarrantably thrust himself; more particularly when he considers that the

whole affair was so eccentric as to create mirth, rather than a desire to effect chastisement; and that many, particularly the junior members, had no small curiosity to witness the termination of an adventure so impudently and so ludicrously carried on. But, these considerations apart, it is not to be supposed that men whose courage on ordinary occasions might easily be "screwed up to the sticking point," should be very ready, as Admiral Stewart expressed it, "to risk their lives against that of a madman." Moreover, in addition to the well-founded and rational dislike which many men have to duelling, family considerations and a natural love of life were sufficient to deter any man of sense from encountering the *fighting Fitzgerald* either with sword or pistol; for, being really a good swordsman and marksman, and being accounted almost *invulnerable* in his own person, the result of a combat with him ceased to be an affair of chance, but amounted to a *dead certainty*. Is it surprising, then, that no gentleman should have had the hardihood to espouse the cause of *all*, by throwing away his own life on the desperate chance of overcoming a professed bully?

To the foregoing account of the notorious Fitzgerald, given in the work entitled "the Clubs of London," we may add, that at a subsequent period he fought a duel, as it happened, with swords, when he was fully detected in *wearing armour beneath his clothes*, which accounted at once for his extraordinary boldness. This discovery blasted his reputation. He betook himself to Ireland, where with a band of associates he waylaid and shot a gentleman in cold blood; he resisted all civil force in capturing him; his house was at last seized by a military party, after a regular bombardment; he was taken, tried, and condemned; and finished his atrocious career, in the cowardly and most miserable plight, on the common gallows.

ST CRISPIN AND THE SHOEMAKERS.

"Cobblers from Crispin boast their public spirit,
And all are upright, downright men of merit."

THE most curious relics of the pageants of a past age, still exhibited in our streets in public processions, is that of King Crispin and his gaudy retinue. Many of the beholders, however, are ignorant of the origin of so remarkable an exhibition, which indeed is referable to times exceedingly remote. Crispin and Crispianus, according to the tradition, were brethren, and born at Rome, from which city they travelled to Soissons, in France, for the purpose of propagating Christianity, in the year 303. It seems these pious pilgrims were of a noble disposition; and in order that they might not be chargeable to others for their maintenance, they exercised the trade of shoemakers, which it is believed they learned on purpose. Crispin and his brother were unfortunate in their apostolic career; they were seized by the governor of Soissons, and were inhumanely beheaded. In consequence of their piety, and the nature of their profession, they were hence chosen to be the titular saints of the shoemakers, whose occupation has since been designated as the *gentle craft*. At what period the shoemakers first began to form themselves into societies, and to observe the festival of these sainted personages, does not appear; it is natural enough to suppose that the celebrity of Crispin and Crispianus would confer on the day and place of their martyrdom an honour which they who wrought at the same occupation would wish to record and celebrate. Be this as it may, it is certain that the memory of the above saints is honoured in the city of their decollation, where churches and other religious buildings are dedicated to "St Crispin," "St Crispin the Greater," "St Crispin the Less," &c. In the Almanack, Crispin's day is marked the 25th of October. In Shakspeare's speech of Henry the Fifth, before the battle of Agincourt, the anniversary of Crispin is thus noticed—

This day is called the feast of Crispian:
He that outlives this day, and comes safe home,
Will stand a tip-toe when this day is named,
And rouse him at the name of Crispian—
And Crispin Crispian shall ne'er go by,
From this day to the ending of the world.

Among the various associations who have honoured St Crispin, are two pious societies in Paris (that is to say, if they have not perished amidst the wreck of the religious institutions in that unhappy city), with the title of *Freres Cordonniers*, or brother shoemakers. They were established, by authority, about the middle of the sixteenth century; the one under the patronage of Crispin, and the other of Crispianus.

Shoemakers are legally called cordwainers, from Cordovan, a town and province in Spain, from whence the leather called cordovan was brought. The Latin appellation of a shoemaker is *Sutor*—a word rendered popular in this country by its application in a contemptuous sense to the members of this ancient profession. The oldest association of shoemakers in Britain is the Cordwainers' Company in London, which was first associated by Henry the Fourth, in the year 1410, by the style of the Cordwainers' and Cobblers' Company; the latter appellation not being a term of reproach, as it now is. They were afterwards incorporated by the title of "Cordwainers" alone. In Edinburgh, and, we suppose, every Scottish royal burgh, companies of cordwainers were established by the Scottish sovereigns, and remain constituted to the present day.

Although there is little reason to doubt that the story we have given of Crispin and Crispianus has a foundation in fact, it has been told in a variety of ways; and the shoemakers themselves appear to be

much more fond of styling Crispin a *king* than a *saint*; and in some places they transform him, or one of his attendants, into an Indian prince. The pageants of Crispin in modern times, it may be remarked, also vary in their character in different places, according, perhaps, to the fancy of the members of the *gentle craft*. Nowhere are these pageants enacted on such a scale of splendour as in Scotland, though it is chiefly on great occasions, as was witnessed in the celebration of a recent event of national importance, that the processions take place. In Edinburgh, a great expense is lavished on the dresses of the retinue of office-bearers of the *prince*, who among other officials has a chamber-cased in armour, and mounted on horseback.

THE MONKS OF NEWHALL.

MOST persons will have heard of the hospitality which was at one time exercised by the religious houses, prior to the Reformation. When the country was in a rude state, the monasteries served as a species of inns for the use of weary travellers, with this distinction, that they charged no price for their food and lodging. At the Reformation, all this was done away, by the monks themselves being reduced to a forlorn condition; yet we have to record a remarkable instance of a semblance of the old hospitable custom being continued, and which still continues in feeble operation. On the boundary of the counties of Edinburgh and Peebles, and lying at the southern base of the Pentlands Hills, there was once a rich conventual institution of Cistercian monks. They had a great deal of the adjacent lands in their possession; some of which, till this day, are distinguished as having belonged to the monks. Fortunately this religious body did not lavish their ample endowments on improper objects. Over a tract of country, of many miles in extent, they were alike renowned for their hospitality and piety. They were at that time, in this part of Scotland, what the monks of St Bernard are in our own times. Their house was situated in the midst of a very wild region, yet far from being reclaimed. From the threshold of their monastery, the eye travelled over an apparently unlimited bleak morass, indented by ravines and hollows—that wilderness land, a great portion of which is known by the name of Pennycaik Moor. To the west, this wretched district extended almost as far as the banks of the Clyde. For the greater part of the year, the climate here is raw and pinching. In the winter it is exceedingly inclement. The good Cistercian monks, it may well be supposed, were seldom at a loss for objects whereupon to lavish their hospitality. At different places they established hospitals, or houses of refuge, at which refreshments were freely given to the passing traveller, who used them with becoming moderation, and warm lodgings for the night to persons overtaken by fatigue or darkness, in travelling over the waste. Besides these hospitals, or inns, there were two or three houses in which the sick and superannuated were attended to on a more permanent scale. For the farther security and comfort of the traveller, there were crosses reared beside little fountains of water on the sides of the thoroughfares, which at once answered as landmarks in cases of deep snows, and as watering-places for cattle.

Every vestige is now gone of these edifices; and it is only in the course of agricultural improvement that their sites can be accurately pointed out, from the foundations being turned up. The names of the places likewise fix the locality of the institutions of the Cistercians. The modern mansion of Newhall is built on the site of the monastery, and different places in its neighbourhood are called 'Spital. Thus, there is the Fore 'Spital and the Back 'Spital, both now farmsteads. Likewise Monkhaugh, Monkrie, Monkburn, and one place is still named Font-and-Cross. In confirmation of what has just been said of the ancient hospitality of the 'Spitals, a custom has prevailed from time out of mind, at the Fore 'Spital, for giving shelter for a night to poor wayfarers. An outhouse, well furnished with straw, is devoted to this object; and many is the occasion that, but for the beneficent though mean hospitality of the place, the poor beggar would have perished in this dismal territory. Few nights pass over, indeed, on which some houseless wanderers have not occasion to bless the kindly usages of the monks of Newhall.

QUARRELLING OVER DRINK.

TWO generations have scarcely elapsed since the custom of drinking deep, and taking deadly revenge for slight offences, produced very tragical events on the border, to which the custom of going armed to festive meetings contributed not a little. A minstrel who flourished about 1720, and is often talked of by the old people, happened to be performing before one of these parties, when they betook themselves to their swords. The cautious musician, accustomed to such scenes, dived beneath the table. A moment after, a man's hand, struck off with a back-sword, fell beside him. The minstrel secured it carefully in his pocket, as he would have done any other loose moveable; sagely observing, that "the owner would miss it next morning." It is remarked of the inhabitants of Tweeddale, that they were exempt from this vicious practice of shedding blood at their orgies. It is said in praise of the inhabitants of that district, that "when they fall in the humour of good fellowship, they use it as a cement and bond of society, and not to ferment revenge, quarrels, and murders, which is usual in other countries."

COLUMN FOR MOTHERS.

MOTHERS, especially those who are inexperienced, often feel the want of some correct information for the guidance of the infants requiring their tenderest solicitude. On this, and every other topic connected with the management of a young family, we are furnished with much valuable information in the work entitled "Domestic Duties, or Instructions to Young Married Ladies, by Mrs William Parkes," which we would particularly recommend to the perusal of our maternally readers. Having been occasionally asked to give some details of this nature, we take the liberty of quoting from Mrs Parkes, who, we are informed, will be found a very safe and appropriate adviser.

"It is a very common practice in monthly nurses" (says the authoress), "to keep an infant from its mother's milk for two or three days after its birth; this is equally bad for the parent and child. The first milk which the child draws out acts as a purgative upon it, while its suckling keeps the parent's breast soft and pliable, and brings the milk into the proper channel. For these reasons, the infant should be placed at the breast three or four times after its birth; and this should be repeated as often as the mother's strength will permit it. When, however, there is a strong inflammatory disposition in the mother, the early application of the child to the breast is insufficient to keep down the milk, and sore nipples is the consequence. If a lady is to suckle her infant, the sooner it is applied to the breast the less chance there is of the nipples becoming sore; but in some constitutions this will occur in spite of every precaution. In washing an infant during the month, the water should be tepid; for water either too cold or too hot is equally injurious. The whole body of the infant, with the exception of the head, should be immersed in the water when it is washed. The nurse should in the morning have in readiness a basin of tepid water, a very soft sponge, and a fine soft towel. On her right hand should stand her basket, in which should be laid her dust-bag, containing powdered starch, a clean flannel band, and, in proper order beneath, all the other articles she will require in dressing the baby. The head, face, and throat, are then to be washed with the sponge, and to be dried with a soft linen towel. The starch powder may be used in those parts which appear at all tender, or likely to become chafed. Drying the skin well, when it has been wetted, is the best mode to prevent soreness. A careful nurse will endeavour to guard the organs of sense from any injury; such as exposing the eyes to a strong glare of light, or the ears uncovered to currents of air.

At the end of the month, or even before that time, if the weather and other circumstances permit, gentle exercise is very desirable for the lying-in lady, and particularly if she suckle her baby; because whatever tends to give her health and strength, will render her better able to perform that important duty. The office of suckling is, I am very sorry to say, considered by many mothers as troublesome and irksome, and as depriving them of that freedom which is valuable to them for the purpose of amusement and dissipation. Unless a woman can resolve to give herself up in a great measure to the performance of this duty, conforming her habits, as much as the circumstances in which she is placed will permit, so as to enable her to discharge it in a manner beneficial at once to her baby and to herself, she had better abandon it altogether, and leave the maternal office to be supplied by a kind nurse. Thus, late hours, much dancing, frequent and long absence from her nursing, would render her a bad nurse, and consequently her child would be puny and delicate. In most cases health is promoted, and sometimes established by suckling; and in many instances constitutional diseases have been checked, if not entirely subdued by it. This is certainly a strong argument in favour of the practice, life being a blessing to the healthy, but a burden to the diseased; yet still more powerful inducements to maternal affections and solicitude are to be drawn from the hopes of securing not only present health to our offspring, but in establishing in them sound and vigorous constitutions, which can scarcely be done by any less natural means of rearing them.

The cry of an infant ought never to be disregarded, as it is Nature's voice, which speaks of some pain or suffering. Cries, however, are of different kinds: for example, that of hunger may be soon known; it is short and wrangling; but when the cry is a continued one, and the legs are drawn up, there must be pain.

In such a case as this, the breast must be administered until the pain be removed. Warm bathing, gentle friction on the bowels, examination of the clothes, to ascertain whether any ligature is drawn too tight, should be first tried; and if the infant still appear to be in pain, a gentle aperient medicine should be administered. Powerful medicines should be given only by the advice of the medical attendant. The *hiccough* in young infants may be stopped either by a little finely powdered sugar laid on the tongue, or by putting the child to the breast for a few minutes. If the chests of infants are well covered, they will not be very liable to hiccough, as it is often caused by cold air affecting that part.

The time of weaning an infant depends so much upon circumstances that no fixed period for so doing can be assigned. Sometimes a child may be healthy and thriving, while its parent or nurse is weakly and delicate; in which case the welfare of both requires the weaning to take place at a very early period; but if, on the contrary, the child be delicate, and the parent vigorous, it may be advisable to continue the suckling even for an unusual period. When nothing, however, exists to demand a deviation from what is common, a child may generally be weaned without suffering inconvenience, at seven, eight, or nine months. Care should be taken not to begin weaning an infant when there are any untoward symptoms of dentition. In every case, weaning should be effected by degrees; and this not more on account of the infant than of the mother. Three or four weeks should be devoted to the accomplishment of this point.

As soon as the child's strength will permit, it should be in gentle motion almost the whole of the day, excepting during the intervals necessary for its sleep and nourishment. A child of four months old should begin to spring in its nurse's arms, to crouch at the objects which attract its attention, and to grasp, though with imperfect vision, at the things beyond its reach. But how often have we seen the reverse! and have wished to have taken from the dull and indifferent nurse the little being that has hung heavily upon her arms, while it looked around it with vacant stupidity.

Children, unless they are ill, are generally ready to be pleased, particularly if they have not been permitted, by the neglect of their comfort, and for want of suitable amusement, to acquire the habit of fretful crying, which, besides being painful to hear, is most likely to end in forming a temper of confirmed fretfulness and discontent. It is an excellent art in a nursemaid to accustom children to amuse and occupy themselves, an art equally conducive to her comfort and their benefit. If she thus preserve their good temper and her own, she will not find them often refractory." Our accomplished authoress might here have added, that the plan of cramming children with food, or the fully worse practice of frightening them with looks or stories of a horrifying tendency, for the purpose of quieting them, are to the last degree improper, and should meet with the instantaneous reprobation of every sensible mother. Farther observations on the bringing up of children must be left till another opportunity.

MIRKWOOD MERE.

[BY SIR WALTER SCOTT.]

Late, when the autumn evening fell
On Mirkwood Mere's romantic dell;
The lake returned, in chaste d'gleam,
The purple cloud, the golden beam;
Reflected in the crystal pool,
Headland and bank lay fair and cool,
The weather-tinted rock and tower,
Each drooping tree, each fairy flower,
So true, so soft, the mirror gave,
As if they lay beneath the wave,
Secure from trouble, toil, and care—
A world than earthly world more fair.
But distant winds began to wake,
And roused the Genius of the Lake!
He heard the groaning of the oak,
And donnd at once his sable cloak,
As warrior at the battle cry
Invests him with his panoply;
Then, as the whirlwind nearer press'd,
Began to shake his foamy crest
O'er furrow'd brow and blacken'd cheek,
And bade his surge in thunder speak.
In wild and broken eddies whirl'd,
Flitted that fond ideal world;
And to the shore in tumult tost,
The realms of fairy bliss were lost.
Yet, with a stern delight and strange,
I saw the spirit-stirring change!
As war'd the wind with wave and wood,
Upon the ruin'd tower I stood,
And felt my heart more strangely bound,
Responsive to the lofty sound.
While joying in the mighty roar,
I mourn'd that tranquil scene no more.
So, on the idle dreams of youth
Breaks the loud trumpet-call of Truth,
Bids each fair vision pass away,
Like landscape on the lake that lay;
As fair, as flitting, and as frail,
As that which fled the autumn gale;
For ever dead to Fancy's eye
Be each fair form that glided by;
While dreams of love, and lady's charms,
Give place to honour and to arms!

THE LAST WOLVES OF MORAY.

The last wolves existing in this district had their den in a deep sandy ravine, under the Knock of Bre-Moray, a lofty mountain near the centre of the shire, near the source of the Burn of Newton. Two brothers, residing at the little place of Falkirk, boldly undertook to watch the old ones out, and to kill their young; and as every one had suffered more or less from their depredations, the excitement to learn the result of so perilous an enterprise was universal. Having seen the parent animals quit their den in search of prey, the one brother stationed himself as a sentinel to give the alarm in case the wolves should return, whilst the other threw off his plaid, and armed with his dirk alone, crawled in to dispatch the cubs. He had not been long in the den when the wolves were seen by the watchman hastening back to the ravine. A sudden panic seized the wretched man, and he fled without giving the promised warning, and never stopped till he crossed the Divie, two miles off. There, conscience-stricken for his cowardice, he wounded himself in various places with his dirk; and on reaching Falkirk, he told the people, who eagerly collected to hear the result of the adventure, that the wolves had surprised them in the den, that his brother was killed, and that he had miraculously escaped, wounded as he was. A shout of vengeance rent the air; and each man catching up whatever weapon he could lay hands on, the whole gathering set out, determined at all hazards to recover the mutilated remains of their friend. But what was their astonishment, when, on reaching the Hill of Bogney, they beheld the mangled and bloody form of him whom they supposed dead, dragging itself towards them! For a moment they were awed by a superstitious fear; but they soon learned the history of his escape. He had found little difficulty in killing the cubs, and he was in the act of making his way out, when the mouth of the hole was darkened, and the she-wolf was upon him. With a lucky thrust of his dirk he killed her at once; but his contest with her grim companion was long and severe; and although he fought in that narrow place, and from behind the body of the brute he had killed, he was nearly torn to pieces before he succeeded in depriving his ferocious enemy of life. The indignation of the people against the dastard brother, on thus beholding his falsehood and cowardice made manifest, knew no bounds. They dragged him before the laird, who on hearing the case adjudged him to be forthwith hanged on the summit of the conical hill—a sentence that was immediately put in execution.—*Sir Thomas Dick Lauder's Account of the Moray Floods.*

ANECDOTE OF PITT.

He received the rudiments of education under the parental roof; and notwithstanding his delicate health prevented him from devoting more than half the usual time to study, his progress was so rapid that Lord Chatham, who assisted the Rev. Edward Wilson in instructing him, frequently expressed his firm conviction that the boy would one day increase the glory of the name of Pitt, for that he would be the first man in the senate, whether in administration or not, and if a minister at all, that he would be premier. One evening, a member of parliament proposed taking the earl's sons to hear an important debate in the House of Commons; but Lord Chatham would only suffer the elder, John, to go; "for," said he, "if William hears any arguments of which he does not approve, he will rise to controvert them; and young as he is, he has not even in that able assembly many equals in knowledge, reasoning, and eloquence!"—*Georgian Era.*

GIPTSIES, THEIR FIRST APPEARANCE IN EUROPE.

In 1400, the gipsies abounded in Hungary, Servia, Bulgaria, and Macedonia, and, shortly afterwards, were found scattered through all the provinces of Italy, where the superstitious believed that the penance of wandering about for a term of seven years had been imposed on them by some supernatural agency. Here they were known by the appellation of Zingari or Zingari, and in Saxony, in the year 1417, they were called "Zigeni, or Zigeuni." Avenine, too, mentions their arrival in Bavaria in 1411, and they then spread through Flanders and France, in which countries they were called Egyptians and Bohemians. In Spain, about the same period, they were termed Gitanos; and shortly subsequent to this, they appeared in England under the name of gipsies.

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Orr & Smith, Paternoster-row, London; and George Young, Dublin.—Agent in Glasgow, John Macleod, 20, Argyle Street; and sold, by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half-year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-press of W. and R. Chambers.

EDINBURGH CHAMBERS' JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," &c., AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "PICTURE OF SCOTLAND," &c.

No. 38.

SATURDAY, OCTOBER 20, 1832.

PRICE THREE HALFPENCE.

TAILORS.

THERE are some things in this world which astonished me when I first opened my eyes upon it, and which I have never since been able to understand. One of these is the popular ridicule about the business of a tailor. The arts and crafts all alike refer to one grand object, the convenience and pleasure of the human race; and though there may be some shades of comparative dignity among them, I must profess I never yet could see any grounds, either in reason or jest, for the peculiar contempt thrown out upon one, which, to say the least of it, *eminently* conduces to the comfort of man. A joke is a joke, to be sure; but then it should be a *real* joke. It should have some bottom in the principles of ridiculous contrast, or else it cannot be what it pretends to be, and must consequently fall to the ground. Now, it strikes me that all the sniggering which there has been about tailors since the beginning of the world (the first attempt at the art, by the bye, was no laughing matter) has been quite in vain—perfect humbug—a mirth without the least foundation in nature; for if we divest ourselves of all recollection of the traditionary ridicule, and think of a tailor as he really *is*, why, there is positively nothing in the least ridiculous about him. The whole world has been upon the grin for six thousand years about one particular branch of general employment; and if the world were seriously questioned as to the source of its amusement, I verily believe that not a single individual could give the least explanation. The truth is, the laughter at tailors is an entire delusion. While the world laughs, the artists themselves make riches, and then laugh in their turn—with this difference, that they laugh with a cause. I am almost tempted to suspect that the tailors themselves are at the bottom of this plot of ridicule, in order that they may have the less competition and the higher wages; for again I positively say, I cannot see what there is about the business to be laughed at. Nobody ever thinks of laughing at a shoemaker, though he applies himself to clothe the very meanest part of the human body. Nay, the saddler, who furnishes clothes to a race of quadrupeds, is never laughed at; while few trades awaken the human sympathies so strongly as that of the blacksmith, who is relatively as much meaner in his employment than the saddler, as the shoemaker is than the tailor. What, then, is the meaning—what is the cause of all this six thousand years' laughing? If any man will give me a feasible answer, I will laugh too; for I like a joke as well as any body; but, upon my honour, I cannot laugh without a cause. I must see where the fun lies, or it is no fun for me.

If the mirth be, as I suspect, entirely groundless, what a curious subject for consideration! A large and respectable class of the community has been subjected, from apparently the beginning of the social world, to a system of general ridicule; and when the matter is inquired into, it turns out that nothing can be shown in the circumstances of that class to make the ridicule merited. Men talk of the oppression of governments; but was there ever such oppression, such wanton persecution and cruelty, as this? Does any superior, in almost any instance, inflict such wrong upon those under him, as is here inflicted, by ordinary men, upon a part of their own set? How much discomfort there must have been in the course of time from this cause; and yet the jest turns out to want even the excuse of *being a jest*! Thousands of decent and worthy people have felt unhappy and degraded, that their neighbours might have an empty, unmeaning, witless laugh. The best of the joke is, that the human race must have paid immensely, in the course of time, for this

silly sport. The tailors, very properly, would not make clothes and furnish laughing-stocks without payment for their services in both capacities. Their wages, therefore, have always been rather higher than those of other artizans; and few tradesmen are able to lend so much ready cash to good customers as the London tailors. The fellows pocket the affront amazingly, having become quite reconciled to a contempt which is accompanied with so much of the substantial blessings of life. But the world should not allow this. It should say, "No, no, Messieurs Tailors, we see through the folly of our jesting, and would rather want it altogether, than pay so much more than is proper for our coats. So, if you please, we'll make a new arrangement. We'll agree never more to reckon up nine of you as necessary to make a man—never more to speak of either goose or cabbage—never more to use the words 'prick the louse,' or any thing of that kind—in short, we'll give up the whole of this system of obloquy, and make men of you, if you will only give us a discount of five per cent. off your charges." Let the world do this; and if the tailors be not by this time quite hardened in endurance, and impervious to all shame, I think we might all save a good deal of our incomes every year, and yet the amount of genuine mirth not be much diminished.

THE NE'ER-DO-WHEEL.

NE'ER-DO-WHEEL is a term applied in Scotland to a class of individuals, who, let them try what course of life they please, *never do well* in any. There are two ways of accounting for such phenomena. Either the individual is supposed to want *good fortune*, or his infelicity is traceable to a want of certain powers necessary for success, with the possession, perhaps, of certain other qualities which operate unfavourably. Many of our readers will recollect the story of "Murad the Unlucky," by Miss Edgeworth, where two Musselmauns, brothers, are represented as setting out in life together, with equal chances of prospering; but while one does every thing he should do, and at its right time, and consequently thrives to admiration, the other does every thing he ought not to do, or if he does a right thing by chance, it is out of time, and consequently he ends in misery, with the nickname which furnishes a title to the tale. It has for a considerable time been contemplated by one of the editors of this Journal, to pen the adventures of a kind of Scottish Murad, of whom many instances, alas, are to be found; but a friend of much more experience in the world than he can pretend to, has to his great satisfaction spared him this trouble, by placing the following narrative at his command.

My uncle was a Scotsman:—that is but another name for a dry wit. He respected most of the feelings of his country, and even some of its superstitions; but if he thought either calculated to lead to wrong conclusions, he showed them no mercy. He often chose to reprehend them, however, in a way of his own: one of these was, to appear to chime in with the superstition—to give it every apparent credence; and then, by accounting in a natural manner for the facts referred to, to tear it to pieces by showing it to be wholly absurd.

One morning, a good-natured friend of his, of the opposite sex, was pleased to expatiate in his presence on the subject of witchcraft, adducing, as is usual in such circumstances, a great variety of facts, that could not in appearance be accounted for in any other way. My uncle heard her in his usual manner, with his eyes shut, and leaning back on his chair; but without a symptom of dissent. At length, when she was

fairly exhausted, he raised himself, not to express any dissent from her opinions, but in appearance to give a story in corroboration, and he gave it as follows:—

Unquestionably, some people are bewitched from their birth, or mad, without suspecting it, or being suspected by others. I knew a person of this description. His name was Nicol Badenoch. His father was a merchant in the country, in rather an extensive way; but he had risen to it entirely by his own exertions, and in a way that would make an entertaining and instructive history. In process of time he married a lady of a respectable family, but unfortunately not distinguished in their particular generation. In honour of this family, and to inherit a small maternal property, it was arranged that Master Nicolas should take the name of Badenoch; and it proved ominous to him; for either from that, or from some defect in his understanding or education (for I do not pretend to decide dogmatically upon anything), young Badenoch never prospered in any action of his life. Some said the property was in itself unlucky, and destroyed the prosperity of every one who ever meddled with it. But it was not entailed, so as to make the son independent of and indifferent to his father; so it could not injure the individual in that way. It was not a life-interest in any respect, so as to render the inheritor indifferent to the property; so it could hardly injure him any way. Some pretended, indeed, that in very remote times it had been wrested from a good-natured proprietor for a debt, which, even with interest and law charges, formed a very inadequate price; but if we were to go back to these things, what lands would appear to have come well?

Be this as it may, Badenoch completely answered to his name from his earliest years upwards. Whether he meant well or ill, it was all one; he never *did* well; and yet no one considered him particularly vicious or foolish—they only thought him *bewitched*.

There was one person who always dissented from the general conclusion, and that was his mother. Whatever was the cause, that individual showed an attachment and a good opinion of him that was wholly unaccountable. She had other children, and these amiable and sensible; but she left them wholly to the guidance of their father. She thought only of her son Nick. If he was well, all was well; and if not, it was of little consequence how other matters went. If he played truant, which he often did, it was of no consequence; he had an estate, and did not need to care for the school. If he tore his clothes, it was no matter, so it was not his person. If he belaboured another boy, infinitely his junior, it was a proper act, and no doubt the little rascal deserved it; but if another boy happened to belabour him, and this often did happen, it was a shame and a scandal, and the schoolmaster and the whole parish heard of it. At last he could hardly stir out but some mischief happened to him. Some people said he had brought this upon himself by his own cowardice, and by exciting the constant clamour of his mother; others by his being constantly over-dressed, and seeming very unworthy of it; and a school-green is certainly not the place for a young master to exhibit extra finery; but most people were satisfied by merely saying he was bewitched.

As he grew up, he exhibited rather a handsome person and a stupid head. He was what in Scotland is termed a *weel-faured gomeril*; a young man with the affectation of gentility, without the good sense that alone gives grace. He did not compete for any of the prizes at college, because he had no need. He did not talk of the learning he had acquired at college, but of the sums he had spent, and the tricks he had played—boasts that even the youngest of his hearers had

sense to despise or to disbelieve. At last, after finishing his course, he was found to be as ignorant of all matters taught at college, as he had previously been of all matters taught at school; consequently, he could not be of any of the professions proper to gentlemen; neither could he be a mere landholder, for he had already spent half his estate, and the other was inadequate to his maintenance. He was therefore compelled to think of becoming a merchant, in order to avoid being a beggar; and every one was more and more satisfied that young Badenoch was certainly bewitched.

Well, he became a merchant, and opened in a great way; for it would have been disgraceful to him to have opened in a small one. For a time he flourished in appearance, for his house was always full of company, and his goods were new and fashionable, and sold cheap. Some people, indeed, alleged that he often sold cheaper than he bought; but that must have arisen from ignorance on their part. It seemed probable, however, that, as was farther alleged, he was often feasting his friends when he ought to have been following his business; and that they were such friends as neither added to his credit by their countenance, nor to his understanding by their counsel. At last his entertainments began to be laughed at as the feasts of a fool; and his name became so common on bills, that it began to be refused at the banks. This was a critical moment for a merchant—it proved fatal to him. In eighteen months his affairs were so involved that they could not be extricated. From a blaze of apparent prosperity, he sunk at once into a bankrupt and a beggar. He had in that short space paid so many debts for other people, that he had nothing left to pay his own; and every body was satisfied that he was certainly bewitched.

And where was his mother during all this period? The admirer of all his proceedings, and now the trumpeter of his injuries, she saw nothing in his extravagance but liberality; nothing in his misfortunes but good nature. She did not say that he was imprudent, but that those who had taken advantage of him were villains; and she determined to support him at whatever expense.

In pursuance of this resolution, she insisted upon his being received back into his father's house. To have allowed him to be worse dressed, or less furnished with money than had been usual to him, would, she conceived have been an affront to the family. There was therefore no change in this respect. His father protested against all this; often asseverated that, as he had made his money with toil, so no one should spend it in idleness. He even went so far as to refuse all supplies whatever, on the plea that those who would not work should not live; and farther, that his family was large, and had been expensive, and he could not afford it; and this last was found actually to be true. But with an infatuation not easily accounted for, the mother would not believe it, or, believing it, disdained to yield to the change of conduct necessary in the circumstances. She had formerly been useful in aiding the exertions of her husband, and he had trusted her largely. She not only knew where his bank bills were deposited, but had occasionally acted for him in investing or drawing sums. Will it be believed? In order to supply the foolish, tasteless, and even unenjoyed extravagance of a worthless son, or to pay debts which he chose to consider debts of honour, though from the actual circumstances they were only debts of folly or infamy, this woman forgot all duty to her husband and her family, and, by privately removing documents of debt, and uplifting their contents, in one year reduced her husband from a state of perfect credit to one of the greatest difficulty and danger; for though he saw his son was supported from some quarter, probably in a dishonourable manner, he never dreamt of the extent, nor of the treachery of his wife; and in these circumstances came under engagements in the way of his business, which she had wholly deprived him of the means of answering. Nothing but his long-known probity, added to a distinct declaration of the fraud that had been practised upon him, could have saved the old merchant from ruin, and his family from want; and now every one who heard of the circumstance, declared that Nicol Badenoch was *certainly* bewitched.

It would be painful to enter into a detail of the miseries which these circumstances introduced into the family. It was now indispensable that the father should expel the son from his house, unless he would be considered cognisant of his follies, and even using them as a blind for defrauding his own creditors. This last feeling the honourable old man found intolerable; and therefore, though the mother clung to her son with a pertinacity little short of madness, he was decidedly expelled, and with him, for a time, the mother: for she declared that she would not be separated from him.

At last an incident happened that shook the foolish affections of even the mother. It is generally known how easily the marriage tie is come under in Scotland. The parties have only to acknowledge each other, before competent witnesses, to be husband and wife, and they are so to all legal intents and purposes, though certainly with the violation of all decency. Being one evening among his companions, and, as he pleaded, in no condition to judge for himself (if ever he was in that condition) in protecting the character of a young woman, whose character, it was supposed, required protection, and whose circumstances, at least, were humble, he declared, and, it is said, was from

mere mischief incited to declare, in testimony of his conviction of her purity, that he himself was ready to make her his wife; and the young woman being procured, or, as it was said, being ready to be introduced at the expected crisis, the man made good his threat, and next morning found himself indissolubly married! It need not be added, that the world now declared unanimously that Ne'er-do-weel was *undoubtedly* bewitched.

Amid all his misfortunes, his mother had thought so well of her darling Nicolas, that she looked to his repairing every thing, and even rising beyond what he had ever been, by a splendid marriage. This was so completely fixed in her imagination, that she considered all that might happen in the interval as of little consequence; she merely looked forward to the period when he might submit to marry. In this impression she had singled out for him none but women of first rate fortunes and accomplishments; and if she ever attempted to hint an instruction to her son, it was to think of looking after this or that lady, whom she considered such as he ought to be inclined to marry. A refusal on the part of the lady never entered her thoughts. It never affected her, that, one by one, the ladies she had in succession thought worthy of his preference, were retiring to their respective residences, with husbands of undoubted respectability, and of their own choosing. She only chid her son for not having stepped forward in time. But this blow was a destroyer. She could not believe it—she *would* not believe it. It was such a folly, such a disgrace; she asseverated that it was impossible; and carrying her son off to another quarter, sent to tell the young woman never to think of what had passed but as a piece of folly and a dream. But the young woman had different views on the subject. At last the mother, foolish in every thing, thought of her usual remedy in such emergencies—money; but there she was less powerful than heretofore, and the young person was vain. Though she believed her husband was a fool, and knew him to be a beggar, he was yet what the world had called a gentleman; and she was desirous of being a gentleman's wife. She was therefore as obstinate in maintaining her bargain as the mother was for annulling it, neither being conscious that it did not rest with them; and the rage and agony of the mother were indescribable.

Had it rested with her, no punishment would have seemed too great for the low-born gipsy that had dared to get married to her son; but in Scotland there is no punishment by law for marriage, and we can fancy the face of sarcasm with which our ancient lawgivers would leave it to itself.

The old lady saw no remedy for this last misfortune of her son, but in, for a time, foregoing his presence in this country, and sending him abroad; and she hoped that by thus decidedly breaking the connection, the young woman would soon seek a more equal match for herself, or otherwise so misconduct herself as to forfeit the title that had been given to her, and so give her husband an opportunity of speedily revisiting his country, and at liberty to enter into a more suitable connection. In pursuance of this prospect, a passage was taken for him in a vessel bound for the West Indies; and his father, who had of late remained callous to all circumstances connected with him, was prevailed on to advance the money necessary upon this occasion.

His infatuated mother, though the sole adviser of the expedition, yet could not avoid hazarding its success, by her extravagant and unaccountable sorrow. The son, too, though ruined and laughed at by his companions, could not avoid taking farewell of them. The circumstances transpired, and his route was traced by a circumstance completely characteristic. In taking leave of his mother, he was too late for the stage coach! She regarded this as very lucky, for it promised her another day of his company; but his father very truly predicted, that if he did not go as he could, he might not be allowed to go. The mother, as usual, ridiculed the old man's fears, and attributed them to the worst motives; but the approach of officers to surround the house, with the view of apprehending the son as in meditation of flight, soon satisfied her, for the thousandth time, that her folly was as complete as it seemed likely to be endless.

Contraband trade had been one of the occasional resources of the old gentleman, and so he still had the means of concealing his son. But the madness of the mother had well nigh rendered even this useless. She could not conceal her agony while the search of the officers was going forward—scarcely refrain from screaming as they approached where she thought it likely her son was concealed. It was necessary to remove her by force to a room which the officers had searched, and there secure her on her bed, or she would have divulged the whole. In the same spirit she rendered it indispensable that her precious son should be huddled off in the dark, and without seeing her, to find his seaport as he best could.

He found the seaport; but the frenzy of his mother having blabbed it, the officers watched the vessel, and one of them even declared his intention of going with an admiralty warrant as far as a boat would carry him. The sagacity of his father had anticipated this, and so a correspondent was directed to repair to the vessel, and announce that they should lie to, to receive him off the Western Isles. His escape now seemed certain, therefore; but there are people whose folly sets all human wisdom exerted in their favour at de-

fiance. The hero of this story was one of them. On the eve of setting off for his rendezvous, he could not help boasting to a cory of two days' standing, how he had detected the plot laid for him, and how defeated it. He had scarcely been gone twelve hours, when the story was repeated in an open taproom, in presence of the very officer who had been baffled, and who had now embarked so much money in the chase, and which he had no chance of realising but by the capture of his man, that he was well nigh desperate. He therefore started immediately in pursuit; and the correspondent of the old gentleman, seeing the vessel no longer watched, soon traced the cause, and the route of the officer. He immediately sent a person in whom he could trust, to give warning; and the warning was duly received. But a fool, by being warned of danger, is only rendered incapable of escaping from it. This infatuated person's only plan for governing those he wished to influence, was by appealing to their grossest passions, without considering whether he should not thereby incapacitate them from rendering the service he was so anxious to obtain. The difficulties of the land journey were past; he had only to embark for the island, when he received information that it was necessary he should embark immediately. The boatmen were summoned. They were ready to embark; but he deemed it necessary to apprise them that they must also use dispatch, and the wind was adverse. Nothing better occurred to this derelict than to ply them with ardent spirits—wisely deeming that the better they were fortified in this respect, the more they would be able and anxious to second his wishes. As might have been anticipated, they became irrationally drunk. They came to the beach, it is true, all confidence and noise, but wholly unfit for the business of facing a rough sea and a head-wind in a dark night. But they got on board. With much staggering, and noise, and swearing, the sail was hoisted; but the boat could not be made to clear the bay. All night they lay hard to the wind; those at the sails and helm never quitting them, but, on the contrary, holding on with the most desperate perseverance, to prevent the vessel again falling upon the lee-shore; for our hero now felt it necessary to declare that he must not upon any account be landed again.

During the darkness they could see nothing but that there were breakers still on the sea. The sailors swore and prayed by turns; for with every rag set, and the man at the helm watching every wave, they were satisfied they had not yet cleared the head, and, in short, with all their exertions, were doing nothing. They had never experienced any thing like this, and believed they must be bewitched. Our unfortunate hero himself believed at last that he must be bewitched. He ran over the whole course of his life. It was a life that ought to have been prosperous, but in every circumstance had been unprosperous. When others, without a shilling, had made fortunes, he, with every opportunity, had lost one. Instead of having married, so as to increase his comfort and respectability, he had become involved in a way that precluded him for ever from either being comfortable or respectable through that connection. Even when he had wished to fly from his native country, without a shilling that he could call his own, and without knowing whether he should ever be enabled to earn one, he had found it impossible. By merely telling to companions he had trusted, the course he meant to follow, that course had been betrayed. By lingering for a moment with a mother that loved him, he had lost the opportunity of travelling in comfort. And by merely mentioning to a stranger the fact of having overcome all difficulties, he had not only protracted and increased them, but rendered them overwhelming. The vessel even refused to sail, that ought to bear him on his destination. He sunk, overpowered with the inscrutable severity of his fate. He was certainly bewitched, if ever a man was.

When daylight appeared, it was found that though every sail was set, and every hand was at his post, and straining every nerve, they had not left the spot from which they intended to start. The wind was howling in the rigging, the sails were full to bursting, the helmsman was watching every pitch of the vessel, and screaming his orders to the over-laboured tars, who, now sober from fatigue and anxiety, were tightening every rope with increased ardour, and looking at the ocean and at the land at once, with a disappointment and astonishment almost amounting to frenzy. At last a horseman was seen to reach the beach, attended by numerous companions on foot. Our hero at once knew him. It was his pursuer! Shouts at once of triumph and of laughter burst from them, as they leaped into a boat to board the enchanted vessel. This only increased the rage of those on board of her. They saw that the others made way freely to overtake, while they could not stir to fly. They gnashed their teeth, while they exclaimed, *what could be the cause!* The cause was at once discovered—the vessel was hard at anchor! In the drunkenness of the preceding night, they had totally omitted to weigh anchor; and all night, of course, had been contending with a phantom. In the rage of the moment, one of the seamen cut the cable, and the vessel darted to seaward, exactly as the officers in pursuit hauled our hero into their own boat.

It will seem strange, that while the boat escaped, the person who formed the sole object of that escape should have remained behind. But this fact is to be referred, like the rest, to that person's unchangeable

folly. He was standing, so anxious to see the vessel escape, that he had no eye or thought for any other circumstance; and, consequently, one of his pursuers threw a rope round him, without observation or resistance, and in another moment he was in the water, and too glad to be taken up even by his worst enemy.

The often disappointed messenger, as soon as he could reach our hero, clutched him as if every thing short of strangulation was justified! He had often received money from him before, it is true; but no thanks for that. He had now a good ten pounds depending upon him; and to secure that, he would have dragged him through fire, had it been necessary, as well as water. From the mere instinct of outraged nature, our friend for once in his life showed some sense of right. He knew he had done nothing to justify the harshness shown to him; and therefore, or from the necessity of freeing himself from suffocation, immediately exerted all his strength to free himself from the aggressor, and with such effect, that the messenger very speedily found himself in the same element from which our friend had so recently been rescued. At the same time, Mr Badenoch, who for his amusement had learned to swim, immediately again plunged into the water, in a direction, it may be supposed, the very opposite to his antagonist. The boatmen were now divided in their object. Could they have seen the messenger, to throw him a rope, they would have done so, and made after his prize; but the messenger had not yet again made his appearance. One of the boatmen, therefore, threw a rope after the escaping individual; but they of the other boat, and who had fortunately not been paid their fare, had now returned, and either entering into the spirit of the rescue, or wishing to establish a merit with their own man, seemed determined to defeat the object of their neighbours, if possible. As soon as the rope was thrown, therefore, one of them seized it with a boathook, pretending to understand it to be meant to bring the yawl on board. But this would have left their paymaster to his fate, and, consequently, their fare unpaid; for once, therefore, our friend was fortunate, and escaped. His boat flew to sea, as if with a joyous velocity; and the disappointed officer, when picked up, was in no condition to reproach himself or any one else for what had happened. He only "grinned horrible," forgetting to add the smile.

The boat of the bewitched one then got to sea, but only to be satisfied it was too late! The vessel had waited the appointed time, but in vain; and with a heart bursting with many contending emotions (for these unfortunates have feelings—often strong feelings—though generally of the wrong description), our hero saw the masts of the ship, that was to have borne him to oblivion and safety, disappearing on the far ocean, and leaving him more hapless than ever!

The boatmen, seeing his situation, very feelingly took some trouble to avoid returning in such a way as to expose him to farther persecution. They steered for another part of the island; and having landed their fare, returned as quickly as possible, and as if they had succeeded in effecting their object. Perhaps their personal vanity upon this subject was the real secret of their exertions. The messenger was deceived, and left the field.

Again our hero, therefore, became a burden upon his friends; but as he had shame enough to avoid returning to them, it was more tolerable. Taught at last by dire experience, he kept his own secret, and, in a few weeks after this disappointment, was fairly on his way to a foreign land.

[The remainder of the Ne'er-do-weel's adventures in our next.]

POPULAR INFORMATION ON SCIENCE.

THE ATMOSPHERE—Continued.

THE humidity of the air next claims our attention; and we need scarcely observe, that the vegetable creation, which appears to have been destined for the support of myriads of animate beings, requires a certain quantity of moisture, whether it descends in the form of dew, or of genial and refreshing rains, which are supplied by the evaporation which is constantly going on from the rivers, lakes, and seas which adorn the surface of the earth. Accordingly, it is found that the air always holds, either in solution or in suspension, a certain quantity of moisture. At 50° of Fahrenheit's thermometer, it will contain one-fiftieth of its own volume, or about one seventy-fifth of its own weight of this vapour; but the quantity is varied by many causes. More vapour rises in maritime countries, and those interspersed with lakes, than in inland countries; more rises during hot than during cold weather, and during a brisk wind than during a calm. So long as the air holds this moisture in solution or suspension, so as not to exceed its capacity of saturation, it remains invisible; but if the temperature diminishes, the quantity of vapour which surpassed the degree of saturation condenses, and, according to its degree of condensation, resumes the liquid state, descending in the shapes of fogs or rain. It often happens on a fine clear day, when there is not a speck apparent in the azure sky, that from some sudden current of cold air in those higher regions, this vapour is suddenly condensed into light billowy clouds, which again after a time disappear. The excess of moisture in the air indicating the approach of rain, is recognised by many prognosics, which are perhaps more familiarly known to the sailor and the peasant than to the man of science. Thus, when the moon

appears of a pure and silvery white, good weather is indicated; but when it exhibits a reddish light, wind and storm, and when a brown tint, rain may be predicted; all of which appearances depend on the increased quantity of moisture affecting the density of the air. When the odour of plants is more powerful, when distant sounds are heard more distinctly, when objects afar off are seen more perceptibly than usual, the air is saturated with excess of moisture, and rain may generally be prognosticated. Instruments to ascertain the quantity of moisture present in the air, are termed *Hygrometers*, and are generally made of sponge, hair, or whalebone. That used by the celebrated Howard, who has furnished us with an admirable work on the climate of London, consists of a very slender strip of whalebone, which having been cut out of the piece across the grain, and reduced by scraping to the requisite thickness, with a length of about three and a half inches, is so mounted on a brass frame, with a counteracting spring of wire, as to move an index round a circular scale of three inches circumference. The shortening of the strip of whalebone by dryness, and the lengthening by moisture, while the spring keeps it extended, respectively carry the index towards the extremes of the scale. Certain vegetables, more especially the wild oat and other kinds of grasses, and also some flowers, indicate the excess of moisture in the atmosphere, and are good hygrometers.

The electrical condition of the air merits notice, as it obviously influences a variety of atmospheric phenomena. Here, then, we may observe, that the peculiar matter known under the form of electric fluid seems to pervade all nature. It constantly seeks an equal distribution, and some bodies conduct it with more facility than others. Of this remarkable fluid the earth is the great reservoir; and when an equilibrium exists between it and atmospheric bodies, no sensible phenomena take place: water is a better conductor than air, for which reason, during a thick fog, when the earth is surcharged with electrical matter, the electricity is conducted away without any sensible effects; but if the air remain dry, as it often is in this country during the summer and autumn months, then the fluid, instead of being conducted gently, forces itself through the intervening space to the attracting body, and produces loud explosions. Hence the correctness of the poet, who, in describing a storm among the Alps, says—

—far along,
From peak to peak, the rattling crags among,
Leaps the live thunder. Not one lone cloud,
But every mountain, now hath found a tongue,
And Jura answers, through her misty shroud,
Back to the joyous Alps, who call to her aloud.

The electrical state of the air varies in different climates, and at different periods of the day; hence storms rarely occur immediately after sunrise, because the rising vapours then equalise the electric fluid without any sensible commotion; but they occur when the air has become dry during the more advanced period of the day and during the night. In summer, when the earth is dry, and the day warm, droughty, and serene, the atmospheric electricity increases from sunrise until mid-day, when it arrives at its maximum, and remains stationary a couple of hours, after which it diminishes until the fall of dew, and revives and increases again until midnight, to be shortly after almost extinguished.

When the electrical condition of the earth and clouds is dissimilar, and the equilibrium is disturbed, nervous people are often much affected, suffering difficulty of breathing, headach, painful anxiety, a sense of oppression, pains in the limbs, and mental depression, by which many of them are enabled to predict with certainty the approach of a storm. Nor does this result merely from imagination, for many animals, and persons who are insane, are at such times much affected. Occasionally the air is so much charged with electricity, that fireballs are seen at the tops of masts, towers, and monuments. The manes of horses, and tips of their ears, often appear luminous during a thunder-storm. Julius Cæsar states, that, after a great storm which occurred during the African war, and which injured the Roman army, the end of the soldiers' javelins and darts shone with a great light. The electricity of the atmosphere is not less by day than by night; but it has been observed that winds often augment, and often diminish considerably, its electrical state. Northern lights, shooting stars, the zodiacal light, and other similar phenomena, have been attributed to the accumulation and transmission of the electric fluid through the higher regions of the air. The forms of clouds and the fall of rain are said likewise to depend on electricity; but the variations in the electrical state of our atmosphere, and the influence of these on the human body in health and disease, are not yet sufficiently understood.

We shall next consider the colour of the atmosphere; and assuredly there are few observers of nature who have not marked with delight the glowing tints that "live along the sky," and the greater or the lesser intensity of the azure vault at different seasons of the year, and in different countries. It has by some been supposed that the air is itself of a blue colour, which when the air is accumulated in a mass is rendered more apparent; but this explanation is by no means so satisfactory as that which rests on the principles and beautiful theory of light propounded by Sir Isaac Newton. That illustrious philosopher showed, that, when a ray of white light passes from a rarer into a

denser medium, as from space, or subtile ether, into our denser atmosphere, it is bent out of its course, and resolved into its primary ray. The colour of the sky is owing to the vapour suspended in the air absorbing the least refrangible—that is, the red and yellow rays—and transmitting the blue or most refrangible of the rays, which, when blended together, constitute a beam of light. Accordingly, the different shades of blue which the heavens display depend on the quantity and nature of vapour suspended in the atmosphere. If the watery particles be to a certain degree condensed, the white light, or the light undecomposed, is reflected, and we have the pale tint of sky so frequently observed in this country. But if their suspension be more complete, and the air fully saturated, as is the case in warmer southern climates, then the blue rays are transmitted in their softest and deepest intensity. Travellers have observed, that in general the air is of a deeper blue under the torrid zone than in high latitudes; and so likewise, in this climate, in summer than in winter. Baron Humboldt remarks, that from the coasts of Spain and Africa, the azure colour of the heavens augmented from thirteen to twenty-three degrees, which he estimated by an instrument invented for that purpose, named the Cyanometer. Near the horizon, on account of the opacity of the vapours there generally accumulated, the sky is often of a pale tint; and for the same reason, when viewed from coasts, it appears paler on the sea than on the land side of the prospect. When we ascend a mountain, and attain a region above the diffusion of the aqueous vapour, which thus refracts the blue rays, the sky becomes of a deeper blue, and then its shades grow darker and darker, until its whole expanse appears black. Such was the aspect of the heavens, described by Saussure, from the top of Mont Blanc and the Andes. So, likewise, M. Auldjo, in describing the sublime prospect from the top of Mont Blanc, thus expresses himself:—"On the south, a blue space showed where the plain of Piedmont lay; and far in the background of this, rose the long chain of the Appennines, and lofty Alps, forming the coast of the Mediterranean, and running thence towards the right, meeting the mountains of Savoy. Gilded as they were by the sun, and canopied by a sky almost black, they made up a picture so grand and awful, that the mind could not behold it without fear and astonishment." Here we may add, because it is consonant with this explanation, that Professor Leslie, of the University of Edinburgh, has observed, that the light diffused is weaker when the sky is of a very deep and pure blue, than when it is slightly covered by transparent vapour. Assuredly, the reason of this is, that, in the deep blue atmosphere, the rays of light are many of them decomposed, as we have explained; while in the more opaque vapoury sky they are reflected in all their original dazzling whiteness. Hence, by presenting a medium for the refraction and reflection of light, the atmosphere which invests the earth tends to diffuse this blessing equally around us. Without its presence, when we turned our back on the sun, the rest of the sky would appear quite black; and the instant that glorious orb sunk below the horizon, instead of a gentle twilight succeeding, we should be involved in total darkness.

We do not in this place consider it expedient to dwell at any length on the chemical constitution of atmospheric air; but we may remark, that instead of being a simple element, as was supposed by the ancients, it is a mixture of two gases, the one named oxygen, the other nitrogen; besides which, there is found a small portion of a more deleterious gas, known as carbonic acid gas, the fixed air which gives the sparkling buoyancy to soda water, champagne, &c. The oxygen may be called the stimulating principle of the air. If a spark of light be plunged into it, the spark shines with a bright and dazzling lustre. If we were to inspire it, the pulse would become increased, the breathing more rapid, and the stimulus be too great for the endurance of life. Yet without its presence no animal could live, so that, when confined in a close apartment, as the quantity of this gas diminishes, our breathing becomes laborious, and, were not a fresh quantity admitted, respiration would entirely cease. Without its presence no flame is supported. A candle placed under a jar, when it has consumed the oxygen, becomes extinguished. It likewise acts upon metals entering into combination with them, as with mercury, lead, manganese, from which it may readily be expelled by the agency of heat. Such being the qualities of this gas, and as it could not be breathed pure, Nature, in forming atmospheric air, has supplied a diluent in the nitrogen, seventy-nine parts of which added to twenty-one of oxygen constitute the air we breathe, and in this proportion the air is found at the highest altitudes and in all countries. Saussure analysed the air on the top of Mont Blanc, and found it consisted of the same constituents as the air in the valleys below. Berthollet analysed the air of Egypt, and found it the same as the air in France. The carbonic acid gas, being so deleterious, exists only in a very small proportion—one part in a thousand; but it varies, the quantity being greater in summer than in winter, and during the night than during the day. It was supposed at one time that it existed only accidentally in the air, but it is now ascertained that it exists in the air over the high mountain ranges. Guy Lussac brought it from twenty-three thousand feet above the level of the sea, that being the amazing height to which he

ascended in his balloon. Every body is aware that air is necessary for the support of human life; hence we read in the Mosaic account of the creation that "the Lord God formed man of the dust of the ground, and breathed into his nostrils the breath of life, and man became a living soul." Let us therefore attend to what has been observed on this subject. At each inspiration from twenty to forty inches of air are taken into the body, and this air consists of a certain quantity of oxygen, nitrogen, watery vapour, and a very little carbonic acid; but at each expiration its condition is materially changed, the quantity of nitrogen remains the same, that of the watery vapour is little changed, but a part of the stimulating principle of the oxygen disappears, and an additional quantity of carbonic acid gas is emitted in its place: this applies to animals. It is evident, therefore, that a vast quantity of oxygen is continually being extracted from the air; and to compensate for this loss, Nature has not failed to make an ample and all-wise provision. This is done by the aid of plants and trees, which, during the day, in the process of their breathing, absorb the carbonic acid gas, and give out a quantity of oxygen, so that while animals are deteriorating, plants are purifying the atmosphere. In the shade, however, and during the night, it is found that plants emit carbonic acid;—hence, in a plain only lightly shaded with wood, the air is salubrious, but in the interior of extensive forests it is thick and unwholesome. Accordingly, as the poet expresses it, "all are but parts of one stupendous whole," and thus is the vegetable creation essential to the purification of the air we breathe. No wonder is it, then, that the Dutch paid so heavy a penalty for their ill-judged proceeding at Ternate, where, in order to heighten the value of the fruit of the clove-tree, which grew plentifully on that island, they ordered all the clove-trees to be cut down, shortly after which the air became unwholesome, and the whole island sickly. Air, we may also remark, is rendered very deleterious by gases and vapours generated in the earth. In the island of Java, the carbonic acid is thrown out in such quantities in a certain valley, that no animal can there exist, and birds flying low drop dead. It is a volcanic district, and thus is appropriately called the "Valley of Death." At Fashun in Sweden, noted for copper mines, the mineral exhalations so affect the air, that the silver in the purses of the possessors becomes discoloured. In Carniola and Campania, the air is impregnated with sulphur. It has also been found to contain arsenic; and that such poisonous matters are sent from below, and arise from some subterranean action, may be inferred from the destruction of millions of fishes. Whole coasts have been covered with dead fishes, supposed to have been killed by such poisonous matter from below; volcanoes have at such times been in a state of activity, and earthquakes have occurred.

After the account we have given of the composition of the air, and the difference between the air expired, and that inspired, how important must be the proper ventilation of all hospitals, prisons, and manufactories! The air of hospitals, during the period of an epidemic, when it was supposed to be loaded with contagious matter, has been analysed; but the proportion of its constituents has not been found altered. We do not believe that any variation in the proportion, or any mixture of gases, could generate a matter of contagion to affect with any specific disease the living body; but when it is rendered deleterious by having been frequently breathed, and when it is charged with the exhalations of filth and putrifying matter, then the seeds of contagion, which have been generated in some sickly but yet living frame, and which are more or less constantly wafting about, find a congenial medium for their evolution, and all the horrors of plague then thicken round us. Thus, when the great fire of London broke out in the year 1665, that city was in the most uncleanly and lamentable condition; dirt of all kinds was allowed to lie in the streets, the drains choked, and every kind of excrementitious matter was thrown into them. The floors even of the middling ranks were covered with hay and rushes, which, though occasionally renewed, were suffered to lie unmolested beneath beer, grease, fragments of meat, excrements, &c. The houses were high, the streets narrow, and every obstacle that could possibly oppose a free current of air was offered. The great plague that ravaged Rome in 1695, is referred by Lancelotti to an analogous want of cleanliness and ventilation. It is indeed commonly observed, that epidemic diseases arise, and often prove most destructive, in the closer and filthier parts of cities; and we are perfectly satisfied that the salutary measures recently recommended and had recourse to by the Edinburgh Board of Health, have in a great measure mitigated and checked the progress of the disease, which has so recently spread tenfold terrors and desolation through Dublin, Paris, and other European cities.

While the atmosphere produces such important effects on living bodies, both animal and vegetable, its influence may also be observed on inert inanimate matter. Iron, copper, and most of the metals when exposed to its action, attract its carbonic acid, and become rusted. Boyle relates, that in the southern English colonies the great guns rusted so fast, that after lying in the air a few years, large cakes of *corrosionis maris* could be separated from them. The purple stone, of which Salisbury Cathedral is built, is observed to become gradually softer on the surface exposed to the air. Rocks, most of which contain iron

in greater or lesser abundance, change their colour, from that metal being acted upon by the carbonic acid of the atmosphere. Hence is derived the red or yellow colour exhibited by rocks, and which seen scattered over with lichens, or crowned with stunted shrubs, adds so much to the beauty of such scenery. We might trace many other effects of the atmosphere on inanimate matter; but already we have exceeded our limits, and for the present bid our readers "all and each a fair good night," promising to appear before them again at our earliest convenience.

THE FREEBOOTER OF LOCHABAR.

TOWARDS the end of the seventeenth century, there lived a certain notorious freebooter, in the county of Moray, a native of Lochabar, of the name of Cameron, but who was better known by his cognomen of *Padrig Mac-an-Ts'agairt*, which signifies "Peter, the priest's son." Numerous were the creachs, or robberies of cattle, on the great scale, driven by him from Strathspey. But he did not confine his depredations to that country; for some time between the years 1690 and 1695, he made a clean sweep of the cattle from the rich pastures of the Aird, the territory of the Frasers. That he might put his pursuers on a wrong scent, he did not go directly towards Lochabar, but, crossing the River Ness at Lochend, he struck over the mountains of Strathnairn and Strathdarn, and ultimately encamped behind a hill above Duthel, called, from a copious spring on its summit, *Cairn-au-Sh'uaran*, or the Well Hill. But notwithstanding all his precautions, the celebrated Simon Lord Lovat, then chief of the Frasers, discovered his track, and dispatched a special messenger to his father-in-law, Sir Ludovick Grant of Grant, begging his aid in apprehending *Mac-an-Ts'agairt*, and recovering the cattle.

It so happened that there lived at this time, on the laird of Grant's ground, a man also called Cameron, surnamed *Mugach-more*, of great strength and undaunted courage; he had six sons and a stepson, whom his wife, formerly a woman of light character, had before her marriage with *Mugach*; and as they were all brave, Sir Ludovick applied to them to undertake the recapture of the cattle. Sir Ludovick was not mistaken in the man. The *Mugach* no sooner received his orders than he armed himself and his little band, and went in quest of the freebooter, whom he found in the act of cooking a dinner from part of the spoil. The *Mugach* called on *Padrig* and his men to surrender, and they, though numerous, dreading the well-known prowess of their adversary, fled to the opposite hills, their chief threatening bloody vengeance as he went. The *Mugach* drove the cattle to a place of safety, and watched them till their owners came to recover them.

Padrig Mac-an-Ts'agairt did not utter his threats without the fullest intention of carrying them into effect. In the latter end of the following spring, he visited Strathspey with a strong party, and waylaid the *Mugach*, as he and his sons were returning from working at a small patch of land he had on the brow of a hill, about half a mile above his house. *Mac-an-Ts'agairt* and his party concealed themselves in a thick covert of underwood, through which they knew that the *Mugach* and his sons must pass; but seeing their intended victims well armed, the cowardly assassins lay still in their hiding-place, and allowed them to pass, with the intention of taking a more favourable opportunity for their purpose. That very night they surprised and murdered two of the sons, who, being married, lived in separate houses, at some distance from their father's; and, having thus executed so much of their diabolical purpose, they surrounded the *Mugach's* cottage.

No sooner was his dwelling attacked than the brave *Mugach*, immediately guessing who the assailants were, made the best arrangements for defence that time and circumstances permitted. The door was the first point attempted; but it was strong, and he and his four sons placed themselves behind it, determined to do bloody execution the moment it should be forced. Whilst thus engaged, the *Mugach* was startled by a noise above the rafters, and, looking up, he perceived in the obscurity the figure of a man half through a hole in the wattled roof. Eager to dispatch his foe as he entered, he sprang upon a table, plunged his sword into his body, and down fell—his stepson! whom he had ever loved and cherished as one of his own children. The youth had been cutting his way through the roof, with the intention of attacking *Padrig* from above, and so creating a diversion in favour of those who were defending the door. The brave young man lived no longer than to say, with a faint

voice, "Dear father, I fear you have killed me!" For a moment the *Mugach* stood petrified with horror and grief, but rage soon usurped the place of both. "Let me open the door!" he cried, "and revenge his death, by drenching my sword in the blood of the villain!" His sons clung around him, to prevent what they conceived to be madness, and a strong struggle ensued between desperate bravery and filial duty; whilst the *Mugach's* wife stood gazing on the corpse of her first-born son, in an agony of contending passions, being ignorant from all she had witnessed, but that the young man's death had been wilfully wrought by her husband. "Hast thou forgotten our former days?" cried the wily *Padrig*, who saw the whole scene through a crevice in the door; "how often hast thou undone thy door to me, and wilt thou not open it now, to give me way to punish him who has but this moment so foully slain thy beloved son?" Ancient recollections and present affliction conspired to twist her to his purpose. The struggle and altercation between the *Mugach* and his sons still continued. A frenzy seized on the unhappy woman. She flew to the door, undid the bolt, and *Padrig* and his assassins rushed in. The infuriated *Mugach* no sooner beheld his enemy enter, than he sprang at him like a tiger, grasped him by the throat, and dashed him to the ground. Already was his vigorous sword-arm drawn back, and his broad claymore was about to find a passage to the traitor's heart, when his faithless wife, coming behind him, threw over it a large canvass winnowing sheet, and before he could extricate the blade from the numerous folds, *Padrig's* weapon was reeking in the best heart's blood of the bravest Highlander that Strathspey could boast of. His four sons, who had witnessed their mother's treachery, were paralysed. The unfortunate woman herself, too, stood stupefied and appalled. But she was quickly recalled to her senses by the active clash of the swords of *Padrig* and his men. "Oh, my sons! my sons!" she cried, "spare my boys!" But the tempter needed her services no longer—she had done his work. She was spurned to the ground and trampled under foot by those who soon strewed the bloody floor around her with the lifeless corpses of her brave sons.

Exulting in the full success of this expedition of vengeance, *Mac-an-Ts'agairt* beheaded the bodies, and piled the heads in a heap on an oblong hill, that runs parallel to the road on the east side of Carr Bridge, from which it is called *Tom-nan-Cearn*, the Hill of the Heads. Scarcely was he beyond the reach of danger, than his butchery was known at Castle Grant, and Sir Ludovick immediately offered a great reward for his apprehension; but *Padrig*, who had anticipated some such thing, fled to Ireland, where he remained for seven years. But the restlessness of the murderer is well known, and *Padrig* felt it in all its horrors. Leaving his Irish retreat, he returned to Lochabar. By a strange accident, a certain Mungo Grant of Muckrach, having had his cattle and horses carried away by some thieves from that quarter, pursued them hot on foot, recovered them, and was on his way returning with them, when to his astonishment he met *Padrig Mac-an-Ts'agairt*, quite alone, in a narrow pass, on the borders of his native country. Mungo instantly seized and made a prisoner of him. But his progress with his beasts was tedious; and as he was entering Strathspey at *Lag-na-caillich*, about a mile to the westward of Aviemore, he espied twelve desperate men, who, taking advantage of his slow march, had crossed the hills to gain the pass before him, for the purpose of rescuing *Padrig*. But Mungo was not to be daunted. Seeing them occupying the road in his front, he grasped his prisoner with one hand, and brandishing his dirk with the other, he advanced in the midst of his people and animals, swearing potently, that the first motion at an attempt at rescue by any one of them should be the signal for his dirk to drink the life's blood of *Padrig Mac-an-Ts'agairt*. They were so intimidated by his boldness, that they allowed him to pass without assault, and left their friend to his fate. *Padrig* was forthwith carried to Castle Grant. But the remembrance of the *Mugach's* murder had been by this time much obliterated, by many events little less strange; and the laird, unwilling to be troubled with the matter, ordered Mungo and his prisoner away.

Disappointed and mortified, Mungo and his party were returning with their fellow captive, discussing as they went what they had best do with him. "A fine reward we have had for all our trouble!" said one. "The laird may catch the next thief her nainself for Donald," said another. "Let's turn him loose!" said a third. "Ay, ay," says a fourth, "what for waud we be plaguing ourselves more wi' him!" "Yes, yes! brave, generous men!" said *Padrig Mac-an-Ts'agairt*, roused by a sudden hope of life from the moody dream of the gallows tree in which he had been plunged, whilst he was courting his mournful muse to compose his own lament, that he might die with an effect striking, as all the events of his life had been: "Yes, brave men! free me from these bonds! it is unworthy of Strathspey men—it is unworthy of Grants, to triumph over a fallen foe! Those whom I killed were no clansmen of thine, but recreant Camerons, who betrayed a Cameron! Let me go free, and that reward of which you have been disappointed shall be quadrupled for sparing my life!" Such words as these, operating on minds so much prepared to receive them favourably, had well nigh worked their purpose. But, "No!" said Muckrach sternly, "it shall never be said that a murderer escaped from

my hands. Besides, it was just so that he fairly spake the Mugach's false wife. But did he spare her sons on that account? If ye let him go, my men, the fate of the Mugach may be ours; for what bravery can stand against treachery and assassination?" This opened an entirely new view of the question to Padrig's rude guards, and the result of the conference was, that they resolved to take him to Inverness, and to deliver him up to the sheriff.

As they were pursuing their way up the south side of the river Dulan, the hill of Tom-nan-Cean appeared on that opposite to them. At sight of it, the whole circumstances of Padrig's atrocious deed came fresh into their minds. It seemed to cry on them for justice; and, with one impulse, they shouted out, "Let him die on the spot where he did the bloody act!" Without a moment's farther delay, they resolved to execute their new resolution. But on their way across the plain, they happened to observe a large fir tree, with a thick horizontal branch growing at right angles from the trunk, and of a sufficient height from the ground to suit their purpose; and doubting if they might find so convenient a gallows where they were going, they at once determined that here Padrig should finish his mortal career. The neighbouring birch thicket supplied them with materials for making a withe, and whilst they were twisting it, Padrig burst forth in a flood of Gaelic verse, which his mind had been accumulating by the way. His song, and the twig rope that was to terminate his existence, were spun out and finished at the same moment, and he was instantly elevated to a height equally beyond his ambition and his hopes.—*Sir Thomas Dick Lauder's Account of the Moray Floods.*

EFFORTS OF GENIUS.

THIRD ARTICLE.

WE now bring forward the conclusion of our list of men who have risen from the lower ranks to eminence through the force of their genius and perseverance.

Hawkesworth, the author of the *Adventurer*, was the son of a watchmaker, and was at first brought up to that profession. He afterwards became a clerk to a stationer, and then rose to distinction as a literary character. Sir John Hawkwood, a distinguished military commander of the fourteenth century, was originally an apprentice to a tailor, but entering as a private soldier, he rose to eminence. Haydn, one of the most celebrated music composers, was the son of a poor cartwright. Herder, a German philosopher and writer, and who has been called the Fenelon of his country, was born of poor parents, and nurtured in adversity. Sir William Herschel, one of the greatest astronomers of modern times, was originally a player in the band of a Hanoverian regiment. General Hoche, who commanded an expedition against Ireland, in 1796, began life as a stable-boy. The Joan of Arc, who by her heroism delivered France from the English, was born of poor parents, and supported herself in early life by keeping sheep, and taking care of horses at a country inn. Samuel Johnson was the son of a bookseller at Litchfield, and attempted to support himself by keeping a school; before he became known, and was patronised by the crown, he had to endure severe pecuniary difficulties. Henry Jones, a poet and dramatist of last century, was born of poor parents at Drogheda, and was bread a bricklayer. The famous Paul Jones was the son of a working gardener, and commenced his maritime life as a sailor boy. La Harpe, a French dramatist, poet, critic, and miscellaneous writer, was the son of a Swiss officer, who died in poverty, and left him an orphan, in such destitute circumstances, that he was supported by the Sisters of Charity, and it was by their recommendations that he was gratuitously educated. Lannes, Duke of Montebello, and a marshal under Napoleon, who esteemed him highly for his bravery, was born of poor parents, and was, at his outset in life, a common dyer. David Levi, a Jew of considerable literary talent, and author of a variety of works, was first a shoemaker and next a hatter, but contrived to acquire a respectable portion of learning. Leyden, the author of some beautiful Scottish poems, and a person of refined sentiment, was the son of a shepherd in Roxburghshire. Maidland, the historian of London and Edinburgh, began the world as a travelling dealer in hair. Benjamin Martin, who flourished as a writer on science at the beginning of the last century, was originally a farmer's labourer, but by dint of perseverance he acquired sufficient learning to become a schoolmaster, and afterwards a lecturer on experimental philosophy. Matsys, an eminent Dutch painter, was originally a blacksmith, and his love for the daughter of an artist is said to have been his inducement to study painting. Moliere was the son of a

valet-de-chambre of the French king. Murat, one of the most intrepid of the French marshals, was the son of an innkeeper at Bastide. Ney, "the bravest of the brave," was the son of an artisan. Samuel Richardson, the author of *Sir Charles Grandison* and other works of fiction, was the son of a joiner, and had a very scanty education: he was bound an apprentice to a printer, and by his genius and perseverance rose in his profession, and became an eminent literary character. Rousseau, one of the most eminent French writers, was the son of a watchmaker; and being apprenticed to an engraver, he was so ill treated by his master, that he ran away before he was sixteen: his education was totally neglected, and for years he wandered as a vagabond seeking a precarious subsistence; yet by his natural abilities he brought himself into notice and fame. Ruyter, the famous Dutch admiral, began the world at eleven years of age as a poor sailor boy. The illustrious Shakspeare was the son of a dealer in wool, and such was the poverty of the young dramatist, that he employed himself first as a prompter's call-boy; other accounts represent him as holding gentlemen's horses at the door of the playhouse. Shield, the famous English violinist and musician, was the son of a singing-master, who left him fatherless; his early years were spent as an apprentice to a boat-builder, but his genius led him from this occupation to that of music, in which he was eminently successful. Jeremy Taylor, an eminent theologian and prelate of the seventeenth century, was the son of a barber. Toussant L'Ouverture, who was appointed governor and president of the free black republic of St Domingo, was born a slave, in which condition he remained till the revolution in the island brought forward his abilities and courage. Wallenstein, a celebrated German general, began life as a page to the margrave of Burgau, a situation almost equivalent to that of a footboy to an English country gentleman. Webbe, who has been so celebrated for his musical compositions, especially his glees, was originally a poor destitute boy, who gained a meagre subsistence by copying music, but by dint of incessant study, he became an excellent composer.

West, the American painter, was the son of a Quaker, and had many difficulties to contend with at his outset. Jarvis Spencer, a miniature painter of last century, was originally a valet, or menial servant. Hanam, the painter, was at first the apprentice of a cabinetmaker. Richard Wright and Lawrey Gilpin were originally ship-painters. Barry, an Irish painter, was originally a working mason. Sir Thomas Lawrence was the son of an innkeeper at Bristol, and such was the poverty of his parents and his own natural genius, that, when a mere boy, he supported the family by painting. Giotto, the reviver of painting in Italy, was the son of a peasant, and he himself kept sheep while a boy. Ghret, the famous drawer of botanical objects, was the son of a working gardener. Canova was the son of a stonecutter, was left an orphan, and raised himself entirely by his genius. Taylor, the water poet, was a waterman. Antonia Bianchi, an Italian poet, was a gondolier. Allan Ramsay was the son of a workman at Leadhills, and began life as a barber. Stow, the author of the *Survey of London*, and Speed, the author of the *History of Great Britain*, were originally tailors. And Anthony Purver, a self-instructed man of learning, and a preacher; Joseph Pendrell; Bekman, the German; Holcroft, the novelist; Bloomfield, the poet; Lackington, who rose to such eminence as a bookseller in London; and Drew, the metaphysician, were all originally members of the "gentle craft" of shoemaking.

[The next number of the Journal will contain an article embodying a few general views as to advancement in the world.]

BRITISH WOOLLEN MANUFACTURE.

THE manufacture of woollen cloth in Britain derives its origin chiefly from the settlement of ingenious tradesmen from the Netherlands, who were compelled to emigrate on account of civil and religious persecution. The excellence of British cloths has been long acknowledged, although they are hardly superior to those of Germany, as was recently decided by competent judges at Leipsic; and it appears that, from being the leading branch of manufactures in the country, they are now second to cotton goods, which have rendered many articles of inferior consequence. It has been estimated that the value of the manufactured woollen goods annually consumed in Great Britain is £11,000,000; and if to this be added £7,000,000, which is about the average value of those exported, the total value of the annual produce of this manufacture will be about £18,000,000. Estimating the value of the raw material at one-third of the value of the goods, a sum of £12,000,000 is left as the aggregate amount of profits and wages. Estimating the profit of the manufacturers, and the sum necessary to indemnify them for their outlay, at 18 per cent., the total amount of wages paid in this manufacture will be £9,840,000, and taking £15 as a fair average of the annual wages obtained by the various descriptions of individuals in this department of industry, we shall get 546,000 as the total number of workmen, and at least 1,100,000 human beings, or one-thirteenth part of the inhabitants of Great Britain, as supported by the woollen manufacture. In the course of years, numerous improvements have been effected in the cloth-making establishments, which have simplified human labour, and caused more work to be done by fewer

hands. But we learn that another improvement, of American origin, is about to be adopted at the mills, which will very considerably diminish the number of persons employed, and throw many families into that state of destitution, so obviously the case of the hand-loom cotton-weavers. In ten years hence, therefore, much less than a thirteenth part of the inhabitants will be so employed. In Scotland, the manufacture of cloths is continuing to advance, both in the quantity and the quality of the article produced.

The finer cloths made in England are now made partly from fine foreign wool, of which the import for the ten years previous to 1819 amounted to 11,000,000 lbs. The following was the declared value of British manufactured woollens, and of woollen yarns, exported from Great Britain to foreign parts, from 1820 to 1828. —

CREDULITY IN INDIA.

AN amusing anecdote, related by Bishop Heber, gives us a good idea of the foibles and ignorance of one of the petty princes of India, and the rascality of the minister who managed his affairs. The fondness of the king for mechanics (says the Bishop) led him to try some experiments, in which he fell in with a Mussulman engineer of pleasing address and ready talent, as well as considerable, though unimproved, genius for such pursuits. The king took so much delight in conversing with this man, that the minister began to fear a rising competitor, as well knowing that the reamness of his own birth and functions had been no obstacle to his advancement. He therefore sent the engineer word—"If he were wise, to leave Lucknow." The poor man did so, removed to a place about ten miles down the river, and set up a shop there. The king, on inquiring after his humble friend, was told that he was dead of cholera, ordered a gratuity to be sent to his widow and children, and no more was said. During these last rains, however, the king sailed down the river in his brig of war, as far as the place where the new shop stood. He was struck with the different signs of neatness and ingenuity which he observed in passing, made his men draw in to shore, and to his astonishment, saw the deceased engineer, who stood trembling, and with joined hands, to receive him. After a short explanation, he ordered him to come on board, returned in high anger to Lucknow, and calling the minister, asked him again if it were certain that such a man was dead. "Undoubtedly," was the reply; "I myself ascertained the fact, and conveyed your majesty's bounty to the widow and children." "Harumzada," said the king, bursting into a fury, "look there, and never see my face more!" The vizier turned round, and saw how matters were circumstanced. With a terrible glance, which the king could not see, but which spoke volumes to the poor engineer, he imposed silence on the latter; then turning round again to his master, stopping his nose, and with many muttered exclamations of "God be merciful!" "Satan is strong!" "In the name of God, keep the devil from me!" he said; "I hope your majesty has not touched the horrible object." "Touch him!" said the king; "the sight of him is enough to convince me of your rascality." "Istufallah!" said the favourite; "and does not your majesty perceive the strong smell of a dead carcass?" The king still stormed; but his voice faltered, and curiosity and anxiety began to mingle with his indignation. "It is certain, refuge of the world," resumed the minister, "that your majesty's late engineer, with whom be peace! is dead and buried; but your slave knoweth not who has stolen his body from the grave, or what vampire it is who now inhabits it, to the terror of all good Mussulmans. Good were it that he were run through with a sword before your majesty's face, if it were not unlucky to shed blood in the auspicious presence. I pray your majesty dismiss us: I will see him conducted back to his grave; it may be that when that is opened, he may enter it again peaceably." The king, confused and agitated, knew not what to say or order. The attendants led the terrified mechanic out of the room; and the vizier, throwing him a purse, swore, with a horrible oath, that "if he did not put himself upon the other side of the company's frontier before the next morning, if he ever trod the earth again, it should be as a vampire indeed." This is, I think, no bad specimen of the manner in which an absolute sovereign may be persuaded out of his own senses.

PECULIARITIES OF GERMANY.

EVERY hotel in Germany is divided into three departments; the hotel (properly so called), the tavern, and the café; each of these is perfectly distinct and separate from the other two, and the waiters' accounts, &c. are totally unconnected one with another, although all be paid to the same proprietor. In consequence of this, it is not the custom here, as in France and England, to run up bills; you pay for each article immediately on receiving it; and certainly this practice has its advantages, compelling you, as it does, in a great degree, to live within your income, and precluding the possibility of your being cheated by clerks or waiters.

In almost all the towns of Germany, Vienna excepted, there is a table d'hôte at one o'clock. In general, you get an excellent dinner on reasonable terms. The society, too, is for the most part very good, and adorned by the presence of a fair proportion of charming women. After dinner, mountebanks, singers, and musicians, attend for the amusement of the company, who reward them after their own good pleasure, from one halfpenny up to twopence; the latter sum makes a German stare. At most places, smoking does not begin till the ladies have retired; but at the Schwartzer Ross, the first hotel in Prague, I remarked it commenced long before the fairer portion of the company had displayed any intention to leave the table. You generally sup *à la carte*, paying separately for each article ordered, and gratifying the attendant with a donation of a halfpenny or a penny, the latter being very liberal.

In most hotels in which there is not a table d'hôte, there are two separate dining rooms, or *spiese saales*, one for the benefit of smokers, the other for ladies and such gentlemen as are not amateurs of the pipe.

In England, or even in France, it would be considered an unpardonable offence against the common decencies of life to spit or throw water or beer about the room; here it is done constantly in the very best houses. A young blood of the first water will come into your lodgings, take one of your pipes (of which, to be in the fashion, you should have ten or twelve), and however handsome and costly may be the furniture, spit about him in all directions, without even dreaming of offering the least apology. You of course avail yourself of the earliest opportunity to return the compliment *chez lui*, that the reciprocity may not be all on one side, as a gallant admiral declared it was in the free-trade system. So that every thing is comfortably arranged upon the accommodating principle—

Hanc veniam pelimus damus que vicissim.

It must be borne in mind, though, that such a thing as a carpet is totally out of the question, even in the palaces of Prince Esterhazy, sovereign though he be. Indeed, if you wish specially for cleanliness, you should never leave England, or, at farthest, France; *c'est à dire*, as far as taverns, cafés, and hotels are concerned; but touching the peasantry and their cottages, there is nothing to reproach withal. The cottages and peasantry throughout Hungary and Austria Proper are both remarkable for the neatness and comfort of their appearance. The house is always conveniently furnished, and you generally see in its neighbourhood a couple of horses and as many cows, which are the property of the tenant. Before I had seen other countries, I was in the habit of considering the peasantry of England the happiest and most comfortable in the world. My opinion is now, I confess, altogether changed. The lower orders throughout the Austrian dominions are in a condition far superior to those of a similar rank in any English county. This speaks much in favour of the despotic government of the empire, which, however rigorous in theory, must be essentially mild in practice, since it secures such general happiness and prosperity to the people who are subject to it.—*From a recent book of Travels, of which we have mislaid the title.*

BIOGRAPHIC SKETCHES.

NICOLÒ PAGANINI.

THE power of natural genius, in bursting forth under every species of disadvantage and impediment, has been seldom so triumphantly manifested as in the life of Paganini, the musician. To excel in music as a science, does not require, by any means, a high order of intellect, neither does it demand that extraordinary cultivation by art necessary in the pursuit of the other sciences; but to be perfect in its theory and practice, much intuitive ability, and a happy expertness, are requisite; for, without these, the aspirant will in general only reach a respectable mediocrity, hardly worthy of being attained. In the life of the renowned personage now to be noticed, it will be seen that genius was born with him and soon made itself known.

Nicolo Paganini was born at Genoa, in February 1784: it is not mentioned what his father's profession was, if indeed he had any; and all we are told is, that his chief pursuit was to improve his circumstances, which were not the best in the world, by speculating in the lottery; so that when his little son

Nicolo began, at an unusually early age, to give strong indications of musical talent, it seemed as if the wheel of fortune had at last been propitious, and he accordingly lost no time in setting to work to make the most of his prize. Having some skill on the violin himself, he resolved to teach him that instrument, and as soon as he could hold it, put one into his hands, and made him sit beside him from morning till night to practise it. The incessant drudgery which he compelled him to undergo, and the occasional starvation to which he subjected him, seriously impaired his health, and, as Paganini himself asserts, laid the foundation of that valetudinarian state which has ever since been his portion, and which his pale sickly countenance and his sunk and exhausted frame so strongly attest. As his enthusiasm was such as to require no artificial stimulus, this severe system could only have been a piece of cool and wanton barbarity.

In his eighth year, under the superintendence of his father he had written a sonata, which, however, along with many other juvenile productions, he lately destroyed; and as he played about three times a-week in the churches and at private musical parties, upon a fiddle nearly as large as himself, he soon began to make himself known among his townsmen. At this time he received much benefit from one Francesco Gnecco, who died in 1811, and whom he always speaks highly of.

In his ninth year, being applied to by a travelling singer to join him in a concert, he made his first public appearance in the great theatre at Genoa, and played the French air, "La Carmagnole," with his own variations, with great applause.

His father now resolved to place him under the tuition of the well-known composer Rolla, and for that purpose took him along with him to Parma. The particulars of their interview afford a striking proof of the proficiency which he had by this time acquired. As Rolla happened to be ill and lying in bed, the party were shown into the antechamber, when, observing upon the table one of the composer's newest concertos, the father beckoned to his son to take up his violin and play it, which he did at sight, in such a way that the sick man immediately started up, demanded who it was, and could scarcely be prevailed upon to believe that the sounds had proceeded from a little boy and his intended pupil; but as soon as he had satisfied himself that that was really the case, he declined to receive him—"For God's sake," said he, "go to Paer; your time would be lost with me; I can do nothing for you."

To Paer accordingly they went, who received him kindly, and referred him to his own teacher, the old and experienced "Maestro di Capella" Giretti, from Naples, who gave him instructions for six months, three times a-week in counterpoint. During this period he wrote twenty-four fugues for four hands, with pen, ink, and paper alone, and without an instrument, which his master did not allow him, and, assisted by his own inclination, made rapid progress. The great Paer also took much interest in him, giving him compositions to work out, which he himself revised, an interest for which Paganini ever afterwards showed himself deeply grateful.

The time was now come when Nicolo was destined, like other youthful prodigies, to be hawked about the country, to fill the pockets of his mercenary father, who managed to speculate upon him with considerable success in Milan, Bologna, Florence, Pisa, Leghorn, and most of the upper and central towns of Italy, where his concerts were always well attended. Young Paganini liked these excursions well enough; but being now about fifteen years of age, he began to be of opinion that they would be still more agreeable if he could only contrive to get rid of the old gentleman, whose spare diet and severe discipline had now become more irksome to him than ever. To accomplish this desirable object, an opportunity soon offered. It was the custom of Lucca, at the feast of Saint Martin, to hold a great musical festival, to which strangers were invited from all quarters, and numerous travellers resorted of their own accord; and as the occasion drew near, Nicolo begged hard to be allowed to go there in company with his elder brother, and after much entreaty, succeeded in obtaining permission. He made his appearance as a solo player, and succeeded so well, that he resolved now to commence vagabondising on his own account—a sort of life to which he soon became so partial, that, notwithstanding many handsome offers which he occasionally received to establish himself in several places as a concerto player, or director of the orchestra, he never could be persuaded to settle any where. At a later period, however, he lived for some time at the court of Lucca, but soon found it more pleasant and profitable to resume his itinerant habits. He visited all parts of Italy, but usually made Genoa his headquarters, where, however, he preferred to play the part of the dilettante to that of the virtuoso, and performed in private circles without giving public concerts.

It was not long before he had amassed about 20,000 francs, part of which he proposed to devote to the maintenance of his parents. His father, however,

was not to be put off with a few thousands, but insisted upon the whole. Paganini then offered him the interest of the capital, but Signor Antonio very coolly threatened him with instant death, unless he agreed to consign the whole of the principal in his behalf; and in order to avert serious consequences, and to procure peace, he gave up the greater part of it.

Those who know any thing of the gay, romantic sort of life which artists in Italy, particularly those connected with the all-engrossing object of music, usually lead, the diversified society in which they mingle, and the incident and adventure which they meet with, will not wonder that Paganini should have felt inclined to pass his days there among his own countrymen, who felt and appreciated his talent, received him upon all occasions with the most enthusiastic applause, and showered down upon him all the gold they could afford, besides flowers, garlands, and sonnets, in abundance. He loved the manners and customs of his country, its beautiful scenery, its climate; but their kindred souls were still more congenial to his heart. He was their idol; wherever he went, his fame preceded his approach, and the multitudes poured in to hear him in streams as if he had been a worker of miracles. Having music at their command at all hours of the day, there is no country where concerts are worse attended than in Italy, and yet those which he gave never failed. People seemed never to be satiated with the delight of hearing him; and at Milan he gave, with the most brilliant success, no fewer than nineteen concerts rapidly succeeding each other. The only place in the whole of his peregrinations where he was unsuccessful, was at Palermo, in Sicily. At Rome, Naples, and Florence, he was eminently triumphant, and at the former of these places, his holiness the Pope was pleased to confer upon him the order of the *Speron d'Oro*.

It was early in 1828 when Paganini arrived at Vienna, where he gave a great many concerts with a success equal, if not superior, to any which had hitherto attended his exertions. His performance excited the admiration and astonishment of all the most distinguished professors and connoisseurs of this critical city. With any of the former all idea of competition was hopeless; and their greatest violinist, Mayseder, as soon as he had heard him, with an ingenuousness which did him honour, as we ourselves have reason to know, wrote to a friend in London, that he might now lock up his violin whenever he liked.

In estimating the labour which it must have cost a performer like Paganini to have arrived at such transcendent excellence, people are often apt to err in their calculations as to the actual extent of time and practice which has been devoted to its acquisition. That the perfect knowledge of the *mechanique* of the instrument which his performance exhibits, and his almost incredible skill and dexterity in its management, must necessarily have been the result of severe discipline, is beyond all question; but more, much more, in every case of this kind, is to be ascribed to the system upon which that discipline has proceeded, and to the genius and enthusiasm of the artist. The marvellous powers of Paganini, in the opinion of his auditors, were not to be accounted for in the ordinary way. To them it was plain that they must have sprung from a life of a much more settled and secluded cast, than that of an itinerant Italian musical professor. It was equally clear, from his wild, haggard, and mysterious looks, that he was no ordinary personage, and had seen no common vicissitudes. The vaults of a dungeon accordingly were the local habitation which public rumour, in its love of the marvellous, seemed unanimously to assign to him, as the only place where "the mighty magic" of his bow could possibly have been acquired. Then, as to the delinquency which led to his incarceration, there were various accounts. Some imputed it to his having been a captain of banditti; others, only a carbonaro; some to his having killed a man in a duel; but the more current and generally received story was, that he had poisoned or stabbed his wife, or, as some said, his mistress; although, as fame had ascribed to him no fewer than four mistresses, it was never very clearly made out which of his *se raglio* it was who had fallen the victim of his vengeance. The story not improbably might have arisen from his having been confounded with a contemporary violin player, of the name of Duranowski, a Pole, to whom in person he bore some resemblance, and who for some offence or other, having been imprisoned at Milan, during the leisure which his captivity afforded, had contrived greatly to improve himself in his art; and when once it was embodied into shape, the fiction naturally enough might have obtained the more credence, from the fact that two of his most distinguished predecessors, Tartini and Lully, had attained to the great mastery which they possessed over their instrument during a period of solitude—the one within the walls of a cloister—the other in the privacy and retirement of a remote country village. At all events, the rumours were universally circulated and believed, and the innocent and much-injured Paganini had for many years unconsciously stood forth in the eyes of the world as a violator of the laws, and even a convicted murderer. He seems never to have been made fully aware of the formidable position in which he stood, until he had reached Vienna, when the Theatrical Gazette, in reviewing his first concert, dropped some pretty broad hints as to the rumoured misdeeds of his earlier life. Whereupon he resolved at once publicly to proclaim

his innocence, and to put down the calumny; for which purpose, on the 10th of April 1828, there was inserted in the leading Vienna journals, a manifesto, in Italian as well as German, subscribed by him, declaring that all these widely circulated rumours were false; that at no time, and under no government whatever, had he ever offended against the laws, or been put under coercion; and that he had always demeaned himself as became a peaceable and inoffensive member of society; for the truth of which he referred to the magistracies of the different states, under whose protection he had till then lived in the public exercise of his profession. No one dared to invalidate the truth of this appeal.

His command of the back string of the instrument has always been an especial theme of wonder and admiration, and, in the opinion of some, could only be accounted for by resorting to the theory of the dun-geon, and the supposition that his other strings being worn out, and not having it in his power to supply their places, he had been forced from necessity to take refuge in the string in question; a notion very like that of a person who would assert, that for an opera dancer to learn to stand on one leg, the true way would be, to have only one leg to stand upon. We shall give Paganini's explanation of this mystery in his own words.

"At Lucca, I had always to direct the opera when the reigning family visited the theatre; I played three times a-week at the court, and every fortnight superintended the arrangement of a grand concert for the court parties, which, however, the reigning princess, Elisa Bacciochi, Princess of Lucca and Piombino, Napoleon's favourite sister, was not always present at, or did not hear to the close, as the harmonic tones of my violin were apt to grate her nerves, but there never failed to be present another much esteemed lady, who, while I had long admired her, bore (at least so I imagined) a reciprocal feeling towards me. Our passion gradually increased; and as it was necessary to keep it concealed, the footing on which we stood with each other became in consequence more interesting. One day I promised to surprise her with a musical *jeu d'esprit*, which should have a reference to our mutual attachment. I accordingly announced for performance a comic novelty, to which I gave the name of 'Love Scene.' All were curiously impatient to know what this should turn out to be, when at last I appeared with my violin, from which I had taken off the two middle strings, leaving only the E and the G string. By the first of these I proposed to represent the lady, by the other the gentleman; and I proceeded to play a sort of dialogue, in which I attempted to delineate the capricious quarrel and reconciliation of the lovers; at one time scolding each other, at another sighing and making tender advances, renewing their professions of love and esteem, and finally winding up the scene in the utmost good humour and delight. Having at last brought them into a state of the most perfect harmony, the united pair lead off a *pas de deux*, concluding with a brilliant finale. This musical scene went off with much eclat. The lady, who understood the whole perfectly, rewarded me with her gracious looks, the princess was all kindness, overwhelmed me with applause, and after complimenting me upon what I had been able to effect upon the two strings, expressed a wish to hear what I could execute upon one string. I immediately assented; the idea caught my fancy; and as the emperor's birthday took place a few weeks afterwards, I composed my sonata 'Napoleon' for the G string, and performed it upon that day before the court with so much approbation, that a cantata of Cimarosa, following immediately after it upon the same evening, was completely extinguished, and produced no effect whatever. This is the first and true cause of my partiality for the G string, and as they were always desiring to hear more of it, one day taught another, until at last my proficiency in this department was completely established."

No one has been more cruelly misrepresented than the subject of this notice. In reality a person of the gentlest and most inoffensive habits, he is any thing rather than the desperate ruffian he has been described. In his demeanour he is modest and unassuming to a fault. Like most artists, ardent and enthusiastic in his temperament, and in his actions very much a creature of impulse, he is full of all that unaffected simplicity which we almost invariably find associated with true genius. He has an only son, a very precocious child, who already indicates strong signs of musical talent. Being of a delicate frame of health, Paganini never can bear to trust him out of his sight. "If I were to lose him," says he, "I would be lost myself; it is quite impossible that I can ever separate myself from him; when I awake in the night, he is my first thought." Accordingly, ever since he parted from his mother, he has himself enacted the part of a child's nurse. Nor in his filial duties is he more remiss than in the parental. The wealth which he has amassed has been partly applied to provide for the comforts of an aged mother, and not unfrequently dispensed in acts of bounty towards his more necessitous relations and friends.

The above life of Paganini we have condensed from an able account of him, which appeared upwards of a twelvemonth ago in an extremely useful and meritorious publication, devoted to continental literature, under the title of the *Foreign Quarterly Review*. Since then, the genius of the violin, as he may be called, has paid a professional visit to Great Britain and

Ireland, in which countries he is understood to have reaped very large sums. Ultimately, we believe, he intends to retire to the Continent, to enjoy his gains in Tuscany, the climate of which he prefers to all others.

AN AMERICAN SCENE.

IN travelling through the state of New York, Mr Fergusson, from whose notes we have already quoted, mentions, that he arrived at the rural town of Waterford, which, says he, "is a sweet village, containing many gay white mansions, with green Venetians, neat gardens, &c., and the scenery around is extremely pleasing. The Hudson flows past the town, and the Mohawk falls in a short way below, with many wooded and rocky islands in front. From Waterford our route lay nearly parallel to the river, through a well-cultivated country, with many handsome farms, the soil varying in quality, and of inferior value as you recede from the river. A gentleman whom I had known in Scotland possesses a fine property on this road, and I resolved to surprise him with a visit.

We were most heartily welcomed, and only made good our retreat by a promise, if possible, to return. He has found his purchase a very advantageous one; the land seems of excellent quality, and he has evidently made great improvements in clearing, draining, fencing, &c. The Northern Canal intersects the estate. He has a very comfortable mansion, with a well laid out garden, rather ingeniously formed in the hollow of an old quarry. The Hudson, with many wooded romantic islets, and enlivened by rapids, constantly shooting down some strong rapids, with high land, well timbered, on the opposite bank, forms the landscape from his porch, where we found the old gentleman enjoying the sunshine of a delightful April day. A few miles after passing Stillwater (a small hamlet and post-office), we arrived opposite to Easton, the residence of my friend. It was now requisite to cross the river, which here expands to a very considerable breadth, and, from its placidity, gives name to the hamlet and district. A rather ill-defined track led us through a field, and we descended the bank, as I thought, with some hazard, to the water's edge. Here no handy waterman waited to give us his aid, but a *catamaran-like* boat, denominated a *scow*, long enough, though of a breadth barely sufficient to receive the carriage, was at our service, when cleared of the water, with which she was half full. I received orders to remain in the phaeton, under the guidance of the coachman, while my friends soon baled out a portion of the water, and handled two long poles, by which we were to be put across. The prospect, I must admit, was far from satisfactory; however, having no choice, I had only to submit, and, after a proper plunge and a rare jolt, our well-trained active horses deposited us on board, and we committed ourselves to the gentle current. In due time we reached the opposite bank, and, after another scramble, got safely ashore, where my good friend was ready to welcome us. This was the first specimen I had met with of the docility which is almost universal in American horses, and is the natural result of kind treatment. From the moment that these four spirited animals entered the boat, until they were required to leap out, a period of half an hour, not one of them moved a hoof. My friend's property formerly belonged to a branch of the Schuyler family, and is beautifully situated on the east bank of the Hudson, consisting of rich clay land, low hills well adapted for sheep pasture, and woodland behind. The house stands not far from the river, and commands a very pleasing view. The valley of the Hudson is here of considerable breadth. The Northern, or Champlain Canal, connecting New York with Vermont, Lower Canada, &c. passes on the west side, at the distance, in general, of about half a mile from the river. There is a large extent of rich flat land upon the eastern bank, rising into low hills and woodlands as you recede; and some miles in the interior, it is intersected by a line of turnpike from Troy, &c. to the north, with a district of settled country, inferior, however, in quality to the river side. Numerous little brooks descend from the hilly ground, affording a copious supply of water for agricultural, and sometimes for mechanical purposes. Upon one of these, running through his property, my friend has erected a brewery, which, in the hands of two enterprising Scotchmen, promises to flourish. Sure I am, if superlatively good ale can secure customers, the Easton brewery deserves to succeed. Ice is supplied in a particular and scientific method, which enables the brewery to work when others are in general closed, from the temperature of the summer. In returning one evening from dining with our neighbours at the brewery, I was regaled and astonished, for the first time, with a frog concert. The night was dark, and we were picking our steps by the aid of a lantern, when the chirrup at once opened on every hand from a thousand mouths. The whole valley seemed to be alive with one mass of squeaking voices, which continued through the night without intermission. The bull-frog occasionally sings bass, but this evening he was silent. The noise breaks strangely to a stranger's ear on the quiet hour; and I could not help associating it, in some degree, with the annoying recollection of fever and ague, which will, less or more, continue to prevail until a general system of draining shall thin this orchestra.

Some varieties of the frog grow here and in Canada

to a prodigious size. A plain honest Scotsman, with whom I travelled some days in Canada, amused me much with his account of them, when detailing his feats in the slaughter of wood pigeons. 'You never saw the like o' the puddocks, sir; I brought down three doos at ae shot, and afore I could tak' them up, a muckle deevil, wi' a mouth as braid's my loof, gobbed up yin o' them, stoup an' roup.' Mrs R—, too, assured me, that from her vicinity to the meadows at the river side, she had no chance of rearing ducks, the young brood always falling a prey to the frogs."

SNUFF-TAKING—SMOKING.

As snuff and tobacco form a considerable item in the expenditure of the working classes, it may be proper to mention, that the highest medical authorities are of opinion that the use of them is prejudicial to health. The following is the opinion of the celebrated Dr Cullen on the subject:—"Tobacco is a well-known drug, of a narcotic quality, which it discovers in all persons, even in a small quantity, when first applied to them, I have known a small quantity of it, snuffed up the nose, produce giddiness, stupor, and vomiting; and when applied in different ways, in larger quantity, there are many instances of its more violent effects, even of its proving a mortal poison. In all these instances, it operates in the manner of other narcotics; but, along with its narcotic qualities, it possesses also a strong stimulant power, perhaps with respect to the whole system, but especially with respect to the stomach and intestines, so as readily, even in no great doses, to prove emetic and purgative. By this combination of qualities, all the effects of tobacco may be explained; but I shall begin with considering its effects as they appear in the use of it as an article of living. When snuff is first employed, if it be not both in small quantity, and be not thrown out immediately by sneezing, it occasions some giddiness and confusion of the head; but, by repetition, these effects cease to be produced, and no other effect of it appears in the accustomed, when it is not taken beyond the accustomed quantity. But even in the accustomed, when it is taken beyond the usual quantity, it produces somewhat of the same giddiness and confusion of head that it did when first employed; and, in several cases, these effects in the accustomed, depending on a larger dose, are not only more considerable, as they act on the sensorium, but as they appear also in other parts of the system, particularly in the stomach, occasioning a loss of appetite, and other symptoms of a weakened tone in that organ. With respect to this, it is to be observed, that persons who take a great deal of snuff, though they seem, from the power of habit, to escape its narcotic effects, yet, as are they often liable to go to excess in the quantity taken, so they are still in danger from these effects operating in an insensible manner; and I have observed several instances of their being affected in the same manner as persons are from the long use of other narcotics, such as wine and opium, that is, by a loss of memory, by a fatuity, and other symptoms of the weakened or senile state of the nervous system, induced before the usual period. Among other effects of excess in snuffing, I have found all the symptoms of dyspepsia produced by it, and particularly pains of the stomach, occurring every day. The dependence of those upon the use of snuff became very evident from hence, that, upon an accidental interruption of snuffing for some days, these pains did not occur, but upon a return to snuffing, the pains also recurred; and this alternation of pains of the stomach and of snuffing having occurred again, the snuff was entirely laid aside, and the pains did not recur for many months after, nor, so far as I know, for the rest of life. Another effect of snuff to be taken notice of is, that, as a part of the snuff is often carried back into the fauces, so a part of this is often carried down into the stomach, and then more certainly produces the dyspeptic symptoms mentioned. These are the considerations that relate to snuffing; and some of them will readily apply to the other modes of using this drug. Smoking, when first practised, shows very strongly the narcotic, vomiting, and even purging powers of tobacco, and it is very often useful as an anodyne; but by repetition, these effects disappear, or only show themselves when the quantity smoked is beyond what habit had before admitted of; and even in persons much accustomed to it, it may be carried so far as to prove a mortal poison. From much smoking all the same effects may arise which we said might arise from excess of snuffing. With respect to the evacuation of mucus, which is produced by snuffing, there are analogous effects produced by smoking, which commonly stimulates the

mucous follicles of the mouth and fauces, particularly the excretories of the salivary glands. Sometimes snacking dries the mouth and fauces, and occasions a demand for drink; but as commonly the stimulus it applies to the mucous follicles and salivary glands draws forth their liquids, it occasions, on the other hand, a frequent spitting. So far as this is of the proper saliva, it occasions a waste of that liquid so necessary in the business of digestion; and both by this waste, and by the narcotic power at the same time applied, the tone of the stomach is often weakened, and every kind of dyspeptic symptoms are produced. The third mode of using tobacco is that of chewing it, when it shows its narcotic qualities as strongly as in any other way of applying it, though the nauseous taste of it commonly prevents its being carried far in the first practice. When the practice, however, is continued, as it is very difficult to avoid some part of it, dissolved in the saliva, from going down into the stomach, so this, with the nausea excited by the taste, makes vomiting more readily occasioned by this than the other modes of applying it. They are the strong, and even disagreeable impressions repeated, that give the most durable and tenacious habits, and, therefore, the chewing of tobacco is apt to become one of these; and it is therefore in this way that it is ready to be carried to the greatest excess, and to show all the effects of the frequent and large use of narcotics. This practice is also the occasion of the greatest loss of saliva; and the effects of this in weakening digestion, and, perhaps, from thence especially its noted effect of producing emaciation, may appear."

Several cases of disease are mentioned, in which the use of tobacco is said to be beneficial; but it appears to be the conviction of this great physician, that in none of its forms can it be beneficial to the healthy subject.

THE LARCH.

This species of the fir, or pine, which is now seen in every gentleman's plantation, was accidentally brought to Scotland about a hundred years ago. Mr Menzies of Culdare was in London in 1737, and hearing of a beautiful pine shrub recently imported, procured four plants; he gave two to the Duke of Atholl, which are now in full vigour at Dunkeld, and may be called the parents of all the larch in the kingdom; he gave a third to Mr Campbell of Monzie, and kept the fourth for himself, which was unfortunately cut down fifty years ago. It had been planted forty-five years, and had grown to seven feet nine inches in circumference. The Duke of Atholl's plants were placed in a greenhouse at Dunkeld, where they did not thrive, and were thrown out, when they immediately began to grow, and quickly showed the consequence of being placed in a proper climate. The larch has proved a valuable acquisition to the produce of many barren moors in the Highlands, where the climate is found more favourable for this species of pine than in the plains. As an instance of the value of these trees, the late Duke of Atholl sold one thousand larch trees, of seventy years' growth, for L.5000.

DR ADAM FERGUSON.

The late celebrated Dr Adam Ferguson, who was chaplain to one of the Highland regiments, is well remembered for the fearlessness with which he went through his affecting and sacred duties in the midst of the hottest engagements. On one occasion, when the regiment to which he belonged was taking its ground preparatory to battle, Sir Robert Munro perceived the chaplain in the ranks, and, with a friendly caution, told him there was no necessity for him to expose himself to unnecessary danger, and that he ought to be out of the line of fire. The doctor thanked Sir Robert for his friendly advice, but added, that on this occasion he had a duty which he was imperatively called upon to perform. Accordingly, he continued with the regiment during the whole of the action, in the hottest of the fire, praying with the dying, attending to the wounded, and directing them to be carried to a place of safety. By his fearless zeal, his intrepidity, and his friendship towards the soldiers, (several of whom had been his schoolfellows at Dunkeld), his amiable and cheerful manners, checking with severity when necessary, mixing among them with ease and familiarity, and being as ready as any of them with a poem or heroic tale, he acquired an unbounded ascendancy over them.

JOCK GRAME.

The Salkeldes, or Sakeldes, was a powerful family in Cumberland, possessing among other manors that of Corby, before it came into the possession of the Howards, in the beginning of the seventeenth century. A strange stratagem was practised by an outlaw, called Jock Grame of the Pear Tree, upon the Salkelde, sheriff of Cumberland, the fact having occurred late in Elizabeth's reign. The brother of this freebooter was lying in Carlisle jail for execution, when Jock of the Pear Tree came riding past the gate of Corby Castle. A child of the sheriff was playing before the door, to whom the outlaw gave an apple, saying, "Master, will you ride?" The boy willingly consenting, Grame took him up before him, carried him into Scotland, and would never part with him till he had his brother safe from the gallows.

BRITISH FOOT REGIMENTS.

THE Scots Royals are known to be the oldest regiment in the British service. We are not informed when this corps was raised, but there is a commission in it still extant, bearing date in 1636.

In the old French army lists, the Scotch Guards likewise were distinguished as the oldest regiment in their service.

The oldest regiment in the British service, however, whose rise is ascertained, is the Coldstream Guards, raised for General Monk in 1660.

Upon Charles the Second's marriage with the infant of Portugal, the city of Tangier was ceded to the English, as part of her marriage portion, and four regiments sent to take possession of it. Out of these four was formed the Queen's Tangier regiment, or Queen's Royals, ranking at present as the Second Regiment of foot. As this regiment, in James the Second's reign, was commanded by Colonel Kirk, it is likely to have been the same corps that was guilty of so many excesses in the west of England, after the Duke of Monmouth's insurrection, where they were ironically nicknamed Kirk's Lambs.

The Royal Irish, or 18th Regiment, seems to have particularly distinguished itself at the siege of Namur, the principal achievement of King William in his Flanders campaign. The officers' badge is still inscribed with the words, "Premium virtutes Namurcensis."

The 25th and 26th Scots, and the 27th Irish Regiment, were raised at the time of the Revolution, and were all three at that time composed of Presbyterians.

Three of the old Scots regiments seem to have been a good deal noticed in King William and Queen Anne's wars, viz. the present 21st, or Scots Fusiliers; the 25th or Old Edinburgh; and the 26th, or Cameronians. After the Revolution, they were known as M'Kay's, Leven's, and Angus's regiments. It is curious enough that Stern in his Tristram Shandy, and he is known to be correct enough in his allusions to the history of these wars, speaks of these regiments a good deal; and as a compliment to them, puts his uncle Toby in Leven's, and Lieutenant Le Fevre in Angus's.

The old British foot regiments were first publicly distinguished by their numbers, according to seniority, about the year 1750, though we find them numbered in the army lists some years before. Formerly they were distinguished by the names of their colonels only.

In 1782, for the sake of more speedy recruiting, such of the old foot regiments as had no other distinction but their numbers, were allowed to take the name of one or other of the counties in England. Thus the 52d regiment is designated the Oxford Regiment, &c.

LINLITHGOW PALACE.

Where noble men of proven might,
And ardent youthful souls, have been,
And eyes, full of love's glances, bright
Have shone on many a festal night—
Bright, and bewitchingly serene;
Where hearts of warriors have leapt
When daring deeds were to be done,
And ladies at the thought have wept
How that might end which was begun;
The damp-drops, like those baneful dews
Which trickle from the dungeon-wall,
Now from the vaulted ceilings ooze,
And heavy on the pavement fall.
These roofs, when wassail cups went round,
To mirthful shouts have often rung;
But now their echoes' doleful sound,
Long, long unused to human tongue:
Where once were gay and gilded halls,
Are now but crack'd and blacken'd walls,
With blades of grass among their seams,
And weeds and ends of fore-scathed beams.
And where are they—the brave and fair—
Who have been glad and happy there?
How many hands that grasped the hilt,
With eager haste, for war or tilt—
How many arms that none might stay,
That swept resistless, and made way
Among a thousand foes,
Have lain at rest through long, long years,
And stir'd not though fierce shouts and cheers,
And groans among conflicting spears,
Above their graves arose!
How many ages, too, are over,
Since watchful eye of timid lover
Responsively hath trembled,
Upon the glance of one, of all
The lady-loves, whom mask, and ball,
And pomp, have here assembled.
The gaudy barge, by galliards row'd,
That still blue lake has often plough'd—
Their plumes upon its billows danced—
With love the eyes of ladies beam'd—
The sun upon the fair scene glanced,
Then gay that lake, and lovely seem'd,
As was the freight upon its waves
Of Scotland's sons and daughters;
'Tis lonely now, as are the graves,
Beside its silent waters.
Thus they, perhaps, in musing mood,
Have said of those before them,
Unthinking that like darkness should
In future gather o'er them;
Thus do we ponder of the past,
And our own fate is coming fast.

SIR WALTER SCOTT.

OUR sketch of the life of this illustrious man, which we have some pride in pointing out as the first instance of an original work of such extent being published in a style calculated for universal circulation, has by this time, we trust, afforded to many thousands of our countrymen, such a picture of excellence in mind and character, as they have never before looked on. We have now much pleasure in giving our readers assurance of the general accuracy of that work—the quality chiefly aimed at in its composition—from the testimony of one peculiarly able to speak to the point; namely, the editor of the Edinburgh Weekly Journal newspaper, who for forty years was the bosom friend of the illustrious subject of our memoir, and might be styled, indeed, his literary Achates. After expressing, in the paper of October 3, his regret that ill health prevented him from giving a sketch of Sir Walter Scott, from his own pen, the editor of the Journal thus proceeds:—"In the meantime, we recommend to general perusal an excellent biographical sketch of the great departed, which appeared in a supplement to Messrs Chambers's last journal. It is singularly copious, comprehensive, and correct, and arranged with that marked fairness and perspicuity which have mainly contributed to give to these writers their extensive popularity."

While we have to express the gratification we derive from this decisive testimony, candour also obliges us to mention one or two mistakes chiefly of a trivial kind, which have been pointed out to us upon good authority.

The real situation of Sir Walter Scott, in the volunteer corps in 1797, was that of quarter-master, and the name of the regiment was the Edinburgh Light Dragoons.

[A characteristic anecdote, connected with this part of his life, may here be introduced as a compensation for the error. The commander of the corps, as not unusually happened, was rather ignorant of his duty, and required to have a card of the movements constantly in his hand. One unfortunate morning—a very cold one—he forgot to bring this monitor along with him, and was of course desperately nonplussed. He could positively do nothing; the troop stood for twenty minutes quite motionless, while he was vainly endeavouring to find the means of supplying the requisite document. At this moment, while the men were all as cold as their own stirrup-irons, and were more like a set of mutes at a funeral than a band of redoubted volunteers, ready to do battle at whatever odds against the might of Gaul, Sir Walter came limping up, and said to a few of the other officers, in his grave way, "I think the corpse is rather long in lifting this morning;" a drolery so fit to the occasion and to their feelings, that the whole burst out in a fit of laughing, which speedily communicated to the whole corps.]

The story of Sir Walter's financial embarrassments is so exceedingly involved and confused, that perhaps it could not be properly explained without the aid of an accountant. The deceased himself, in his preface to the new edition of his Chronicles of the Canongate, mentions L.120,000 as the extent of his losses by Messrs Constable and Cadell. Yet the trust, as recorded in our narrative, embraced only L.102,000, of which a large part referred to personal debts otherwise incurred. Our statement as to a dividend of six-and-eightpence is not exactly correct; but there can be no mistake as to the aggregate of the dividends that had been paid at the time of Sir Walter's decease—namely, eleven-and-eightpence. This, we understand, with the money payable by insurance offices, and sums due out of the profits of his works, left twenty-one thousand pounds due at the period of his decease, exclusive of the accumulated interest.

In a note upon the 299th page, we regret to find that an unjust imputation (originally adopted from a newspaper) was conveyed, respecting the bill of 6th August, for appointing a new sheriff for Selkirkshire. That bill was in reality unavoidable, on account of the new duties imposed on officers of this class by the reform bill, and was entered into with the full concurrence of Sir Walter's nearest relatives.

EDINBURGH: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Orr & Smith, Paternoster-row, London; and George Young, Dublin.—Agent in Glasgow, John Macleod, 20, Argyle Street; and sold, by all other Booksellers in Great Britain and Ireland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half-year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

From the Steam-press of W. and R. Chambers.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 39.

SATURDAY, OCTOBER 27, 1832.

PRICE THREE HALFPENCE.

ADVANCEMENT IN LIFE.

THE last number of the Journal contained the conclusion of a pretty ample list of persons who originally were in very humble and apparently unfavourable circumstances, but eventually rose, through the force of talent and application, to eminent situations in life. That list was drawn up, and presented in our humble, but, we earnestly hope, useful pages, as a means of furnishing every poor boy into whose hands it might chance to fall, with some hope of also escaping from his native condition, and shining out hereafter as a superior character.

It is very certain that all men are not born to be Franklins, and, likewise, that if any considerable number of such persons were to arise, their utility and their distinction would be diminished. There is a good old proverb, however—"aim at a silk gown, and you may get a sleeve of it;" which may be followed out, both to the advantage of individuals and to the benefit of the community. As it, therefore, would seem proper that every means should be taken to inspire youth with the ambition of well-doing, we make no apology for laying the following general observations before the public.

First, there is one great maxim that no youth should ever want before his eyes, namely, that hardly any thing is beyond the attainment of real merit. Let a man set up almost any object before him on entering life, and, if his ambition be of that genuine kind which springs from talent, and is *not too much for his prudence*, there is a strong chance in his favour that a keen and steady pursuit of the object will make him triumph at last. It is very common, when the proposal of a young man's entry into life is discussed, to hear complaints as to the pre-occupation of every field of adventure by unemployed multitudes. There may occasionally be some cause for this; but the general truth is undeniable, that, in spite of every disadvantage, men are rising daily to distinction in every profession—the broadest shoulders, as usual, making their way best through the crowd. It is the slothful and the fearful that generally make such complaints; and they obviously do so in order to assure themselves that they are not altogether wrong in continuing to mispend their time. When we hear of the overcrowded state of any proposed profession, we are apt to overlook that an immense proportion of those engaged in it are destined, by the weakness of their character, and want of specific qualifications, to make no way for themselves, and must soon be the same, so far as rivalry is concerned, as if they had never entered it. If the entrant, then, has only a well-grounded confidence in his own powers of exertion and perseverance, he need hardly be afraid to enter any profession. With the serious desire of well-doing at heart, and some tolerable share of ability, he is sure very soon to get ahead of a great proportion of those already in the field. Only let him never despair—that is, tell himself it is all in vain, in order that he may become idle with a good conscience—and there is hardly any fear of him.

The present writer entertains some different ideas respecting original humility of circumstances from what are generally prevalent. The common notion is, that humble circumstances are a great obstruction at the outset of life, and that the more difference between a man's origin and his eventual condition, the greater is the wonder, and the greater his merit. Since it appears, however, that so large a proportion of distinguished men were poor at the beginning, a question may naturally arise, are not men just the more apt, on that account, to become eminent? Al-

though we are all familiar as possible with instances of fortunes made from nothing, it will be found, on recollection, that cases are comparatively rare of men who began with fortunes having ended by greatly increasing them. Many a poor boy has made twenty thousand pounds before he was forty years of age; but few who had ten thousand at the age of majority are found to double it with their years. Here—here is a reason for hope. The fact is, large sums are not to be acquired without an appreciation and an understanding of the meanest financial details. To make pounds, we must know the value of shillings; we must have felt before how much good could sometimes be done, how much evil could sometimes be avoided, *by the possession of a single penny!* For want of this knowledge, the opulent youth squanders or otherwise loses more, perhaps, than he gains. But he who has risen from the ranks knows the value and powers of every sum, from the lowest upwards, and, *as saving is the better part of the art of acquiring money*, he never goes back a step—his whole march is onward. At the very worst, it is only a question of time. Say one man begins at twenty with a good capital, and another at the same age with none. For want of experience, and through other causes above mentioned, it is not likely that the former person has made much advance within the first ten years. Now, ten years is an immense space to the individual who only commenced with good resolutions. In that time, if he has not accumulated actual money, he may quite well have secured good reputation and credit, which, prudently managed, is just money of another kind. And so, while still a young man, he is pretty much upon a par with him who seemed to start with such superior advantages. In fact, fortune, or original good circumstances, appear to the present writer as requisites of a very unimportant character, compared with talent, power of application, self-denial, and honourable intentions. The *fortunate*—to use the erroneous language of common life—are selected from those who have possessed the latter indispensable qualifications in their best combinations; and as it is obvious that young men of fortune (necessarily the smaller class) have only a chance, according to their numbers, of possessing them, it follows, as a clear induction, that the great mass of the prosperous were originally poor.

TALENT.—It is a common cry that those who succeed best in life are the dullest people, and that talent is too fine a quality for common pursuits. There cannot be a greater fallacy than this. It may be true that some decidedly stupid people succeed through the force of a dogged resolution, which hardly any man of superior genius could have submitted to. But I am disposed to dispute, in a great measure, the existence of talent, where I do not find it at once productive of superior address in ordinary affairs, and attended by a magnanimity which elevates the possessor above all paltry and vicious actions. The genius which only misleads its possessor from the paths of prudence, or renders him a ridiculous and intolerable member of society, is too much allied to Bedlam to be taken into account; and in reality there is nowhere so much of what is called genius as in the mad-houses.* The imputation of dullness to a man who has prospered in life, will be found by impartial inquirers, in nine cases out of ten, to be a mere consolatory appliance to the self-love of one who has neither had the talent nor the morality to prosper in life himself. Let every man, then, who possesses this gift,

rejoice in it with all his heart, and seek by every means to give it proper guidance and direction.

APPLICATION is another of the indispensable requisites. Detached efforts, though they may individually be great, can never tell so well in the aggregate as a regular and constant exertion, where the doings of one day fortify and improve the doings of the preceding, and lead on with certainty to the better doings of the next. It is not economical to work by fits and starts; more exertion is required, by that system, for a certain end, than what is necessary in the case of a continuous effort, and thus the irregular man is apt to fall far behind his rivals. Men of ability are apt to despise application as a mean and grubbing qualification—which is only a piece of overweening self-love on their part, and likely to be the very means of frustrating all the proper results of their ability. On the other hand, the industrious man is apt to despair for want of ability—not seeing that the clever fellows are liable to the weakness we describe, which causes them to be constantly giving way in the race to mere plodders. Besides, while few faults are more common than an over-estimation of one's self, it is equally obvious that many men only discover their abilities by chance, and that all of us possess latent powers, which might be turned to good account, if we only knew and had confidence in them. No man, therefore, should be too easily dashed on the subject of his abilities. He should try, and, with the aid of a persevering industry, he may do wonders such as he never dreamt of.

SELF-DENIAL.—Perhaps among all the qualifications which, in a combined form, lead to fortune, none is more absolutely indispensable than this. A man may have talent, may have application, both in abundance; but if he cannot resist vulgar temptations, all is in vain. The Scotch, as a nation, are characterised immensely by self-denial, and it is the main ground of their prosperity both at home and abroad. It is one of the noblest of the virtues, if not, indeed, the sole virtue which creates all the rest. If we are obliged at every moment to abandon some sacred principle in order to gratify a paltry appetite; if the extensive future is perpetually to be sacrificed for the sake of the momentary present; if we are to lead a life of Esau-like bargains from the first to the last—then we are totally unfit for any purpose above the meanest. Self-indulgence makes brutes out of gods: self-denial is the tangent line by which human nature trenches upon the divine. Now, self-indulgence is not inherent except in very few natures; it is almost invariably the result of "evil communications" in youth, and generally becomes a mere use or habit. The most of error arises from the contagion of example. A youth at first debauches himself because he sees others do it; he feels, all the time, as if he were sacrificing merely to the glory of bravado; and there is far more of martyrdom in it than is generally supposed. But though a person at first smokes in order to show how much disgust he can endure, he soon comes to have a real liking for tobacco. And thus, for the paltriest indulgences, which only are so from vicious habit, and perhaps, after all, involve as much dissatisfaction as pleasure, we daily see the most glorious and ennobling objects cast, as it were, into hell-fire.

We are by no means hostile to all amusement. The mass of men require a certain quantity of amusement almost as regularly as their daily food. But amusement may be noxious or innocent, moderate or immoderate. The amusements which can be enjoyed in the domestic circle, or without company at all, are the safest; there is great danger in all which require an association of individuals to carry them into effect.

* This remark is borrowed from the conversation of a medical friend.

Upon the whole, a multitude of bosom friends is the most pernicious evil that ever besets a man in the world. Each becomes a slave to the depraved appetites of the rest, and is at last ulcerated all over with their various evil practices. At the very best, he is retarded to the general pace, and never finds it possible to get a single vantage hour, in order to steal a march upon his kind.

HONOURABLE INTENTIONS are also indispensably necessary. The reverse is simply want of sense and understanding; for it is obvious to every one who has seen the least of human life, that infinitely more is lost in reputation and means and opportunities of well-doing, by an attempt to gain an undue advantage, than what can in general cases be gained. If we had to live only for a short time certain, trickery might be the most expedient course, so far as this world is concerned; but if a man contemplates a life above a single twelvemonth, he will endeavour, by the guarded correctness of his actions, to acquire the good character which tends so much to eventual prosperity. The dishonest man, in one sense, may be termed the most monstrous of all self-flatterers: he thinks he can cheat the whole of the remaining part of mankind—which certainly is no trifling compliment. He soon finds, however, that he was seen through all the time by those whom he thought mere children, and his blindness and silly arrogance receive their deserved punishment. Even where the depravity may be of a very slight kind, it is alike in vain. In ordinary transactions, the one party deals with the other exactly according to his character: if the one be in general disposed to overreach, the other is just proportionally on his guard; so that there is no result but trouble, and a bad name. One thing should be strongly impressed upon such persons: they are far more generally understood and watched than they are aware of; for the world, so long as it can simply take care of itself without much difficulty, is not disposed to adopt the dangerous task of a monitor. The police-officer knows of many rogues whom he passes every day on the street; he never lays hold of any, unless for some particular offence.

Such are the principal qualities necessary for advancement in life, though any one of them, without much or any of the other, will, if not counteracted by negative properties, be sure to command a certain degree of success. He who is about to start in the race would do well to ponder upon the difficulties he has to encounter, and make up a manful resolution to meet them with a full exertion of all his powers. To revert to the general question—what is it that enables one man to get in advance of his fellows? The answer is obvious—it can only be his *doing* more than the generality of them, or his *enduring* more privation than they are generally inclined to do [that is, self-denial], in order that he may acquire *increased power of doing*. The fault of most unsuccessful persons is their want of an adequate idea of what is to be *done*, and what is to be *endured*. They enter business as into a game or a sport, and they are surprised, after a time, to find that there is a principle in the affair they never before took into account—namely, the tremendous competition of other men. Without being able to do and suffer as much as the *best* men of business, the *first* place is not to be gained: without being able to do and suffer as much as the *second* order of men of business, the *second* place is not to be gained: and so on. New candidates should therefore endeavour to make an estimate of the duties necessary for attaining a certain point, and not permit themselves to be thrown out in the race for want of a proper performance of those duties. They should either be pretty certain of possessing the requisite powers of exertion and endurance, or aim at a lower point, to which their powers may seem certainly adequate.

NATURAL HISTORY.

We stated in a former article, that, in the animated kingdom of Nature, there appeared to be one general chain of being, from man down to the lowest degree of animated existence. How numerous, therefore, must be the links of that chain! This has rendered indispensable the conventional institution of systems, so as to enable us the more easily to trace and investigate the history, character, and relations, of any animal, plant, or mineral, which may come under our notice. Without such systematic arrangements, the task would be next to an impossibility.

It was not till the time of Linnaeus, that systematic arrangement was brought to any thing like perfection. This great naturalist reduced all natural objects into three great divisions; these he termed kingdoms—namely, the Animal, Vegetable, and Mineral kingdoms. Each of these he again subdivided into classes, orders, genera, species, and varieties.

Let us trace the superstructure of the system to its simplest elements. All animals, which are alike in every particular, are of the same species. For example, the sky-lark is a distinct species. Climate and accidental circumstances may produce a variety; but its specific distinctions will ever remain the same. Now, almost every one knows, that there are several kinds

of larks, which, upon the whole, are very much alike, but, when examined minutely, have characters, or parts, differing from each other in size, the colour of the various parts of their plumage, the colour of their eyes, bills, and legs, the length of their toes, nails, and legs, with various other trivial distinctions, which constitute them of different species. These, in a state of nature, by a wise law, abstain from sexual intercourse, and thus maintain in purity their race to the end of time. In Britain, we have the sky-lark, tit-lark, field-lark, wood-lark, red-lark, &c. all having well marked distinctions, but all agreeing in having certain characters; such as *cylindrical-shaped bills, which are awl-shaped; the upper and under mandible, or chaps, both of equal length, and opening a little at the base; their tongues are cleft at the points; the claws of the back toes are longer than the toes themselves, and nearly straight*. This, then, is their generic character, which Linnaeus considered as entitling them to be brought under one genus. Let us compare this generic character with that of the parrots, and we shall at once see the distinction. *Bills hooked, the upper mandible moveable, and in general furnished with a skin called a cere, which covers its lower half; the under mandible is cut off at the point, as if incomplete; the tongue is fleshy, blunt at the point, and not cleft*. There are a vast variety of parrots, all agreeing in these particulars, but very different in point of size, colour, and other peculiarities. These, of course, are so many different species of parrots. We now come to the formation of orders, which comprehend a plurality of genera. The birds which we have above chosen as illustrations are of different orders. The larks are of the order called Passarines, all the genera of which agree in the following particulars. *They have conical sharp-pointed bills; their nostrils are generally naked and oval; their feet are formed for walking, or hopping, with three toes before, and one behind; and feed on seeds, plants, and worms*. Now the parrots belong to an order called *Leviostres*, or smooth-bills. *The bills are remarkable for their size and strength; they are always of a convex form, more or less crooked; the toes are formed for climbing*. They feed on the fruits of plants, nuts, &c. The number of orders vary according to the opinions of different naturalists, who have constructed systems; but birds, taken generally, constitute one class. When to these we add the classes of quadrupeds, fishes, insects, shells, &c. we make up what is termed the animal kingdom. When, therefore, an object is presented to us which we have never before seen, we first refer it to a class; we next compare it with the characters of the orders; and having ascertained to which it belongs, we trace it to its genus; and, having satisfied ourselves as to this, we next endeavour to ascertain its species. Here, then, an animal has been sent to us; we find it belongs to the class called Birds; that it is of the *Passarine* order, that is, an *Alauda*, or lark; and that, from its specific character, it must be that charming songster—the harbinger of the morning—the sky-lark, who is heard,

From its watch tower in the skies,
Ere the dappled dawn doth rise.

It will thus be seen how perfectly simple and natural systems are, and that, without their aid, the innumerable objects in the great field of nature must present themselves to us in a confused mass; and, by their aid we can now readily trace every object to its proper station in the system of Nature. We shall first treat of the animal kingdom.

Since the time of Linnaeus, has arisen that great genius, and profound comparative anatomist, Cuvier, who has remodelled the system of Linnaeus, in his great work, called, "The Animal Kingdom." His system is a natural one, founded on the organization and essential resemblances of living beings. It may be compared to a kind of chart of animal life, and shews us, at one comprehensive view, all the great leading characters and varied forms, from which are founded the four grand divisions of the animal kingdom; namely, I. VERTEBRATED ANIMALS, or those animals which have a backbone, or spine. II. MOLLUSCOUS ANIMALS, or animals which are destitute of a spine, or bones of any kind, as snails, &c. III. ARTICULATED ANIMALS, which have no internal bones, but whose members are articulated by an external crust or shell, as crabs, &c.; and, IV. RADIATED ANIMALS, or such as those whose members radiate from a common centre, as exemplified in star-fish, &c.

There are two leading characters which are common to all animals; these are sensation and motion. The brain and nervous system are the channels by which all the animal functions are conveyed; while the heart and its accessory organs, nutrition and generation, are what may be termed the vegetative functions, and are common to both animals and plants. Sensation exists in the nervous system. As we descend in the scale of being, these agents gradually become less perfect, till they finally disappear, or grow imperceptible to human scrutiny—if they really exist at all; and the muscles or flesh gives place to a shapeless mass of animal matter, a mere pulp.

THE PLAGUE-SHIP.

[THE following impressive story was first published a few years ago in the *Edinburgh Observer* newspaper, to which it was contributed, among other excellent articles in prose and verse, by Mr Andrew Belfrage Picken, a youth of no ordinary talent, but who, we regret to think, has ultimately seen fit to cast his lot on the other side of the Atlantic. Mr Picken, whom we knew from boyhood to more advanced life, was a leading individual in the expedition to Poyais, and it was while returning from that unfortunate enterprise that he picked up the impressions embodied in "The Plague-Ship."]

SOME years ago, Carl Andersen, the mate of the Mayflower, and the original narrator of the following occurrences, was associated, by necessitous circumstances, with the mob of ragged and sun-burnt adventurers that infest the quays and landing places of Campeachy, and gather their miserable livelihood by assisting in the shipment of sugar and indigo cargoes, or any other office of drudgery at which the slave is permitted to turn up his nose. These sort of rabble are common to all the seaports of the West Indies, but in particular to those of Havannah and Campeachy. In the latter place they are very numerous, and are mostly to be met with on the moles and quays near the harbour, sauntering idly up and down, or squatted in the dirt, playing at cards, or extracting chiggers and worms from their feet, exhibiting the most disgusting picture of filth and indolence the traveller can meet with either in Europe or America—the Neapolitan lazzaroni, and the Gitanas of Madrid, not excepted. The chinganahs or coffeehouses of Campeachy are, particularly during the heat of the day, infested with these vagabonds, though their beverage is rarely confined to that refreshing liquid. They meet in those places in such numbers that the smoke of their segars may be seen issuing in a continued stream through the gellosees and other apertures of the house, as if from a confined fire, while the ringing of flagons, the loud discord of voices, among which, ever and anon, the piercing treble to which the angry negress can so well elevate her tones, wakens like the scream of a peacock, strike the ear with a clamour, which, on a near approach, is absolutely deafening. There are many circumstances which combine to render the chinganah a scene of merriment: all sorts of itinerant musicians, jugglers, and mountebanks, are there permitted to pursue their vocations; and it is not unfrequent to find a company of dancers and a trained monkey performing antics to the same guitar; sometimes, also, Carib children, who are particularly dexterous in the use of the bush knife, exhibit a sort of gladiator game, which consists in throwing these weapons at each other, and catching them in the air before they have time to do injury. I have witnessed those feats at different times, and it is singular that they were never attended with any bad consequences. It is no wonder, therefore, that the chinganahs should be the favourite resort of the rabble I have alluded to, when they afford such ample and constant means of beguiling the time which hangs so heavy on their hands.

It so happened that a group of those worthies was stationed one evening under a bungalow or small shed, erected for the shelter of goods, upon one of the quays. The sun had descended into an abyss of huge clouds that gathered over him like conquerors, darkening his glorious path with deep and stormy shadows, and reflecting his farewell smile upon the world with a lurid and brassy glare. Those banners of the tempest were not long of imparting their gloomy colours to every object beneath them, and the white-walled houses of Campeachy, which a little while before had blushed beneath the declining ray, now shrunk into obscurity, and speckled the gathered darkness like tombs of Italian marble, peering through the gloom of a cemetery. Andersen and his companions had been waiting for the arrival of a vessel, whose approach had been announced by the island telegraph two days before, but which had been kept beating about in the offing by head winds ever since. This day, however, had been remarkably calm and sultry, and the loiterers, who had expected to profit by her arrival, after lingering till expectation became vain, had disappeared one after another, so that the solitary group I have mentioned was all that remained to face the squall that seemed bearing overland. Before it set in, they were hailed from the water by a negro pilot, named Mingo, who was bringing up his canoe, with an appearance of anxiety and fatigue. Andersen returned his halloo. "What cheer, Mingo?" "A plague-ship! a plague-ship!" was his immediate reply, as with two or three heavy strokes he ran his craft up to the landing. His relation was received with mingled curiosity and indifference. Andersen contemned the idea of danger, and most of his companions had never heard of the contagion but as a sort of yellow fever to which they were familiar. It was, therefore, a matter of speculation and interest to them, but not of alarm. The pilot informed them that the strange vessel was a brig from Cadiz, which he had gone out to meet in the morning. She was now brought to anchor on the lee-side of a small quay covered with mangrove, and had suffered much from stress of weather; the island, however, presented a sort of shelter for the meantime, and she was likely to ride out the gale in safety. He had been surprised, on coming within hail of the vessel, to perceive no person upon deck, and was at a loss whether to make the customary signals, or to run his craft round to leeward at once. He did not remain long in uncertainty—his first halloo had the effect of calling up a single figure from the forehatch, who invited his ap-

proach with hurried and frequent gestures, and he ran his doree alongside. The sailor leant over the gangway, and as Mingo raised his eyes towards him, he was struck with the appearance of ghastly and death-like languor which he presented. He spoke in Spanish, with a low exhausted voice, and informed the terrified pilot that the vessel contained the plague—that it had first broken out in the Gulf of Florida, when the hatches were opened to stop a leak, and that it had been brought from Barcelona with some bales of cloth, which had been shipped at Cadiz for Vera Cruz. "We are all dying," said the poor wretch, wringing his hands, "we are all dying." Mingo set his feet in the chains, and sprang up to look over the side; two men were lying dead upon their faces in the lee-scuppers, and a third was reclining against the caboussie, with his head thrown back, his teeth set, his eyes strained, and his hands clenched, as if he had expired in despair. One look of those dismal objects was sufficient for the little pilot, who leapt back into his canoe instantly, and put off from the vessel, regardless of the melancholy cry that adjured his stay only to convey a message to the shore; and it was not until he had almost exhausted himself in rowing, that he ventured to rest his paddle, and pause for respiration. The vessel was still within hail, and Mingo could perceive the same solitary individual pacing the deck, and tossing his arms distractedly above his head. After several turns in this manner, he appeared to stop opposite the caboussie, as if he was contemplating, with a sort of desperate firmness, the object from which the pilot had retreated. Mingo then observed him stoop, as if to raise the dead body from its recumbent position, and having lifted it, with great apparent effort, to the taffarel, let it drop overboard. The white spray leapt up against the ship's side for a moment as it fell, and the sailor leant faintly over the bulwarks, either overcome by the exertion, or watching the eddies which the sinking carcase left upon the surface of the water. Mingo's heart sickened within him, and, feeling a kind of insecurity while he shared the same element with the infected vessel, he made for the land with the utmost eagerness. Andersen and his associates were the first who received his intelligence. I recollect well the manner in which Andersen related this part of the story, and it will be told better in his own words.

"What was the plague to us," said he, "who were compelled to risk our lives for almost every mouthful we swallowed—to us who had spent merry privateering lives through all the long French war—to us who had tracked the Guineamen to their bushlairs, and waded up to the very ankles in blood before we left it? Had we not, besides, seen the eyes running out of their heads with the horrid disease which is peculiar to slave traders.—what was the plague to us?—not the whiff of a cigarita! 'Come, my lads,' cried I, 'we will count the pesos of the Spanish skipper—we will see whether the sea water will not wash the plague from his Barcelona cravats.' They would have followed me to Davy Jones, who was just beginning to sound his whistle overhead; but the scud was fair for the ship, and we had all seen the weather-side of Davy's face before now; so we unfastened Mingo's doree, as soon as the cowardly lubber, who was lipful of the story, had gone up with the news to the commandant's house, and put off for the plague-ship. It was now as dark as the grave, but we kept her close before the wind, which was almost due south; and we knew that, in that case, we were standing fair for the Mangrove Key. It was then, skipper, while Mingo's cock-boat was mounting like one of Mother Carey's birds over the black waves, that there were rising like leviathans around us—it was then—I remembered the osier sledges that used to carry me, like a Will o' the Wisp, over the icy tracks of my own country, and my whole heart leapt up to my throat, with a feeling of wild and measureless exultation. As the surges tossed our slight craft in the air, I recollected all those happy feelings; and, wringing the spray from my hair, I called to mind one of my old Norse ditties, and piped it loudly and willingly to the gale that was passing over us. Ha, ha!—I did not think I had so much of the young slip left in me; but I neither feared the devil nor the deep sea."

There are very few better sea-boats than the creecars of the West Indian pilots, and few who are more expert in managing them than the stivie doers, as they are called, of Campeachy. The reckless adventurers reached their destination in safety. The Mangrove Keys were an archipelago in miniature, and formed a kind of semicircle, in the centre of which, sufficiently screened from the weather, the "pesthous of the waters" floated in perfect security. There was a dim light twinkling in the binnacle, that discovered to Andersen and his companions the same solitary wretch mentioned by the pilot, still reclining on the taffarel, with his arms folded drowsily beneath his head, as if he had been yet watching the body he had consigned to the waters. He did not appear to distinguish the canoe, though the desperadoes that manned her ran her close up to the ship's side, and shouted lustily for a rope's end; neither was there the slightest attention paid to the demand, though it was urged with a volley of Spanish execrations, which could not fail at least to be understood. A wave gave the slight craft near to the gangway, and one of the crew laying hold of the chains, the canoe yawed close, and the whole company leapt easily on board. Andersen, as self-appointed leader of the enterprise, was

the first who approached the "watch on deck," and he shouldered his long paddle with an air of menace as he did so, which was meant to impress the sufferer with the conviction that in this case "might would constitute right." The watchman did not move, however, and a suspicion, which a moment's scrutiny confirmed, occurred to Andersen, and overcame his determined indifference—with a feeling of involuntary dread. The Spaniard was a corpse—and at the very time when Andersen became aware of the fact, the vessel gave a sudden lurch, and the body fell back upon the quarter-deck. Andersen retreated in disgust, and the creoles lifted the body, and threw it overboard. They then advanced to the companion; and, looking down, Andersen perceived that the cabin, which the creoles were in some hesitation to enter, was lighted by a small lantern suspended from a bulk head. "Pray for me, my hearties," cried the Norwegian, "for I'll bide this risk by myself," and he descended the trap-stair at two steps.

Oh! what a scene of utter misery and desolation did that dark and confined apartment present to him, and how welcome was the first breath of the cold and pure atmosphere that he inhaled as he retreated at first with an impulse of horror from its infected precincts! It was the very charnel-house of the plague, and the crew of the vessel were mingled there without distinction; some dead, and some whose feeble moanings were the last exertions of exhausted nature. Its victims in the first stages of the disease had forsaken the fore-castle, the close contaminated air of which was imbued with destruction, and had gathered in the cabin, whose lattices gave a free current to the breeze, and made it therefore the most eligible situation for the sufferers. The first object that arrested Andersen's attention, as he entered, was the countenance of a negro, probably the steward of the vessel, which was still distorted by the convulsions in which he had expired. He was reclining upon a locker immediately opposite the light, which fell upon his sable visage with an imposing and frightful effect. Turning from this object, the regards of the Norwegian were attracted to an obscure corner of the cabin, where, stretched on a low mattress, in an attitude of exhaustion and despair, lay the figure of a young female. A profusion of dark hair lay dishevelled on her pillow, and formed a strong contrast to the ashy paleness of her features; and her heavy voluptuous eyelids, deeply marked by long black fringes, appeared closed in a stupor from which she was never to awake. One white arm was folded listlessly over her bosom, as if to watch the expiring struggles of nature, and the other sustained a rosary of very large amber beads, that reflected the light of the cabin lantern with a warm and steady lustre. The sight of this valuable object restored the Norwegian to a sense of his interest, and at once swallowed up every feeling that interfered with it. It was, he considered, now perfectly useless to its possessor; and he approached to claim it, before the creoles, who had apparently mustered courage from his example, had descended the trap-stair. He plucked it hastily from the relaxed fingers of the dying girl, who opened her dim eyes for an instant, with a feeble exclamation in Spanish, and, immediately closing them again, breathed out her spirit with a heavy and convulsive sigh. It was the action of a moment, and before any of his associates had entered the cabin, he had secreted his prize under his Guernsey frock; and if any human eye in that dismal place was aware of the theft, death had sealed it up ere it could betray it.

To dwell upon the proceedings of those desperadoes, during that long stormy night, and the feeble and unavailing resistance that was offered to them by a few dying wretches, who lay in an adjoining birth, would compel me to enter upon a detail of cruelties of which Andersen had long and sincerely repented before he related the adventure, and which, for his sake, I would now willingly forget. The centinels and night-watchers of Campeachy and its neighbourhood were astonished by an apparition, which borrowed a deeper character of terror from that wild and squally night, and was not soon forgotten by those that witnessed it. The midnight gun had discharged its wonted signal; and though the gale was somewhat abated, the sky was loaded with black and dreary clouds, which still sent out arrows of fire as if the angels of the tempest were unwilling to forego their warfare. But though less vivid than those "electric wanderers," there suddenly arose through the blackness that pervaded the offing, a long fiery train, which appeared to be carried away by the wind as it ascended, as if some "mysterious monster of the deep" were flying up to heaven, and had tinged with a red lurid glare the low hung clouds that were drifting over it. This phenomenon lasted for at least an hour. At the end of that time it passed away with an explosion like the discharge of a cannon, which came booming over the disturbed waters with a lulled and heavy sound. The plague-ship was swallowed up in that dreadful conflagration, the dying and the dead were mingled in one funeral pile, and those who had set forth on that evening on their errand of plunder, had concluded it with an act of desperate and merciless wickedness.

"We stood up in our creecar, skipper," said Andersen, "when we had rowed to a safe distance, and watched the progress of the flames, which were already bursting through the hatchways enveloped in sheets of smoke, and were reflected from the wet sails that flapped above them. There was one devoted sinner, strong in his agony, who staggered about the deck

like an antic fiend exulting in his own element. I think I still hear the shrill, searching cries of that doomed wretch—that rose above the gale in tones that were almost heartbreaking—but I dared not listen to them. Sometimes the fiery smoke whirled round him as if impatient for its prey, and for a moment stifled the accents of his despair, but the next they rose louder and louder, and ran through my head like a knife. Woe for me, skipper, if my penitence has been rejected in Heaven, for I shall hear those screams of agony again when the anchor of fate is fixed for ever."

GEOGRAPHICAL DISTRIBUTION OF DISEASES.

THE following observations on the geographical distribution of diseases have been extracted from an excellent article on the subject in the Edinburgh Medical and Surgical Journal, for October 1832, by Henry Marshall, Esq. Deputy-Inspector-General of Army Hospitals:—

In some portions of the earth's surface particular diseases occur much more frequently than in others; and there are great divisions of the globe where certain specific diseases never, or very rarely, appear. The causes of the prevalence of diseases in one part of the world, while they are not found in another, are frequently involved in great obscurity. Sometimes they seem to depend upon the influence of meteorological phenomena; but they frequently happen where no satisfactory origin can be assigned. Wherever mankind exists, there disease of one kind or another will occur, whatever care may be taken to obviate its causes. Death will have its victims; and probably from one to five per cent. die annually, not only among the savage races, and other classes who undergo great privations and want of skilful medical attendance, but also among those orders of society which are furnished with every comfort and luxury that wealth can procure.

Examples of a deficiency of the skin, hair, and eyes, occur much more frequently among the inhabitants of intertropical [or hot] climates than in temperate latitudes. Albinoes [or persons of a supernaturally or extremely fair complexion] seem to be relatively more numerous in Africa than in Asia or America. The King of Ashantee collected nearly 100 white negroes. It is remarkable that the few Albinoes who have been born in Europe have been generally males. When Albinoes are matched with blacks, the progeny is either white or black, not brown coloured, like a mulatto. In the oriental archipelago [a large cluster of islands near Hindostan] Albinoes are not rare among quadrupeds.

The affection called *goitre* is common among the inhabitants of the valleys of the Alps, Apennines, and Pyrenees. In Savoy, Switzerland, the Tyrol, and Carinthia, there are villages in which the greater number of the inhabitants, more particularly of the female population, have some swelling of the neck. About two-thirds of the inmates of the Lunatic Asylum at Milan, when it was lately visited by a friend, suffered under this affection.

In the frozen regions of the north, the appetite for food and the power of digestion are commonly excessive. Captain Cochran, in his account of a Journey through Russia and Siberian Tartary, gives some remarkable illustrations of this fact. Admiral Sarichef states, that a Yakuti informed him, "one of their men was accustomed to consume at home, in the space of a day or twenty-four hours, the hind quarter of a large ox, twenty pounds of fat, and a proportionate quantity of melted butter for his drink. The appearance of the man not justifying the assertion, the Admiral had a mind to try his gormandizing powers, and for this purpose he had a thick porridge of rice boiled down with three pounds of butter, weighing together twenty-eight pounds; and although the glutton had already breakfasted, yet did he sit down to it with the greatest eagerness, and consume the whole without stirring from the spot." Captain Cochran says, "I have repeatedly seen a Yakut, or a Tongouse, devour forty pounds of meat in a day;" and "I have seen three of these gluttons consume a rein-deer at one meal." He adds, "I myself have finished a whole fish in a frozen state, which might have weighed two or three pounds; and, with black biscuit and a glass of rye brandy, have defied either nature or art to prepare a better meal."

The geographical distribution of the disease of stone (*calculus vesicæ*) seems to be, in a great measure, limited to the temperate latitudes. But even in temperate climates it is much more frequent in one place than in another a very short way distant. Dr Dancer states, that calculus never occurs in Jamaica. Dr Scott makes a similar statement in regard to Bombay. Dr Ainslie, who was for more than thirty years on the peninsula of India, says, "I have had occasion to attend both Hindoos and Musselmauns suffering for gravel or stone."

Cancer.—This disease is, in a great measure, confined to the temperate latitudes. In Jamaica, Dr Dancer states that "cancer seldom occurs, and it is peculiar to water-drinkers."

The mean annual mortality of all ages in Great Britain has been found, by the census of 1821, to be about 1 in 58; but in round numbers I shall assume that it is 1 in 50, or 2 per cent. Now, according to the London bills of mortality since 1808, it appears that one-fourth, or 25 per cent. of the deaths is oc-

casioned by consumption. If the proportion of consumption to general mortality be admitted to be as 1 to 4, and if it be granted that the annual mortality is to the population as 1 to 50, while, by the census of 1821, it is ascertained that the inhabitants of Great Britain amount to 14,391,631, it will be found that the annual number of victims to consumption in this island amounts to 71,358. Perhaps this estimate is rather below than above the real number. At New York, consumption seems to engross one-sixth, and sometimes a fifth, of all the deaths.

The annual mortality in France is about 1 in 40, and the relative proportion of deaths by consumption to the general mortality is 23 per cent., or nearly one-fourth. Pleurisies destroy one-fourth of the whole population of Petersburg, fevers one-third, and consumptions one-sixth. Within the tropics, Europeans suffer much less by consumptions than in temperate latitudes. On the continent of Africa consumption is a rare complaint. In the West Indies, Africans are very liable to diseases of the chest, but chiefly to tubercular consumption.

Hydrophobia has been chiefly observed in Europe. It has, however, never been described as occurring beyond the Arctic Circle; and, indeed, according to some authors, it is seldom if ever heard of at Archangel, Tobolsk, or in the country north of St Petersburg. It has never been observed at Constantinople [which swarms with dogs], Syria, or Egypt. Hillary states that he saw some cases of the disease at Barbadoes. It is, however, a disease which is extremely rare in the West Indies; I believe that, in many of the islands, it has never been noticed. Valentin asserts that it is extremely rare in the warm regions of America, but common in the northern part of that continent. Rabies occurs in India, but not often. According to Barrow, the dogs in the vicinity of the Cape of Good Hope very rarely go mad.

EXTRAORDINARY HISTORY OF WILLIAM FRASER.

SOME remarks on the Admirable Crichton, penned in a spirit of incredulity, lately appeared in the Journal, and were followed up by a translation of one of his poems, which certainly showed little of the feelings and ideas which are now deemed requisite for that branch of composition. Since the publication of that paper, we have been made acquainted with some particulars respecting William Fraser, a youth born in Edinburgh, near the close of the last century, which, taken in connection with what we know of similar persons, such as Zara Colburn, the American boy, and the boy Bidder of England, would seem to prove that nature does occasionally send forth prodigies of genius, such as Crichton is reputed to have been. We shall proceed to lay before the reader such particulars as we have been furnished with respecting Fraser:—

He was the son of an engraver in Edinburgh, and had the misfortune to lose both his father and mother at a very early age. Circumstances then threw him under the protection of an eminent teacher of writing and accounts in his native city, who treated him as one of his own family, and gave him the advantage of instruction in an *intellectual* system of arithmetic, which he had invented for the use of his own scholars, and practised with great success. Not only did Fraser make great progress in this branch of knowledge, but in languages, in music, and many other accomplishments, he displayed an aptitude that astonished all who had occasion to observe him. What rendered this the more surprising, was, that he never appeared to study. His disposition was playful to an extreme bordering on folly, and he indulged to the fullest extent in all the sports of his companions. He seemed to acquire all his knowledge and proficiency by intuition; for it is the distinct recollection of his patron, that he was hardly ever seen *seated at a book*. Yet, in this way, without the least observable exertion, he speedily mastered the Latin, Greek, French, Italian, Spanish, and (what is perhaps most surprising) German languages, so as to be able, at an almost childish age, to teach them to others. He could also play beautifully on the violin, flute, and piano-forte, and sing in a masterly and graceful manner, without ever having received instruction from a teacher.

At a very early age he was adopted as a sort of assistant by his kind patron, and took his share in all the laborious duties of the academy. His extraordinary genius had now attracted considerable attention, and, being very good natured, he made no scruple to gratify visitors with an exhibition of his arithmetical powers. He would allow a person to cover an entire slate with figures, and hold the wrong end towards him from the other side of an ordinary dining-table. He would then, in a playful manner, look at it with one eye, and sum up the columns, though twelve or fifteen figures deep, at the rate of a second for each column. Being asked, on a certain occasion, how he could know the amount of a column by a single glance of his eye, he answered by another question, "How do you know a friend when you meet him, without distinctly and sensibly marking every part of his per-

son from top to toe?" "But how is it," said the inquirer, "that you know the columns equally well when the figures are all upside down?" "Why," said Fraser, "if your friends were all to change their mode of walking, and meet you every day with their heels uppermost, would you not soon come to recognise them as readily in that way as in any other?" It afterwards turned out that he had got into a habit of reckoning accounts in this inverted manner, in order to save time in his teaching operations. The pupils being arranged along two sides of a broad desk, he found it convenient sometimes to examine the proceedings of a scholar on the off side, without going round by the end of the table, at the same time that he was keeping his eye upon those who were nearer to him; and thus he gradually became able to read figures as well the one way as the other. It was at length found necessary to invent a short-hand set of figures for his use in arithmetical calculations.

Many anecdotes are preserved of the frolicsome disposition which Fraser manifested throughout all these triumphs of his genius. When about eight years old, he was mentioned to Sir John Sinclair of Ulbster as an extraordinary genius, and that gentleman, with his usual benevolent interest in such subjects, expressed a desire to see him. He accordingly called at Sir John's residence, but the servants refused him admittance. He then obtained the loan of a trifle from a companion, with which he hired a pony, and, mounted on this animal, he called again at Sir John's house, with the same companion equipped as his servant. Being then readily admitted, he showed his expertness in calculation, and came off with great éclat.

An unhappy accident, which happened when he was a very young man, and some time after he had left the house of his first patron, produced a considerable derangement in the nervous system of Fraser. While fencing with a companion, he had the misfortune to wound a boy who ran in between them, in a mortal part. Some of the other boys having raised a cry of murder, the city-officers rushed in, and, apprehending Fraser, dragged him like a common felon to jail. The horror of his mind at the unfortunate act, joined to his mortification at thus enduring the gaze of the multitude, gave such a shock to his nerves as affected him seriously through life.

In early life, Fraser left the Scottish metropolis, and sought his fortune in London. He soon obtained employment as usher in one of the principal boarding-schools in the neighbourhood of the metropolis, but was speedily dismissed, on account, it was understood, of the jealousy of the master, who could not bear to see himself outshone before the boys. Previous to this time, Fraser's Edinburgh patron had removed to London, and it was in his friendly home that the unfortunate youth now sought a refuge, which, it is needless to say, was readily and cordially granted. Soon after this, a gentleman, in conversing with his patron, mentioned that he had in view to propose to government the establishment of a public office in the Admiralty, which would be of great service in that department; and that the preparatory calculations were so extensive as to require an unusually expert arithmetician for that part of the undertaking. Mr Paton—for it was he who acted in so kind a manner to this extraordinary youth*—at once recommended Mr Fraser; but it was thought necessary to consult certain eminent calculators concerning the preparatory business—namely, the formation of a complete set of annuity tables for three lives. The answer was, that it would require ten accountants for ten years, or one person for one hundred years, were it possible that he could live so long;† and that Price and other great calculators had contented themselves with making approximations, instead of forming a complete set of tables. In short, it was reckoned that the figuring requisite for the above purpose, by ordinary modes of calculation, would cover waggon-loads of paper. Fraser, however, undertook to finish the whole in one year, and actually produced a proportionate quantity in a month, so that the office was immediately established.

Soon after this, the gentleman formerly mentioned proposed the formation of another government office, and Mr Fraser was employed as before, and with equal success. While thus occupied, his apartment presented the idea of a magician's cave, being filled with graduated scales, yards in length, corresponding to magic wands, with other ingenious apparatus, contrived by himself, and inexplicable by others. Like many ingenious individuals, who have benefited others without improving their own condition, he failed in obtaining the advantages which were to have been expected from these singular efforts, and again was obliged to take a situation as usher of a provincial academy. Soon after, Mr Paton received a letter from him, mentioning that he was now very happily situated, having the honour of frequent invitations to the houses of the neighbouring gentry, among whom he figured to great advantage. Within a month, all

this happiness was reversed. Having caught a severe cold, by exposure on the top of a public coach during a rainy night, he found it necessary once more to return to the house of his early friend and protector—thus resembling the hare, which, when closely pursued by the hounds, and unable any longer to extend her course over the country, reverts at length to her own form. Though medical advice was procured, and every comfort administered, poor Fraser died in a fortnight—a mere youth, but not before he had given token of such mental powers, as, in their maturity, must have been a wonder and a blessing to his kind.

Alas! while we thus endeavour to rescue from oblivion the story of one of the most extraordinary geniuses that ever lived, and which, but for a mere accident having brought it under our notice, might have remained in obscurity for ever, how forcibly occurs the melancholy thought—that many persons of singular genius are *never heard of by the world at large*, but live and die as noiselessly as those to whom no such gifts have been vouchsafed!

THE TRAVELLER AND THE POLE-CAT.

ON a journey from Louisville to Henderson in Kentucky, performed during very severe winter weather, in company with a foreigner, the initials of whose name are D. T., my companion, spying a beautiful animal, marked with black and pale yellow, and having a long and bushy tail, exclaimed, "Mr Audubon, is not that a beautiful squirrel?" "Yes," I answered, "and of a kind that will suffer you to approach it, and lay hold of it, if you are well gloved." Mr D. T. dismounting, took up a dry stick, and advanced toward the pretty animal, with his large cloak floating in the breeze. I think I see him approach, and laying the stick gently across the body of the animal, try to secure it; and I can yet laugh almost as heartily as I then did, when I plainly saw the discomfiture of the traveller. The pole-cat (for a true pole-cat it was, the *Mephitis Americana* of zoologists) raised its fine bushy tail, and showered such a discharge of the fluid given him by nature as a defence, that my friend, dismayed and infuriated, began to belabour the poor animal. The swiftness and good management of the pole-cat, however, saved its bones; and as it made its retreat towards its hole, it kept up at every step a continued ejection, which fully convinced the gentleman that the pursuit of such squirrels as these was at the best an unprofitable employment.

This was not all, however. I could not suffer his approach, nor could my horse; it was with difficulty he mounted his own; and we were forced to continue our journey far asunder, and he much to leeward. Nor did the matter end here. We could not proceed much farther that night; as, in the first place, it was nearly dark when we saw the pole-cat, and as, in the second place, a heavy snow-storm began, and almost impeded our progress. We were forced to make for the first cabin we saw. Having asked and obtained permission to rest for the night, we dismounted, and found ourselves amongst a crowd of men and women who had met for the purpose of *corn-shucking*.

To a European who has not visited the western parts of the United States, an explanation of this corn-shucking may not be unacceptable. Corn (or you may prefer calling it maize) is gathered in the husk, that is, by breaking each large ear from the stem. These ears are first thrown into heaps in the field, and afterwards carried in carts to the barn, or, as in this instance, and in such portions of Kentucky, to a shed made of the blades or long leaves that hang in graceful curves from the stalk, and which, when plucked and dried, are used instead of hay as food for horses and cattle. The husk consists of several thick leaves rather longer than the corn-ear itself, and which secure it from the weather. It is quite a labour to detach these leaves from the ear, when thousands of bushels of the corn are gathered and heaped together. For this purpose, however, and in the western country more especially, several neighbouring families join alternately at each other's plantations, and assist in clearing away the husks, thus preparing the maize for the market or for domestic use.

The good people whom we met with at this hospitable house were on the point of going to the barn (the farmer here being in rather good condition) to work until towards the middle of the night. When we had stood the few stares to which strangers must accustom themselves, no matter where, even in a drawing-room, we approached the fire. What a shock for the whole party! The scent of the pole-cat, that had been almost stifled on my companion's vestments by the cold of the evening air, now recovered its primitive strength. The cloak was put out of the house, but its owner could not be well used in the same way. The company, however, took to their heels, and there only remained a single black servant, who waited on us until supper was served.

I felt vexed at myself, as I saw the good traveller displeased. But he had so much good breeding as to treat this important affair with great forbearance, and merely said he was sorry for his want of knowledge in zoology. The good gentleman, however, was not only deficient in zoological lore, but, fresh as he was from Europe, felt more than uneasy in this out-of-the-way house, and would have proceeded towards my own house that night, had I not at length succeeded in persuading him that he was in perfect security.

* MR GEORGE PATON, himself the father of a family of genius, and who, after having for some years been unknown in Edinburgh as a teacher, has again recently commenced amongst us the business of instructing youth in accounts, writing, geography, &c. using, in the first of these branches, the excellent system which may be said to have produced the extraordinary specimen of scholarship he has been employed in commemorating.

† This circumstance has a kind of resemblance to an anecdote in the life of the Admirable Crichton. When that personage challenged the Professors of the University of Paris, and came off triumphantly, they are said to have decided that it would require an ordinary person a *hundred years* of constant study to acquire the knowledge which he had displayed on the occasion.

We were shewn to bed. As I was almost a stranger to him, and he to me, he thought it a very awkward thing to be obliged to lie in the same bed with me, but afterwards spoke of it as a happy circumstance, and requested that I should suffer him to be placed next the logs, thinking, no doubt, that there he should run no risk.

We started by break of day, taking with us the frozen cloak, and after passing a pleasant night in my own house, we parted. Some years after, I met my Kentucky companion in a far distant land, when he assured me, that whenever the sun shone on his cloak, or it was brought near a fire, the scent of the pole-cat became so perceptible, that he at last gave it to a poor monk in Italy.

The animal commonly known in America by the name of pole-cat is about a foot and a half in length, with a large bushy tail, nearly as long as the body. The colour is generally brownish-black, with a large white patch on the back of the head; but there are many varieties of colouring, in some of which the broad white bands of the back are very conspicuous. The pole-cat burrows, or forms a subterranean habitation among the roots of trees, or in rocky places. It feeds on birds, young hares, rats, mice, and other animals, and commits great depredations on poultry. The most remarkable peculiarity of this animal is the power, alluded to above, of squirting for its defence a most nauseously scented fluid contained in a receptacle situated under the tail, which it can do to the distance of several yards. It does not, however, for this purpose, sprinkle its tail with the fluid, as some allege, unless when extremely harassed by its enemies. The pole-cat is frequently domesticated. The removal of the glands prevents the secretion of the nauseous fluid, and when thus improved, the animal becomes a great favourite, and performs the offices of the common cat with great dexterity.—*Audubon's American Ornithology.*

BRITISH SILK MANUFACTURE.

It is learned, from the accounts of different authors, that the Chinese were the first people who cultivated the production of silk by the means of silk-worms, and that a knowledge of the art was made known in Europe as early as the sixth century, and that by an accidental circumstance. Two Christian missionaries having travelled into China, there viewed with a curious eye the common dress of the people, and the myriads of insects employed in furnishing the material for the manufacturer. On returning to Europe, they mentioned these circumstances; and, stimulated by the offer of a large reward, they retraced their steps to China, where they contrived to possess themselves of a quantity of the eggs of the silk-worm moth, which they concealed in a hollow cane, and brought safely to Constantinople, in the year 552. From this careful of eggs, which were hatched in due season, have sprung all the silk-worms now found in almost every country of Western Asia and the south of Europe. These are daily multiplying, and, up to the present time, an immensely increased demand for silk has been felt all over the civilized globe.

Silk came into use in England in the fifteenth century, but its manufacture was long in arriving at maturity. It was for more than two hundred years used almost exclusively by the upper ranks, and it is only in recent times that it has formed a part in the garments of the middle and lower classes. The first manufacture of the article on regular principles was at Spitalfields, where a large body of French refugees settled, in consequence of the revocation of the edict of Nantes, in 1685; it was, however, upwards of a century later, when the raw silk of India could be imported with facility, before it became a great object of national concern. The imports of raw and thrown silk into Great Britain in 1824 amounted to 3,392,357 lbs., of which 1,716,734 were furnished by Italy, and 1,307,300 by the East Indies and China; in 1829, they amounted to 2,892,201 lbs. It is difficult to form any precise estimate of the present value of the British silk manufacture. Mr Wilson, a well-informed and extensive manufacturer, in his evidence before the House of Lords' Committee, stated that he calculated that 40,000 hands, whose wages would amount to £350,000, were employed in throwing silk for the weaver; that £300,000 were consumed in soap and dye-stuffs used in the manufacture; and £265,000 were paid to 16,500 winders. The number of looms he estimated at 40,000, affording employment to 80,000 persons, whose wages would amount to £3,000,000. If we include infants and dependants, about 400,000 mouths will be fed by the silk-manufacture, the value of which Mr Wilson estimated at £10,000,000. British silk goods are, in general, higher priced than those of France; but the prejudice in favour of the latter is wearing out, and, in fact, the greater proportion of silks professing to be brought from Lyons and Marseilles, are direct from Spitalfields or Manchester.

It appears, from a statement now before us, that it requires thirty thousand worms to produce five pounds of silk. If we reckon that at the present time a million and a half pounds are imported annually, it therefore seems that nine thousand millions of insects are kept constantly working in order to furnish the British with the raw silk from which we make such a beautiful article of manufacture.

HISTORY OF THE VIOLIN.

THE violin holds in the orchestra the highest rank: it always, and of right, is in the hands of the leader; for the grand point of instrumental imitation is the human voice, and no instrument approaches, by its tones, its delicacy of execution, and its brilliancy, so close to the human voice as the violin. Its origin is in the remotest antiquity. Bernardin Maffei, the cardinal, born in 1514, in his treatise on inscriptions and medals, gives an antique of Orpheus playing with a bow on an instrument resembling the violin, but which was called the lyre. The Nubium and the Psalterium of the ancient Jews are said to have strongly resembled the violin, as the Psalterium of the present day obviously does. Euphorion, in his book de Isthmiis, describes an ancient instrument called Magadis, which was surrounded by strings, and which, placed on a pivot, turned round, while the performer drew his bow across it. This machine was also called the Sambuce. The hieroglyphics of Peter Valerian, p. 628, c. 4, have a figure of a muse holding a bass viol in her hand. Philostratus, who taught at Athens in the time of Nero, thus describes the lyre:—"Orpheus supported the lyre against his left leg, while he beat time by striking his foot on the ground; in his right hand he held the bow, which he drew across the strings, turning his wrist slightly inwards; he touched the strings with his left hand, keeping the knuckles perfectly straight." This was of the nature of the modern viol-di-gamba. The word *plectrum* should be generally translated by bow, though it is uncertain whether the bow was not sometimes used merely to strike the strings. In the middle ages, the violin family were numerous, though the instrument had not attained its present exactness of shape. The troubadours were often called *vielleurs*, or violin players. It was in high estimation in the monasteries; and among their treasures are still preserved cases of violins, violas, and similar instruments tending to the lute, beautifully wrought with ivory and the precious metals. The modern violin has been brought into celebrity by a long succession of fine performers. Arcangelo Corelli, a Bolognese, was the first great violinist. He died January 1713, aged 60 years. He was the founder of the Roman school. Tartini was of a noble Venetian family. He died in 1770, first violin master of the church of St Anthony, in Padua. In Germany, the violin received great cultivation during the last two centuries. In France, the violin was brought into favour by Baltazarini, an Italian, sent from Piedmont by Marshal Brissac to Catherine de Medici. Lully flourished in the time of Louis XIV., 1662. The conservatoire has in the present age furnished France with a multitude of fine violin performers. In England, the violin became popular at the Restoration. Charles II. established a band of violin tenors and basses, and placed at their head Thomas Baltzar, a Swede, the first violinist of his time. Banister, an Englishman, succeeded Baltzar. At the latter end of Charles II.'s reign, Nicolas Mattei, an Italian, arrived, and astonished every one by his mastery of the instrument; his style of bowing and his shakes were peculiarly fine. Francesco Geminiani, born at Lucca about 1666, a disciple of Corelli, was leader of the orchestra at Naples. He died in Ireland in 1762, aged 96. He was a great improver of the general taste on the violin by his publications. Veracini, the first violinist of his time, and a man of great power of composition, arrived in London in 1715. Felici Giardini, a Piedmontese, and pupil of Somis, arrived in England in 1750. His first performance was for the benefit of Cuzzoni, at the little theatre in the Haymarket, when he played a solo and a concerto. The applause rivalled the loudest ever given to Garrick. In 1755 he led at the opera. His elegance of bowing, his facility in embellishing passages, and his taste in varying common airs extempore, were surprising. After a long residence he retired to Italy. William Cramer was born in Mannheim in 1744; about 1773 he came to London, and succeeded Giardini as leader of the opera band for nearly twenty years. He led at the commemoration of Handel in 1784. His execution was remarkable for neatness, and fullness of tone; his facility of playing at sight was extraordinary; as a leader he had no equal; he died in 1799. The principal native violinists were, Corbett, leader of the opera in 1710; he died in 1748;—Dubourg, leader of the King's band in Ireland; he died in London in 1767;—Clegg, his pupil, leader of the opera band;—Pinto, born of Italian parents, leader at the opera, and afterwards at Drury Lane; he died in Ireland a few years since; his grandson, G. F. Pinto, also dead, was a great performer and musical genius.

The finer order of violins are expensive instruments; a brilliant toned violin can seldom be had in England or France for less than fifty guineas. Violins have been raised even so high as £250. The general price for a Stradivarius is a hundred guineas. The choice of violins cannot be made but by a master's experience. But new instruments are always to be avoided: if they have a good tone, it is almost sure to grow worse. The best violins are generally repulsive in their early tone, and few of them are good for any thing under fifty years. The violin makers most memorable are, Amati, of Cremona—(there were several of the name, Andreas, Jerome, and Anthony, his sons, and Nicolas, the son of Anthony); he flourished about 1600. Their violins are distinguished by beauty of shape and sweetness of

tone. Stradivarius; there were two of the name, both of Cremona; the latter was living in 1700. His signature was *Antonius Stradivarius Cremonensis faciebat, anno A. S. Andreas Guarnerius, also of Cremona.* His signature was *Andreas Guarnerius, fecit Cremona, sub titulo, Sancta Teresa, 1680.* Stainer, a German, a native of Tyrol; his violins are distinguished by their piercing and full tone. His signature is *Jacobus Stainer, in Absom prope Cnipontum, 1647.* Mathias Albani, a Tyrolese; his signature was *Mathias Albani, fecit, in Tyrol, Bulsani, 1654.* It is remarkable that almost the entire of the fine violins now to be found are the work of those Cremonese makers. Time may have done something for them, for the violin certainly improves by age, if it be originally a good one. But there is still something more difficult to be ascertained in their workmanship. Their violins have often been taken to pieces by the most expert artists, for the purpose of constructing others on their exact model, and yet the experiment has utterly failed. New constructions have been tried, and scientific models on the principles of sound have been invented, but without shaking the superiority of the Cremonese. But the most studied and dexterous experiments were made about ten years ago in Paris, by a M. Chanot. This intelligent artist presented one of his instruments to the French Royal Academy of the Fine Arts, with a curious memoir, in which he explained his proceeding. His principle was the acknowledged one, that the long fibres of the wood are fitter for the production of the low tones, and the shorter fibres, or arches, for the high tones. By fixing the sounding post at the back of the bridge, the fibres of the sounding board are divided into two arches, instead of being cut in two on the side of the E string. And this division is necessary, because the high tones being produced on that side, the bridge acts on the shorter arches like a small lever, while on the side of the bass string the fibres are enabled to vibrate in the long arches necessary to produce the low tones. But the more remarkable change was in the cutting of the sounding board. Among other points here, M. Chanot disapproves of the shape of the letter *f* for the sound holes of the violin, as cutting too many fibres. In his invention those holes are parallel and straight. A committee, on which were Cherubini the composer, and Prony the engineer, gave in a favourable report on this violin, which they had heard played on by Boucher, the famous violinist, in an adjoining room, alternately with a Stradivarius, without being able to discover which was which, excepting that they mistook the old violin for the new, which, as being the presumed superior, was a triumph for M. Chanot. But from all this we have not heard of any further results. The violin of Cremona still holds its ancient supremacy, and deserves it, at least in point of figure, for the new violins are angular and unpleasant to the eye. We have heard no more of M. Chanot, and are inclined to conclude that his invention was finally found inapplicable. This, however, should not deter our English artists from the experiment. They make the best harps and pianos in the world, and why they should not make every other instrument equally well, is beyond our conjecture.—*From an Album.*

THE NE'ERDOWEEL.*

To continue the relation of my uncle.—Mr Badenoch was now on his way to a foreign strand. It is unnecessary to trace the progress of a man so hopeless, as if he were a hero. He was landed at Demerara, that land where health is staked by the desperate for a chance of wealth, and where, with care and assiduity, wealth may be attained, and some measure of health preserved. The little island of Wakenham, at the mouth of the river, was the scene of our hero's destination. As he arrived at the finest part of the season, the country seemed delightful; and as he had formed the most anxious determination to repair the past, and as, moreover, his recommendations were strong, he soon found employment. He became a book-keeper under the attorney on a considerable estate.

For a time he exerted himself to acquire a knowledge of the duties of his new profession; and though he felt humbled from many circumstances, and, consequently, unhappy, yet, as he was inoffensive in his nature, and his employer proved one of those who can maintain their dignity without harshness, he was becoming a very faithful and useful servant of the estate. He had ever a pride in keeping his provision-grounds neat, and the fences of his coffee-land in the very best order, and yet working his people with the greatest gentleness, and expending his stores at once with fairness and economy. A feeling for the poor blacks, compelled, like himself, to a situation that was unpleasant to them, was the cause of much of this, combined, perhaps, with a melancholy wish to disappoint the auguries of his enemies, and to return to no distant day to his native country, with at least some share of wealth. Be this as it may, he became a favourite with the slaves, and so far respected by his master; and being now, in some measure, seasoned to the climate, he considered himself at last in the way to do well. Must it be told?—this was the dream of a moment. The good feelings of those to whom discretion has been denied, are equally capable of injuring themselves as the bad. He could not be kind to the poor slaves without forgetting that they were uninformed. From wishing to show kindness, perhaps a foolish and pa-

* Resumed from last week.

tronising kindness, he became familiar; from familiarity, they became presuming and negligent. Seeing his kindness, as he conceived, abused, he became resentful. The slaves could not bear ordinary severity where they had been treated with indulgence. From mutual sullenness, they proceeded to hatred; severity on his part, and rebellion on theirs. The gang was declared disorganised, and the manager was compelled to intimate his wish to the proprietors that they should part. Once more, therefore, our hero was at large upon the world, and had he been near those who formerly knew him, once more he would have been pronounced bewitched.

He soon found another appointment; but his character for discretion was lost. He could never hope to rise beyond the situation of a mere overseer, unless after proof of a steadiness of which he was little capable. He soon put an end to his probation. Some of the slaves whom he had helped to spoil, now regretting him as much as they had hated him, and resenting the just distance observed by his successor as much as they had abused the undue lenity shown by himself, escaped from their plantation, and ran to him for protection. Had he known any thing, he would have known that the concealment of a runaway slave is never forgiven by the colonists. He should instantly have given information, endeavouring only to mitigate the punishment. He intended this, but from time to time deferred it, till the retreat of the negroes was discovered. It was then too late for both parties. The act was plain; his intentions could not be known; and it was speedily evident that he must leave the colony, or starve. He went to Jamaica; but he took no character with him—or rather his character followed him—he was a marked man. He wandered about from estate to estate—hospitably enough received, as far as a meal would go, but employment was out of the question. He was declared unfit for, and even dangerous in, the West Indies, at least in any situation connected with the negroes, though it seemed extremely probable he might in time find something to do in a store.

As he wandered about from estate to estate, he envied even the slaves, as, contented and free of care, they trudged along under branches of rich plantains, or, in merry bands, carried the richer cane to its final destination in the mill. Often, if shame would have allowed him, he would have begged to take the place of the well-fed and cheerful black, that acted as "boy" in the families that, from time to time, received him as he trudged his weary round, sooner than submit to returning home poorer than he left it, and with the reputation of being fit for neither the old world nor the new.

A very unexpected incident soon decided him. A vessel from Scotland arrived in Kingston Roads; and having nothing to do, and the thoughts of home again coming strong upon him, he went on board. As he was ashamed to declare himself, farther than as a native of Scotland, little passed beyond the usual and natural inquiries; but being accustomed in his young days to climb about his father's vessels, he must needs shew the seamen of the vessel in question his dexterity. She was of considerable tonnage, so that in ascending the masts he had to come out a considerable distance in the puttock shrouds, his back downwards, and hanging by the feet and arms. Either from being long unused to such exercise, or from being desirous to shew off a little too much, he lost hold with his feet and one hand; and after hanging by the other for some time, to the amusement, doubtless, of the seamen, who were occasionally looking at him, as, with folded arms, they leaned on the gunwales, or loitered about the deck, he dropt with a scream into the water; and a shark having been for some time in waiting, right under him, he came up in a very few moments with a loss of a very serviceable leg! Here was a consummation! Was it possible to account for such misfortune on ordinary principles? Even the people of Kingston, who had never heard the opinion of those of the place of his nativity, could not help looking and laughing even while they pitied him, and exclaiming that the fellow was certainly bewitched!

This was too much. Unable to live on land, and bit by sharks the moment he, but by accident, dropt into the water, he now felt that there was only one refuge left, and that the sooner he was with his mother the better. But how to return? He had no money. He could not now work, even as a common seaman. A merchant who heard his history told him to make himself easy, and, as soon as he had recovered, gave him a passage to London. In the interval he had given him some employment about his stores—and had he been of ordinary prudence, an opening might thus again have been found for him; but lame and penniless as he was, and a married man as he had confessed himself, he had taken some opportunities afforded by the civility of the merchant, to make advances to his only daughter! and the old man, in turning him with contempt from his premises, could not help joining in the universal exclamation, that the fellow was certainly bewitched!

After any misfortune, our friend generally became prudent—it might be said religious—for a period proportioned to the severity of the evil. Upon this occasion his good resolutions lasted him till he was several days at sea. His fellow passengers were highly respectable. Our hero attached himself particularly to an elderly gentleman who had made his fortune, and was returning home, accompanied by a lady, the sister of a friend, and who was coming to join some relations

in this country. According to his general custom, Mr Badenoch boasted of the wealth of "the Old Boy," as he termed his father, and of his own absurdity; and the last being very obvious, connected with other circumstances, generally gained credence for the first. The young lady proved nearly as absurd as himself; at least they had not been many days in company till they began to be very constantly together; to consider in secret every body fools but themselves, and quiz them accordingly; and at last to join in evading the old gentleman, who, doubtless for very good reasons, saw it necessary to discourage rather than encourage their intimacy.

It was too late! The lady was stout and handsome, sung delightfully, and conversed well—at least our friend thought so; for by silly people mere talk is considered conversation. As she had been genteelly educated, however, had much softness of person, and grace and even dignity of manners, it is very possible the man was attached, and that, had there been no obstacle in the way, and either possessed of fortune, their connection might have appeared sufficiently suitable, and, as Squire Richard says, "done no harm to nobody." But there was not a shilling of fortune upon either side, the gentleman, as we have seen, being worse than nothing, and the lady depending on the good opinion of her friends; and to crown all, the man was already married! All these things, however, went for nothing. They were intoxicated with one another: they rose up but to flirt and wander together, and lay down only to dream of one another. The elderly gentleman found his authority set at naught—the captain and other persons in authority were bribed—a marriage ceremony even was gone through in the Scottish form, which, being accompanied by written engagements, satisfied both parties, and the moment they could confirm it in England, it was confirmed. Being firmly married, they began to think at last of what they should have thought of first, namely, how they should maintain themselves; and upon this point their speculations were very black. The gentleman knew he had nothing to look to, so upon that point there was no difficulty; and the temporary guardian of the lady, as well as her friends in the country, being either really enraged, or finding it for their interest to appear so, they were at once left to themselves, with the old declaration that they were certainly bewitched.

At last it occurred to our friend that he had written to his family of his misfortunes, and his intention to return home, and desiring to hear from them in London, at the house of an old correspondent of his father. As he had given the name of the vessel in which he sailed, and her arrival had been announced for some time, he found a letter for him, but it was neither from his mother nor his father, the last being still too angry to write to his son, and the first incapable of permitting herself to write, in the terms that were necessary. Since his leaving the country, short as that period had been, strange things had happened. First, a young gentleman had come into the world, who claimed to be the inheritor of his name, and, what proved of rather more consequence, his estates. These, it is true, were at one time considered little more than his share of the General Entail, that is to say, of the states of sin and misery bequeathed by Adam; but the father of the lady who had the honour of producing him, being one of those pragmatical fellows, who, though they expect to see nothing in a well, will yet look into it, and talk about a property that has been, for three or four generations after it has left them, so now, finding his daughter not only within a hair's breadth of having been a woman of property, but absolutely not exactly divorced from it, nothing would hinder him from stepping forward to see whether he had not at least a right to talk about the matter.

He decided very properly, that, of lawyers, the best for a doubtful case is one whom all his brethren have conspired to call the most troublesome fellow on earth; one whose very name strikes terror; who knows it, and acts up to it, in order to secure the reputation of his *prestige*, that being his talisman for opening the purses of his employers. It is impossible to step aside to describe the person and character of a Scotch country writer particularly, but we shall do what we can. Mr Thomas M'Quirk was a middle-sized, dark, pock-pitted man, with bushy hair; very tolerably made, but with a most forbidding look; at least all who disliked him said so, and they were pretty numerous. Your dandy man of business, who has only one journey to go in a year, not only torments his maid servant in preparations for a whole morning, after having tormented the neighbourhood about it for a week, but has as many knick-knacks proper for riding to put on, as a tailor preparing for a race-course. Our friend Tom had not time for ceremonies. After taking a proof ten or fifteen miles from home in one direction, and astonishing all the old women of the place with the fact of his keeping all law and lawyers at defiance by his single strength, he often found letters lying for him, or messengers waiting with directions not to go without him, that whistled him perhaps twice as far on the other side of his residence; for a famous writer, like a famous doctor, is sent for, as the saying is, from far and near; and no one that can get hold of either can die or be banged comfortably without having him. Our friend Tom, in consequence, required often to start on a new journey without shaving, after feeling at the fag-end of the old one as if his bones were shaking loose in his clothes. His riding appointments, there-

fore, were very simple. He wore leather breeches, because they served for dress or riding clothes indifferently; shoes and stockings for the same reason; and a single spur; because, like Hudibras, he knew that, when one side of his horse could be stirred to a trot, the other was not likely to lag behind. A spur, therefore, might be said to constitute his whole riding-dress—switch he had none. He always supplied himself from the hedges, any thing else being expensive, and apt to be lost. He carried a pen in his waistcoat pocket with a nose that defied injury, and abundance of paper in his coat. Such were the person and appointments of Mr M'Quirk—and Mr M'Quirk was the lawyer selected upon this occasion.

As lawyers know, as well as vultures, when a carcass is in the wind, and Mr M'Quirk knew upon this occasion that the windfall was considerable, the very idea of having a finger in it was sufficient. He already looked upon the greater part of the property as his own. When he entered the room, all was going on smoothly. The creditors of Nicholas Badenoch had lodged claims sufficient to have swallowed up fifty such subjects as remained to pay them; many groaning over the loss of hundreds, that were never supposed to have had twenties to lose; others pretending claims whom every body else supposed to be debtors; but Mr Fiddledede, the agent in the sequestration, was what the world calls a very decent man—that is, nine times in ten a very great blockhead. He received and entered all claims with suitable gravity, regretting only that there would be so many honest men losers. He very prudently said little about his own loss on the occasion, because it is no credit for a man of business to lose upon any occasion; moreover, perhaps, because upon this occasion he had not lost at all. He had taken all suitable instructions for disposing of the property, and the meeting was about to have closed with the utmost harmony, when, to their horror, they saw approaching the figure of Tom M'Quirk!

When Tom entered, and saw so many there whom he did not expect to see, he gave a loud whew! which did not diminish their uneasiness. They instantly saw for whom he appeared—for a country client knows too well to trust even his own writer out of his sight; so the grey hair and sun-burnt brow of old Dockenroot were seen behind Tom, like a victim behind the swarthy figure of a demon. At first there was an impression that his appearance there was ridiculous, as he had advanced no money, and there could be no reversion; and it seemed to give great satisfaction that they might oust him summarily. But Tom took his seat. He stated himself to appear *inter alios* for the heir of the bankrupt, and as *curator ad litem*!—which means, to manage his law-pleas; desired that the minutes of the meeting might be read; and heard all with such an imperturbable stare as made all alike afraid. "Have you the titles to the property?" said he, for that was their principal hope. "No; but there could be no doubt it fell under the sequestration." "The minute's no worth a damn!" said Tom; and immediately every one believed it. He said the first thing was to apply to the Court for authority to recover their titles; after that, he believed his client would be found exclusively entitled. He also knew that many of the claims would be found bad, at all events; but he did not desire them to be withdrawn, as an agent could never have too much security for his account; but, in the meantime, he declined to rank his own client, or to go farther than record his demand of the titles, as he might be compelled to take entirely separate measures. Several who had at the outset been freely and even ostentatiously showing their grounds of claim, had long since removed them out of sight with great quietness; and others, as they put their hats on their heads with both hands, and took a farewell look of the meeting, took also farewell of the business; for they saw it would now end in no good. In this way our friend was left to dictate his minute to rather a thin meeting; and to them he did not hesitate to let it be known that he meant to contend every inch of ground for the benefit of his infant client, who, he thought, in his long minority, would again bring matters round.

All this was mere bravado at the time, but it proved to be nearly correct; for upon looking into the titles of the property, it was found that it was so devised to a series of heirs, by the contract that had been entered into by Nic's father and mother, as to be incapable of being burdened by him, or evicted for his debts. This had been done by the old grandfather, to guard against the vicissitudes of trade, which he hated, being himself unfit for it—but kept a secret, almost from the parties themselves, certainly from the mother, that the credit of the father might be increased by the supposed unfettered property of the estate, rather than diminished by a recorded restriction. The debts, therefore, incurred in Nic's minority, and which had been subsequently confirmed by him, and made good, as it was supposed, against the estate by adjudication, now became merely personal; the young heir and his mother remained unencumbered possessors in expectancy, and with such advice as they had, were not likely to be smuggled out of it. In addition to this, it was discovered that sundry superiorities, or rights to vote for a member in Parliament, belonged to the property; and titles to these, even for the life of the incumbent, were then of great value. Upon proper inquiry, also, it was ascertained that many of the bills of poor Nic had been granted for accommodation of

the parties who held them, and yet had not scrupled to propose ranking for them, as they afterwards said, that the dividends might cover other and unknown claims; and, lastly, many debts obviously due to him, but which had been ranked against him, as the parties said, for greater security, were in due time recovered from the real debtors. The father, therefore, soon saw it expedient to step forward, and, upon a principle at once proper and honourable, made offer of a composition generally, that he might get quit as easily as possible of debts that were unreal, or had been improperly contracted, but paid all such debts as were just, without any deduction. In short, it was soon seen that Nic might have remained at home, and almost in independent circumstances; and when this was heard, it only confirmed people in saying, what they had long said before, that he was certainly bewitched.

The letter which he now received in London briefly announced these circumstances, so far as necessary, and informed him that his wife and child were well, and living creditably on an allowance made by his father, from the proceeds of the estate. It farther enclosed him a sum for his immediate expenses, and to bring him home; and concluded by cautioning him against all farther nonsense, as, though he fortunately could not do all the mischief which it had been supposed he could, he would at least make himself miserable for life, and that was pretty well.

When our friend had read this letter, he was so overpowered as to let it fall from his hands; and the old merchant who delivered it, having nearly about the same time received one from the father, that put him nearly in possession of the facts of the case, could not help being astonished. He therefore asked with some impatience what was the matter; and very soon ascertained that our friend had once more arrived at what might be termed prosperity—with the trifling drawback of being liable to be transported for bigamy! He immediately inquired into the circumstances; and finding that the lady was not only respectable, but had a guardian of very strong notions of propriety, and, therefore, likely to do the worst, he could not help exclaiming with the rest of the world, as he turned from him, "The fellow is certainly bewitched!"

The advice of the old merchant was very distinct. It was immediately to make himself scarce in England, and not even to sound a trumpet before him in Scotland; and Badenoch took leave with the intention of implicitly obeying him. But good advice is wasted on fools: it is, as Solomon has said long ago, casting pearls to pigs. Our friend had not passed a thousand yards in the right direction, when he thought it would be in the last degree cruel to part without seeing his Maria, as he called her, and even sharing what he had with her; forgetting that the old merchant was, as soon as he should be out of danger, to do every thing that was proper in that respect. He therefore went to her; and having blubbered till she thought him a fool, and almost told him so, closed by convincing her that he was also a knave. This was too much! Casting upon him one bitterly contemptuous look, she left the apartment; and while he sat in stupor, vainly trying to think what he should do, she had hastened to the house of her guardian. He began to think at last that he must pack up his things at least, if only to be in readiness; but by the time he had finished this, he found himself attended by several ill-looking gentlemen, with the warrant of a magistrate to commit him for examination!

The greatest fool has generally some sense of shame. He was almost distracted to think that his name and crime should be blazed in all the newspapers, and read by every one by whom he wished to have been respected. He was carried to the house of a bailiff for the night; and as these places soon extinguish lights, he had ample time to reflect upon his *incurable folly in every single circumstance*. Even to himself it appeared endless as it was inconceivable; and he threw himself upon the bed in an agony of shame and repentance. He acknowledged to himself that he could follow no right advice in any one particular, far less act rightly for himself.

As he, above all things, wished to escape public examination, and he had seen that the doors were so secured as to render egress in that way impossible, he determined to try the window. For this purpose he got up; and having placed the table under the window, and such props as he could find, upon it, he mounted, and opened the casement to reconnoitre. To his surprise he found that though there were bars set into the wall, they were not strong; probably from the height of the apartment, or from its opening into a yard, about as secure as the house; but these things did not occur to our friend. He therefore set himself to force out the bars, that he might see from what height he had to fall; and he succeeded. He now stretched up at all his length to ascertain the height, but a man with a wooden leg, however well made, does not act so freely as a man whose supports are natural. Just as our friend, therefore, had satisfied himself that his escape was hopeless, and was drawing back his head, the support of his feet gave way, and his head being caught between the casement and its frame, he hung suspended at a height of several feet!

As the casement opened outwards, his weight only increased the certainty of its hold. It seemed certain that he would soon be relieved from all farther trouble. Indeed, he felt that he deserved to be hanged; he was so utterly incorrigible. But it was otherwise ordered.

The bailiffs, always on the alert to secure, and even keep alive people whom it would be charitable to allow to escape or die, heard the noise, and were instantly in the apartment. Thinking of nothing but to pull the man back into the den, they had almost destroyed in the act of endeavouring to secure him, by pulling him down instead of lifting him up; but a groan soon apprised them that he was suspended. A light being procured, they soon released him, but found that he was in a state of insensibility.

Medical aid was obtained, and he was at last recovered so far as to breathe; but the idea of an examination was out of the question. The old merchant's address being found upon the letter that had been obtained through him, he was sent for; and having met with the lady's guardian, they soon came to an understanding. The former marriage, though involuntary, was indisputable; that point, therefore, was settled. The man, though a criminal, was a fool; that also was settled; and the old gentleman took care to say nothing of his inheriting the slightest property, and he himself fortunately could not blab for the present. It was, therefore, resolved, as the best way of settling a bad business, that the lady should immediately return to her friends, as the climate of this country was evidently too cold for her—and she returned accordingly.

In the meantime, our friend Nicholas had in so far recovered, as that he could sit in the sun in a chair, and even turn his head, though not without pain. It was universally believed that he had wished to destroy himself, and, though that was not the fact, he half inclined to let it be understood, that people might be more gentle with him. He agreed to live in England, to the great relief of his father—and his wife and child joined him; and though he never experienced what could be called happiness, yet he was so far happy from not expecting it. He had ease and competence, with a careful, almost an affectionate nurse; and having no charge of money, nor opportunity of wasting it, he got by degrees into the reputation of a respectable invalid; and, dying at last without encumbering his estate, he was considered as not the most unfavourable specimen of the family of Badenoch.

His second wife, not relishing the idea of returning to her friends with such a character as she knew she must carry with her, married the master of the vessel in which she had embarked, and never set foot in Jamaica.

A feeling so strong as this indicated, interested her friends in her behalf, and they gave her a sum sufficient to set her husband forward in his profession. Thus prospering, and with a woman naturally good hearted, and now painfully instructed, handsome, moreover, and accomplished far beyond his hopes, he was tolerably well off; and though her fortune was not brilliant, she had the means of humble happiness, and was contented. Her only regret was, that she had ever been connected with the name of Badenoch.

It would appear, from all together, that stupidity is worse than witchcraft; that there is no witchcraft so destructive as stupidity. That without proper training, the world is a world of pitfalls, while with it there are few situations in which opportunities of happiness do not present themselves—in short, that conduct is fate, misfortune too often but another name for folly; and bewitching for good or ill but another mode of indicating good or bad conduct—at least such was the opinion of my uncle.

WALTER-SCOTTIANA.

It was stated in our Life of Sir Walter Scott that the title of his Thesis was not mentioned in the minutes of the Faculty of Advocates, at the place where his admission into that body was recorded. We have now not only learned the title of his Thesis, but obtained the use of a copy; and as it is curious, both on general and particular considerations, we have resolved to present an English translation to our readers. The title-page is as follows:—

JURIDICAL DISCOURSE,
On the 24th head of the 48th book of the Pandects,
Concerning the BODIES OF CRIMINALS,
which,
under divine favour,
by authority of the most illustrious and learned
HENRY ERSKINE
of Newhall,
Dean of the Honourable Faculty of Advocates,
and also
With the permission and by decree of the said Faculty,
was submitted to public discussion,
in order to obtain the office of Advocate,
by

WALTER SCOTT, AUTHOR AND RESPONDENT,
On the 10th day of July, at the usual hour and place.

Edinburgh:
From the press of Balfour and Smellie,
Printers to the Faculty of Advocates.
M,DCC,XCII.

After an imprimatur from William Miller and David Williamson, now Judges under the respective designations of Lord Glenlee and Lord Balgray, follows the dedication:—

To the Honourable ROBERT MACQUEEN
of Braxfield,
Lord Justice Clerk,
and a most meritorious Judge in the Court of Session;
a faithful as well as skilful lawyer,
and therefore
distinguished equally by prudence and impartiality
in the discharge of these offices,
both in punishing crimes with due severity,
and in restoring and vindicating the rights of the
oppressed;
These Juridical Theses are dedicated
with the highest respect,
by
Walter Scott.

The body of the work then follows; and we may mention that it is an *unusually short* juridical discourse:—

INTRODUCTION.

It would almost appear that there is implanted in mankind a certain care and solicitude for the decent burial of the body after death, as if on the disposal of it in some measure depended the condition of the soul. For among all the nations hitherto discovered, not one has been found in which some funeral ceremonies, however dissimilar, did not prevail. This anxiety is indeed the natural consequence of the various doctrines concerning the state of the dead, and the migration of souls, held by different tribes.

The opinion of the Romans on this subject appears from the following lines of Virgil:—

The ghosts rejected are the unhappy crew
Deprived of sepulchres and funerals due;
The boatman, Charon; those the buried host
He ferries over to the farther coast;
Nor dares his transport vessel cross the waves
With such whose bones are not composed in graves.
A hundred years they wander on the shore,
At length, their penance done, are wafted o'er.

DRYDEN.

The opinions of the Stoics also leant the same way. Lipsius, in the 9th dissertation of his third book *De Physiologia Stoica*, has shown from various authors that they considered the soul to be nothing else than a particle of ethereal fire. Burning was therefore held by the Stoics to be the shortest and most compendious way of unloosing the souls of the dead from the earth, and of enabling them to rejoin their proper element—namely, ethereal fire (Macrobius, book 1st, chapter 9th; Martian. Capella, book 2d, *De Nupt. Phil.*). If the body was not consumed, it was believed that the sorrowful spirit lingered round the corpse, and did not ascend to heaven till the last honours had been duly paid (Pliny, *Nat. Hist.* book 7th, chapter 52d). But if a person had been drowned in the sea, it was thought the soul of fire was completely extinguished by the contrary element.

It is not therefore surprising that the exposure of the body should be denounced against the more atrocious criminals as the severest possible infliction. Hence was probably derived the punishment of paricide, described in § 6. *Instit. de Pub. Jud.*, and dwelt upon in such emphatic language by Cicero in his oration for Roscius. He who had deprived a parent of life was sewed up in a leathern sack, along with a viper, an ape, a dog, and a cock, conveyed to the sea-side on a cart drawn by black oxen, and cast into the deep, that the water gaining admission by degrees, might extinguish him. Thus while alive he was deprived of the power of breathing, and when dead, rejected by the earth, and tossed between sea and shore; he underwent, according to the Stoics, the death and destruction of the soul as well as of the body. Against robbers also, and those convicted of treason, this last doom is threatened (book 28th, § 15, *D. de Panis*.) The bodies or ashes of traitors were thrown into the Tiber; but robbers were fixed to a cross, to remain the sad memorials of their crime and punishment.

Although the introduction of Christianity abolished the doctrines of the Stoics, these laws were not abrogated. For as we have been accustomed to feel the utmost horror at the sight of a corpse unburied and decaying, so we are willingly led to believe that some kind of intercourse still subsists between this body and the soul; in consequence of which the latter, so long the guest and companion of the former, sympathizes, in some degree, with whatever injuries and contumely are inflicted upon it. And, indeed, from the very dawning of Christianity, an opinion prevailed that the connexion between soul and body is not wholly dissolved by death, but that souls cherish a certain affection for their terrestrial relics, hover round, and never cease to protect them.

The exposure of the bodies of criminals was ordered, however, not so much to punish the dead, as for a warning to the living. For what is calculated to strike greater terror into those who meditate unholly deeds, as the loathsome, foul, and livid corpses of those who have undergone sentence for similar crimes, exposed to be the prey of fowls and wild beasts?

By the municipal law of Scotland, the exposure of the bodies of those who have been hanged on the accursed tree, in some cases, especially on account of the crimes of murder or homicide, is in like manner appointed. In modern times, however, the custom, certainly to be approved, has become frequent among us of delivering such bodies to anatomists to be dissected for the ad-

vantage of medicine. In this manner criminals are not only stigmatized with deserved infamy, but, at the same time, good is elicited from evil, the bodies of those who, when alive, made it their study to produce loss and the worst of evils to the state, being, when dead, converted to beneficial purposes.

THESIS I.

Among the Romans the bodies of condemned persons could not be interred unless permission were obtained from the prince or judge (book 1st, *D. huj. tit.*) It might be obtained, however, if petitioned for, unless in regard to the more atrocious criminals, concerning whom we shall afterwards treat (book 2d, *D. huj. tit.*) Thus in the New Testament we find Pilate readily granting the blessed body to Joseph of Arimathea. See also book 11th, *C. De Religiosis*, and book 3d, *huj. tit.*

THESIS II.

In a few cases, however, the privilege of burial was denied to the bodies of the condemned. Many lawyers (legislators) ordained that noted highwaymen or robbers should after death be fixed on gibbets in the places where they resorted; both that the mournful spectacle might deter others from the same outrages, and that the infliction of punishment in the spot where the murders had been perpetrated might afford consolation to the relatives and friends of those who had been slain (book 28th, *D. de Pœnis*, § 15). Sometimes even these enemies of the human race were sentenced to be cast to wild beasts, in the bloody jaws of which they found a bloody grave.

But, in particular, sepulture was denied to traitors (book 1st, *D. huj. tit.*, book 11th, *D. de his qui notant infamia*; book 35th, *C. de Religiosis*). The bodies or ashes of those guilty of treason were to be thrown into a river.

THESIS III.

Finally, the bodies of exiles, or of those confined in an island, who died in banishment, were not to be transported to another place or buried, unless the permission of the prince were specially asked and obtained (book 2d, *D. huj. tit.*) Permission to this effect was very frequently granted by rescripts, as is testified from the same law by Marcian.

ANNEXED POINTS.

I.

A mandatory, if he exceeds the limits of his instructions, cannot maintain an action.

II.

An oath concerning crimes cannot be given by proxy.

III.

An oath contains a sort of bargain.

IV.

An action for expenses incurred is not competent to a possessor who has not acted in the best faith.

V.

A father may appoint a tutor even to a disinherited son.

VI.

An accused person may be twice put to the torture on suspicion of the same crime.

VII.

An agreement to make a partnership pass to heirs is not valid.

Lady Scott one day speaking of a person who had been very fortunate in life, seemed to impute a good deal of his success to luck. "Ah, Mamma!" said Sir Walter (he often addressed his wife familiarly by the term *Mamma*), "you may say as you like; but take my word for it, 'tis skill leads to fortune."

Lady (then Mrs) Scott had a rich piece of cake, which she presented—upon a salver to a glass of wine, and which, not being cut into nibbleable pieces, had been long permitted to remain entire, and had been presented and re-presented times without number to successive visitors, till her husband at length became quite tired of seeing the same piece so often, and one day remarked, when a guest was present, "Really, Charlotte, this piece of cake of yours is beginning to make me an *auld man*!"

Sir Walter resembled every man of true greatness of mind, in his deep respect for the illustrious Johnson. This is apparent throughout all his prose works, in which he never misses an opportunity of introducing a quotation from the "great moralist." Being one day in company when the various merits of Johnson's imitators were discussed, "Ay, ay," said he, "many of them produce his report, but which of them carries his bullet?" This is one of the most beautiful testimonies that one great mind ever bore to the greatness of another; and the metaphor in which it is conveyed is, in addition, singularly appropriate to the forcible character of Johnson's writings. We have been informed that Sir Walter was often heard to express his admiration of Dr Johnson, and, on one occasion, in the presence of several persons, he took out a volume of his works, and read "the Vanity of Human Wishes" in a tone which showed how deeply he felt the beauties and acquiesced in the truths of that fine moral poem.

Sir Walter said to a friend one day (long before the Waverley secret was divulged), "Man, do you ken what was the first book that was lent out in the circulating libraries at sixpence a-night?" The individual thus addressed did not know what to say, for

he had never heard of any book but the Author of Waverley's novels being lent at that enormous charge. Sir Walter, however, soon relieved him by saying, "Man, it was *Bruce*," meaning Bruce's Travels into Abyssinia, which, being a very expensive book (£7, 7s.), was charged proportionably high by the librarians.

Sir Walter told the following anecdote to a gentleman, who immediately afterwards related it to one of the Editors of this paper:—"When Marmion came out, it made a considerable noise, and had its day, no doubt; and many people went to see Flodden Field; so that an honest fellow thought it would be a good speculation to set up a public-house upon the spot, for the accommodation of the visitors: and he sent to me, asking me to write a few lines for a sign he was going to erect, thinking, as his letter told me, that any thing from me would have a good effect. I sent him back word, that I was at present a good deal occupied; but begged to suggest, as a next best, a quotation from the book which had occasioned his undertaking, which, I remarked, would do very well with a slight alteration—taking out the letter *r*—"

"Weary stranger, rest and p[er]j[ur]y."

Sir Walter, who hardly ever spoke slightly of superstitious beliefs, related the following circumstance to the same gentleman:—"When Abbotsford was built, the furniture was procured from London, and some of the upholsterer's men came down to put it up, and arrange it in the house. The night after all was put to rights, Sir Walter, and indeed the whole household, heard noises among the furniture in a distant part of the house, as if the workmen had been still engaged in arranging it. A few days after, intelligence was received that the upholsterer had died in London.

Sir Walter also gave this gentleman a curious trait of his own personal character. He had once ridden in a chase, along side of Mr Archibald Park (brother of the celebrated traveller), when that person, observing his fearless deportment in riding (which in Sir Walter's young days was very remarkable), said to him, "Od, ye'll never halt till ye get a fa' that'll send ye hame wi' yere feet foremost!" Sir Walter replied, that when he got upon horseback he felt himself quite changed, entering as it were upon another sort of existence, and having no power of restraint over himself. After this, who can wonder at his glowing descriptions of knights and war-horses?

He also said, that when his first two or three works were published, he felt exceedingly anxious to see the reviews, and hear how the world received him; but after that his curiosity or vanity died so much away, that he never made the least attempt to see a review, and often never heard or saw a word that was said upon the subject.

He had sent a copy of his first publication to a lady of Jedburgh, the wife of his friend Mr Robert Shortreed, who accompanied him on his tour among the Liddisdale farmers.* On his next seeing her, he asked, with the solicitude of a young author, how she liked his "William and Helen." She plainly answered, "Not very much;" upon which he took up the little volume, and requested permission to read it aloud to her, in order that the composition might receive all possible advantage from his knowledge of the emphasis due to various passages. After he had done, he was somewhat provoked to find that the good lady's opinion was quite unaltered. It is somewhat curious thus to view the champion of a hundred fields in his first stage as a warrior, and anxious, as we may say, about what people thought of his way of tying on his sash.

Sir Walter was one day visiting the Ettrick Shepherd, while the Waverley authorship was still a mystery, and took a sight of his library, in which his own prose works formed a conspicuous feature, with the back-title, "SCOTT'S NOVELS." "What a stupid fellow of a binder you must have got, Jamie," exclaimed Sir Walter, "to spell Scotts with two t's!"

A Methodist congregation at Kelso, when some repairs were about to be made upon their chapel, sent some of their number about through the country to get subscriptions for the undertaking. An old widow brought a subscription paper to Sir Walter. He read only the preamble and the conclusion, which bore—"and your petitioners shall ever pray;" and returned the paper to the woman with a guinea, saying only, "Well, well, my good lady, here is something for you, as I am very anxious to have the prayers of the righteous."

So facile was he in contributing to charitable purposes, that a Burgher congregation, about to set up a meeting-house in opposition to a country minister, who was not giving satisfaction, applied to him for a subscription towards the building. He said, "Really, I am not very favourable to such things as this, and think I shall not subscribe." To which the applicant made answer, "Come, come, now, Sir Walter; ye ken ye subscribe to mony a thing ye care as little for as this, and ye maunna begin and mak' step-bairns o' hus!" "Well, well," said the good-natured poet, "here's a guinea for you." Out of all the numerous applications made to him for charity, he was hardly

* It may be mentioned, by the way, that, besides the gig employed by the two travellers on these occasions, they sometimes also rode on horseback. Mr Shortreed generally used a grey mare, which recommended itself to the young minstrel by its sagacity in crossing mosses and mires; and it was the prototype of Dandie Dimmont's Dumble, as Sir Walter himself stated a few years ago.

ever known to refuse one; and, indeed, it is acknowledged by all who knew him that he squandered a great deal of money every year in this way.

Not long before the close of his life, while sitting to Mr Watson Gordon, he was shown a little picture by that distinguished artist, representing a battle. "This is not the thing at all," said he, in reference to the clearness and multitude of the figures; "when you want to paint a battle, you should in the first place get up a gude stour [cloud of dust]; then just put in an arm and a sword here and there, and leave all the rest to the spectator." In this sublime counsel may be said to lie the germ of all his power in the description of battles.

Like his counterpart Shakspeare, Sir Walter Scott was much given to punning. Among a thousand instances of this propensity in the latter, we record one. A friend borrowing a book one day, Sir Walter put it into his hands with these words—"Now, I consider it necessary to remind you, that this volume should be soon returned, for, trust me, I find that although many of my friends are bad arithmeticians, almost all of them are good book-keepers."

THE JEWS.

On the hopelessness of all attempts to convert the Jews to Christianity, Carne, in his Travels in the East, thus speaks:—"Great efforts have been made for some years, and much money has been spent, for the regeneration of this singular and fallen people; or rather, it should be said, for their conversion, of which their establishment in their native land is to be one of the results. The wisest and best people of England have a right to disperse their donations to any land under heaven, and there is, no doubt, a peculiar charm in the idea that they are scattering them over so hallowed a country; that they are aiding to bestow on it a fresh glory, second only to that of the last dispensation of life and truth. It is a pleasing, but entire illusion. The mind of the Israelite is steered at all points against the pure and simple faith of Christianity; he will persevere and resist, and will not be brought to perfect good-will, and will, in most cases, give him a very civil reception in his house. We have even seen the descendants of the ancient people receive copies of the New Testament, sit on the divan by the side of their converted countrymen, listen calmly to his remonstrances and persuasions, promise to consider the weighty and long disputed subject, and read and judge of it maturely for themselves. All this sounds very pleasantly and sweetly to the ear that is ever on the stretch for the happiness of the fallen Hebrew, to whom words and promises cost nothing, but who in every instance stop short, sternly and decidedly, of the threshold of conversion. Long cherished devouring pride, like a spectre, stands in the way that leads to Calvary, and warns the wanderer back."

TURKISH MANNERS.

There is a curious dissimilarity between many of the customs of Christian Europe and those of Turkey. The Ottomans commence their wooden houses at the top, and the upper apartments are frequently completed and inhabited before the lower are closed in. They write from right to left; their masons sit while they lay the stones, and their compositors, while they arrange the types. The slipper, and not the turban, is removed in token of respect, to uncover the head being deemed highly indecent. They turn in their toes, mount on the right side of the horse, assign the left hand as the place of honour, follow their guests into a room, and take precedence on quitting it; help themselves first at their own tables, assume the place next the wall, and move rapidly in token of deference; wear no hair except on the chin and the crown of the head, sleep in their clothes upon mattresses on the floor, hold strangulation as less disgraceful than decapitation, treat an inquiry after their wives as an insult, regard dancing as a spectacle to be looked at and not mingled in, except by slaves; wear white as their mourning colour, and interdict green garments, the sacred colour of the Prophet and his descendants, to any of a different persuasion. Many of these peculiarities, as well as others in use among them, such as the flowing robe and the seclusion of the women, have existed in the East from the earliest ages.—*Travels in Turkey.*

HORSES' POWER.

This term, used as the name of a measure of power, is an expression which has had its origin in convenience. In its first application, no great nicety was necessary; but as the value of mechanical power became better understood, an exact measure, nearly coinciding with the power of a horse, and uniformity in the practice of engineers, became desirable. Mr Watt has fixed the elementary horse power at 1,980,000 lbs. raised one foot per hour, or 33,000 lbs. raised one foot per minute, or 550 lbs. raised one foot per second. Mr Watt further assigned a proportion for the low pressure steam-engine equivalent to a horse's power, which is 5.5 times the square of the diameter of the cylinder, in inches, multiplied by the velocity of the piston six feet per minute, and the product divided by 33,000, the result is the number of horses' power. The advantage of steam power is apparent; the horses can work at that rate only eight hours; the engine may be kept at work as long as it is wanted.

AUSTRALIAN SPORTS.

The following account of the sporting, &c. at Bathurst, in New South Wales, is given by a recent traveller:—"Bream is caught in all the rivers, bites very fast, and is nearly as large as the salt-water fish of the same name caught on the coast. The cod is the most remarkable fish at Bathurst, and is not infrequently caught as heavy as fifty, sixty, and even ninety pounds; when caught in large quantities, they are generally dried, and may be seen in this state hanging up inside the roofs of the settlers' houses. Game is plentiful; ducks, snipes, widgeon, teal, abounding near the rivers. I saw eight black ducks brought down at one shot, weighing, as I guessed, four pounds each. These are delicious eating. Sometimes the sportsmen will throw up a breast-work of boughs, near some favourite rendezvous of the birds, close to the water, and when they have collected near the spot, the sportsman fires from behind his battery, and does dreadful mischief among them, forty ducks having been brought down in this manner at one fire. The plover and bronze-winged pigeon are very numerous, and easily shot; the latter, especially, is a beautiful creature, and twice the size of the domestic pigeon. Bathurst, well, and it eats unfat at table. But the best sport at Bathurst is the quail: This is the partridge shooting of New South Wales generally; but the Bathurst settlers seem to enjoy it in perfection, having a much greater scope of clear open country. The cockatoo and magpie also abound at Bathurst, and are a great nuisance to the cultivated fields. In the forest country a variety of parrots, of the most beautiful plumage, fly about in every direction. This abundance of game, and the fine scenery, the more remarkable, as, in a late journey to Hunter's river, very few birds of any kind were seen. There is a hunt at Bathurst for the purpose of enjoying the sport after the kangaroo, and exterminating the native dog."

Edinburgh: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving the addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Edition is published, with the permission of the Proprietor, by W. S. ORR, Paternoster Row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Walk.

CHAMBERS' EDINBURGH JOURNAL

PRICE THREE HALFPENCE.

ATTACHMENTS.

ATTACHMENTS to persons and places are among the most familiar sentiments of the human heart; yet there are some very mistaken notions respecting them. The general idea is, that they are, or ought to be, as enduring as the heart itself; that no one who has ever cherished either friendship for man or love for woman should change, or *can* change; and that, let our circumstances or our situation on the globe be altered as they may, we must never forget the people who formerly were around us, or the spot we once called our home. Thus, when we part from a friend, whom we are almost certain never to see again, we take as many vows of fidelity, and exchange as many promises of a close epistolary correspondence, as if our mutual welfare in future depended upon a continued attachment, or as if any thing else would be a kind of treason against one of the most sacred of human sentiments. We depart for the new scene and the new society, with desponding hearts, as if we believed it impossible ever again to form such attachments as those we are just breaking. It may be whispered to us that there is much pleasure in novelty, and that we may perhaps soon forget our old friends for the sake of the new, and lose the recollection of former scenes in the charm of the present. But we repel these insinuations with a kind of indignation, and determine, I may almost say, whether we will or no, to preserve a mournful retrospection of the past.

Now, the truth is, we are not designed to live upon the recollection of either past faces or past scenes. Friendship and love are not to be supported for any length of time without personal intercourse; nor can any scene ever be so important to us in recollection as that in which we are immediately placed. Instead of affection being a tangible object, which we can pledge away for ever, as the heart is supposed to be in non-sensical poetry, it is a *power* residing inalienably within us, to be exerted on whatever successive objects we are pleased with, the new objects regularly attracting a certain quantity of affection away from the old, till, in the end, the old have little or none remaining. Some readers will exclaim against this doctrine as a most unnatural one; but, in order to convince ourselves that it is really correct, let us recollect the fate of any one of all the friendships and loves we ever cherished. Suppose, for instance, the case in which friendships are supposed to be most warm—a school intimacy. Who that ever entertained even the most enthusiastic attachment of this kind, and, on parting, vowed to write regularly every month, if not oftener, ever found that the correspondence was in the least degree interesting after the first year? A few fond letters are exchanged, breathing the very spirit of old friendship. But soon this becomes tiresome. One of the parties happens to delay answering a letter of the other, till he is almost ashamed to do it; the reply to this is more dilatory still; and at last the correspondence, from which so much was expected, ceases altogether. It is much the same with tenderer intimacies. Love, to be lasting, must be frequently fed with a sight of the loved object. At a distance, other objects are presented, and the affair is at length only maintained at the expense of a struggle of principle—in which case it is, of course, no longer love. Nor is it wrong that our affections should be thus transferable. If we could never love but one woman in the course of our lives, or experience a friendship but for one local set of friends, we would be miserable creatures indeed. The chances would in that case be ten to one against our obtaining a partner in the least agreeable to us: we would probably enjoy both friendship and love only for one brief space in youth, while hap-

pening to be at a particular place, far from our eventual residence. All the rest of life—every other part of the world—would to us be a waste. Now, as the case really stands, though the scenes, and the friends, and the mistresses of youth, are, perhaps, the most permanently endeared, and though it is certainly proper that we should not cast off old attachments with an appearance of indifference or inconstancy, so as to give pain to those we are parting from, we can, nevertheless, find more or less pleasure in all the scenes which fortune has provided for our residence—all the various sets of people among whom we are thrown, from the beginning even to the close of life—and each successive woman upon whom our *power* of affection has chanced to be exerted.

POPULAR INFORMATION ON SCIENCE.

TREES.

"GIVE me," says the common thinker, "only a little practice, and a fig for the visions of theory." Theory, nevertheless—that is, science—is the great source of instruction for practice, and it would be just as reasonable for the man who lights the gas lamps in our streets to laugh at the German philosopher who invented the use of gas, as it is for practice in general to undervalue theory. In most of the arts of life, theory already regulates the most esteemed practice, and these may be said to be in a perfect state; because, in them, every thing that is done is done on principles perfectly well ascertained, and for which it is known that none better can be substituted. But yet, in some of the most common and most important arts, it is surprising to find that science was only of late, or is not even yet, employed. For example, it is not above forty years since a Scottish nobleman, the Earl of Dundonald, gave the first hints as to the application of chemical science to agriculture; it is little more than twenty years since these hints were enlarged upon and enforced by Sir Humphrey Davy; and even at this day, important as agriculture is to all men, most rural operators proceed upon practice alone, and are totally ignorant of many methods suggested by Dundonald and Davy, of cultivating the ground in a much superior manner.

It is natural that men should at first proceed upon practice alone. Adam, and his descendants for many generations, could know nothing but that, if they put seed into the earth, it would grow up again with an increase; or that, if they boiled their grain or their animal food, it would make it more agreeable in taste, and perhaps more salubrious. But it is disgraceful to mankind to continue acting upon these simple principles, after men of science have pointed out to them principles that are superior, grounded upon the internal nature of the things operated on, by which the workman may not only know *why* he does such or such things, but may do them in a better and far more profitable manner. Science, from its usually coming in so late, finds unfortunately that practice, with all its blindness, has established itself in a certain degree of reputation, and that men are, from natural indolence, apt to content themselves with a present good, derived from this source, to the neglect of a greater, which could not be acquired without superior labour. But this must be manfully contended with. We must not permit the mass of mankind to be too easily contented. They must be roused to a sense of their own benefit, whether they will or no—if not for their own enjoyment, at least for that of their posterity. Learn, then, they must, that science, in almost every case, can confer some advantage on the common arts of life, and that theory, as they call it, so far from being

a more vague or uncertain thing than practice, is in reality the *only certain guide of the two*, and that, without it, we should not perhaps have as yet made any great advances beyond the condition of our savage ancestors.

The cultivation of timber, as every body knows, is an art of great importance, especially in a country whose chief means of defence lie in what are fondly called its "wooden walls." Trees protect the country from foreign invasion: Trees soften the climate, and shelter the soil, so as to favour the production of food: Trees render the country more delightful to the eye, and give it an indelible and endearing feature in the fondness of recollection. The children of the gentry delight in the old trees that surround the ancestral homes of Britain: The children of the peasantry have their own heartfelt pleasure in the ancient village beech, beneath whose boughs youth has sported, and age looked on, during many generations. Whither does the lover delight to lead the mistress of his bosom?—to the green and far retreats of the wood, where all the minstrels of nature are in full voice. What scene does the student choose for his abstracted wanderings?—the solemn grove, where few intrude. Wood, indeed, enters to an immense extent both into the pleasures and the accommodations of human beings, and its culture, accordingly, cannot be otherwise than an important object of science.

Strange to say, no attempt was made in Britain, nor in any other country of Europe, to apply scientific principles to this useful art, till the year 1823, when Sir Henry Stenart, of Allanton, in Lanarkshire, published his "*PLANTER'S GUIDE*," a work in which those principles are laid down in clear, forcible, and even eloquent terms, together with a complete view of their previous reduction to practice on the author's own estate. By the diffusion of two ample editions of this work, the scientific principles of the art are already pretty generally known; yet they have not hitherto been so generally acted on as to preclude the necessity of our giving a brief view of them, for the use of our own readers.

Trees, as well as all other plants, are living beings, organised on principles somewhat similar to, but not possessed of all the functions of, animals. It might at first sight be supposed that they are chiefly composed of fibres or thready substances; but in reality the substance of trees is almost altogether composed of vessels or tubes, through which the sap flows, like blood in the veins of an animal. Seven millions of these vessels have been counted in the surface of a square inch of wood! The vessels in trees, like those in animals, are of different sizes; but it has been ascertained that there is not any thing in trees performing the same functions as the heart in animals; that is, propelling the blood throughout the system, and, by its return again to the heart, completing the circulation. The vessels simply extend from one end of the tree to the other, sometimes joining with each other, as the veins and arteries of animals do, and, moreover, exhibiting circles, which, when the tree is cut across, have the appearance of rings. One of these circles of vessels grows round the outside of the tree (under the bark) every year, and is called *albumum*, or sap-wood, while the inner and harder matter is called *duramen*; and thus, when a tree is cut, it is possible, by counting the rings, to ascertain its age.

A tree consists of four principal parts—the Root, the Trunk, the Branches, and the Leaves.

The Root consists of two parts—the body or bulb of the root, and the long branch-like fibres, great and

small, which disperse themselves abroad into the soil. The body of the root differs little in substance from the trunk, but the rootlets terminate in slender spongy threads, fitted for absorbing the sap of the earth, and sending it up into the rootlets, whence it ascends into the trunk. It is observed that the earth is only exhausted of its nourishing matter in the neighbourhood of those soft extremities of the roots.

The TRUNK is called by Linnaeus *Caudix ascendens*, or root above ground, an illustration perhaps more fanciful than philosophical. It is covered by bark, consisting of a series of thin layers, one of which is formed (next the timber) every year; while in the outside of all is a very thin layer of a different substance, called the epidermis or cuticle, analogous to the outer skin of the human body. The new inner layer which is formed every year receives the name of *liber*, because it was on this substance that the ancients, before the invention of printing, were accustomed to write; and *liber*, it is well known, is the Latin word for a book. Within the bark is the wood, consisting chiefly of vessels, great and small, which may be torn asunder from each other, and which are employed in conveying sap to the upper extremities. In the very centre of the trunk is a small space filled with a soft substance called pith, which is supposed to be a reservoir of nutritious matter for the development of the buds in spring.

The BRANCHES require no further notice than that they precisely resemble the trunk in every respect, except that they are upon a minor scale in point of size.

The LEAVES consist principally of tissue, like the trunk, with vessels throughout, and an external cuticle enveloping the whole; and they are connected with the branch by a small stalk called the *petiole*. The leaf is one of the most important parts of the whole tree. By a most curious process, not certainly known to us, the crude sap rises through the wood, in the manner just described, and is elaborated or prepared into juice of a more nutritious sort, by the leaves. That process, according to some, is effected by means of an alternate contraction and dilatation of the sap-vessels, and, still more, by a respiration, perceptible and imperceptible, in the leaves, and by the action of the atmosphere; but, according to others, it is rather the exhalation from the leaves, than what are properly their respiratory functions, that effects the ascent of the crude sap. It is then converted into proper sap, or cambium, and, being fitted for the nutrition of the whole tree, it descends by the returning vessels of the leaf-stalk, and the longitudinal vessels of the rind or inner bark. At length it reaches the roots, which originally supplied the crude sap itself. This elaborated sap is like human food digested into chyle, and as it forms the only real nourishment of the tree, it becomes apparent that the plant must decay if stripped of its leaves.

Although some of these facts were discovered about the year 1660, by Dr Grew, an English physician, and nearly about the same time by Dr Malpighi of Bologna, yet, till Sir Henry Steuart published his book in 1828, no planter of wood had ever thought of applying them to the practice of his art. The transplanting of a full-grown tree has, in all ages, been deemed next to impossible; and when it was attempted, the operator thought it necessary to cut off a great number of the branches (and consequently the leaves), from an idea that, if suffered to remain, they would require more sap than the roots could supply in their new situation. Of course, just in as far as they deprived the tree of its branches, or, we may rather say, of its leaves, they deprived it of the principal organ of its existence, and it invariably decayed to a corresponding degree. The lopping was like a cutting off of the lungs in a human being; and it would be as absurd to expect a man in that state to be healthy and strong, as it was to hope for vigour in the stripped member of the forest.

Sir Henry Steuart, having studied the internal structure of trees, began, a good many years ago, to practise the art of transplanting on what he justly calls the preservative principle; that is, without mutilating either roots or branches, as was universally practised till his time. His seat, Allanton House, is situated on an irregular slope, on the right bank of the river Calder, which is a tributary of the Clyde. The neighbouring ground, though diversified, has no very picturesque natural points; but he has contrived, by the removal of large trees, and forming an artificial lake and river, to realize in some measure the miracle of bringing new and picturesque scenery into actual existence, in an almost endless variety of combination. He has, in fact, created landscape, where no landscape existed before, and almost as promptly as the Hero of the Lamp created the palace of Aladdin. An English aristocrat, who observed with jealousy the extensive building operations of a mercantile neighbour, cried, "Thank heaven, the fellow can't build a tree!" But the citizen who seeks to employ his honourable wealth in rearing a suitable home for the evening of his life, is now placed by Sir Henry Steuart upon a level with the proudest baron in the kingdom, seeing that he can build a forest, if he pleases, by only exerting industry, according to the laws of Science, and then leaving Nature to do her own work. Having studied the principles of landscape, Sir Henry arranged his trees in such a manner as to form a great variety of beautiful pictures on a larger or smaller scale, the combination of which is almost as endless as there are numerous points in the park for beholding them. Here almost every tree is made to serve several

purposes. Perhaps, when beheld from the west, it is an undistinguished member of a beautiful clump or grove; when seen from the east, it possibly terminates a fine vista; at some other point, it forms the opening of some delightful glade, leading the eye in *remoto gramine* (to quote a happy expression of Horace); that is to say, into some far and dim retreat, where the eye is lost in a mass of foliage and verdure.

Besides all this, each individual tree is, of course, useful to the general landscape effect of the whole park. Sir Henry, as we understand, does not previously, as might be imagined, delineate these striking pictures on paper; he merely stakes them out upon the ground in the general outline, adding the subordinate features as the work proceeds in the execution, until the whole is finished to the intended design, and as he has imagined it in the beginning. Yet the result is a new and happily conceived mode of producing pictures in real landscape,* which has probably never been attempted in our times, and such as would transmit his name, as an artist, to future ages, were not his discoveries destined to a higher and more useful purpose, namely, that of giving *fixed principles to general arboriculture*, and raising it from the rank of a mechanical, to that of a *scientific art*. Had he drawn up a dry and didactic treatise on general tree culture, as improved by physiology, instead of enforcing its laws through the medium of a popular branch of the art, his work most probably would have attracted but little notice.

It is impossible, in our limited space, to pursue this interesting and scientific system through its various ramifications; we must therefore refer the reader to Sir Henry's excellent volume. But we cannot omit to suggest to an intelligent public, laudably anxious to carry *reform* into every department of arts as well as institutions, the expediency of establishing a society for promoting the improvement of arboriculture among us. As it is to our English neighbours that we stand originally indebted for our knowledge of most of the useful and elegant arts, so, in eminently advancing those of agriculture and arboriculture, it is pleasing to think that we have of late been able to repay, with interest, some portion of these obligations. Of such an object as the society in question, the landowners and country gentlemen must beyond a doubt be the prime movers and most efficient supporters. These constitute the great and influential class of British planters; and were phytological science to become a favourite study among them, it would, of course, be acquired by gardeners and nurserymen, who would soon become its ostensible and most appropriate professors, whether in the creating of real landscape in parks, or for general forest purposes. In their present state, we regret to say that the British planter is never a physiologist, and the physiologist is never a planter, whether in the north or south. The planter, therefore, is the mere pupil of experience, that slow instructress who can tell him only *how* certain results are brought about respecting trees, but who is utterly ignorant *why* they are brought about. But before many years pass over us, we are confident that a revolution must take place in our ideas of arboricultural skill and science, as complete as in political. The future, compared with the present condition of our race of planters, will then be like that of mariners who have long been at sea without a compass, or like men *working in the dark*, when the *light of the sun* was let in upon their labours!

THE BRAVE BRITISH TAR.—A TALE.

"There's a sweet little cherub sits perch'd up aloft,
To keep watch for the life of poor Jack."

To be sure there is, and it's the best and sweetest hope of a tar, that, in every hour of danger and of difficulty, "the same gracious Providence watches for all." But there, I ain't a going to give you a long rigmarol for a prologue. No, no, I'll just tell you the story as I've heard it fifty times with my own ears on board the old "Marmad," commanded by Captain Malcolm, for d'ye see Jem Gantline knew all about it, and many a mid-watch he's kept us awake by telling it.

"It was one beautiful morning in July (says Jem), and the sun was just taking his look-out aloft, that Ned Davenport quitted his native village to become a lonely wanderer upon the wide world, determined to stifle recollection among the busy scenes of life, or amidst the tumult and wild roar of warfare. Yet, on passing through the churchyard, he stopped to shed one last tribute on the grave of his parents. He looked on the surrounding lands and spacious farm which once had been their property, and thought of the time when, overwhelmed with accumulated distress, they had descended to their long home in anguish and poverty. He turned from this to catch a distant view of the stately mansion which contained all that was dear and precious to him in existence; and a sweet girl she was too (Jem would say), for I remembers her, messmates, like a lovely dower blooming on the breast of spring. But when poor Ned was left destitute, all intercourse was forbidden between them, and the hearts that had throbb'd together from infancy were cruelly torn from each other; but I lie, messmates, I lie; nothing on earth can separate the hearts that truly love. Howsomever, they parted without a hope of

meeting again on the shores of time. Oh, who can paint the sorrows of his soul as he lay prostrate on the grassy mound, and poured forth the anguish of his spirit? I cannot do it justice, messmates, for my suppers overflow whenever I think of it. That name, that endearing name, he had first learned to lip in early infancy, 'My mother!' burst from his lips, and then he prayed to Heaven for mercy. Mercy was near—a kindly voice, mild as the gentle breeze on the shores of the Mediterranean, instilled the balm of consolation on his wounded mind, and directed him to look up to that wise unerring Being who feeds the young ravens when they cry. 'Twas the curate of the village, who had been passing the night by the humble pallet of a dying cottager, administering the last offices of humanity, and encouraging the departing spirit ere it took its flight to the realms of everlasting rest. He was returning to his little home when he heard the petition for mercy, and, as the servant of that Power to whom it was addressed, he soothed the sufferer's anguish, calmed the inward tempest of his mind, and they parted—the curate to his modest mansion, and Ned—ay, Ned, to brave the dangers, to feel the contumely, of that world to which he was a stranger.

"The father of Anna had risen from comparative obscurity to wealth and honours: he was what they call a privy councillor. I don't know what it means, but they told me it was something near the King, and so he had no time to devote to his daughter, whose mother died in giving her birth; and the sweet girl grew like a mountain-rose-bud, luxuriantly wild, till poor Ned's parents, feeling for her situation, loved and cherished her as their own; and thus was formed that deep, strong, deathless passion, which distance could not shake, nor time dissolve. I knows what love is, messmates, for in my younger days I—but there, its over now, its over—yet I love to think about it too. She heard of Edward's departure, and struggled with her agony; but the generous man who had softened the sorrows of the youth performed the same kind office for the sinking maid. Her principal gratification was to wander to the lone churchyard, and, sitting on the cold grave-stone near the resting-place of her early friends, she would recall the visions of her childhood, and commune with her own sad heart. Now, messmates, you shall hear in what manner she kept her vows of truth and constancy; but, poor thing, she couldn't help it!

"It was one still calm evening that a gallant little 20-gun ship lay under easy sail in the middle of the Atlantic Ocean, to protect the commerce of our country from the attacks of the enemy. Five weeks had already passed off that enchanted station (many of you know it, messmates, no doubt), and our cruise (for I was in her) had been particularly fortunate in making captures and reprisals. The week after we were to return into port for stores and provisions. Well, d'ye see, the hands were turned up to skylark, and every soul hurried upon deck to enjoy the sport. The captain and officers assembled abaft, and shared among themselves in the amusement; but in all their athletic exercises no one could be found fore and aft to equal the junior lieutenant. This young man had risen solely by merit to the quarter-deck; and his bravery in several actions had recommended him so powerfully to his commander (whose life he had once preserved at the imminent risk of his own), that he adopted him as his son, and obtained him a commission in his own name, for Captain Malcolm himself had come in at the hawse-holes, and had no relations that he knew of in the world. Young Malcolm was beloved, ay, almost idolized, by every hand aboard. He was the smart seaman, the brave officer, and, without departing from the strict line of duty, he conciliated the esteem and regard of all the men. His face, bronzed by a tropical sun, was seamed with honourable scars, that made him appear much older than he really was. His figure was remarkably neat and trim, firm-built and powerful, and he tried to copy his benefactor in every pursuit.

"A match against time had just been made from the deck to the mast-head and down again, and the lieutenant was laying his hand upon the truck, when, casting his eye round the horizon, he shouted, 'A sail, a sail upon the lee beam!' All was instantly hushed. 'Turn the hands up, make sail!' cried the captain. 'Keep her away, boy! Square the after-yards! Stations, men, stations! Mast-head there!' 'Sir!' 'Look out when she's right a-head.' 'Ey, ey, sir; starboard a little—there, steady, so, steady!' In a few minutes every stitch of canvass that would draw a breath of wind was spread and trimmed. We had just light sufficient to make out that the stranger was a large ship, when darkness obscured all further observation. The breeze freshened, and the officers crowded on the fore-castle to look out for the chase. Eight bells came, and we began to fear that we had missed the stranger. The captain was just giving directions to alter the course, when a marine sung out, 'I've got her, sir, I've got her!' 'Got who?' inquired the lieutenant. 'Got her, sir, got the ship,' replied the sodger. 'Where? where?' said the captain, running aft. 'Here, sir! here, in the starboard waste.' 'That's right, my lad, hold her fast,' exclaimed a midshipman, while the sail was shortened and the ship hauled to the wind. We were sufficiently close to discover that the stranger was a heavy frigate, and, as our night signals were unanswered, concluded she was an enemy. 'Give him a shot,' cried the captain;

* By "real landscape" is here meant a picture formed of Nature's own materials, such as wood, water, ground, &c., in contradistinction to "artificial landscape," which is produced by canvass or paper, by means of colours.

it was instantly returned by a whole broadside that laid several of our best men lifeless on the deck, and the action commenced with daring bravery. Well, d'ye see, we kept at it for about two hours, when the frigate's fire began to slacken, and shortly after ceased. 'Sail-trimmers to the weather braces,' cried the captain. 'Boarders on the starboard quarter! Stand by to heave all aback, and, Malcolm, be ready to lead the men.' All this was obeyed; but, just as we got to our yard-arms touching, the enemy poured in a tremendous fire, and Captain Malcolm, with his second lieutenant, fell. It would be impossible to describe the sensations of horror which this event occasioned. The young officer ran and raised his generous friend. He was yet living, though the tide seemed ebbing fast; but his poor messmate was a corpse. 'Leave me, Malcolm; leave me, my brave lad,' faintly articulated the captain; and pointing to the colours, added, 'Tis the flag of England—do your duty. Take her, and I die content.' At this moment one of the midshipmen came to young Malcolm, and told him the first lieutenant talked of striking. Rage and indignation shook his frame. The captain had been carried below senseless, and the command devolved upon the senior officer—that officer who was about to disgrace himself for ever. The first lieutenant was giving directions to haul down the colours and the light, when Malcolm rushed aft. Here he found the boatswain standing by the ensign halliards, with his pistol cocked, swearing he would shoot the first man that offered to touch them. The commanding officer drew his sword, and was in the act of making a thrust, when a shot very unceremoniously walked off with his head, and the sole charge now rested upon Malcolm, who fought the ship with heroic intrepidity, determined not to surrender till every hope was lost. The carpenter appeared, and reported that we were making so much water, that she could not hold it out another half hour. This was appalling news, yet, rousing all the energies of his mind, he called to the master to lay him aboard the frigate. In a few minutes the young officer, followed by his brave crew, were upon the enemy's deck, and the conflict became terrible. In vain we swept away our foes; others instantly supplied their places, and, though our numbers were fast diminishing, yet our hearts were unsubdued. Twenty minutes had elapsed in hard fighting, when the master, carpenter, and surgeon, were seen on our own decks carrying in their arms our beloved commander—the ship was sinking. This sight operated like enchantment on the men; a wild shout of desperation resounded, and in a few minutes more the frigate was our own. Scarcely had Malcolm received the Dutch captain's sword (for she was a Dutch frigate, laden with specie for the Cape), scarcely had the three officers with their dying burden been assisted on board, than our own gallant little bark went down. In a few hours afterwards our brave captain breathed his last, and we bore up for England, where we anchored in Plymouth Sound, in about eight days' time. The young hero landed, and was ordered by the commander-in-chief to carry his own dispatches to the metropolis; at the same time receiving letters of introduction to a nobleman in a high official station. On his arrival he drove immediately to the house, and it happened that a large party of the nobility were assembled to a shew-o, as they call it. Now, I can tell you all this, messmates, for a fact, because, d'ye see, I was with him to take care of the colours and baggage, having sailed with him when he was a youngster, and first taught him his duty as a seaman; but no matter for that; his Lordship left the company, and entered the room where Malcolm was waiting to receive him; but when their eyes met, the young officer staggered back upon a chair, and turned as pale as ashes. Recovering, however, he apologized for his behaviour, and attributed it to the effects of his unhealed wounds. The Dutch captain's sword and the frigate's colours were displayed, and, while the lieutenant took some refreshment, Lord N—— returned to the drawing-room, and related the particulars. All were desirous of seeing the intrepid young tar immediately; but his Lordship promised to introduce him the following day, as he had no doubt that Malcolm required rest. Among the party were several members of the cabinet (that's a strong box, I believe, messmates, and every one of the gemmen belonging to it carries a gold key in his pocket, but I ain't sure): howsoever, next morning some of 'em got telling our good old King about it, and he expressed a wish to see the officer. Malcolm, of course, was introduced, and appeared before his Majesty with his right arm bound round with a black bandage, his left suspended in a sling, while his curly hair, hanging over his forehead, scarcely concealed the covering of a deep wound. 'Make, make, make him a captain,' said old George; 'shall be a captain, shall be a captain—he deserves it—good officer, brave officer—shall be a captain;' and Malcolm obtained a commission for post rank. On the same evening he dined with his Lordship, but on entering the room his embarrassment and agitation were excessive, as the ladies crowded round, and were almost ready to embrace him. Lord N—— led him first to his daughter, and Anna (for 'twas she, messmates, 'twas she) received him with all the natural warmth and goodness of her heart. I saw it all, for they would drag me up too. I was never so daunted in my life; for all the beautiful creatures said such kind things, I was ready to pipe my eye. I dare say I looked foolish enough, for I scratched my head,

shucked up my trousers, and twirled my hat, till at last I dashed my quid into the fire, and offered to kiss 'em. My eyes, how they run! all but one sweet little cherub, who put her arms round my neck, and then—there, don't laugh, messmates, 'twas the sweetest buss I ever had in my life—and says she, 'If the brave defenders of our country do not merit our gratitude, who does?' To see Anna, and not love her, was impossible; and what's a sailor without a sweetheart, eh? Why, he is like a ship without stays, and so Malcolm fell in love. When we were alone, he used to talk all manner of things, but I couldn't understand him. Anna's affections, however, were still fixed on him, whom she feared was lost to her for ever. 'Tis true, she felt pleased in the captain's company, for he was so widely different from the airy flutterers that continually buzzed in her ear; but love—oh, no, she had sworn never to love but one. On the following week after our arrival, his Lordship purposed returning to his country seat, and we were invited to accompany him; but Malcolm candidly told him the state of his heart, and his Lordship, with equal candour, related the story of her early attachment and continued fidelity, declaring 'that, though the captain was unexceptionable, yet he had promised never again to importune his daughter.' A circumstance occurred which detained Lord N—— another week in town, during which time the captain passed every spare moment with his beloved Anna, till she became alarmed at his attentions, and yet an indescribable emotion prevented her from checking them. His conduct was so delicate, his manners were so engaging, and he appeared to anticipate her wishes with such winning kindness, blended with a marked respect, as excited a deeper interest in her heart than she liked to confess even to herself. Well, d'ye see, at last we commenced our journey early one morning, and the next afternoon arrived at the family seat. After partaking of a sumptuous dinner, his Lordship withdrew to arrange some affairs with his steward. The captain took a stroll in the park, while Anna hastened to her old friend, the curate, who had been prevented by the gout from attending their arrival. After passing some time with that excellent man, she promised to return on the morrow with the captain, and took her leave. One other duty yet remained—the visit to the lone churchyard. The shades of evening began to fall heavier and heavier on the landscape, but Anna was superior to fear. Advancing with a light step towards the hallowed spot, what was her surprise and agony to see a man kneeling by the grave in the attitude of prayer! She bounded forward, 'It is he—it is he—Edward, my Edward!' and she sunk senseless in the arms of Captain Malcolm, who sprang from the grassy tomb, and caught her to his heart. Yes, it was Edward, her own Edward, that held her to his breast, changed in all but that affection which could never change. He called her his Anna, moistened her lips with kisses, and, as she slowly recovered, heard her sweet voice acknowledge him. The poor lad, who had once implored the mercy of Heaven on that very spot, when cast abandoned like a weed upon the ocean, was now—yet, why need I repeat it? Ned Davenport and Captain Malcolm were one. Together they retraced their steps to the curate's cottage, where they poured forth the fulness of their hearts in gratitude and praise. Lord N—— heard their tale, joined their hands, and blessed them. There, messmates, it's a tough yarn, but 'tis all true, you may depend on't; and some other time I'll tell you all about the wedding, when I got groggy for joy; but it's my next look-out, and so I'll just shut my eyes for five minutes, to keep 'em warm.'—*Greenwich Hospital.*

BIOGRAPHIC SKETCHES.

PETER THE GREAT.

Few men, and, least of all, those in an exalted station in society, have so distinguished themselves for the pursuit of knowledge as Peter the Great of Russia, one of the most extraordinary men who ever lived; and although his life has been already communicated in various forms to the public, it is considered that a relation such as that which follows will not be without its effect in the present publication:—

The Czar, Peter I. of Russia, was born in 1672, and at ten years of age found himself in nominal possession of the throne, although, for some time, all the actual power of the state remained in the hands of his sister, the princess Sophia, who was about five years older than himself. But his boyhood was scarcely expired, when he gave proof of the energy of his character by ridding himself of this domination; and in 1689 the princess was already removed from the government, and immured in a monastery. From this moment, the young Czar, now absolute in reality as well as in name, directed his whole efforts to the most extraordinary enterprise in which a sovereign ever engaged; being nothing less than to change entirely the most settled habits and prejudices of his subjects, and not so much to reform them, as to transform them, almost by main force, from barbarians into a civilized people; for the Russians at this time—not more than a century and a half ago—were, in truth, little better than a nation of savages. Nay, Peter himself was born and reared a savage; and to his last days the passions and propensities of his original condition remained strong in his nature. It speaks the more for his wonderful genius that, throughout his whole history, he forces us to feel that we are reading the adventures of the chief of a barbarous

country, struggling to civilize himself as well as his people; and undoubtedly we do not follow his progress with the less interest on that account. Nothing, in fact, in his proceedings or his character, so much engages our curiosity as to watch the astonishment with which his own ignorance was struck on the first view of those arts of civilized life which he was so anxious to introduce among his less ambitious, but hardly more ignorant, subjects. It is exactly the case of a strong-minded and enterprising leader of some tribe of wild Americans, or South Sea Islanders, setting out to see with his own eyes the wonders of those distant lands of which his white visitors have told him, and, after all, viewing the scenes which civilization presents to him with an intoxication of surprise, which shows how imperfectly even his excited fancy had anticipated their actual nature. But, however he was at first struck with what he beheld, Peter did not continue long lost in mere amazement. The story which is told of the occasion which awakened him to the ambition of creating a Russian navy is very illustrative of his character. While looking about one day among some old stores, and other neglected effects, he chanced to cast his eye upon the bulk of a small English sloop, with its sailing tackle, lying among the rest of the lumber, and fast going to decay. This vessel had been imported many years before by his father, Alexis Michelovitch, also a prince of distinguished talents, and who had nourished many schemes for the regeneration of his country; but it had long been forgotten by every body, as well as the object which it was designed to promote. No sooner, however, was it observed by Peter than it fixed his attention; he made inquiries of some of the foreigners by whom he was surrounded, as to the use of the mast and sails, even the general purposes of which he did not know; and the explanations which he received made him look on the old bulk with new interest. It immediately became, in his imagination, the germ of a magnificent national marine; and he could take no rest till he had made arrangements for having it repaired and set afloat. With some difficulty the Dutch pilot was found out whom Alexis had procured at the same time with the sloop to teach his subjects the method of managing it; the man, like the vessel of which he was to have the charge, had long been forgotten by all the world. Once more, however, brought out of his obscurity, he soon refitted the sloop; and the Czar was gratified beyond measure by at length beholding it, with its mast replaced and its sails in order, moving on its proper element. Delighted as he was, he went himself on board, and was not long before he became a sufficiently expert seaman to take the place of his Dutch pilot. For several years after this his chief attention was given to maritime affairs; although his first ships were all of foreign construction, and it was a considerable time before any issued from his own docks. From so small a beginning as has been described, Russia has since become, after England, one of the greatest naval powers in the world.

But the most extraordinary of the plans which Peter adopted in order to obtain an acquaintance with the arts of civilized life, was that which he put in execution in 1697, when he set out in the suite of his own ambassador to visit the other countries of Europe. On this occasion, passing through Prussia, he directed his course to Holland, and at last arrived in the city of Amsterdam. His embassy was here received by the government of the United Provinces with all manner of honour and distinction; but he himself refused to be recognised in any other character than as a private individual. The first days of his visit were spent in perambulating the different streets of the city, the various wonders of which were probably never viewed by any eye with more astonishment and gratification than they excited in this illustrious stranger. The whole scene was nearly as new to him, and as much beyond any thing by which he had ever before been surounded, as if he had come from another world. The different arts and trades which he saw exercised, and the productions of which met him, wherever he turned, in such surprising profusion, were all attentively examined. But what especially attracted his attention was the great East India dock-yard in the village of Saardam (situated a few miles from Amsterdam), which was then the principal establishment of this description in Holland. Here he actually took the singular resolution of entering himself as a working carpenter; and accordingly, giving in to the superintendent the simple name of *Peter Michaelof*, he took his place among the other workmen, and became in all respects one of them, even wearing the same dress, eating the same sort of food, and inhabiting equally humble lodgings. The hut in which he lived is still shewn at Saardam. When he first made his appearance in the dock-yard, nobody knew who he was, and he of course attracted no notice; but, even after his true quality was discovered, he would suffer none of the observances usual to persons of his rank to be paid to him, repelling every attempt of the kind with evident displeasure. And in this way of life he passed several months, during which time he bore a considerable part in the building of a vessel, which, when completed, was named the *St Peter*, and was purchased by the royal person whose hands had thus helped to put its timbers together. While thus employed, however, the Czar did not neglect his duties and appropriate occupations as a sovereign. After the labours of the day were over, his evenings were generally employed either in writing dispatches to the mi-

nisters whom he had left in charge of affairs at home, or in holding consultations with his ambassador regarding the negotiation pending with the Dutch government, in which he took the most anxious interest, as having for its object the procuring of a supply of vessels and seamen from that power to aid his favourite scheme of forming a navy for Russia. In this application, however, he was unsuccessful.

On leaving Holland, Peter proceeded to England in a vessel sent to convey him by the government; but on his arrival in London he insisted upon still being treated only as a private individual. Here he spent his time at first as he had done in Holland, examining the many interesting objects that everywhere met his view. Among other places he went to see the Tower, where he was much delighted with the armoury, and the coining of money in the Mint. He was taken also to see the two houses of Parliament when sitting; and he appeared twice or thrice at the play, but did not seem to have much relish for that species of amusement. He was very fond, however, of visiting the churches; and was so anxious to learn the mode of worship observed by the different denominations of dissenters, that he attended several of their chapels. On one occasion he was present at a Quaker's meeting. He paid one visit to Oxford, to see the University; and another to Portsmouth, where he was greatly entertained by a mock sea-fight that was exhibited to him. On this occasion he declared that he considered an English admiral a happier man than a Czar of Muscovy. He also applied himself with zeal and diligence to learn whatever he deemed useful, without regarding the humble nature of any of the handicrafts in which he wished to become a proficient. With these views he did not scruple to work as a common labourer in paper-mills, saw-mills, rope-yards, and other establishments of a similar kind. Voltaire mentions that he studied with particular attention the art of watch-making. His first residence was a house appointed for his reception by government below York Buildings, in the neighbourhood of Westminster Bridge; but he found this both a very noisy place of abode, and not conveniently situated for the object on account of which principally he had come to England—his improvement in the art of ship-building. After a short time, therefore, he removed to Deptford; and here he spent several months in the dock-yard, employing himself in the same manner as he had done in that of Saardam.

While the dock-yard, however, was the place in which the Czar spent the greater part of the day, he employed many of his leisure hours in taking lessons in mathematics, navigation, and even anatomy, which he had begun to study, while in Holland, under the instruction of the eminent professor Frederick Ruysch, whose museum he afterwards purchased for the sum of thirty thousand florins. Peter, indeed, neglected no opportunity, during his travels, of forming the acquaintance of distinguished individuals; and both in Holland and England many of the ablest men of the time were introduced to him, some of whom he persuaded to accompany him home to Russia. He also expended considerable sums in purchasing such curious productions of art as he conceived might best excite the emulation of his subjects.

We cannot here enter into any detail of the various reforms in the customs of his people which this extraordinary man proceeded to introduce on his return to his own dominions, with the view of assimilating them more to those which he had found prevailing in the other countries of Europe. Suffice it to say, that by a series of the most energetic and frequently violent measures, he succeeded in effecting a complete change in some of the oldest institutions of his empire, and even commenced a revolution in the habits and manners of general society, which, from that beginning, has since gone on till it has established, in what was before almost a barbarous country, all the benefits of a flourishing civilization. Peter may be said, indeed, to have given to his subjects nearly every art of civilized life, of which they were some time afterwards found in possession. He taught them navigation, commerce, and even agriculture and the management of flocks, having imported from Saxony and Silesia both herds of sheep and shepherds to take care of them. He called to him artists of all descriptions from other countries, and employed them in contriving, each in his appropriate department, how best to bring into development the natural resources of the country. He built a new capital, the first truly European city that had been seen in Russia, on a site which did not form part of the empire at his accession. Finally, he founded schools, academies, colleges, libraries, and museums, and thus laid the surest of all foundations for the permanent and progressive improvement of his people.

A college of physicians, a dispensary, an observatory, and a botanical garden, were among the establishments with which he adorned his two capitals. The art of printing had been introduced into Russia about the middle of the sixteenth century; but this early press seems to have hardly left any trace of its operations, and Peter, at his accession, found his country without books. To supply this deficiency, he had some scientific works translated into Russian; and when he was in Amsterdam, he employed a printer of that city to print them, giving him a monopoly for the sale of them in Russia. His Majesty himself, some time after this, remodelled the alphabet of his native language, considerably simplifying the forms

of the characters, and established several printing-houses in Petersburg, at which various elementary works were thrown off, mostly translated from foreign tongues.

In 1717, the Czar set out on a second foreign tour, attended on this occasion as became his rank. In the course of his progress he visited successively Hamburg, Berlin, Amsterdam, and Paris; in the last of which cities especially he found all that the arts had yet contrived for the use and enjoyment of man, in the highest state of advancement. He no longer now applied his hand to the practice of the different crafts which he inspected; his days of apprenticeship were over; but he was not on that account less diligent in visiting every workshop and manufactory in which any thing novel or curious was to be seen. He went also to see the observatory, the libraries, and the different learned institutions, and was present at a sitting of the Academy of Sciences, which admitted him one of its members.

This great man's education in his youth had been worse than neglected. His sister and her counsellors had even surrounded him with every seduction most calculated to deprave both his moral and intellectual nature, and to stifle in him the desire of knowledge. The bad parts of his character were undoubtedly, in a great measure, the result of the manner in which he was treated at this time of his life. Yet, violent and ungovernable as his passions continued to be, in some respects, to the last, making him act often with a ferocity unsurpassed by any thing that is told of the excesses of infuriated savages, he succeeded in completely overcoming that one of his evil habits which he found would have interfered most with the conduct of his great schemes. In his youth he was a slave to the love of ardent spirits, but he had weaned himself entirely, in his maturer days, from that destructive vice; nor was he insensible to the other defects of his original character which he had failed to correct. "Alas!" he would sometimes exclaim, on recovering from one of those paroxysms of rage by which he was liable to be carried away, "I have reformed my people, but have not been able to reform myself." Perhaps, however, no man in any station ever did more than this illustrious monarch to repair the mischievous consequences of a neglected youth, as far as intellectual acquirements are concerned. In addition to a competent knowledge of mathematics, mechanics, navigation, medicine, and anatomy, he appears to have made himself master of more than one of the modern languages of Europe. He translated several works from the French, the manuscripts of which are still preserved at Petersburg. He had even made himself familiar with the Latin tongue, if we are to believe an anecdote told by M. Stählin, of his detection, upon one occasion, of the inaccuracies of a monk whom he had employed to translate a work written in that language into Russian.

When he began to educate himself, he did not neglect even the more elegant and ornamental acquirements. During his first visit to Holland, he had an opportunity of seeing many good pictures; and this gave him a taste for painting, to which he was ever afterwards much devoted. Even while at Amsterdam, many of his hours were spent in the working-rooms of the eminent artists who then resided in that city, some of whom he engaged to accompany him to Russia. He afterwards expended very considerable sums in the purchase both of pictures and sculptures, and commenced the formation of a gallery of these works of art at Petersburg. He also formed a valuable collection of medals. Every department of liberal knowledge, indeed, found in Peter a munificent patron, and, so far as his leisure and opportunities permitted, even an ardent cultivator. When passing through any country, interesting from its historical recollections, were he conducting his army on a warlike expedition, he would go many miles out of his way to examine a celebrated ruin, or to tread a spot that fame had consecrated. In the same spirit, he was especially solicitous for the preservation of the old historic memorials of his own country. While travelling, his constant habit was to obtain as much information as he could beforehand, with regard to every place he was about to visit; and even when he approached the smallest village, he would inquire if it contained any thing remarkable. If those about him told him it did not, he would reply, "Who knows? if it be not so to you, perhaps it is to me; let me see all." When setting out on his investigations, on such occasions, he carried his tablets in his hand; and whatever he deemed worthy of remembrance was carefully noted down. He would often even leave his carriage, if he saw the country people at work by the way side as he passed along, and not only enter into conversation with them on agricultural affairs, but accompany them to their houses, examine their furniture, and take drawings of their implements of husbandry. He obtained in this manner much minute and correct knowledge which he could scarcely have acquired by other means, and which he afterwards turned to admirable profit in the improvement of his own country.

He was rarely absent when a dissection took place in Petersburg, and occasionally he assisted as one of the operators. He let blood and extracted teeth with great expertness; and he is recorded to have once tapped a patient for dropsy. These may not seem the most appropriate accomplishments for a king; but we must remember the peculiar circumstances of Russia during the reign of this great author of her civil-

ization. On the one hand, the simplicity of the national manners was such that it was not held at all indecorous for the Emperor to mix in the domestic circles of his subjects, almost as one of themselves; and, on the other, the prejudices of the people were so strong, and their aversion to innovation so bigotted, that probably nothing less than the actual example of their sovereign would have roused them to take any interest in the new arts he wished to introduce among them. Peter, therefore, rightly felt that the consideration of the undignified nature of some of the occupations in which he engaged was far more than overbalanced by the advantages that his personal exertions gave him, in overcoming the inertness and positive opposition on the part of his countrymen which his reforms had to encounter.

This must be his apology also (if the case shall be thought to require any) for certain other labours to which he was sometimes wont to apply his hand. He once passed a month, M. Stählin tells us, at Müller's iron-works at Istia, about seventy miles from Moscow, during which time he employed himself in learning the business of a blacksmith; and so much progress did he make, that on one of the last days of his stay he forged, with his own hand, 720 pounds of iron, making his mark on each bar. On his return to Moscow, he proceeded to Müller's house, and, having received from that gentleman the same pay for his labour which would have been allowed to any other workman, about two shillings of our money, he immediately went and purchased a pair of shoes with it, which he ever afterwards took great pleasure in shewing. One of the bars he forged on this occasion is still to be seen at Istia. He was also accustomed, according to Voltaire, to take his place sometimes among the men employed in cutting canals, a species of public labour on which he expended large sums, in order to encourage and animate them in the more difficult parts of their work. But his favourite art was that of ship-building, his lessons in which, learned in Holland and England, he took care not to forget on his return home.

Peter died in 1725, in the fifty-third year of his age. His history presents us with, perhaps, as remarkable a case of the conquest of difficulties in the pursuit of knowledge as it would be possible to quote. In his noble resolution to educate not only himself, but his country, he had to contend with obstacles at every step, which nothing could have overcome but that determination to succeed which overcomes all things. Few monarchs have better deserved the epithet of Great, if he is to be appreciated either by the great powers of mind he displayed, or the great effects he accomplished. And of these last, it is to be remarked that none have passed away; all have been permanent and productive. Compare Peter the Great, in this respect, with many other characters who during their time have filled the earth with the noise of their exploits, and how high must he be placed above them! Alexander's mighty empire fell to pieces as soon as his own hand had resigned its sceptre; so did that of Charlemagne; so did that of Buonaparte. These all, after moving everything, established almost nothing. But whatever the Russian planted still grows and flourishes, and bears fruit more plentifully every year. The reason is, that while other builders, up of empires have trusted, for the support of their institutions, alone, or chiefly to the sword, he based his on the moral strength of knowledge and civilization.

BURYING WITH THE HEAD TO THE WEST.

It is too much the custom in Presbyterian places of worship for the congregation to disregard all those observances which might be construed as signs of respect for the place where they are assembled. The people in the country march along the passages with their hats on, in the very same manner that they do in the highway; and when seated, they loll about in the pews, rest their heads upon their hands, fold their arms, and try all methods to adjust themselves in an easy position during the service. Then they think nothing of blowing their noses, which sound like so many occasional blasts of a trumpet; they seem to keep all their coughs for the Sunday, and burst in, full bark, between the singing of psalms and prayers, so that the minister and precentor are frequently under the necessity of pausing a space, until these appalling stertorations subside. Some, indeed, do remain at rest during the sermon; but though the poor preacher may flatter himself that it is because they are immersed in the profoundest and most reverential attention, he is destined, at the close of his discourse, to behold them stretch themselves as if they were just relieved from an oppressive load, or were struggling to get rid of the effects of a powerful soporific draught. If any one drops a bible or a pair of spectacles, a great commotion and stretching of necks take place, on account of the remarkable anxiety which generally prevails to ascertain with precision what it is that has caused the noise. There is a general looking of watches when the hour strikes, from a natural curiosity to know how many minutes of difference there is between their pieces and the church clock; and some who are scrupulous about keeping time, take that opportunity to adjust and regulate their watches, so that, as the cases are again successively closed, a snapping of springs and catches is heard all over the church. Then, if a baptism is to take place, every

as if he were about to put in a ceremony, though the real motive of the man and his child are like pardonable to go home, and not to be at church; and a sketch of the colour and texture of the clothes they were never proving unacceptable to the female friends who may happen to have kept the house for the day, a concussion of bonnets is not unfrequently the consequence of one female being desirous to gratify her curiosity as to the occupants of the seats to the left, while her next neighbour on that hand is preparing to make a similar scrutiny of those to the right. In short, too many people do little else, from the moment they enter church, but make signals to show how extremely uneasy they are in it.

On the other hand, the Catholic is attentive to preserve all the appearances of devotion. He listens unweariedly to the discourse of the priest, looks with reverence upon the ceremonies which are gone through in his presence, and departs apparently impressed with a sense of the truth of what he has heard. This punctiliousness in the observance, in all that regards the Deity, of all those forms of respect which civility requires from a man towards his superior, probably gave rise to a custom, which, as it is a convenient one, has been adhered to by Protestants, of whom few have any idea, or at all trouble themselves to consider, what may be the origin of it. The practice of digging all graves in a direction from west to east produces this advantage, that a much smaller plot of ground serves for a churchyard than if space were less economized, and bodies were laid in all directions, along, across, and aslant, as accident or fancy might determine. It was not this, however, but another consideration, which gave rise to it. There is a passage in the Gospel of St Matthew (chap. xxiv. ver. 27), which says, "For as the lightning cometh out of the east, and shineth even unto the west, so shall the coming of the Son of Man be." The meaning of this passage probably is, not that our Saviour, when he comes to judge the world, will approach it from any particular quarter, but that the knowledge of his presence will pervade it as rapidly as lightning. From a literal interpretation of the words, however, the opinion seems to have in elder times prevailed, that Jesus would at the resurrection appear from the east; and hence that, by being deposited in the grave with their faces upward and their heads to the west, the dead would be in readiness to stand up with their faces towards their Judge—a position more respectful than any other mode of sepulture would permit them to assume. As we have said, the custom, being established, is convenient for the present, though wholly immaterial as respects its supposed ultimate results.

It is plain that Swift alludes to this practice when he says, in *Gulliver's Voyage to Lilliput*, that the inhabitants of that country "bury their dead with their heads directly downward, because they hold an opinion, that in eleven thousand moons they are all to rise again, in which period the earth, which they conceive to be flat, will turn upside down, and by this means they shall at their resurrection be found ready standing on their feet. The learned among them," he adds, "confess the absurdity of this doctrine, but the practice still continues in compliance to the vulgar." This Lilliputian theory, it will be observed, would, if carried into effect, have produced peculiarly awkward consequences to those who held it, because, although, by the earth turning upside down, they would have been placed with their feet downwards, it would have been with nothing to stand upon; which any one may satisfy himself of who sticks a pin in a board, supposing the point to be the head of a man, and the board the earth; on reversing the board, the man's head is indeed upward, but the earth is above him, and his feet rest upon nothing. In this situation the Lilliputians would have been in a bad case for walking. This may be one absurdity of the doctrine which their learned men perceived; but the main one was that of believing that it could be of the slightest avail to any one at the last day whether his body had been deposited with the head or the heels upward. One of Swift's commentators has very wisely mistaken the meaning of this passage. "Here," says Lord Orrery, "the author dares even exert his vein of humour so liberally as to place the resurrection, one of the most encouraging principles of the Christian religion, in a ludicrous and contemptible light. Why should that appointment be denied to man, or appear so very extraordinary in the human mind, which the Author of Nature has illustrated in the vegetable world, where the seed dies and corrupts before it can rise again to new beauty?" This is a very cruel misinterpretation, the doctrine ridiculed being, as is above shown, not that of the resurrection, but the belief that the particular position of body will be of any consequence to people when that great event arrives.

It is probable that the Author of *Waverley* had this superstitious belief in his eye when he makes Meg Merrilies manifest her anxiety to be placed on her deathbed in a posture the reverse of that in which the dead are buried. It is very natural to suppose that the laying of a sick person with his head to the west should come to be considered ominous, and that, therefore, the position was always the reverse. It is quite in unison with Meg's character, that, though in a state where an omen of death could not make its approach more certain, she should be scrupulously observant of old customs. The passage referred to is as follows:—

"When the gipsy arrived at the hut, she produced the key; and when they entered, and were about to deposit her upon the bed, she said, in an anxious tone, 'Na! na! not that way; the head to the east;' and appeared gratified when they reversed her posture accordingly." On the scaffold, before the execution of Sir Walter Raleigh, a reference to the same superstition was made, and his comment upon it may very well serve to conclude what we have to say on the subject. "He called for the executioner," says Jardine, in his *Criminal Trials* (vol. i. p. 509), "who kneeling, and asking his forgiveness, he laid both his hands upon his shoulders, and said he heartily forgave him. And there being some dispute that his face should be toward the east, he made answer and said, 'So the heart be straight, it is no matter which way the head lieth.'"

Now that the bodies of suicides are sometimes permitted to be interred in consecrated ground, they are not buried like the other dead, but with the head to the north and the feet to the south. Suicides were formerly buried in England in cross ways, and had a hedgeway driven through their bodies; in Scotland they were buried—as if not only consecrated ground, but every other portion of earth, rejected, as far as possible, the unholy remains—where "three lairds' lands met." This was for the most part in wild situations on the tops of mountains; and many such places, particularly in the south of Scotland, are still distinguished by names which mark them out as spots where such interments have taken place. "The Dead Wife's Grave" is a prevailing designation of this kind for mounds still to be seen on many elevated ridges.

POPULAR INFORMATION ON HISTORY.

EGYPT.

THE study of History, which is so much calculated to enlarge and cultivate the understandings of youth, usually commences with a perusal of the annals of those nations in the east in which the light of science and the charms of civilization first arose and humanized the faculties of our race. Among those ancient kingdoms and empires, now decayed and little known in the intercourse of the modern world, the most honourable place has been given to Egypt—a country which, long ere Greece was known, or the foundations of Rome were laid, was inhabited by a learned and ingenious people, governed on regular principles, and capable of offering an example to the inhabitants of other parts of the earth. In point of local situation, Egypt possesses various advantages. It lies in the north-east corner of Africa, in a salubrious part of that vast continent, presenting its northern base to the Mediterranean Sea, and bounded on the east by the Red Sea, which separates it from Asia. Through the whole land from north to south, a length of six hundred miles, flows the Nile, a fine large stream rising in the inland kingdom of Abyssinia, and, from certain periodic floods, of great use in irrigating and fertilizing the country. A large portion of Egypt consists of an alluvial plain, similar to our fertile carse grounds, formed by the deposits of the river, and bounded by ranges of mountains on either side. The greatest breadth of the land is 150 miles. Anciently this territory was divided into three principal parts—Upper Egypt, or Thebais (from Thebes, its capital city), which was in the inner or southern part; Middle Egypt; and Lower Egypt, which included what was called the Delta, a low district of land on the shores of the Mediterranean, formed by the mouths of the Nile into the shape of the Greek letter Δ, or delta.

The history of the people who at one time inhabited this remarkable country is carried by their annals to the very earliest ages of the world; indeed, to a period far more remote than that ascribed by Moses to the creation of the universe. When divested of fable, it appears that an Egyptian monarchy was established by Menes, or Misraim, in the year of the world 1816, and that it lasted till the year 3479, when it was destroyed by Cambyses, King of Persia. To Misraim succeeded a line of sovereigns of great power and fame, almost every one of whom seems to have delighted in rearing edifices of extraordinary magnitude and splendour. Extensive and beautiful cities, obelisks, pyramids, and temples, were erected without regard to the toil or resources of the people; and as their remains are till this day extant, and have been described by travellers, we are impressed with the most significant tokens of the taste and knowledge of the ancient Egyptians. Although each of the Egyptian monarchs was distinguished by his own peculiar name—as Moeris, Rameses, Sesostrius, Pheron, Cheops, &c.—those who reigned for a considerable period, in Lower Egypt especially, were designated Pharaoh, a title commonly used in Scripture to express the Egyptian

rulers at the time. The Pharaoh who was noted for his oppression of the Israelites, and who flourished 1577 years before the Christian era, was properly called Rameses Miamum, while his son, the Pharaoh under whose reign the Children of Israel departed out of Egypt, and who was drowned in the Red Sea, was entitled Amenophis.

The country thus governed, by a course of circumstances unknown to the present age, and which will most likely ever remain hid from our understanding, was the first on the face of the earth which exhibited any demonstrations of education and intelligence, and it was from hence that most of the arts, the sciences, and other branches of human skill and knowledge, were derived. "This kingdom (says Rollin) bestowed its noblest labours and finest arts on the improving of mankind; and Greece was so sensible of this that its most illustrious men—as Homer, Pythagoras, Plato, even its great legislators, Lycurgus and Solon, with many more—travelled into Egypt to complete their studies, and draw from that fountain whatever was most rare and valuable in every kind of learning. God himself has given this kingdom a glorious testimony, when, praising Moses, he says of him, that 'he was learned in all the wisdom of the Egyptians.'" Such was the desire for encouraging the growth of scientific pursuits, that discoverers of any useful invention received rewards suitable to their skill and labour. They studied natural history, geometry, and astronomy, and, what is worthy of remark, they were so far masters of the latter science as to be aware of the period required for the earth's annual revolutions, and fixed the year at 365 days 6 hours—a period which remained unaltered till the very recent change of the style. They likewise studied and improved the science of physic, in which they attained a certain proficiency. The persevering ingenuity and industry of the Egyptians are attested by the remains of their great works of art, which could not well be surpassed in modern times; and although their working classes were doomed to engage in the occupations of their fathers, and no others, as is still the custom in India, society might thereby be hampered, but the practice of handicrafts would be certainly improved. The Egyptians were also the first people who were acquainted with the process of communicating information by means of writing, or engraving on stone and metal; and were, consequently, the first who formed books and collected libraries. These repositories of learning they guarded with scrupulous care, and the titles they bore naturally inspired a desire to enter them. They were called the "Office for the Diseases of the Soul," and that very justly, because the soul was there cured of ignorance, which, it will be allowed, is the source of many of the maladies of our mental faculties. As these repositories of the learning of the ancient Egyptians were all destroyed, and are only known from the records of historians, the works of their sages and poets cannot now be shewn; and it is by little else than the inscriptions on stones, found amidst the ruins of pyramids and temples, that we are so much as aware of the nature of the characters employed in their writing. These characters were exceedingly curious, consisting chiefly of representations of animate and inanimate objects, each of which stood for some particular idea. The use of emblematic figures seems to have been, as it still is, common among uncultivated races of men, being the first approach towards literature; but the use of an alphabet, by which words are formed by combinations of different characters, was, in early times, confined entirely to the Egyptians, from whom the invention was communicated across the Mediterranean to Greece, by a person of celebrity called Cadmus, and from thence spread into other European nations. It is also understood that the Israelites, and other Asiatics, received their knowledge of letters from the learned inhabitants of Egypt. The use of rude emblematic figures was not abandoned by the Egyptians as letters became known, but continued chiefly to denote matters of a mysterious or religious tendency. These figures have received the name of *hieroglyphics*, and are of various kinds, more or less significant of the thing or idea intended to be expressed. For thousands of years the world remained in total ignorance of the manner of deciphering these hieroglyphics, for the Egyptians left no clue wherewith to make the discovery; and it was only in 1814 that, by the researches of some Frenchmen, a key was made known. It was found that, although the figures often signify the thing which they represent—for instance, the figure of a lion signifying that animal—yet, that in many instances it does no such thing, but stands simply for the letter L, which is the initial letter in the word *lion*. The discovery of this mode of deciphering the Egyptian hieroglyphics, by reckoning only the initial letters in the names of the things represented, lays open a wide field for the investigation of learned and inquisitive travellers in the ancient territory of the Pharaohs.

The comparative intelligence of the Egyptians did not rescue them from the most debasing superstitions in their religious faith. They had a great number of ideal gods; among others, Osiris and Isis, which are thought to have been the sun and the moon. They also worshipped a number of beasts, as the ox or bull (under the name of Apis), the dog, the wolf, the hawk, the crocodile, the ibis or stork, the cat, &c.; and such was the reverence which they had for these animals, that, in extreme famine, they chose to eat one another rather than feed on their imagined deities. The Egypt-

tians had a belief, inculcated by their priests, that the souls of men, after death, passed into the bodies of clean or unclean animals, according to the deeds done in the body, and that at a distant period of time they returned to the body to which they originally belonged. A doctrine so extravagant led their kings to build enormous architectural edifices for the reception of their bodies, in order that they might, as they thought, repose in safety till they were again to be endowed with a living soul. In this fantastic notion we find a satisfactory solution of the mysterious practice of inhaling mummies in those huge pyramids, now reckoned among the greatest wonders in the world.

In the days of Egypt's ancient glory, it was dignified with two greater and many lesser cities. The two principal were Thebes, the capital of Upper Egypt, and a city of extraordinary extent and splendour; and Memphis, the capital of the middle district of the country. Memphis was built on the west side of the Nile, and has been succeeded by the comparatively modern city of Cairo, on the east bank of the river. On the site of Thebes and Memphis, and in their neighbourhood, are now found the greatest quantity of the ruins of ancient temples and other magnificent erections. In the present day Thebes receives the name of Said.

Like all other distinguished nations of antiquity, Egypt, after a lengthened period of extensive civil power, military glory, and dignified learning, suffered a series of reverses of fortune, and finally sunk into a state of utter poverty and barbaric ignorance. The political distractions into which it fell were taken advantage of by the Babylonians, under their king, Nebuchadnezzar, who, according to the promises of the Almighty, recorded by the prophet Jeremiah—"I will give the land of Egypt unto Nebuchadnezzar, King of Babylon, and he shall take her multitude, and take her spoil, and take her prey, and it shall be the wages of his army," &c.—overran the country with his hosts, and carried off, in peace, an immense quantity of its moveable wealth. This transaction took place about 569 years before Christ; and it will be remembered by the readers of Scripture that the Egyptians, on this and other occasions, excited the anger of the Deity, and brought upon them the visitations of his outraged providence, by their vicious and idolatrous practices. About forty-four years afterwards, Egypt was again intruded upon by force of arms, and fell a prey to the conquering hordes of Persia under Cyrus. It now became a distant colony of Persia, which maintained an authority over it for more than two hundred years, at the end of which it was seized by Alexander the Great, a monarch of Greece, who shortly afterwards conquered the whole of Persia. Besides settling the government of the country, Alexander improved it in various ways—among the rest of his enterprises, building the city of Alexandria, which he called after his own name; and as it was placed on the sea-coast, at one of the mouths of the Nile, it speedily rose to be one of the largest and most opulent sea-port towns in the world. Upon the division of the Persian empire some time later, Egypt fell to Ptolemy Lagus, one of Alexander's generals, who was succeeded by a race of princes distinguished by the name of Ptolemy, in addition to their other appellations; and hence the Ptolemies of Egypt who are spoken of in ancient history. The last royal descendant of this noble Grecian line was Cleopatra, a princess of great beauty and accomplishments, and at her decease, which she accomplished by suicide, the land of Egypt became a province of Rome, some of whose emperors endeavoured to revive in it a love of letters, and enriched it by various improvements. Subsequently, Egypt fell into a state of ruinous distraction, consequent on the troubles and decline of the Roman government, and was at last completely subdued by the Saracens, who introduced the religion of Mahomed, destroyed the libraries, and, as far as possible, the splendid works of art; so that, under their sway, every species of barbaric rudeness was made to supersede the ancient refined habits of the people. Since that dismal epoch, Egypt has, century after century, sunk deeper and deeper into a state of perfect neglect and ruin. In recent times it has been under the immediate despotic rule of Mahomet Ali, nominally a pasha of the Sultan of Constantinople, and a man who is apparently both able and willing to do much towards restoring civilization to the place of its birth.

CRACOW.*

AT about one A.M. on the 19th of August we reached the confines of the small portion of territory attached to the town of Cracow. Here we were stopped, it being necessary that our passport and luggage should be examined at the customhouse, which could not take place before five or six o'clock. Our German had now ceased to be of service to us; and as the postilion understood nothing but Polish, we were kept half an hour in the midst of the road in a dark rainy night, vainly endeavouring to persuade our postilion to proceed, and unable to conjecture the cause of delay. The mystery was at length explained by our being taken back to the posthouse where we had last changed horses, the driver of which, being a German, informed us of the nature of the predicament in which we were placed, and having directed us to a miserable hovel, called an inn, left us to shift for ourselves during the rest of the

* One of the chief cities in Poland.

night as well as we were able. We aroused the people, and, after much difficulty, gained admission to a dirty room, where we found two German officers asleep on the chairs. There being no beds to be had in the place, they brought us in two bundles of straw, and spread it on the floor. We laid ourselves down in the hope of having a few hours' repose. Scarcely, however, had we closed our eyes, when a simultaneous attack of fleas soon convinced us that sleep was not for us; and the remainder of the night was spent in writhing and scratching, and wishing for day-light. An early breakfast, on black coffee and brown bread, the only refreshment which the house afforded, having been soon despatched, we once more set out, and in a few hours after, having passed through the purgatorial forms of the customhouse, we found ourselves in the suburbs of the once flourishing and populous Cracow. The inn at which we stopped had a long range of apartments for windows, eighteen in number, only three of which were furnished with glass. The chimneys tottering, and the tiles sliding from the roofs of all the surrounding houses, added to the miserable and squalid appearance of the inhabitants, who consisted of Jews, convicts, and a semi-barbarous peasantry, presented a scene of dilapidation and misery never to be forgotten. Having been provided by the landlord of the inn with a sort of cicerone, who undertook to shew us the principal parts of the town, we turned our steps towards the castle. This is a large pile of building, on a slight eminence, which commands the town. Only a part of the inclosure within the walls is occupied by the structure itself, there being a large yard, from which you enter the cathedral. Here are the tombs containing the mouldering remains of the Kings of Poland. The valiant and the vile, the paternal and the despotic, side by side, partake a general doom, untroubled by the woes and slavery of their wretched country, for whose downfall they, by internal dissensions, but too surely prepared the way. But the tombs of the Casimirs, the Sigismunds—rich as they are in historic recollections—pass from the mind of the traveller as he stands by the monument raised to the memory of Sobieski. This hero was the first to stem the torrent of Islamism, which, having overrun the whole of Hungary, threatened to sweep away the Austrian empire; and, with an army of sixty-three thousand men, though opposed by six times that number, he repelled the invaders, saved the throne of Leopold, and caused a turn in that tide of Ottoman power which is now at its lowest ebb in Europe. Lamentable indeed is it, that the empire, so rescued in its hour of need, which owed its safety, and, we may say, owes its present existence to Poland, should have been among the first to assist and partake in the dismemberment of that once rich and noble kingdom—a dismemberment which must eternally stand recorded among the most flagitious and unblushing outrages on political faith and national law. Our regret for the unmerited prostration of Poland is increased, if we take a comparative view of the present state and prospects of the Poles and Greeks. Whilst the former are subject to a system of unrelenting espionage and constraint, and, in return for their chivalrous exertion in the cause of Christianity and European freedom, are abandoned to a merciless despotism, the latter, who, by their intrigues and pusillanimity, prepared the way for the Turkish invasion; who lowered the cross to the crescent, and crouched in the very dust beneath Ottoman dominion; who equal their conquerors in fanaticism, and exceed them in vice, without partaking of one spark of that honour and bravery which have ever distinguished the Turkish character; are held forth as the inheritors of the high spirit and patriotism which gave undying glory to ancient Greece. Thus, the needy adventurer and Philhellene, taking advantage of the false impressions imbibed through classic associations, mislead the untravelled enthusiast; and thus is the fate of nations decided by the dreaming influence of schoolboy recollections.

On leaving the body of the church, we were conducted by our guide to the crypt below, which contains the tomb of Sobieski, and the coffin in which are the remains of Poniatowski. We then left the castle, and, descending the eminence, entered a church, which we found crowded with people lying round the altar, with their arms extended and motionless. The aisles were filled with devotees, many kissing the ground, some striking their breasts, and few evincing the calm of true devotion. The church is long, lofty, and gaudily gilded. Returning towards the inn, we entered a bookseller's shop, to seek for some publication enumerating the objects worthy of being visited in the town, and were surprised to find a translated edition of Scott's *Life of Napoleon*, which, though only published in England a few weeks before, had already found its way to this remote and unfrequented city.

On a height to the left, about a mile from the town, is a conical mount, to the memory of Kosciusko.

Cracow has about forty thousand inhabitants, chiefly Jews, all of whom dress alike, in a black robe, and wear their hair very long. They carry long sticks, and usually wear fur hats with broad rims. The part called Mount Vistula is inhabited exclusively by them. As you pass the doors, they come out and take you by the hand, imploring you to buy something of them. The women have very long hair, and caps of cloth and fur. The dress of the unmarried is somewhat distinctive, consisting of a red kerchief tied round the head like a turban, the curls falling from beneath.—*Webster's Travels through the Crimea*, 1830.

BATTLE OF OTTERBOURNE.

In the year 1388, the Scottish nobles had determined upon an invasion of England on a large scale, and had assembled a great army for that purpose; but, learning that the people of Northumberland were assembling an army on the eastern frontier, they resolved to limit their incursion to that which might be achieved by the Earl of Douglas, with a chosen band of four or five thousand men. With this force he penetrated into the mountainous frontier of England, where an assault was least expected, and, issuing forth near Newcastle, fell upon the flat and rich country around, slaying, plundering, burning, and loading his army with spoil.

Percy, Earl of Northumberland, an English noble of great power, and with whom the Douglas had frequently had encounters, sent his two sons, Sir Henry and Sir Ralph Percy, to stop the progress of this invasion. Both were gallant knights; but the first, who, from his impetuosity, was called Hotspur, was one of the most distinguished warriors in England, as Douglas was in Scotland. The brothers threw themselves hastily into Newcastle, to defend that important town; and as Douglas, in an insulting manner, drew out his followers before the walls, they came out to skirmish with the Scots. Douglas and Henry Percy encountered personally; and it so chanced that Douglas got possession in the struggle of Hotspur's spear, to the end of which was attached a small ornament of silk, embroidered with pearls, on which was represented a lion, the cognizance, as it is called, of the Percies. Douglas shook this trophy aloft, and declared that he would carry it into Scotland, and plant it on his castle of Dalkeith. "That," said Percy, "shalt thou never do. I will regain my lance ere thou canst get back into Scotland." "Then," said Douglas, "come to seek it, and thou shalt find it before my tent."

The Scots army, having completed the purpose of their expedition, began their retreat up the little river Reed, which afforded a tolerable road running towards the Scottish frontier. They encamped at Otterbourne, about twenty miles from the frontier, on the 19th August 1388. In the middle of the night the alarm arose in the Scottish camp that the English host were coming upon them, and the moonlight showed the advance of Sir Henry Percy, with a body of men equal, or superior, in number to that of Douglas. He had already crossed the Reed water, and was advancing towards the left flank of the Scottish army. Douglas, not choosing to receive the assault in that position, drew his men out of the camp, and, with a degree of military skill which could scarce have been expected when his forces were of such an undisciplined character, he altogether changed the position of the army, and presented his troops with their front to the advancing English.

Hotspur, in the meantime, marched his squadrons through the deserted camp, where there were none left but a few servants and stragglers of the army. The interruptions which the English troops met with threw them a little into disorder, when the moon arising showed them the Scottish army, who they fancied were retreating, drawn up in complete order, and prepared to fight. The battle commenced with the greatest fury; for Percy and Douglas were the two most distinguished soldiers of their time, and each army trusted in the courage and talents of their commanders, whose names were shouted on either side. The Scots, who were outnumbered, were at length about to give way, when Douglas, their leader, caused his banner to advance, attended by his best men. He himself, shouting his war-cry of "Douglas!" rushed forward, clearing his way with the blows of his battle-axe, and breaking into the very thickest of the enemy. He fell, at length, under three mortal wounds. Had his death been known, it would probably have decided the battle against the Scots; but the English only knew that some brave man-at-arms had fallen. Meantime the other Scottish nobles pressed forward, and found their general dying among several of his faithful esquires and pages, who lay slain around. A stout priest, called William of North-Berwick, the chaplain of Douglas, was protecting the body of his patron with a long lance.

"How fares it, cousin?" said Sinclair, the first Scottish knight who came up to the wounded leader.

"Indifferently," answered Douglas; "but, blessed be God, my ancestors have died in fields of battle, not on down beds. I sink fast; but let them still cry my war-cry, and conceal my death from my followers. There was a tradition in our family that a dead Douglas should win a field, and I trust it will be this day accomplished."

The nobles did as he had enjoined; they concealed the Earl's body, and again rushed on to the battle, shouting "Douglas! Douglas!" louder than before. The English were weakened by the loss of the brave brothers, Henry and Ralph Percy, both of whom were made prisoners, fighting most gallantly, and almost no man of note amongst the English escaped death or captivity. Hence a Scottish poet has said of the name of Douglas—

"Hosts have been known at that dread sound to yield,
And Douglas dead, his name has won the field."

Sir Henry Percy became the prisoner of Sir Hugh Montgomery, who obliged him, for ransom, to build a castle for him at Eaglesham, in Renfrewshire, which he called *Poinon*, from having been reared with *poiné* money. The battle of Otterbourne was disastrous to

the leaders on both sides, Percy being made captive, and Douglas slain on the field. It has been the subject of many songs and poems, and the great historian Froissart says that, one other action only excepted, it was the best fought battle of that warlike time.

NOVEMBER.

Now (says the author of the *Mirror of the Months*), as the branches become bare,—another sight presents itself, which, trifling as it is, fixes the attention of all who see it. I mean the *birds' nests* that are seen here and there in the now transparent hedges, bushes, and copses. Now, the *falling of wood* for the winter store commences; and, in a mild still day, the measured strokes of the woodman's axe, heard far away in the thick forest, bring with their sound an associated feeling, similar to that produced by a wreath of smoke rising from out the same scene: they tell us a tale of

"Uncertain dwellers in the pathless wood."

The "*busy flail*," too, which is now in full employment, fills the air about the homestead with a pleasant sound, and invites the passer-by to look in at the great open doors of the barn, and see the wheatstack reaching to the roof on either hand; the little pyramid of bright grain behind the threshers; the scattered ears between them, leaping and rustling beneath their fast-falling strokes; and the flail itself flying harmless round the labourers' heads, though seeming to threaten danger at every turn; while, outside, the flock of "barn-door" poultry ply their ceaseless search for food, among the knee-deep straw; and the cattle, all their summer frolics forgotten, stand ruminating beside the half-empty hay-rack, or lean with inquiring faces over the gate that looks down into the village, or away towards the distant pastures.

Of the *birds* that have hitherto made merry even at the approach of winter, now all are silent; all, save that one who now earns his title of "the household bird," by haunting the thresholds and window-cills, and casting sidelong glances in-doors, as if to reconnoitre the positions of all within, before the pinching frosts force him to lay aside his fears, and fit in and out, silently, like a winged spirit. All are now silent except him; but he, as he sits on the pointed palings beside the door-way, or on the topmost twig of the little black thorn that has been left growing in the otherwise closely-clipt hedge, pipes plaintive ditties with a low inward voice—like that of a love-tainted maiden, as she sits apart from her companions, and sings soft melodies to herself, almost without knowing it.

Some of the other small *birds* that winter with us, but have hitherto kept aloof from our dwellings, now approach them, and mope about among the house-sparrows, on the bare branches, wondering what has become of all the leaves, and not knowing one tree from another. Of these the chief are the hedge-sparrow, the blue titmouse, and the linnet. These also, together with the goldfinch, thrush, blackbird, &c., may still be seen rifling the hip and haw-grown hedges of their scanty fruit. Almost all, however, even of those singing-birds that do not migrate, except the redbreast, wren, hedge-sparrow, and titmouse, disappear shortly after the commencement of this month, and go no one knows whither. But the pert house-sparrow keeps possession of the garden and courtyard all the winter; and the different species of wagtails may be seen busily haunting the clear cold spring-heads, and wading into the unfrozen water in search of their delicate food, consisting of insects in the *aurelia* state.

Now, the *farmer* finishes all his out-of-door work before the frosts set in, and lays by his implements till the awakening of spring calls him to his hand-labour again.

Now, the *sheep*, all their other more natural food failing, begin to be penned on patches of the turnip-field, where they first devour the green tops joyfully, and then gradually hollow out the juicy root, holding it firm with their feet, till nothing is left but the dry brown husk.

Now, the *herds* stand all day long hanging their disconsolate heads beside the leafless hedges, and waiting as anxiously, but as patiently too, to be called home to the hay-fed stall, as they do in summer to be driven afield.

Now, cold rains come deluging down, till the drenched ground, the dripping trees, the pouring eaves, and the torn ragged-skirted clouds, seemingly dragged downward slantwise by the threads of dusky rain that descend from them, are all mingled together in one blind confusion; while the few cattle that are left in the open pastures, forgetful of their till now interminable business of feeding, turn their backs upon the besieging storm, and, hanging down their heads till their noses almost touch the ground, stand out in the middle of the fields motionless, like dead images.

Now, too, a single rain-storm, like the above, breaks up all the paths and ways at once, and makes home no longer "home" to those who are not obliged to leave it; while, *en revanche*, it becomes doubly endeared to those who are.

London is so perfect an antithesis to the country in all things, that whatever is good for the one is bad for the other. Accordingly, as the country half forgets itself this month, so London just begins to know itself again. Its streets revive from their late suspended animation, and are alive with anxious faces, and musical with the mingled sounds of many wheels.

Now, the shops begin to shine out with their new winter wares; though as yet the chief profits of their

owners depend on disposing of the "summer stock," at fifty per cent. under prime cost.

Now, the theatres, admonished by their no longer empty benches, try which shall be the first to break through that hollow truce on the strength of which they have hitherto been acting only on alternate nights.

Now, during the first week, the citizens see visions and dream dreams, the burthens of which are barons of beef; and the first eight days are passed in a state of pleasing perplexity, touching their chance of a ticket for the Lord Mayor's dinner on the ninth.

Now, all the little boys give thanks in their secret hearts to Guy Faux, for having attempted to burn "the Parliament" with "gunpowder, treason, and plot," since the said attempt gives them occasion to burn every thing they can lay their hands on—their own fingers included: a bonfire being, in the eyes of an English schoolboy, the true "beauteous and sublime of human life."

YOUNG RANDAL.

Young Randal was a bonnie lad, when he gaed awa,
Young Randal was a bonnie lad, when he gaed awa;
'Twas in the sixteen hunder year o' come had chresty twa,
That Randal, the laird's youngest son, gaed awa.
It was a' to seek his fortune in the High Germanie,
To fecht the foreign loons in the High Germanie,
That he left his father's tower o' sweet Willanslee,
And mony wae friends i' the North Countrie.
He left his mother in her bower, his father in the ha',
His brother at the outer yett, but and his sisters twa,
And his bonnie cousin Jean, that look'd ower the castle wa',
And, mair than a' the lave, loot the tears down fa'.
"Oh, when will ye be back?" sae kindly did she spier,
"Oh, when will ye be back?" my himmie and my dear!"
"Whenever I can win enouch o' Spanish gear,
To dress ye out in pearlyns and silks, my dear."
Oh, Randal's hair was coal black, when he gaed awa,
Oh, Randal's cheeks were roses red, when he gaed awa,
And in his bonnie ee, a spark glintit high,
Like the merrie, merrie lark, in the morning sky.
Oh, Randal was an altert man when he came hame,
A sair altert man was he, when he came hame;
Wi' a ribbon at his breast, and a sif at his name,
And grey, grey cheeks, did Randal come hame.
He leikit at the outer yett, and rispit wi' the ring,
And down came a ladie to see him come in,
And after the ladie came bairns fifteen—
"Can this muckle wife be my true-love, Jean?"
"Wha'na stoure carl is this," quo' the dame;
"Sae gruff and sae grand, and sae feckless and sae lame?"
"Oh, tell me, fair madam, are ye bonnie Jeanie Grahame?"
"In troth," quo' the ladie, "sweet sir, the very same."
He turned him about, wi' a waeiful ee,
And a heart as sair as saul could be;
He lap on his horse, and awa did wildly fee,
And never mair came back to sweet Willanslee.
Oh, dule on the purith o' this countrie,
And dule on the wars o' the High Germanie,
And dule on the love that forgetfu' can be—
For they've wrecked the bravest heart in this hale countrie!
R. C.

MIERS'S "TRAVELS IN CHILE."

THE difference between a Frenchman and an Englishman is certainly very great and very remarkable. Mr Miers, the author of this book, in conjunction with a friend, was possessed of a disposable capital of twenty thousand pounds. Were a Parisian to find himself in possession of a moiety of this sum, would he not, married or single, live in two or three spacious garrets within half a mile of the gardens of the Tuilleries or the Luxembourg? Would he not spend his mornings at the café or the reading room? his evenings in promenading the walks and gardens, or assisting at some *spectacle*? Would his wife have any domestic affairs to attend to? Certainly not. He and she dine, separately or in company, at a restaurateur's, who takes all the business of dinner on himself, and, with the keeper of the café, all the business of all the meals. The quiet home is disturbed by few servants, and by no odour of cookery, neither by noisy children: a Parisian family is always small. It is exceedingly *ennuyeux* to both parties to be burthened by more than one or two children. Look on this picture, and then on the English one. Mr Miers, being in possession of a moderate and disposable fortune, considers it in no other light than capital—as the seed of future wealth—and immediately casts about how he may increase it by some enterprise tenfold, and in a few years make himself an enormously rich man. The scene of money-making for the moment is supposed to be South America—Chile presents itself, and an experiment on copper promises much. Yes; "the conclusion was irresistible," says Mr Miers, "that upon the given data an immense fortune might rapidly be made in the proposed speculation." This was enough—Mr Miers spends his honeymoon in purchasing and shipping a grand train of machinery for refining, rolling, and manufacturing copper into sheathing; the next months of married happiness are spent on board a packet bound for Buenos Ayres; his wife is then hurried across the continent, from the Atlantic to the Pacific, and the painful period of gestation is passed in tumbling through the broken roads and barbarous deserts of the Pampas, until the moment of parturition arrives, and the unfortunate wife of the anxious speculator is brought to bed, if it may be so termed, in a savage pass of the lofty and almost inaccessible Andes. All this too, with the utmost attachment and tenderness on the part of the enterprising husband; and with the greatest courage, strength of mind, and heroic fortitude of the English wife. The unhappy lady faints on her mule; her anxious husband conveys her to a wretched post-bud, unsheltered from either rain or wind, where she is delivered. In this atrocious place she recovers from her labour and her puerperal fever, until the time comes when her husband may carry her, on hides and poles borne on the shoulders of himself and of three

others, forty-five miles to the nearest civilized place, which he does till the poles eat into the very flesh of his scapulary muscles. This is only a trifling part of the difficulties which Englishmen will voluntarily encounter in a speculation, when an "immense fortune" is to be "rapidly" acquired. Mr Miers leaves his wife and new-born child in a comfortable retreat, and proceeds to the end of his journey; for his machinery is to be landed, the ships will charge for demurrage, and the workmen will get drunk and run away; besides, the capital is lying dead. When this machinery is landed, the speculator has all the prejudices of the natives to contend with, their rogueries and jealousies to defeat, the corruption and delay of their courts of justice to submit to, the ingratitude and neglect of friends to bear with, before the great manufacturing train can be put into action. All this and more Mr Miers, it seems, had to contend with, for we doubt whether the machinery is even yet at work; and Mr Miers is in England, and Mrs Miers is at Concon, in Chile, where the great fortune is or was to be made. However, whether Mr Miers has succeeded in making a good speculation or not, his adventures have put him into the way of compiling an excellent book. Certainly, neither the very excellent one of Captain Basil Hall, nor that of Mrs Graham, nor any other we have seen, is entitled to more attention, from the fulness and variety of its instruction.—*London Magazine*.

AN OLD SCOTTISH PUNISHMENT.

It appears, from the Records of Justiciary, that a custom at one time prevailed in criminal jurisprudence of commuting sentence of death into gifting away as slaves into perpetual servitude under specified masters. The following extract will make the mode of gifting understood:—

"At Perth, the 5th day of December 1701. The Commissioners of Justiciary of the south district, for securing the peace in the Highlands, considering that Donald Robertson, Alexander Stewart, John Robertson, and Donald McDonald, prisoners within the Tolbooth, and indicted and tried at this court, and by virtue of the inquest, returned guilty of death; and the Commissioners have changed their punishment of death to perpetual servitude, and that the said pannels are at the court's disposal: Therefore, the said Commissioners have given and gifted, and hereby give and gift, the said Donald McDonald, one of the said prisoners, as a perpetual servant to the Right Honourable John Earl of Tullebardane; recommending to his Lordship to provide a collar of brass, iron, or copper, which, by his sentence or doom, whereof an extract is delivered to the magistrates of the said burgh of Perth, is to be upon his neck, with this inscription:—'Donald McDonald, found guilty of death for theft, at Perth, December 5, 1701, and gifted as a perpetual servant to John Earl of Tullebardane.' Recommending to his Lordship to transport him from the said prison next week," &c.

It would appear that a similar commutation was made of the doom of the other prisoners. About forty years ago, some fishermen, in dragging their nets in the river Forth, above Alloa, brought up from the bottom a brass collar with this inscription upon it:—"Alexander Stewart, found guilty of death for theft, at Perth, 5th December 1701, and gifted by the Justiciars, as a perpetual servant to Sir John Aresken of Alva." This curious collar is now in the possession of the Society of Scottish Antiquaries.

LORD SANQUHAR AND THE FENCING-MASTER.

We learn from every authority that duels became nearly as common in England, after the accession of James VI., as they had ever been in France. The point of honour, so fatal to the gallants of the age, was nowhere carried more highly than at the court of the pacific Solomon of Britain. Instead of the feudal combats upon the *Hiegate of Edinburgh*, which had often disturbed his repose at Holyrood, his leaves at Theobald's were occupied with listening to the detail of more polished, but not less sanguinary contests.

Though such shifts might occasionally be resorted to by the faint-hearted, yet the fiery cavaliers of the English court were but little apt to profit by them; their vengeance for insulted honour sometimes vented itself through fouler channels than that of fair combat. It happened, for example, that Lord Sanquhar, a Scottish nobleman, in fencing with a master of the noble science of defence, lost his eye by an unlucky thrust. The accident was provoking, but without remedy; nor did Lord Sanquhar think of it, unless with regret, until some years after, when he chanced to be in the French court. Henry the Great casually asked him how he lost his eye? "By the thrust of a sword," answered his Lordship, not caring to enter into particulars. The King, supposing the accident the consequence of a duel, immediately inquired, "Does the man yet live?" These few words set the blood of the Scottish nobleman on fire; nor did he rest till he had taken the base vengeance of assassinating, by hired ruffians, the unfortunate fencing-master. The mutual animosity betwixt the English and Scottish nations had already occasioned much bloodshed among the gentry, by single combat; and James now found himself under the necessity of making a striking example of one of his Scottish nobles, to avoid the imputation of the grossest partiality. Lord Sanquhar was condemned to be hanged, and suffered that ignominious punishment accordingly.

CHAMBERS' EDINBURGH JOURNAL

SATURDAY, NOVEMBER 10, 1832.

PRICE THREE HALFPENCE.

TURNERS.

"TURNERS" are a class of people, so called because they regularly take what they call a *turn* every Sunday afternoon before dinner. They are a middle-aged order of men, married and unmarried; and you may always know them at a distance, even when they mingle in the crowds of the emptying churches, by their faces rendered rosy with the country air, their shoes somewhat dusty or muddy, and the breasts of their coats blown back over their shoulders, as if they were anxious to receive as much of the air as possible. Your *turner* of the present year of God 1832, is a *black* of the year of Grace 1808 or 9, and a *muttoner** of 1820. He is confined all the week by some sedentary employment, to which he sits down every day regularly at ten o'clock—having first opened, with a neat and adroit jerk, the lowest button of his waistcoat—and from which he does not rise till four, after which he takes a *constitutional walk* till five. The arrear of exercise and air, which has been gathering during the week, he pays off by one good "*turn*" on the Sunday afternoon, having first heard the forenoon sermon—or perhaps not—in some respectable church, such as St Giles's, which always presents ample scope and verge enough for a great number of what may be called skir-mishing church-goers. Say he has been indulging a little on the Saturday night, in the lodgings of some friend, or in the Rainbow; perhaps a brother *turner* drops in upon him next forenoon, exactly out of time for sermon, and finds him, as the bells are just ringing in, beginning to reach his arms out of bed, and calling for breakfast. In one hour after that date, the two are seen dropping out at the bottom of the King's Park, on the way to Portobello. We say no more. They return about four, and, falling into the ranks of the church-going people, may be singled out, secure as they think themselves, by the characteristics we have described. But we must look back to the *turners* and the *turner* system of thirty years since—a class, of course, who were the gay young men of the time of Deacon Brodie.

Suppose the High Street of Edinburgh, on a Sunday forenoon, about that period—a fine summer Sunday—the sun throwing a deep black shade on the south side of the street, and brilliantly illuminating the north side; the bells of St Giles's just beginning to stagger to a cessation; Dr Blair past in his gown; only a few decent citizens, with their wives and children, remaining unchurched; these evidently about to disappear off the street altogether. A small group of middle-aged respectable *Lawnmarket*ers, who have hitherto been standing at the Cross, as if intending to go into church themselves, begin to observe that the streets are getting so empty as to make *their* appearance a little conspicuous. When the bell ceases entirely, they start a little, as if taken by surprise, and, muttering something about being too late, psalms begun, and so forth, pull out their watches to see if they are exact with the town clock, cast a few affectedly careless glances around them, and then begin to slide away in different directions, some apparently towards the Tron, others towards St Giles's. They never reach those places, however. They are absorbed in closes and stairs upon the way. In about half an hour, if you were stationed about the Meadow Walk, or Bruntsfield Links, you would see the same figures come oozing out at different exits from the town, and meet at the Golf-house, or at the Cage, or other place of rendezvous, and then proceed, in full band, in the direction of Currie or the Hunter's Tryste. About one o'clock, Mr J— L— might be seen cooling it through

Straiton, in the midst of a slow procession of bellied men, his hat and wig perhaps borne aloft on the end of his stick, and a myriad of flies buzzing and humming in the shape of a pennon, from behind his shining pow. Perhaps Captain B—, of the town-guard, is of the set; he has a brother a farmer about Woodhouselee; and they intend to call there, and be treated to a check of lamb, or something of that kind, with a glass of spirits and water, "for really the day is very warm." The talk is of Sir Ralph Abercromby and General Brune, and the Duke of York and the Texel; or, more interesting subject still, the last week's proceedings of the Edinburgh volunteers in the Links. These fat men, who not only sleep o' nights, but almost o' days too, are all sergeants and corporals in the regiment, though, of course, they employ real veteran sergeants to run about planting the little flags to march by, and other matters of duty; it being as much as they can do to go through the regular business of the drill.

"'Pon my honour," says one, "it was too bad of Justice Clerk Hope to keep us so long upon the ground on Thursday. Two mortal hours. I thought I should have fainted with the fatigue and the heat together. I declare, when we all rushed afterwards into the Golf-house to get a draught of porter, I think I drank a whole bottle before ever I felt the taste of it. It was all spent upon the mere aridity of the soil."

"It was a terrible drill, indeed," remarks another. "I heard Lieutenant Beveridge himself say, that he never knew one so fatiguing; Captain Jardine was quite at a loss to know what his Lordship meant. That hopping body, —, who was my rear rank man, tramped down the heel of my shoe at the beginning of the drill, and I had to march all the time in that state: I thought I should have died of the pain of it."

"But what do you think Lord Cathcart said of us," asks another, "after our last review? Why, he said that with five hundred such troops he would not be afraid to meet the charge of three thousand Frenchmen."

The *turners* do not countenance newfangled flashy houses of entertainment, which spring up by the wayside every now and then, and, after a year or two, sink again into another state of existence. They are attached to old, small, permanent thatched ale-houses, kept by decent *widow-women*, whose husbands perished many years ago by the shooting of quarries, or other accidents, and who were then set up "in a way of doing" by subscription. With the sneaks of the doors of such houses they are as familiar as with their own firesides. They enter the humble quiet abode, and in an easy friendly way step into the family apartment, where they find the widow compounding between God and Mammon (being unable to leave the house for church), by sitting in front of an extinct fire, with a large Bible open upon her knees, which she reads with one of the eyes of her spirit, while the other is cast backward and *benward*, in reflection upon a reckoning there in progress.

"Well, Mrs Simpson, how are you the day? Very warm weather. When did you hear from your son William? And how is John getting on now?"

"Oh, sir," answers the widow, "William's still with the army in Holland; but I heard frae him lately, and, thank Heaven, he keeps his health. John has been in the Hielands for mair than a year, and he's

now gardener to Mr M'Scandlish of Dronascandlish—some gait about Badenoch, I think they ca' it."

"And is your dochter Jean still in her place with Mr Smith, in Edinburgh?"

"Ou ay, sir; and she has got an addition of ten shillings a-year to her wages."

After some chat of this kind, the result of a sincere interest which the Messrs Turners take in the affairs of the widow *once a-week*, some undertoned communications pass amongst them—whispers, and mutterings, and unsyllabled sounds—concerning neither they nor any other body knows what, but which at last take shape and language—"Ay, a little spirits and water;" their minds, be it remarked, having been all alike made up upon the subject, without communication, for the last two miles of the road, though nobody likes to pronounce the exact words till a certain trace of the general wish is mutually perceived through the hum of discussion. "Ay," at last says one aloud, after the sounds have been advancing gradually to speech for a quarter of a minute, "a little spirits and water." The widow parades the desired liquor, which is no sooner set upon the table, than they begin with renewed vehemence to wipe their dewy foreheads, and remark upon the heat of the day, although for a minute or two previously they had intermitted that employment. As there is only a single tumbler, one who assumes the office of high priest of the stoup, presents a little of the fluid to his neighbour, who says, however, with a disinterested air and hurried tone, "Be doing yoursel', Mr —, be doing yoursel'—I'm in nae hurry"—though in secret he is all the time absolutely burning to be at it; and then, taking up the water, he says, "Tell me when to stop," and so pours the proper modicum of that less generous fluid upon the spirits already in the glass. "Hech, that's refreshing!" is the exclamation of each, as he sets down the empty rummer. "We've had a long walk. I dinna ken the time when I was so thirsty before." "Good whisky that," says one; "Clemie's Wells, I suppose." "A wee thocht of a goo,"* says another, "but good whisky." "I thought," says a third, tasting a little of it raw, with a very knowing air, and a peculiar compression of the lips, and shutting of the eyes, "I thought it had a kind o' *look*.† Where dye get this, mistress?" "Ou, I deal wi' Mr Galloway, i' the Bow-fit. We juist get ey the twa gallons as ither twa's dune. He's an *extro-o-rnar* decent man, Mr Galloway." They then enter into extensive conversation with the widow about the improvements of the country-side, and the late deaths and marriages among the inhabitants. "That's a fine new gate Mortonha' is building." Or, "that's an excellent crop of beare behind the house, Mrs Simpson." Or, "Mrs H. of C. has had a son lately, I hear." Or whatever else. The object is to keep up an apparently interested talk, or what Haggart would have styled gammon, for the landlady, till they are fully gratified with liquor. Afterwards they stroll back to town in a cool light way, with their sticks at the advance, and their lapels drifting far over their shoulders in the wind.

Sometimes *turners* are very much annoyed by the weather. At setting out, they are by no means critical about the sky. They hope for good weather so fondly, that they will hardly permit themselves to suppose that it can be any thing but fair. If either the sky, however, is overcast, or a few straggling drops from some passing cloud are felt upon the cheeks, then is it curious to observe how they coax, as it were, the powers of the air, and extract, like true

* This was said by different officers of every militia regiment raised during the French war. It was a pickled phrase for review-days, and, we need not remark, had little reference to the real merit of any particular corps of which it was said.

* Gout—Fr. taste.

† This word, we suspect, is beyond even Dr Jamieson.

philosophers, good out of evil. "A little dull, I think: clouds high, though." "Draw to heat, I think." "Likely clear up about twelve o'clock." "Only a few drops: good to lay the dust." "Too much wind so be much rain." "A little rain do much good: help to lay the wind." Sometimes it is "the rain to lay the wind," sometimes "the wind to lay the rain;" but there is always some consolation—always some refuge. If the rain come seriously on when they are, perhaps, one mile out of town, "Oh, never mind; soon be at Mrs Thomson's." Sometimes, however, a traitor to the cause of turning remarks, as he contemplates the soaking of his clothes, "It would have been better, perhaps, if we had been all at church yet," a sentiment that falls upon the poor company like ten additional bucketfuls. Another, however, chancing to look up, says, cheerfully, "Clearing in the west! We'll have a fine day yet." When, again, all is joy; and Mrs Thomson's door is passed—that not being "the house." "A mere skiff, after all: nothing to speak of. The folk at Penny-cuik are getting it, though." "There's a rainbow—it's all off—down with the umbrellas."

There is a certain class of turners, who have a particular penchant for Leith Pier, as the object and goal of a walk. "A turn to the end of Leith Pier" used to be a nice neat thing, just sufficient to give a keener relish for the jigot of mutton done to a turn at home, and to be partaken of at five. They used to drop down Leith Walk, or the Easter Road, at the rate of two knots and a half in the hour; and when they had reached the end of the pier, they would stand listlessly for a quarter of an hour, gazing over the parapet, and casting their minds, as it were, abroad upon the waters. This has long been a favourite walk, we suspect, among the turners; for we observe that in the acts passed in the reign of King William against Sabbath-breaking, the Castlehill, the King's Park, and Leith Pier, are the promenades particularly pointed out as most frequented by the public. Judge, then, how the race and order of turners have felt of late at seeing the end of the pier—or what had been the end from time immemorial—converted into a middle, by the elongation of the mole towards the Martello Tower! Was not that a matter for despair? A friend, who enters fully into the feelings and associations of "the turners," is of belief that they have not yet acknowledged the wooden addition as a part of the pier proper; just as some stately old government of the east of Europe might refuse to sanction a new-set-up country made out of a province in the west, and which pretended to have a king of its own. They cannot away with this unseemly upstart thing, or piece of work, which has disturbed their souls with new and untoward ideas. In short, the novelty of the lengthened pier has destroyed all their comfort in this walk: and while the managers of the work are congratulating themselves and the public on its advantages for the harbour, they little think how much mischief it has occasioned among the TURNERS.

[The English and provincial reader will, it is hoped, make some allowance for the locality of this article: there is little reason to doubt that corresponding characters are to be found standing in the same relation to corresponding places in and about every large town in the empire. The Editors at the same time hope that the burlesque which lurks at the bottom of the article will be obvious enough to satisfy those who consider the trespasses of the turners in their more serious light.]

POPULAR INFORMATION ON HISTORY.

THE JEWS.

THOUGH there were nearly as great a variety of nations in ancient times as in the present, there were much fewer who practised the art of reading and writing: hence the very names of most of them are forgotten, and what we know of the rest is derived only from the records which three celebrated nations have left of their own neighbourhoods, or of the places visited by their armies or merchants. The countries occupied by these three nations, the Hebrews, Greeks, and Romans (independent of that of the Egyptians, already noticed), lay at different points along the shores of an inland sea, and were neither large nor far removed from each other. When we look on the coast of the Mediterranean, at the places where they dwelt, we wonder that our whole knowledge of the world for four thousand years should be derived only from the inhabitants of such inconsiderable spots. But it was in these spots only that means were in practice for transmitting the knowledge acquired in one age to the people of another. Over all the rest of the world, when a generation passed away, its labours and knowledge passed away with it: the knowledge of every man, however much he had done or learned, died when he died, and was lost to his successors; hence the bulk of the people of antiquity never rose above the situation of savages. Among some of them there were indeed certain imperfect modes of writing; but on account of their clumsiness, these took so much time to acquire even in their imperfections, that they could only be learned by a few, such as the priests, and were never diffused among the people. This was the case in Egypt, and, it is supposed, also in Persia and Chaldaea, in all which countries, relics of some lame attempts at the use of letters are found on stones, and rocks, and in tombs; but they contain, as far as they can be unriddled, only names, and circumstances serving for dates, which would be utterly unintelligible without the light thrown on them by the writings of the three nations we have mentioned. The Egyptians had made considerable progress in some arts, such as

painting, building, and statuary; but every thing was learned by direct instruction from one man to another, almost in the manner of apprenticeship; and their marks used for writing were quite insufficient for communicating specific instruction on any subject. Hence we know nothing of their history but what is learned from the Hebrews and Greeks, whose writings are sometimes dimly illustrated by monuments and dubious inscriptions found in Egypt itself. With regard to all the other nations of antiquity, it is the same; what even is known concerning them is known only from the books of the three nations we have mentioned. Without these the whole world, for four thousand years, would have been to us as if it had never been; and concerning every people whom they have not mentioned (with a few exceptions), it is so now. We know nothing of them, not even of their existence; whole nations lived, flourished, and became extinct; tongues and languages were formed, changed, and lost during several thousand years, without one step of the process having reached our ears; solely because they were beyond that circle which was known to the only nations who were acquainted with the art of writing. In the continent of North America there are now and then found relics of a people more civilized than any who have lived there for many ages; fortifications, it is said, have been discovered, which could only have been planned by some degree of science; and tools of excellent quality have been found in certain gold mines recently opened in Virginia; all of which are traces of the existence of a race of men now forgotten, and of whom the very name has perished; it seems like believing in a mystery to credit even their very existence. Yet, had it not been for the solitary writings of the Hebrews, a like darkness would have overspread the memory of all the nations of our own continent for the first two thousand years of its existence; the Greeks rescued it from oblivion for the next thousand; and the Romans only were added for another thousand, to preserve the memory of its nations from perishing.

The Hebrews are the most ancient of these "People of the Book," and were descended from an Arabian shepherd of the name of Abraham, whose grandson, Jacob, and his children, emigrated into Egypt, where they settled, and became a numerous, though distinct, people. In their adopted country they received the name "Hebrew," or "Foreigners," and were at the beginning treated with much kindness, and had peculiar privileges, especially while under the protection of Joseph, who, as described in Scripture, was the original cause of their migration. Agreeable to ancient patriarchal usages, the sons of Jacob became the heads of separate tribes, or clans, yet all adhering together in a general union of interests. From an early period, the descendants of Abraham, as we are told in the inspired writings, were selected by the Almighty for the purpose of establishing a religion much more pure than any prevalent in the ancient world, and intended as a typical precursor of that still purer faith which all civilized nations now profess. This is a most extraordinary fact in the history of the Hebrews, who, be it well remembered, were, from whatever cause, the only people in the early ages who had any conception of the nature and attributes of the true and unseen God.

The rapid increase of the Hebrews in Egypt soon excited the jealousy of the masters of the country; and, from being in high favour, their tribes gradually fell under the lash of power, and came to be treated as public slaves. From the description of their situation, which is given in Genesis, and the affecting allusions to it afterwards in different passages of the Psalms, it appears that their tyrannical masters viewed them with the same kind of hatred, contempt, and fear, which are now inspired by the negroes in the southern States of America, and by slaves, indeed, in every country. Their sufferings were at last avenged by a direct interposition of Providence, which visited their oppressors with successive plagues, storm, vermin, and pestilence, till every living and growing thing in the land of Egypt was threatened with destruction; and the selfish rulers of the country were at last constrained by terror to release their injured bondsmen. The God of their fathers brought the Hebrews out of Egypt with a high hand and an outstretched arm; a branch of the Red Sea was dried up in order to aid their departure; and the Egyptians, who attempted to pursue them, were overwhelmed in the returning waters. Even during their sojourn in the "house of bondage," the Hebrews seem to have cultivated a national learning, which rendered them superior to their taskmasters; for though Moses, their leader, had been trained in all the wisdom of the Egyptians, he was obliged to have recourse to the eloquence of his brother Aaron, the Levite (who had been educated after the manner of the Hebrews), on any occasion where it became necessary to speak in public. The acquaintance with writing, besides, which is shown in the transactions of the Hebrew leaders, immediately on their taking command of their countrymen, is a feature not to be traced in any relics we have of Egyptian knowledge; the latter people seem to have paid more attention to the arts of life, which their wealth gave them the means and inducement to cultivate; while the Hebrews, who were poor and oppressed, sought relief in the recollection of an ancestry of whom they had just reason to be proud, and cultivated the use of letters, that they might be enabled to cherish their fame. One of the tribes was early set apart for sacred duties, and for preserving the records of their nation; and their history is therefore complete and authentic,

shedding a steady light on all the first ages of the world.

After crossing the Red Sea (before Christ 1490), the Hebrews passed into a desert country, parched, rocky, and barren, with the purpose of journeying through it, to take possession of the fertile land which lay onwards to the north-west. In this sandy and trackless wilderness, their multitudes could neither have traced their way nor procured subsistence, without a continual miracle—the hand of God brought forth rivers of water out of the flinty rock; rained manna, or bread, from heaven; and gave a pillar of cloud to direct their journeys through the day; and a pillar of fire by night. He delivered the tables of a moral law to Moses, their leader; and gave out a set of regulations for the ceremonies of worship, the establishment of a separate order devoted to religion and learning, and for the civil government of the nation. They had thus a regular polity and written laws, when most other countries of the world knew only the law of the sword, or of savage animal superiority.

The country which was allotted as a settlement to this people was at that time occupied by many numerous and warlike tribes, who had grown strong in its fertile plains and valleys; and the generation of the Hebrews, whose spirits had been tamed by the bondage of Egypt, was too timid to be willing to encounter such enemies. Their want of confidence in the arm which had hitherto protected them was punished by a sojourn in the wilderness of forty years, till the whole of that generation had died, and left their bones in the deserts.

The contest of their successors with the Canaanites, the inhabitants of the country which they were to occupy, was not of long duration. They defeated them one after another in rapid succession; and the alarm which had deterred their fathers from making the attack was now transferred to their enemies, who feared it. The old Israelites had said in the desert, "we are in our own sight as grasshoppers, before these sons of Anak; hath the Lord brought us out of the land of Egypt to fall by the sword of this people?" But the new generation had a firmer confidence in the help which was promised them; and it was now the turn of their foes to shrink, insomuch that "their hearts melted, neither was their spirit in them any more, because of the children of Israel." (Before Christ 1450.)

The Book of Judges exhibits the Hebrews in possession of the Promised Land, but often forgetful in their prosperity of the God who had guided them through their sufferings. To punish their ingratitude, and remind them of their dependence on Heaven, they were obliged to maintain a continual struggle with the nations who surrounded them, for the fertile country which they occupied. They were at this time divided into two or three separate governments, each of which had at times a different judge, and sometimes fell separately under the arm of some powerful enemy. The instances of generous patriotism, of bravery, and of devout confidence in the God of their fathers, which are shown in the acts of several of the judges, render the record of their history one of the most interesting and romantic in the earth. Yet they were often reduced to the greatest distress. "Because of the Midianites," it is said, "the Children of Israel made them dens in the mountains, caves, and strongholds; and when Israel had sown, the people of the east came up against them, and destroyed the increase of the earth, till they left no sustenance for Israel, neither sheep, nor ox, nor ass—for they came up as the grasshoppers for multitude; and the Children of Israel cried to the Lord." From these calamities they were at times delivered by the devotion of some pastoral soldier among their tribes. Their songs of rejoicing on such occasions still more pathetically tell the disturbed state of the country, and present the troubles of its inhabitants for three hundred years (before Christ 1427 to 1112), while they formed a republic under their judges; but it is also a picture of the whole earth at that period: the Hebrews only bore a share of calamities which fell much more severely upon others, in an age when regular government was unknown. It says much for this people, that in the midst of such a scene of unrest, they continued still to cultivate letters: The beautiful simplicity of the narratives given concerning the heroes of their country is not to be equalled in any other remains of antiquity.

The epoch of kings succeeded that of judges. The reign of Saul, their first monarch, though the people were stronger by being united, was gloomy and troubled. David, who succeeded, was a soldier and a conqueror. He rendered the Hebrews formidable to the whole of their enemies, and gave them a regular and defensible position, expelling their old antagonists from every part of the country. He left an empire peaceful, respected, and strong; and, what was of as much importance; he selected from among his sons a successor who was able to improve all these advantages, and to add to the progress which his countrymen had already made in prosperity. Under Solomon, the name of the Hebrew government being able to protect its subjects in other countries, the people and their king began to employ themselves in commerce. Their trade was at first engrafted on that of Tyre, a people speaking a similar language with themselves, and like them, too (though certainly to a smaller degree), acquainted with the art of writing. The commerce of the time of Solomon is the only portion of that part of the history of the Jews which is noticed in sacred writ, but there is no reason to sup-

pose that after his day it was discontinued. It was, perhaps, no longer a matter of state; but the wealth of the country (which exposed it to continual pillage), and the number of prosperous Hebrews who were found in all parts of the earth (it would be idle to say that these were all brought away as captives), render it probable that, from the splendid reign of this monarch, they always continued to be addicted to commerce. It is indeed likely that they had been so before his reign, and that Solomon merely took commerce under the protection of the state; for there is no instance on record of any monarch all at once, and successfully, creating a national trade. However this may be, a greater contrast cannot be imagined than between the troubles of the time of the judges (only one hundred years before), and the peace, security, and enjoyment of this reign. "And the king made silver to be in Jerusalem as stones; and cedars made him to be as sycamore trees that are in the vale for abundance: and Judah and Israel were many; as the sand which is by the sea-shore for multitude, eating, and drinking, and making merry." The riches lavished upon the temple, which was erected in his time, are still the wonder of the east and west; and though the building itself may now be rivalled in extent by many of our parish churches, yet the gold, ivory, and other precious materials employed in its decoration, indicate a wealth which must, at that time, have been without a parallel. Both Solomon and David, his father, were men accomplished in learning, as well as in the arts of government; and the writings which they have left, if they show their own abilities, indicate not less a great attention to the cultivation of knowledge among the rest of the Hebrews. That nation could neither have reared such men, nor treasured up their productions, had there not been many among them well qualified to relish, and even to imitate, such efforts. We do not here allude to the inspiration of these writings; it is merely to their poetical beauties, and to the profound and calm knowledge of mankind with which they abound, "beyond all Greek, beyond all Roman fame." It is vain to look in all the long list of the kings of other nations for two such names as David and Solomon.

After the death of Solomon, the country fell into the same divisions which had weakened it in the time of the judges. Each of the districts of North and South Israel were under a separate king, and they were exposed both to the attacks of their enemies and to quarrels with each other. Their history is a succession of agitating conflicts for independence, and of unexpected and remarkable deliverances, of a similar nature to those of the earlier period, and they continued for about the same length of time (380 years); but they are marked by fewer of those traits of heroic devotion which distinguished the epoch of the judges. The backslidings, errors, and misgovernment of their kings, is the chief and painful subject which is presented to us; and though these are relieved at times by the appearance of such monarchs as Josiah, Jehoshaphat, and Hezekiah, yet the whole history of this period is overcast with the gloominess of progressive decline. By far the most delightful parts of it are those which relate to the lives of the Prophets, who were raised up at intervals to warn the nation and its rulers of the fate which they incurred by forsaking the religion of their fathers. These inspired men sometimes sprung up from among the humblest classes of the community: one from "the herdsmen of Tekoa," another from "ploughing with twelve yoke of oxen;" several were of the priestly order, and one (Isaiah) is said to have been of royal lineage; but the works of all are marked with the same sacredness, force, and authority. They reprehend their countrymen, in the most eloquent strains, at one time for their idolatry, and at another for their hypocrisy; and their indignation is expressed with the same freedom and dignity against the vices of the highest and the lowest. It has become fashionable to trace the free spirit of our national tone of thinking to the historians and orators of Greece and Rome, which are taught in our schools; but any one who looks into the writings of the Hebrew prophets, and sees the boldness and energy with which the humblest of them threatens the nobles and princes of his country, or chastises the vices of the nation around him, will remark the pedantry of seeking, in volumes known only to the learned, for an effect which may be traced to books whose strong and pathetic eloquence has long swayed the affections of every peasant of the country. There is no subtlety of reasoning, no sporting with ambiguities, in these writings; every thing is bold, decided, and powerful, appealing to great principles, and marked with high and energetic feelings. What a film of fancy-work are the metaphysical ingenuities of Plato, compared with the firm, broad, and uncompromising morality, the mild domestic charities, taught in the books of Psalms and Proverbs, or the pathetic and indignant remonstrances of the Prophets against the backslidings of the "daughter of their people!"

At the end of the epoch of the kings (about 600 years before Christ), the land of Israel was swept by several powerful invaders, who carried off many thousands of the people into captivity. Little is known of the fate of those of the northern district, who are sometimes supposed to have been carried to India, sometimes to Tartary; but there are many interesting notices of the captives of Judah. They were carried to Babylon, a flat country intersected by rivers, to the eastward of their own. Here they seem to have been treated with kindness, and many of them even arrived

at wealth and distinction. Nothing, however, could overcome their regret at being torn from the country of their ancestors—a feeling which is expressed with unrivalled beauty in the 137th Psalm, where the Hebrew captive looks back mournfully to the mountains and brooks of Judah, as he hangs his harp on the willows by the sluggish Euphrates, and refuses, with sorrow and scorn, to gratify his conquerors by singing the celebrated songs of his country in a strange land. It is a farther proof of what we have said of the general intelligence and education of the Jews, that all the conquerors who carried them off granted them high privileges in their new countries. Alexander, it is said, made them equal with his own Macedonians in the city which he founded; Ptolemy conferred on them similar privileges. We find one celebrated man of their nation (Daniel) chief minister of two successive monarchies. Hebrew generals more than once commanded the armies of Egypt; and the scattered notices of history present to us many of them in other public situations of importance and trust.

After 70 years (during which there is little account of the people who were left in the country), permission was given to some of the chief Hebrews of the captivity to return with their people to Judea, and to establish there a government, conducted by their own countrymen, under the protection of the Persians. They were also allowed to rebuild the temple. Many families returned accordingly; and the Hebrews from this period enjoyed, as tributaries of this powerful monarchy, a long peace of about 220 years, during which their country seems to have been quiet and prosperous. About 187 years before Christ, in consequence of their becoming involved in the quarrels of neighbouring powers, they were obliged to maintain a series of struggles in behalf both of their religious and national independence, more fierce and prolonged than we read of in almost any other nation. We are accustomed to admire the gallantry and perseverance of Wallace and of William Tell in behalf of their country; but Judas Maccabeus surpassed both, and with more brilliant success. The actions of one family of Jewish priests, belonging to a town (Modin) of which the very site is unknown, might dignify the scutcheons of a whole aristocracy. Under them the Hebrews were again, for three reigns, an independent and even a powerful people.

The empire of the Romans was now extending itself to the east; and that power being called in to aid the Hebrews on one occasion (about 70 years before Christ), seized the opportunity to establish its influence among them permanently. Their kings, the three Herods, and their other rulers, were now dependants of the emperor, and their country the tributary of Rome. But they were by this time a people scattered over the whole earth; their captivities and emigrations had taken them abroad, and their intelligence or knowledge had rendered them prosperous; so that, when, about 70 years after our Saviour's birth, those who remained at home engaged in a rebellion against the Romans, and were slain in tens and hundreds of thousands at the capture of Jerusalem, the misfortune had no more effect in extinguishing the Jewish name than it would have now.

As in the case of Egypt, already detailed, the country of the Jews, now known chiefly by the name of Palestine, became a conquest of the Saracens, a half-civilized Arabian people, and the professors of Mahomedanism. Since that event it has been the seat of barbaric ignorance, and been little visited. Of the Jews themselves, few are found in their ancient territory, the nation being scattered over the face of the whole earth, yet in its misfortunes maintaining an individuality so surprising as to be almost miraculous, and as if designed, according to the prophecies of the sacred writers, to be at some period restored to the beloved Zion from which it has been banished.

* HUNTING ADVENTURES.

THE following anecdote is abridged from that clever periodical, the *Monthly Magazine*, of March 1831, where it is given upon the authority of a Danish writer. Whether true or not, it possesses a power and force of description altogether its own:—

About three years since, after a short residence in Mexico, I embarked for Guayaquil, in order to visit from thence the celebrated mountains of Quito. On arriving at Guayaquil, I found there two travellers, who were preparing to take the same route. These were Captain Wharton, an English naval officer, and a young midshipman, named Lincoln. The frigate which Wharton commanded had suffered considerably in her voyage through the South Seas; and as it was now undergoing the necessary repairs, Wharton resolved to devote some of his leisure time to visiting the forests and mountains of Quito. It was quickly agreed that we should make the journey together. I found Wharton a frank and open-hearted man; and his young favourite, Lincoln, a youth of eighteen, had a handsome sun-burnt countenance, with an expression of determined bravery.

We set out on a fine clear morning, attended by my huntsman, Frank, and two Indians as guides. On beginning to ascend the mountain, the scenery became more enchanting at every step. The mighty Andes, like a vast amphitheatre, covered to their summits with gigantic forests, towered aloft; the snow-crested Chimborazo reared its proud front; the terrific Cotopaxi sent forth volumes of smoke and flame; and in-

numerable other mountains, branching from the far-spreading Cordilleras, faded away in the distance. With an involuntary shudder I entered the narrow path that leads into the magnificent forest. The monkeys leaped from branch to branch; the paroquets chattered incessantly; and the eagles, from amidst the tall cypresses where they had built their nests, sent down a wild cry. The farther we advanced, new objects presented themselves on every side: the stately palms, with their broad sword-like leaves; the singular soap-tree; the splendid mongolia; the tall wax-tree, and the evergreen-oak, reared themselves proudly over the orange groves, with whose fragrance was blended the aromatic perfume of the vanilla.

Towards evening, our guides began to quicken their pace, and we hastened after them. In a short time they uttered a shout of joy, of which we quickly discovered the cause. By the light of a large fire, which was kindled in an open space of the forest, we descried a little Indian village, consisting of several huts erected on trunks of trees, and to which were appended ladders of reeds. The Indian who was employed in replenishing the fire, answered the cry of our guides in a similar tone; and, after a short conference, we were conducted into one of the huts, where we passed the night.

Early in the morning we again resumed our way through the deep shade of the forest, and in due time stopped to enjoy a repast under a broad-leaved palm.

We then continued to wind round Chimborazo's wide base; but its snowy head no longer shone above us in clear brilliancy, for a dense fog was gradually gathering round it. Our guides looked anxiously towards it, and announced their apprehensions of a violent storm. We soon found that their fears were well-founded. The fog rapidly covered and obscured the whole of the mountain; the atmosphere was suffocating, and yet so humid, that the steel-work of our watches was covered with rust, and the watches stopped. The river beside which we were travelling rushed down with still greater impetuosity; and from the clefts of the rocks which lay on the left of our path, were suddenly precipitated small rivulets, that bore the roots of trees, and innumerable serpents, along with them. These rivulets often came down so suddenly and so violently, that we had great difficulty in preserving our footing. The thunder at length began to roll, and resounded through the mountainous passes. Then came the lightning, flash following flash—above, around, beneath—everywhere a sheet of fire. We sought a temporary shelter in a cleft of the rocks, whilst one of our guides hastened forward to seek a more secure asylum. In a short time he returned; he had discovered a spacious cavern. We proceeded thither immediately, and with great difficulty, and not a little danger, at last got into it.

The noise and raging of the storm continued with so much violence, that we could not hear the sound of our own voices. I had placed myself near the entrance of the cave, and could observe, through the opening, which was straight and narrow, the singular scene without. The highest cedar-trees were struck down, or bent like reeds; monkeys and parrots lay strewn upon the ground, killed by the falling branches; the water had collected in the path we had just passed, and hurried along it like a mountain stream. When the storm had somewhat abated, our guides ventured out in order to ascertain if it were possible to continue our journey. The cave in which we had taken refuge was so extremely dark, that, if we moved a few paces from the entrance, we could not see an inch before us; and we were debating as to the propriety of leaving it even before the Indians came back, when we suddenly heard a singular groaning or growling in the farther end of the cavern, which instantly fixed all our attention. Wharton and myself listened anxiously; but our daring and inconsiderate young friend, Lincoln, together with my huntsman, crept about upon their hands and knees, and endeavoured to discover, by groping, from whence the sound proceeded. They had not advanced far into the cavern, before we heard them utter an exclamation of surprise; and they returned to us, each carrying in his arms an animal singularly marked, and about the size of a cat, seemingly of great strength and power. Wharton had scarcely glanced at them, when he exclaimed in consternation, "Good God! we have come into the den of ——" He was interrupted by a fearful cry of dismay from our guides, who came rushing precipitately towards us, crying out, "A tiger! a tiger!"—and, at the same time, with extraordinary rapidity, they climbed up a cedar-tree which stood at the entrance of the cave, and hid themselves among the branches.

After the first sensation of horror and surprise, which rendered me motionless for a moment, had subsided, I grasped my fire-arms. Wharton had already regained his composure and self-possession; and he called to us to assist him instantly in blocking up the mouth of the cave with an immense stone, which fortunately lay near it. The sense of approaching danger augmented our strength; for we now distinctly heard the growl of the ferocious animal, and we were lost beyond redemption if it reached the entrance before we could get it closed. Ere this was done, we could distinctly see the tiger bounding towards the spot, and stooping in order to creep into his den by the narrow opening. At this fearful moment our exertions were successful, and the great stone kept the wild beast at bay. There was a small open space, however, left between the top of the entrance and the

stone, through which we could see the head of the animal, illuminated by its glowing eyes, which it rolled, glaring with fury, upon us. Its frightful roaring, too, penetrated to the depths of the cavern, and was answered by the hoarse growling of the cubs, which Lincoln and Frank had now tossed from them. Our ferocious enemy attempted first to remove the stone with his powerful claws, and then to push it with his head from its place; and these efforts proving abortive, served only to increase his wrath. He uttered a frightful howl, and his flaming eyes darted light into the darkness of our retreat.

"Now is the time to fire at him!" said Wharton, with his usual calmness; "aim at his eyes; the ball will go through his brain, and we shall then have a chance to get rid of him."

Frank seized his double-barrelled gun, and Lincoln his pistols. The former placed the muzzle within a few inches of the tiger, and Lincoln did the same. At Wharton's command they both drew the triggers at the same moment, but no shot followed. The tiger, who seemed aware that the flash indicated an attack upon him, sprang, growling, from the entrance, but, feeling himself unhurt, immediately turned back again, and stationed himself in his former place. The powder in both pieces was wet; they therefore proceeded to draw the useless loading, whilst Wharton and myself hastened to seek our powder-flask. It was so extremely dark that we were obliged to grope about the cave; and at last, coming in contact with the cubs, we heard a rustling noise, as if they were playing with some metal substance, which we soon discovered was the canister we were looking for. Most unfortunately, however, the animals had pushed off the lid with their claws, and the powder had been strewn over the damp earth, and rendered entirely useless. This discovery excited the greatest consternation.

"All is over now," said Wharton; "we have only to choose whether we shall die of hunger, or open the entrance to the blood-thirsty monster without, and so make a quicker end of the matter."

So saying, he placed himself close behind the stone which for the moment defended us, and looked undauntedly upon the lightning eyes of the tiger. Lincoln raved and swore; and Frank took a piece of strong cord from his pocket, and hastened to the farther end of the cave, I knew not with what design. We soon, however, heard a low stifled groaning; and the tiger, who heard it also, became more restless and disturbed than ever. He went backwards and forwards before the entrance of the cave in the most wild and impetuous manner, then stood still, and, stretching out his neck in the direction of the forest, broke forth into a deafening howl. Our two Indian guides took advantage of this opportunity to discharge several arrows from the tree. He was struck more than once; but the light weapons bounded back harmless from his thick skin. At length, however, one of them struck him near the eye, and the arrow remained sticking in the wound. He now broke anew into the wildest fury, sprang at the tree, and tore it with his claws. But having at length succeeded in getting rid of the arrow, he became more calm, and laid himself down as before, in front of the cave.

Frank now returned from the lower end of the den, and a glance shewed us what he had been doing. He had strangled the two cubs; and before we were aware of his intention, he threw them through the opening to the tiger. No sooner did the animal perceive them than he gazed earnestly upon them, and began to examine them closely, turning them cautiously from side to side. As soon as he became aware that they were dead, he uttered so piercing a howl of sorrow, that we were obliged to put our hands to our ears. When I censured my huntsman for the rashness and cruelty of the action, I perceived, by his blunt and abrupt answers, that he also had lost all hope of rescue, and with it all sense of the ties between master and servant.

The thunder had now ceased, and the storm had sunk to a gentle gale; we could hear the songs of birds in the neighbouring forest, and the sun was streaming among the branches. The contrast only made our situation the more horrible. The tiger had laid himself down beside his whelps. He was a beautiful animal, of great size and strength, and his limbs being stretched out at their full length, displayed his immense power of muscle. All at once another roar was heard at a distance, and the tiger immediately rose and answered it with a mournful howl. At the same instant our Indians uttered a shriek, which announced that some new danger threatened us. A few moments confirmed our worst fears, for another tiger, not quite so large as the former, came rapidly towards the spot where we were. "This enemy will prove more cruel than the other," said Wharton, "for this is the female, and she knows no pity for those who deprive her of her young."

The howls which the tigress gave, when she had examined the bodies of her cubs, surpassed every conception of the horrible that can be formed; and the tiger mingled his mournful cries with her's. Suddenly her roaring was lowered to a hoarse growling, and we saw her anxiously stretch out her head, extend her nostrils, and look round, as if in search of the murderers of her young. Her eyes quickly fell upon us, and she made a spring forward with the intention of penetrating to our place of safety. Perhaps she might have been enabled by her immense strength to push away the stone, had we not, with all our united power, held it against her. When she found that all her ef-

forts were fruitless, she approached the tiger, who lay stretched out beside his cubs, and he rose and joined in her hollow roaring. They stood together for a few moments as if in consultation, and then suddenly went off at a rapid pace, and disappeared from our sight. Their howling died away in the distance, and then entirely ceased. We now began to entertain better hopes of our condition; but Wharton shook his head—"Do not flatter yourselves," said he, "with the belief that these animals will let us escape out of their sight till they have had their revenge. The hours we have to live are numbered."

Nevertheless, there still appeared a chance of our rescue, for, to our surprise, we saw both our Indians standing before the entrance, and heard them call to us to seize the only possibility of flight, for that the tigers had gone round the height, possibly to seek another inlet to the cave. In the greatest haste the stone was pushed aside, and we stepped forth from what we had considered a living grave. Wharton was the last who left it; he was unwilling to lose his double-barrelled gun, and stopped to take it up; the rest of us thought only of making our escape. We now heard once more the roaring of the tigers, though at a distance; and following the example of our guides, we precipitately struck into a side path. From the number of roots and branches of trees with which the storm had strewn our way, and the slipperiness of the road, our flight was slow and difficult.

We had proceeded thus for about a quarter of an hour, when we found that our way led along the edge of a rocky cliff with innumerable fissures. We had just entered upon it, when suddenly the Indians, who were before us, uttered one of their piercing shrieks, and we immediately became aware that the tigers were in pursuit of us. Urged by despair, we rushed towards one of the breaks or gulfs in our way, over which was thrown a bridge of reeds, that sprang up and down at every step, and could be trod with safety by the light foot of the Indians alone. Deep in the hollow below rushed an impetuous stream, and a thousand pointed and jagged rocks threatened destruction on every side. Lincoln, my huntsman, and myself, passed over the chasm in safety; but Wharton was still in the middle of the waving bridge, and endeavouring to steady himself, when both the tigers were seen to issue from the adjoining forest; and the moment they descried us they bounded towards us with dreadful roarings. Meanwhile Wharton had nearly gained the safe side of the gulf, and we were all clambering up the rocky cliff except Lincoln, who remained at the reedy bridge to assist his friend to step upon firm ground. Wharton, though the ferocious animals were close upon him, never lost his courage or presence of mind. As soon as he had gained the edge of the cliff he knelt down, and, with his sword, divided the fastenings by which the bridge was attached to the rock. He expected that an effectual barrier would thus be put to the further progress of our pursuers; but he was mistaken, for he had scarcely accomplished his task, when the tigress, without a moment's pause, rushed towards the chasm, and attempted to bound over it. It was a fearful sight to see the mighty animal for a moment in the air above the abyss; but her strength was not equal to the distance—she fell into the gulf, and before she reached the bottom she was torn into a thousand pieces by the jagged points of the rocks. Her fate did not in the least dismay her companion; he followed her with an immense spring, and reached the opposite side, but only with his fore claws; and thus he clung to the edge of the precipice, endeavouring to gain a footing. The Indians again uttered a wild shriek, as if all hope had been lost. But Wharton, who was nearest the edge of the rock, advanced courageously towards the tiger, and struck his sword into the animal's breast. Maddened with pain, the furious beast collected all his strength, and fixing one of his hind legs upon the edge of the cliff, he seized Wharton by the thigh. That heroic man still preserved his fortitude; he grasped the stem of a tree with his left hand, to steady and support himself, while with his right he wrenched, and violently turned the sword that was still in the breast of the tiger. All this was the work of an instant. The Indians, Frank, and myself, hastened to his assistance; but Lincoln, who was already at his side, had seized Wharton's gun, which lay near upon the ground, and struck so powerful a blow with the butt end upon the head of the tiger, that the animal, stunned and overpowered, let go his hold, and fell back into the abyss. The unhappy Lincoln, however, had not calculated upon the force of his blow; he staggered forward, reeled upon the edge of the precipice, extended his hand to seize upon any thing to save himself—but in vain. For an instant he hovered over the gulf, and then fell into it, to rise no more.

We gave vent to a shriek of horror—then for a few minutes there was a dead and awful silence. When we were able to revert to our own condition, I found Wharton lying insensible on the brink of the precipice. We examined his wound, and found that he was torn dreadfully. The Indians collected some herbs, the application of which stopped the bleeding, and we then bound up the mangled limb. It was now evening, and we were obliged to resolve upon passing the night under the shelter of some cleft in the rocks. The Indians made a fire to keep the wild beasts from our couch; but no sleep visited my eyes. I sat at Wharton's bed, and listened to his deep breathing. It became more and more hard and deep, and his hand

grasped violently, as if in convulsive movements. His consciousness had not returned, and in this situation he passed the whole night. In the morning the Indians proposed to bear our wounded friend back to the village we had left the previous day. They plaited some strong branches together, and formed a bridge to repass the gulf. It was a mournful procession. On the way Wharton suddenly opened his eyes, but instantly closed them again, and lay as immovable as before. Towards evening we drew near our destination; and our Indian friends, when they saw our situation, expressed the deepest sympathy; but the whole tribe assembled round us, and uttered piercing cries of grief when they learnt poor Lincoln's fate. Some hastened away in search of the body, and I remained with my wounded friend, who still lay insensible to every thing around him. Sleep at length overpowered me. Towards morning a song of lamentation and mourning aroused me—it was from the Indians, who were returning with Lincoln's body. I hastened to meet them, but was glad to return back again, when my eyes fell upon the torn and lifeless body of our young companion. The Indians had laid him upon the tigers' skins, which they had strewn with green boughs; and they now bore him to the burial-place of their tribe.

DIGESTION.

THE food being received into the stomach, is prepared for assimilation with the body by digestion. This process—to borrow the words of an acute modern writer—taken in its most general and most proper sense, may be defined the conversion of dead into living matter; at all events, it is the conversion of dead animal and vegetable substances into an animalized fluid, qualified to enter into the current of the circulation, and then to become part and parcel of the living machine. No other fluid, not even milk from the living udder, can be poured into the blood-vessels without risk of life; and, therefore, we are authorised to conclude, that the chyle (that is, the digested food) is a vitalized fluid, like the blood itself.

There have been various opinions concerning the manner in which the digestive process is carried on. The ancients supposed that it was effected by heat; and this opinion was formed from a consideration of the situation of the stomach, which they thought was in the hottest part of the body, being placed in the cavity of the abdomen, and surrounded by numerous soft organs. That heat acts as an auxiliary to digestion, is not to be doubted; but it can never be considered as a principal agent in the process; for cold-blooded animals are known to digest their food sufficiently well to supply the wants of the machine; their temperature is but little higher than that of the atmosphere.

Another idea was that of *fermentation*; but the food does not remain a sufficient time in the stomach to allow of fermentation; nay, if this process should take place, it would induce disease. The best founded theory is that of solution; that is, of solution through the means of a very peculiar solvent. Rheumur inclosed alimentary matter in tubes, which were pervious at both ends, and introduced them into the stomach of animals; when they were discharged, he found that the substances which he had inclosed in the tubes were so acted upon by the gastric juice as to become almost dissolved. Sometimes a part of the stomach itself has been found dissolved or digested after death; but this phenomenon is rarely found in those who have died of any lingering malady; it usually occurs in such as die suddenly, and are at the time immediately previous to their death in good health; it is observable also, that in these cases it is always the upper portion of the stomach which disappears. The following interesting experiments, made by Dr Stevens, will show, in a very forcible manner, the effect of this peculiar process of solution. The first series which we shall describe was made upon a man who was in the habit of swallowing stones. Alimentary matter was introduced into hollow silver spheres, divided into two cavities by a partition, and having a number of apertures on the surface, to allow the gastric juice to mix freely with the food. In one experiment a portion of *meat* was put into one of the cavities, and into the other a portion of *fish*: when the sphere was discharged, both the substances were found to have been acted upon by the gastric juice, but more especially the fish. In another experiment, the Doctor wished to ascertain if the cooking of meat retarded its digestibility. For this purpose he introduced a quantity of boiled meat into one part of the sphere, and some roast into the other, when it was ascertained that the boiled meat was more dissolved than the roast. The next discovery he wished to make was the comparative effect of this extraordinary solvent upon food previously masticated, and upon that which was swallowed whole. This experiment was conducted like the former, and the food, which was previously masticated, was more dissolved than the other.

Finding that animal substances thus submitted to the action of the gastric juice were easily digested, he made many similar experiments on vegetables, which were also digested, but not so speedily as animal matter. Inanimate substances not being so readily soluble, he next inquired how far living animals were capable of resisting the action of the gastric juice.

To ascertain this, he inclosed a leech in a sphere, to prevent its wounding the stomach. The man swallowed it, and, when voided, nothing was found in the

sphere but a viscid black miasma, the undefined remains of the digested leech.

Dr Stevens, having no longer an opportunity of conducting his experiments on the man, had recourse to dogs and ruminating animals. Having previously weighed a quantity of animal and vegetable matter, he inclosed them in different ivory spheres, and made a dog swallow them. Some hours after this the dog was killed, and the animal food was found to be by far the most dissolved. The gastric juice of these animals has such a strong solvent power, that the ivory spheres which were employed were found to have been acted upon. He then made several experiments on herbivorous animals, by giving them animal and vegetable substances inclosed in different tubes. When these were discharged, the animal food had undergone no alteration; while, on the contrary, there were no remains of the vegetable matter.

These experiments plainly prove that digestion is by solution, in which process the gastric juice is the principal and general agent that acts upon the food, dissolves it, and combines with it previous to its propulsion into the intestines, where the process of assimilation is further advanced. It also appears, from these experiments, that some animals can only digest vegetable substances, while others are only capable of digesting animal food—every species of animal having, in fact, its peculiar gastric juice.—*New London Literary Gazette.*

SICILY.

IN common apprehension, Sicily is a good place for the scene of a dark-blue romance about castles, and dukes, and priests, and daggers. Nobody knows any thing about the place; and the writers of fiction, presuming upon the public ignorance, have taken occasion to people it with a world of their own, which they might almost as well place in Great Britain, if it were not that they would be found out if they did. This is not right. Sicily has as good a right to be known for exactly what it is, and what it contains, as any place; and we therefore present the following account of it from the work of a recent and most intelligent traveller: *

The island of Sicily, which lies in the Mediterranean Sea, at the most southerly extremity of Italy, possesses a population of only a million and a half. The disproportion of nobles is great, there being in this small kingdom, exclusively of the royal family, the archbishops, bishops, abbots, priors, and other church dignitaries, no less than one hundred and twenty-seven princes, seventy-eight dukes, one hundred and forty marquises, with counts, barons, and knights almost innumerable. Many of these titles, however, never wore the honourable badges of power and trust, but simply marks of distinction, conferring little more than local importance, and bestowed by the crown for various services. The baronial peers alone possess any influence in the country, and are entitled to sit in the Upper House of Parliament.

A few of the nobles attend to public affairs, and shew a considerable share of talent and sagacity; but, from defective education, and from being deprived of the advantages of travelling, the majority have narrow and contracted ideas, which lead them to prefer the dissipation and the heartless pleasures of the capital, to rural, literary, or scientific pursuits. So far from enjoying the varied beauties of Sicilian landscape, their country excursions, called *Villeggiature*, are confined to a residence of about a month in spring and autumn, at a small distance from the great towns, where the time is passed in the usual routine of paying and receiving visits, in those monotonous assemblies called *conversazioni*, and in gambling. In their deportment they are obliging, affable, and attentive, though very ceremonious. Those violations of truth and morality that so frequently cloud the brightest titles, may be attributed to the neglect of the domestic ties, to their indolence, and to the effects of bad example.

In this elevated class the rights of primogeniture are so strictly exercised, that the eldest son alone is well provided for; the others, being retainers for life, on a small pension, called "*Il piatto*," or dinner-cover, at the father's or elder brother's table, are driven to mean habits; and, as they are not allowed to marry, and are generally deficient in military or civil enterprise, they abandon themselves to idleness, vice, and debauchery.

There is also a class of nobility miserably poor, whose honours never had any patrimony annexed to them, and who are yet too vain to permit themselves or their progeny to engage in commercial or professional undertakings; and it is this class that, by its misdeeds, has lowered the respectability of the whole Sicilian peerage.

A pompous affectation of title is, indeed, the principal trait of the Sicilian character, and is as observable in the vain inscriptions which their public edifices, fountains, and statues display, as in the metaphoric superscriptions of letters in use among all

ranks; for even tradesmen address each other *Most Illustrious*, and a letter to any gentleman scarcely ranking with an esquire in England, is addressed as pompously as to the first peer of the realm.

Most of the nobles have a palace of their own, which goes by their name; but very few, if any, have an establishment sufficiently numerous to occupy the whole building, and many let even the "*appartamento nobile*," or second floor, restricting themselves to an inferior suite of rooms. They are proud of having a tall robust man as porter at the gate, decked out in more gorgeous livery than any of their other servants, with mustachios, a huge cocked hat and feather, broad cross-belt and hanger, and a large silver-headed cane.

In Sicily every house is a palace, and every handicraft a profession; every respectable person is addressed as his Excellency, and even a servant on an errand is charged with an embassy. This attachment to ostentation is so inveterate, that the poorer nobility and gentry are penurious to an extreme in their domestic arrangements, and almost starve themselves to be able to appear abroad in the evening with an equipage, often mean, and calculated rather to indicate poverty than comfort.

All the Fine Arts are at a very low ebb in Sicily, while the mechanics are idle, and have no notion of constant work. Although there is a manifest decay in the genius of their literature, some expressive sonnets and pastoral poems of merit, with a few works on jurisprudence, ethics, mineralogy, mathematics, natural philosophy, and archæology, however disguised in diffuse and inflated language, prove that talent has not fled from amongst them; but statistics are neglected, and reviews, travels, romances, tales, plays, and other lively productions, are almost strangers to their press. Perhaps the custom of submitting manuscripts to the inspection of supervisors and censors, has contributed to clog the flights of fancy, and occasioned the suppression of many an elegant treatise; for even their "*Opuscoli*, *Effemeridi*, *Notizie Letterarie*," and various other journals, have severally existed but for a short period. From the causes before enumerated, female readers are few, and writers of that sex unknown. Of private libraries there is a great dearth. Public libraries are numerous, though but little attended; and foreign authors, except a favoured few, (those principally German that have been translated,) are interdicted; for the least reference to freedom of opinion, in religion or politics, is sufficient to prohibit their introduction into the country. Scarcely any English works, except *Young's Night Thoughts* and *Hervey's Meditations*, are in circulation. The names of Milton, Dryden, Pope, Thomson, Goldsmith, and other British bards, have barely pierced the gloomy atmosphere of Sicilian prejudice; and even Shakespeare was only latterly introduced to public notice, by a ballet founded on *Macbeth*. Scott, Crabbe, Byron, and other ornaments of the present day, have found a few admirers; some of our new works on chemistry and medicine became known and esteemed, during the occupation of the island by the British troops, when many students were received as assistants into our military hospitals.

Gambling seems to be still more universal than any other pursuit; it is the inveterate vice of all ranks.

Besides the riches of her mineral and vegetable products, Sicily boasts the finest fisheries in the Mediterranean Sea. There is a destructive method of fishing practised, called the *Bilancella*, in which two latine-rigged vessels, with a fresh breeze, drag an immense net by means of hawsers, which draws in every thing in its course.

In eating, the Sicilians are generally temperate, though there are many exceptions; and when an entertainment is given, the guests are expected to taste of all the dishes, which are, therefore, successively handed round by the servants, after having been carved. At the feasts of the great, the head of the table is opposite the door where the servants enter, and is appropriated to the most honoured of the company, while the dependants are ranged at the opposite end, around the family chaplain, who is, too often, the butt of the party. The meal commences with soup, which is followed by maccaroni, vegetables variously dressed, and shell-fish, called "*frutti di mare*." The table, during the changes, remains garnished with small plates of raw ham, anchovies, olives, and fresh figs, and melon when in season; then come bouilli, huge fish, made dishes, roast meats, salad, luscious pastry, and, lastly, fruit and coffee. Wine is plentifully drunk during the repast, sometimes accompanied with "*brindisi*," a kind of toast, expressed in an extemporaneous complimentary couplet, ending with, and rhyming, either to the name of the guest, or that of the host; and, latterly, the English custom of pledging has been frequently adopted. When the dessert is finished, every one rises with the ladies, a measure that contributes greatly to prevent excess. From the jealousy of their government, they are deprived of that fertile topic of conversation, political discussion. The habit of pilfering at entertainments is a singular meanness, derived from the Romans, and still in full practice, as is also that of placing good wine at the

upper end of a table, and bad, or indifferent, among the dependants. The rage to excel in the size of fish for their grand entertainments, yet exists; and I have seen the late Prince of Butera, than whom nobody better understood good cheer, place a whole tunny, garnished round with mullet, like a leviathan, in the centre of his festive board.

Besides the usual fare, snails, ink-fish, frogs, hawks, jacksaws, and small birds of every kind, are eaten; but maccaroni, with cheese grated over it, is the standard and favourite dish of all classes; and there are not a few, even of their public characters, renowned for their prowess in its attack; a kind of honour, corresponding to that enjoyed by our five and six bottle men. Their bread is very fine, and of good quality, with the sweetish seeds of the "*gingiolina*," an indigenous Sicilian plant, strewed over it. They eat a greater quantity of salads, fruit, pulse, and other vegetables, than, perhaps, would be wholesome, were they not qualified by numerous culinary ingredients, among which cinnamon and other spices, sugar, oil, and garlic, form a prominent feature.

The usual drinks are light wines, lemonade, and orgeat; beer and tea they are strangers to, except medicinally. Iced creams are a favourite luxury, with which they daily regale themselves, besides drinking iced water at their meals, sometimes corrected by a few drops of "*zambù*," a spirit distilled from aniseed.

AMERICAN ENTERPRISE.

"THERE is perhaps nothing more difficult to an American traveller (continues Mr Fergusson, in his *Notes on the United States and Canada*) than to assign their due and proper status to the places which he may visit on the Western Continent, where a mill and a few paltry stores or shops start, as it were by magic, into importance, and where he will hear of the busy transactions of men, carried on in villages or towns, which he may look for in vain upon his map. Buffalo [a town at the east end of Lake Erie, opposite the Canadian frontier] was becoming a place of some importance in 1814, when it was burnt by the British in a hostile incursion, and would, in our old *joy-trot* part of the world, have been most probably thereby utterly extinguished, or thrown back for a long and indefinite period. Not so, however, here. A spirit of enterprise, which, without doubt, characterises the citizens of America, forbade the local advantages of such a place to remain dormant. The town is now rapidly advancing in wealth and trade, full of bustling merchants, and stores amply provided with the products of every quarter of the globe. The navigation of the great inland seas [Lakes Erie, Ontario, Superior, &c.], and of the Grand Canal [which, by means of the Hudson river, communicates with the Atlantic at New York] here uniting, must confirm the prosperity of Buffalo; and the influx of emigrants flowing through it, to secure the rich and virgin treasures of the western lands, is almost without example. At this time [about eighteen months ago] the numbers were such, that it required compulsory measures to clear the decks of the daily steamers upon Lake Erie. The population of Buffalo (I believe) at this time is about 7000. Besides the concourse of strangers common to the season, the town was particularly crowded, during my visit, from the interest excited by the incorporation of a new bank, of which the shares were to be at this time apportioned, and being considered an extremely good investment, a downright scramble ensued for the stock. The capital had been fixed by the State Legislature at 200,000 dollars; but in a few minutes a million and a half were subscribed, and the greatest disappointment expressed by those who had failed to obtain shares, and many of whom had come a great distance for that purpose. The dividend was expected at once to reach 10 per cent.

"I took my departure this morning from Buffalo, by the track-boat on the Erie Canal, for Rochester, a distance of 94 miles. Fare $3\frac{1}{2}$ dollars, or 16s. 9d., three capital meals included. These boats are much in use by travellers; they are moderate in their charges, comfortable, and well regulated. The cabins are provided with books and pamphlets, and the table abundantly supplied with good cheer. The upper deck affords a pleasant promenade, with fine views of the country, though rather frequently interrupted by innumerable bridges upon the canal, so near the deck that it is absolutely indispensable to descend upon approaching them. The Erie Canal is undoubtedly a magnificent work, and reflects high credit upon those who planned it, and upon the legislature of the state of New York, who have carried it into effect, within the short period of five years, at an expense of 8,000,000 of dollars. It is the property of the state. The outlay has been most judicious, and will produce large returns to the public exchequer, besides the incalculable collateral advantages which it must confer upon the state. It has made a very prosperous opening this spring. Upon the 23d of April, the collection of dues amounted to 4483 dollars, or about L.1200; and the average since has been about L.450 per day. The canal is 40 feet wide at top, 28 at bottom, and 4 deep. The whole extent is 360 miles. Soon after leaving Buffalo, my eye was attracted to a strange-looking barge, which proved to be a floating menagerie, and I gave *Jonathan* credit for the idea. The great length

* Memoirs descriptive of Sicily and its islands, interspersed with antiquarian and other notices. By Captain W. H. Smyth, R. N. London, 1824.

of the canal, and the rich improving country which it intersects, will make the speculation, I dare say, a good one; and by judicious intervals in their visits, with a reasonable change of stock, it may expect to retain the charm of novelty. Another travelling establishment lay near it, containing a grocer's store, which must prove a considerable accommodation to families on the line of the canal, living distant from villages or towns.

"Lockport, 27 miles from Buffalo, has been rapidly transformed from the wilderness into a thriving village of perhaps 2000 inhabitants. The canal near this has been cut through the solid calcareous rock, for a distance of five miles, to a depth of from 5 to 30 feet, and still maintaining the general width of 40. At the termination of this stupendous excavation are placed five double combined locks, of handsome solid masonry. The descent, I believe, is about 70 feet, and the scene is altogether picturesque and interesting. After having been for above an hour immured by the rock on either side, you find yourself suddenly emerge, and approaching steadily to an abyss of a somewhat threatening aspect. Presently, however, a halt takes place, and the beautiful mechanism of the hydrostatic ladder transports you in safety to the plains below. You have in fact descended the Falls of Niagara, for it is the same ridge which intersects Canada, and you are now upon the level of Ontario. Next day we reached the far-famed Rochester; and here I took leave of the canal, intending to prosecute the remainder of my journey to Albany by land. Rochester is well known, to all who take an interest in America, as a remarkable instance of what may be done in the way of transition, and as exhibiting in its streets a perfect sample of the progress from stumps to steeples. It is certainly an interesting place, and presents a busy scene of manufacturing and commercial enterprise."—*Quarterly Journal of Agriculture.*

BIOGRAPHIC SKETCHES.

THE REV. ROBERT WALKER,

Otherwise styled, THE WONDERFUL WALKER.

MR WORDSWORTH, the poet of the English Lakes, in the notes to his poetical volume styled "Sonnets on the River Duddon," gives a prose account of the Rev. Robert Walker, who acted for many years during the last century as curate of Seathwaite, in that part of the country. This person's character and mode of life are so perfectly extraordinary, and afford a picture so truly grateful to the moral affections, that we have resolved to make room for it in our columns.

In the year 1700, Robert Walker was born at Under-crag, in Seathwaite; he was the youngest of twelve children. His eldest brother, who inherited the small family estate, died at Under-crag, aged ninety-four, being twenty-four years older than the subject of this memoir, who was born of the same mother. Robert was a sickly infant; and, through his boyhood and youth continuing to be of delicate frame and tender health, it was deemed best, according to the country phrase, to *breed him a scholar*; for it was not likely that he would be able to earn a livelihood by bodily labour. At that period few of these dales were furnished with school-houses, the children being taught to read and write in the chapel; and in the same consecrated building, where he officiated for so many years both as preacher and schoolmaster, he himself received the rudiments of his education. In his youth he became schoolmaster at Lowes-water; not being called upon, probably, in that situation, to teach more than reading, writing, and arithmetic. But, by the assistance of a "gentleman" in the neighbourhood, he acquired, at leisure hours, a knowledge of the classics, and became qualified for taking holy orders. Upon his ordination, he had the offer of two curacies; the one, Torver, in the vale of Conistoun—the other, Seathwaite, in his native vale. The value of each was the same, viz. five pounds per annum; but the cure of Seathwaite having a cottage attached to it, as he wished to marry, he chose it in preference. The young person on whom his affections were fixed, though in the condition of a domestic servant, had given promise, by her serious and modest deportment, and by her virtuous dispositions, that she was worthy to become the helpmate of a man entering upon a plan of life such as he had marked out for himself. By her frugality she had stored up a small sum of money, with which they began housekeeping. In 1735 or 1736, he entered upon his curacy; and, nineteen years afterwards, his situation is thus described, in some letters to be found in the Annual Register for 1760, from which the following is extracted:—

"Conistoun, July 26, 1754.

"SIR—I was the other day upon a party of pleasure, about five or six miles from this place, where I met with a very striking object, and of a nature not very common. Going into a clergyman's house (of whom I had frequently heard), I found him sitting at the head of a long square table, such as is commonly used in this country by the lower class of people, dressed in a coarse blue frock, trimmed with black horn buttons; a checked shirt, a leathern strap about his neck for a stock, a coarse apron, and a pair of great wooden-soled shoes, plated with iron to preserve them (what we call clogs in these parts), with a child upon his knee eating his breakfast; his wife, and the remainder of his children, were some of them employed in waiting on each other, the rest in teasing and spinning

wool, at which trade he is a great proficient; and, moreover, when it is made ready for sale, will lay it by sixteen, or thirty-two pounds weight, upon his back, and on foot, seven or eight miles, will carry it to the market, even in the depth of winter. I was not much surprised at all this, as you may possibly be, having heard a great deal of it related before. But I must confess myself astonished with the alacrity and the good humour that appeared both in the clergyman and his wife, and more so at the sense and ingenuity of the clergyman himself."

Then follows a letter from another person, dated 1755, from which an extract shall be given:—

"By his frugality and good management, he keeps the wolf from the door, as we say; and if he advances a little in the world, it is owing more to his own care than to any thing else he has to rely upon. I don't find his inclination is running after further preferment. He is settled among the people, that are happy among themselves; and lives in the greatest unanimity and friendship with them; and I believe the minister and people are exceedingly satisfied with each other; and indeed how should they be dissatisfied, when they have a person of so much worth and probity for their pastor?—a man who, for his candour and meekness, his sober, chaste, and virtuous conversation, his soundness in principle and practice, is an ornament to his profession, and an honour to the country he is in; and bear with me if I say, the plainness of his dress, the sanctity of his manners, the simplicity of his doctrine, and the vehemence of his expression, have a sort of resemblance to the pure practice of primitive Christianity."

We will now give his own account of himself, to be found in the same place:—

"The annual income of my chapel at present, as near as I can compute it, may amount to about L.17, 10s., of which is paid in cash, viz. L.5 from the bounty of Queen Anne, and L.5 from W. P. Esq. of P—, out of the annual rents, he being lord of the manor, and L.3 from the several inhabitants of L—, settled upon the tenements as a rent-charge; the house and gardens I value at L.4 yearly, and not worth more; and I believe the surplice fees and voluntary contributions, one year with another, may be worth L.3; but as the inhabitants are few in number, and the fees very low, this last-mentioned sum consists merely in free-will offerings."

"I am situated greatly to my satisfaction with regard to the conduct and behaviour of my auditory, who not only live in the happy ignorance of the follies and vices of the age, but in mutual peace and good will with one another, and are seemingly (I hope really too) sincere Christians, and sound members of the established church, not one dissenter of any denomination being amongst them all. I got to the value of L.40 for my wife's fortune, but had no real estate of my own, being the youngest son of twelve children, born of obscure parents; and though my income has been but small, and my family large, yet, by a providential blessing upon my own diligent endeavours, the kindness of friends, and a cheap country to live in, we have always had the necessities of life."

About the time when this was written, the Bishop of Chester recommended the scheme of joining the curacy of Ulpha to the contiguous one of Seathwaite, and the nomination was offered to Mr Walker; but an unexpected difficulty arising, Mr W., in a letter to the Bishop (a copy of which, in his own beautiful hand-writing, now lies before me), thus expresses himself: "If he," meaning the person in whom the difficulty originated, "had suggested any such objection before, I should utterly have declined any attempt to the curacy of Ulpha; indeed, I was always apprehensive it might be disagreeable to my auditory at Seathwaite, as they have been always accustomed to double duty, and the inhabitants of Ulpha despair of being able to support a schoolmaster who is not curate there also; which suppressed all thoughts in me of serving them both."

And in a second letter to the Bishop he writes:—

"My LORD—I have the favour of yours of the 1st instant, and am exceedingly obliged on account of the Ulpha affair; if that curacy should lapse into your Lordship's hands, I would beg leave rather to decline than embrace it; for the chapels of Seathwaite and Ulpha annexed together would be apt to cause a general discontent among the inhabitants of both places, by either thinking themselves slighted, being only served alternately, or neglected in the duty, or attributing it to covetousness in me; all which occasions of murmuring I would willingly avoid." And in concluding his former letter, he expresses a similar sentiment upon the same occasion, "desiring, if it be possible, however, as much as in me lieth, to live peaceably with all men."

The year following, the curacy of Seathwaite was again augmented; and to effect this augmentation, fifty pounds had been advanced by himself; and in 1760, lands were purchased with eight hundred pounds. Scanty as was his income, the frequent offer of much better benefices could not tempt Mr Walker to quit a situation where he had been so long happy, with a consciousness of being useful.

Besides being liberal in the education of his numerous family, he was even munificent in hospitality as a parish priest. Every Sunday were served upon the long table, at which he has been described sitting with a child upon his knee, messes of broth, for the refreshment of those of his congregation who came from a

distance, and usually took their seats as parts of his own household. It seems scarcely possible that this custom could have commenced before the augmentation of his cure; and, what would to many have been a high price of self-denial, was paid, by the pastor and his family, for this gratification; as the treat could only be provided by dressing at one time the whole, perhaps, of their weekly allowance of fresh animal food; consequently, for a succession of days, the table was covered with cold victuals only. His generosity in old age may be still further illustrated by a little circumstance relating to an orphan grandson, then ten years of age, which I find in a copy of a letter to one of his sons; he requests that half a guinea may be left for "little Robert's pocket-money," who was then at school; entrusting it to the care of a lady, who, as he says, "may sometimes frustrate his squandering it away foolishly," and promising to send him an equal allowance annually for the same purpose. The conclusion of the same letter is so characteristic, that I cannot forbear to transcribe it. "We," meaning his wife and himself, "are in our wonted state of health, allowing for the hasty strides of old age knocking daily at our door, and threateningly telling us we are not only mortal, but must expect ere long to take our leave of our ancient cottage, and lie down in our last dormitory. Pray pardon my neglect to answer yours: let us hear sooner from you, to augment the mirth of the Christmas holidays. Wishing you all the pleasures of the approaching season, I am, dear son, with lasting sincerity, yours affectionately, R. W."

He loved old customs and usages, and in some instances stuck to them to his own loss; for, having had a sum of money lodged in the hands of a neighbouring tradesman, when long course of time had raised the rate of interest, and more was offered, he refused to accept it; an act not difficult to one, who, while he was drawing seventeen pounds a-year from his curacy, declined, as we have seen, to add the profits of another small benefice to his own, lest he should be suspected of cupidity. From this vice he was utterly free; he made no charge for teaching school; such as could afford to pay, gave him what they pleased. When very young, having kept a diary of his expenses, however trifling, the large amount, at the end of the year, surprised him; and from that time the rule of his life was to be economical, not avaricious. At his decease he left behind him no less a sum than L.2000, and such a sense of his various excellencies was prevalent in the country, that the epithet of WONDERFUL is to this day attached to his name.

There is in the above sketch something so extraordinary as to require further explanatory details. And to begin with his industry: Eight hours in each day, during five days in the week, and half of Saturday, except when the labours of husbandry were urgent, he was occupied in teaching. His seat was within the rails of the altar; the communion table was his desk; and, like Shenstone's schoolmistress, the master employed himself at the spinning-wheel, while the children were repeating their lessons by his side. Every evening, after school-hours, if not more profitably engaged, he continued the same kind of labour, exchanging, for the benefit of exercise, the small wheel, at which he had sat, for the large one on which wool is spun, the spinner stepping to and fro. Thus was the wheel constantly in readiness to prevent the waste of a moment's time. Nor was his industry with the pen, when occasion called for it, less eager. Entrusted with extensive management of public and private affairs, he acted in his rustic neighbourhood as scrivener, writing out petitions, deeds of conveyance, wills, covenants, &c., with pecuniary gain to himself, and to the great benefit of his employers. These labours (at all times considerable) at one period of the year, viz. between Christmas and Candlemas, when money transactions are settled in this country, were often so intense, that he passed great part of the night, and sometimes whole nights, at his desk. His garden also was tilled by his own hand; he had a right of pasturage upon the mountains for a few sheep and a couple of cows, which required his attendance; with this pastoral occupation, he joined the labours of husbandry upon a small scale, renting two or three acres in addition to his own less than one acre of glebe; and the humblest drudgery which the cultivation of these fields required was performed by himself.

He also assisted his neighbours in hay-making, and shearing their flocks, and in the performance of this latter service he was eminently dexterous. They in their turn complimented him with a present of a hay-cock or a fleece; less as a recompense for this particular service than as a general acknowledgment. The Sabbath was, in a strict sense, kept holy, the Sunday evenings being devoted to reading the Scripture and family prayer. The principal festivals appointed by the church were also duly observed; but through every other day in the week, through every week in the year, he was incessantly occupied in work of hand or mind, not allowing a moment for recreation, except upon a Saturday afternoon, when he indulged himself with a newspaper, or sometimes with a magazine. The frugality and temperance established in his house were as admirable as the industry. Nothing to which the name of luxury could be given was there known; in the latter part of his life, indeed, when tea had been brought into almost general use, it was provided for visitors, and for such of his own family as returned occasionally to his roof, and had been accustomed to this refreshment elsewhere; but neither he nor his

wife ever partook of it. The raiment worn by his family was comely and decent, but as simple as their diet; the home-spun materials were made up into apparel by their own hands. At the time of the decease of this thrifty pair, their cottage contained a large store of webs of woollen and linen cloth, woven from thread of their own spinning. And it is remarkable that the pew in the chapel in which the family used to sit remained a few years ago neatly lined with woollen cloth spun by the pastor's own hands. It is the only pew in the chapel so distinguished; and I know of no other instance of his conformity to the delicate accommodations of modern times. The fuel of the house, like that of their neighbours, consisted of peat, procured from the mosses by their own labour. The lights by which in the winter evenings their work was performed, were of their own manufacture, such as still continue to be used in these cottages; they are made of the pith of rushes dipped in any unctuous substance that the house affords. *White* candles, as tallow candles are here called, were reserved to honour the Christmas festivals, and were, perhaps, produced upon no other occasions. Once a month, during the proper season, a sheep was drawn from their small mountain flock, and killed for the use of the family; and a cow, towards the close of the year, was salted and dried, for winter provision; the hide was tanned to furnish them with shoes. By these various resources, this venerable clergyman reared a numerous family, not only preserving them, as he affectingly says, "from wanting the necessities of life," but afforded them an unstinted education, and the means of raising themselves in society.

It might have been concluded that no one could thus, as it were, have converted his body into a machine of industry for the humblest uses, and kept his thoughts so frequently bent upon secular concerns, without grievous injury to the more precious parts of his nature. How could the powers of intellect thrive, or its graces be displayed, in the midst of circumstances apparently so unfavourable, and where, to the direct cultivation of the mind, so small a portion of time was allotted? But, in this extraordinary man, things in their nature adverse were reconciled; his conversation was remarkable, not only for being chaste and pure, but for the degree in which it was fervent and eloquent; his written style was correct, simple, and animated. Nor did his affections suffer more than his intellect; he was tenderly alive to all the duties of his pastoral office; the poor and needy "he never sent empty away"—the stranger was fed and refreshed in passing that unfrequented vale—the sick were visited. The feelings of humanity found further exercise among the distresses and embarrassments in the worldly estate of his neighbours, with which his talents for business made him acquainted; and the disinterestedness, impartiality, and uprightness which he maintained in the management of all affairs confided to him, were virtues seldom separated in his own conscience from religious obligations. Nor could such conduct fail to remind those who witnessed it of a spirit nobler than law or custom; they felt convictions which, but for such intercourse, could not have been afforded, that, as in the practice of their pastor there was no guile, so in his faith there was nothing hollow; and we are warranted in believing, that, upon these occasions, selfishness, obstinacy, and discord, would often give way before the breathings of his good will and saintly integrity. It may be presumed also, while his humble congregation were listening to the moral precepts which he delivered from the pulpit, and to the Christian exhortations, that they should love their neighbour as themselves, and do as they would be done unto, that peculiar efficacy was given to the preacher's labours by recollections in the minds of his congregation, that they were called upon to do no more than his own actions were daily setting before their eyes.

The afternoon service in the chapel was less numerously attended than that of the morning, but by a more serious auditory; the lesson from the New Testament, on those occasions, was accompanied by Burdett's Commentaries. These lessons he read with impassioned emphasis, frequently drawing tears from his hearers, and leaving a lasting impression upon their minds. His devotional feelings and the powers of his own mind were further exercised, along with those of his family, in perusing the Scriptures; not only on the Sunday evenings, but on every other evening, while the rest of the household were at work, some one of the children, and in her turn the servant, for the sake of practice in reading, or for instruction, read the Bible aloud; and in this manner the whole was repeatedly gone through. That no common importance was attached to the observance of religious ordinances by his family, appears from the following memorandum by one of his descendants, which I am tempted to insert at length, as it is characteristic, and somewhat curious:—"There is a small chapel, in the county palatine of Lancaster, where a certain clergyman has regularly officiated above sixty years, and a few months ago administered the sacrament of the Lord's Supper in the same, to a decent number of devout communicants. After the clergyman had received himself, the first company out of the assembly who approached the altar, and kneeled down to be partakers of the sacred elements, consisted of the parson's wife, to whom he had been married upwards of sixty years; one son and his wife; four daughters, each with her husband; whose ages all added together

amount to above 714 years. The several and respective distances from the place of each of their abodes to the chapel where they all communicated, will measure more than 1000 English miles. Though the narration will appear surprising, it is without doubt a fact, that the same persons, exactly four years before, met at the same place, and all joined in performance of the same venerable duty."

It would be unpardonable to omit, that, in the maintenance of his virtues, he received due support from the partner of his long life. She was equally strict in attending to her share of their joint cares, nor less diligent in her appropriate occupations. A person who had been some time their servant in the latter part of their lives, concluded the panegyric of her mistress by saying to me, "she was no less excellent than her husband; she was good to the poor, she was good to every thing!" He survived for a short time this virtuous companion. When she died, he ordered that her body should be borne to the grave by three of her daughters and one granddaughter; and when the corpse was lifted from the threshold, he insisted upon lending his aid, and feeling about, for he was then almost blind, took hold of a napkin fixed to the coffin, and, as a bearer of the body, entered the chapel, a few steps from the lowly parsonage.

What a contrast does the life of this obscurely-seated, and, in point of worldly wealth, poorly-repaid churchman, present to that of a Cardinal Wolsey!

"O 'tis a burthen, Cromwell, 'tis a burthen
Too heavy for a man who hopes for heaven!"

THE PERSECUTIONS OF GENIUS.

THE successful efforts of genius have not been more remarkable in the biography of eminent individuals, than the miseries which have often, during barbarous times, been endured by men of learning and scientific skill, through the ignorance of the very persons whom they intended to benefit. It is only, indeed, in the present age that we find the discoverers of new arts and sciences rewarded with the approbation of their fellows, if not with more substantial gifts; and in considering what has from first to last been the amount of the cruel persecutions of the learned, the existing generation can hardly believe it credible that so much wanton abuse of power can have been exercised. On this subject of melancholy interest, D'Issraeli, in his *Curiosities of Literature*, has collected a variety of striking particulars. "Before the times of Galileo and Harvey (says this accurate writer), the world believed in the diurnal immovability of the earth, and the stagnation of the blood; and for denying these, the one was persecuted, and the other ridiculed. The intelligence and virtue of Socrates were punished with death. Anaxagoras, when he attempted to propagate a just notion of the Supreme Being, was dragged to prison. Aristotle, after a long series of persecutions, swallowed poison. The great geometricians and chemists, as Gerbert, Roger Bacon, and others, were abhorred as magicians. Virgilus, Bishop of Salzburg, having asserted that there existed antipodes, the Archbishop of Mentz declared him a heretic, and consigned him to the flames; and the Abbot Trithemius, who was fond of improving stenography, or the art of secret writing, having published some curious works on that subject, they were condemned, as works full of diabolical mysteries. Galileo was condemned at Rome publicly to disavow his sentiments regarding the motion of the earth, the truth of which must have been abundantly manifest: He was imprisoned in the Inquisition, and visited by Milton, who tells he was then *poor* and *old*. Cornelius Agrippa—a native of Cologne, and distinguished by turns as a soldier, philosopher, physician, chemist, lawyer, and writer, was believed to be a magician, and to be accompanied by a familiar spirit in the shape of a black dog—was so violently persecuted that he was obliged to fly from place to place; the people beheld him as an object of horror, and not unfrequently, when he walked, he found the streets empty at his approach: This ingenious man died in an hospital. When Urban Grandier, another victim of the age, was led to the stake, a large fly settled on his head: a monk, who had heard that Beelzebub signifies in Hebrew the God of Flies, reported that he saw this spirit come to take possession of him.

"Even the learned themselves, who had not applied to natural philosophy, seem to have acted with the same feelings as the most ignorant; for when Albertus Magnus—an eminent philosopher of the thirteenth century—constructed an automaton, or curious piece of mechanism, which sent forth distinct vocal sounds, Thomas Aquinas (a celebrated theologian) imagined it to be the work of the devil, and struck it with his staff, which, to the mortification of the great Albert, annihilated the labour of thirty years. Descartes was horribly persecuted in Holland when he first published his opinions: Voetius, a person of influence, accused him of atheism, and had even projected in his mind to have this philosopher burnt at Utrecht in an extraordinary fire, which, kindled on an eminence, might be observed by the seven provinces. This persecution of science and genius lasted till the close of the seventeenth century."

THE SCOTTISH COTTAR.

THE peasantry of Scotland have been long noted for the simplicity and purity of their manners, as well as for their sagacity and spirit of independence. Burns, in his "Cottar's Saturday Night," feelingly embodies an exceedingly accurate detail of their character and manners, with which his birth and early life led him to be peculiarly well acquainted. Though still maintaining the greater part of their ancient characteristics, the peasantry have been much modified in their habits of living and style of thinking. A taste for refinements in dress, and a less sober system of manners, have in most places broken down the old distinctions of their class, while their deportation from the soil, and the destruction of their hamlets, in consequence of the modern practice of farming on a large scale with improved machinery, have tended to cast them loose on society, and make them totally regardless of their ancient masters, the landed proprietors. The settlement of Irish emigrants has been another obvious cause in reducing the tone of the peasantry, and is one which, in all likelihood, in a certain space of time, will leave no remnant of a class, which for ages has been an object of national boasting.

There are few places in Scotland traversed by the tourist which can now offer a perfect specimen of the old Scottish peasant and his family, nearly the whole land having undergone a change as wonderful as it has been rapid. Perhaps, in the wilder parts of Ayrshire and Galloway, or in the secluded vales of Nithsdale, the "cottar's ha" is to be found in a more primitive condition, as to its structure and inmates, than in any other part of the country. The following picture of one of these rude residences, with the venerable rites of which it was often the scene, presented by Mr Cromek, in his "Remains of Nithsdale and Galloway Song," is extremely interesting, and may be given as a memorial of the former condition of our respected peasantry:—

"On entering a neat thatched cottage, when past the partition or hallan, a wide, far projecting chimney piece, garnished with smoked meat, met your eye. The fire, a good space removed from the end wall, and contained in a grate open all round. Behind this were benches stretching along the gable, for the use of the family as well as for all visitors. The cottar sire was placed on the left of the fire, removed from the bustle of housewifery. A settle of oak, antequely carved, and strewn with favourite texts of Scripture, was the good man's seat, where he rested after the day's fatigue, nursing and instructing his children. His library shelf above him displayed his folio Bible, covered with rough calf-skin, wherein were registered his children's names and hour of birth; some histories of the old reforming worthies, the sacred books of his fathers, lay carefully adjusted and pretty much used; and the acts and deeds of Scotland's saviour, Wallace, and the immortal Bruce, were deemed worthy of holding a place among the heroic divines who had won the heavenly crown of martyrdom. Above these were hung a broad sword and targe, the remains of ancient warfare, which happily the hand of peace had long forgot to wield. From the same pin depended the kirk-cut of corn—the name given to the last handful of grain cut down on the harvest field—curiously braided and adorned with ribbons. Beside him was his fowling-piece, which, before the enactment of game laws, supplied his family with venison and fowls in their season. At the end of the lang-settle was the window, which displayed a few panes of glass and two oaken boards, that opened like shutters, for the admission of air. On the gudewife's side appeared her articles of economy and thrift. A dresser, replenished with pewter plates, with a large lead chest of carved oak, extended along the side wall; bunches of yarn hung from a loft or flooring, made of small wood or ryse, spread across the joisting, and covered with moor turf. The walls, white with lime, were garnished with dairy utensils (every cottar almost having one or two kye). At each side of the middle entry was a bed, sometimes of very curious and ingenious workmanship, being posted with oak, and lined with barley straw, finely cleaned, and inwoven with thread; these were remarkably warm and much valued.

"Family worship was performed every evening; but on the Sabbath morning it was attended with peculiar solemnity. At that season all the family, and frequently some of the neighbours, presented themselves before the aged village apostle. He seated himself on the lang-settle, laying aside his bonnet and plaid. His eldest child came submissively forward, and, undraping the Bible, placed it across his father's knees. After a few minutes of religious silence, he meekly lifts his eyes over his family to mark if they are all around him; and decorous. Opening the Bible he says—in a tone of simple and holy meekness—"Let us reverently worship our God by singing the (eighth) Psalm." He reads it aloud; then gives or recites line after line, leading the tune himself. *The Martyrs* is a chosen air, so called in honour of those men who displayed a zeal worthy of the name, and perished in "the Persecution." All the family join in this exquisitely mournful tune till the sacred song is finished. A selected portion of Scripture is then read from the sublime soarings of Isaiah, or the solemn morality of Job. As the divine precepts of his Saviour are the sacred rules by which the good man shapes the conduct of his children, Isaiah's fifty-third chapter, where the coming of the Redeemer is foretold, is the soul-

lifting favourite of rustic devotion. It is read with an exalted inspiration of voice, accordant with the subject. The family rise as he clasps the book, fall down on their knees, bowing their heads to the ground. The good man, kneeling over his Bible, pours his prayer to heaven in a strain of feeling and fervent eloquence. His severity of church discipline relaxes in the warmth of his heart:—'May our swords become ploughshares, and our spears reaping-hooks: May all find grace before thee!'

"There is not perhaps a more impressive scene than a Scottish Sabbath morn presents, when the wind is low, the summer sun newly risen, and all the flocks at browse by the waters and by the woods: how glorious then to listen to the holy murmur of retired prayer, and the distant chant of the cottarmair's psalm spreading from hamlet and village!"

STREETS.

THE people of Great Britain, who are so much accustomed to the use of certain comforts not known in other nations, that they are hardly aware of possessing any thing peculiar, do not sufficiently appreciate the comparative excellence of the pavement of their streets. Throughout the greater part of the Continent the streets are kept in an execrable condition. There are no water or gas pipes laid;* no proper establishment of lamps; few or no common sewers, the whole liquid refuse of the town flowing in the gutters; and, what is worst of all, no side pavements for foot passengers. When foreigners land in this our well-regulated island, the first thing which astonishes them is the side pavements, of which they had previously little or no knowledge. Bonaparte felt chagrined at the want of these comfortable appliances to the streets of Paris, and in some of his improvements attempted a piece of side pavement, which is esteemed one of the wonders of that city. It is somewhat remarkable that in the destroyed towns of Pompeii and Herculaneum, there were side pavements, which shews that the invention is by no means British.

In illustrating this subject, Beckmann, in his *History of Institutions and Inventions*, has the following observations:—

"The public accommodations now so commonly found in every great town, are considered as so indispensably necessary, that they are generally supposed to have been coeval with the first erection of cities; yet, if we inquire into the antiquity of many of them, we shall find that some, of the most obvious utility, were not only unknown to the most splendid capitals of ancient times, but are, in fact, comparatively modern improvements.

Among the first of all public conveniences is that of a facility of locomotion; and hence we find that the Greeks and Romans paid particular attention to the construction of their roads. But it is somewhat singular, that they were at the same time indifferent as to the state of their streets; and although one might imagine that men would be more desirous of a good pavement in front of their houses, where they daily trod, than on highways which they could seldom have occasion to use, it is nevertheless certain that the streets of ancient Rome were only very partially paved during its most brilliant era, and are described by authors of that period as being filled with dirt.

Although the most minute accounts have been transmitted of the buildings in many of the Grecian cities, yet we hear nothing of the pavement of any of them: except, indeed, that the streets of Thebes were under the inspection of certain officers, whose duty it was to keep them in repair; from which some persons have inferred that they were paved.

The oldest pavement of which we have any account, in modern cities, is that of Cordova, in Spain, which was paved with stones so early as the middle of the ninth century, while under the dominion of the Moors, in the thirtieth year of the reign of the Caliph Abdulrahman II., who also caused water to be conveyed into the city in leaden pipes.

Paris was the next to adopt this improvement; but it did not take place there until the year 1184, on which occasion Rigord, the historian of Philip II., says, 'that the name of the city was changed from Lutetia, by which it had been previously called on account of its filthiness, to that of Paris the son of Priam.' What connection there was between the city and Priam does not appear; but he tells us that the king, standing one day at a window of his palace, and remarking that the dirt thrown up by the carts produced a most noxious stench, resolved to remedy the nuisance by causing the streets to be paved. We may, indeed, conjecture how offensive they must have previously been, from the circumstance that swine were constantly permitted to wallow in them, until a prince of the blood being killed by a fall from his horse, in consequence of a sow running between its legs, an order was issued that they should not in future be suffered in the streets. But against this the monks of the Abbey of St Anthony remonstrated strongly, insisting that it was a want of respect to their patron to prevent his pigs from going wherever they pleased; and it was, in consequence, found ne-

cessary to grant them the exclusive privilege of wallowing in the mire without molestation, only requiring the holy fathers to turn them out with bells about their necks.

The streets of London were not paved in the eleventh century; nor is it certain at what time this improvement was first introduced. In 1090, Cheap-side was of such soft earth, that when the roof of Bow Church was blown off by a violent gale of wind, four of the beams, each twenty-six feet long, were so deeply buried in the street, that little more than four feet remained above the surface. The first toll that we know of in England, for repairing the highways, was imposed in the fourteenth century, during the reign of Edward III., for mending the road between St Giles's and Temple Bar. It was not until 1417 that Holborn was paved, though it was often impassable from its depth of mud. Even during the reign of Henry VIII. many of the streets are represented as 'very foul, and full of pits and sloughs, very perilous and noxious, as well for all the King's subjects on horseback as on foot, and with carriage; and Smithfield was without pavement until 1614. In 1678, Commissioners of Sewers were appointed: but we learn from a proclamation of the Lord Mayor, in the following year, that the paving and cleansing of the city were still much neglected, and, in fact, down to 1762, the streets of the metropolis were generally obstructed with stalls, sheds, sign-posts, and projections of various kinds. Each inhabitant paved before his own door, in such manner, and with such materials, as pride, poverty, or caprice might suggest: there were no flagged trottoirs—the footway was exposed to the carriage-road, except in some of the leading streets, where they were separated by a line of posts and chains, or by wooden paling. In that year the 'Westminster Paving Act' passed, from which we may date all those improvements which have rendered London superior in cleanliness and accommodation for passengers to any other city in Europe.

They who are only accustomed to the pure air and clean streets of London, will scarcely believe that many large cities are even yet in a great measure destitute of the convenience of water-closets. Madrid was without this improvement at a time when it was found by English navigators near the habitations of the savages of New Zealand, and most of the towns throughout Spain are still deficient in that respect. In the streets of Lisbon the filth is suffered to accumulate in heaps, which, in the summer months, are dried into dust and scattered by the wind, and in the winter are partially carried off by the rain; hogs and unowned dogs are the only scavengers; and, in some of the narrow lanes of the old town, the inhabitants are supposed never to have seen the pavement. It is only a few years since the streets of Warsaw ceased to be the common receptacle of every kind of dirt. Even those of the now elegant Berlin were never cleaned until about the middle of the seventeenth century; and hog-sties were at that time to be found immediately under the windows.

The pavement of the cities of Holland is superior to any other, both from being entirely composed of that kind of brick which we call clinkers, and from its being but little worn by carriages. The Dutch could scarcely be otherwise than cleanly, from the abundance of water in all the streets of their large towns."

The streets of Edinburgh, which were formerly in an uncleanly condition, are now kept in the best order, through the exertions of the police, and the improvement in manners in the inhabitants. The side pavement of this city, from the quantity of fine freestone in the neighbourhood, is also excellent, and is, perhaps, superior to that of any other town in the world.

SONG.

MINNIE TO HER SPINNIN'-WHEEL.

By William Tennant, Esq. Author of "Anster Fair," &c.

Birr on, birr on, my spinnin'-wheel!
Spin on, spin on, my birrin'-wheel!
The roods and wa's are dash't wi' rain;
The wind doth gow! at ilka pane;
But here I sit fu' warm and dry,
And care na for the blasts out-by,
Aye birrin' at my spinnin'-wheel!

Birr on, birr on, my spinnin'-wheel!
Spin on, spin on, my birrin'-wheel!
Hey, how the towslat now comes down!
Hey, how the wheel rins round and round!
How merrily, hey, the tirlin' pin
Snaps wi' its iron teeth the yarn,
Aye followin' fast the birrin'-wheel!

Birr on, birr on, my spinnin'-wheel!
Spin on, spin on, my birrin'-wheel!
Kate's bridal day will soon be here,
And she maun ha her pairt of gear;
The weaver's hands are toom of war;
He's crying loud for sheet or sark,
And flytes you, lazy spinnin'-wheel!

Birr on, birr on, my spinnin'-wheel!
Spin on, spin on, my birrin'-wheel!
Haud aff, ye bairns! touch nae the rock;
Play farer aff, we Jean and Jock;
For minnie is taksit and set to hae
A braw linen wae ere sweet May-day,
Wi' birrin' at her spinnin'-wheel!

Birr on, birr on, my spinnin'-wheel!
Spin on, spin on, my birrin'-wheel!
The roods and wa's are dash't wi' rain;
The wind doth gow! at ilka pane;
But here I sit fu' warm and dry,
And care na for the blasts out-by,
Aye birrin' at my spinnin'-wheel!

COTTON TRADE.

Of the cotton cloth made in England, three hundred and sixty million yards are annually exported, and three hundred and ninety-nine million yards are retained for home consumption. This was the state of the cotton trade upon an average of years from 1824 till 1828.

AN ITALIAN ROBBER.

At Rochefort there is a convict, a native of Italy, whose ingenuity in putting up travellers upon a night has been furnished the facetious Grimaldi himself with a bandit scene in a pantomime. This hero was for some years the Turpin of France, and was much dreaded by travellers. Gasparini, though guilty of many robberies on the highway, has never been accused of wanton cruelty. He some years ago undertook alone to stop a diligence as it was passing at night through the woods; here he drew up his forces, which literally consisted of a not of bloody-minded robbers, but of half a dozen of well-stuffed coats, fixed on poles, with formidable caps, travelled arms, and other appendages well suited to inspire the travellers with terror. When the diligence arrived, he ordered the postilion to stop; he then made the conductor and the passengers alight, and in a resolute tone, pointing to his supposed companions, whom he had ranged on the skirts of the woods, he desired the trunks to be opened, out of which he took what he thought proper. He then said to the trembling travellers—"Don't be alarmed, gentlemen; allow me to take what I require, and depend on it my troops shall not advance a step further; from them, I assure you, you have nothing to fear." This modern Rolando was sent to hard labour for life in the galleys. It appeared on the trial, that when the gendarmes went to scour the woods, they were not a little surprised to find half a dozen robbers who appeared determined to stand their ground; they summoned them to surrender, and on receiving no reply, fired a volley, and then attacked the *manikins* sword in hand: of course they met with but feeble resistance, and laughed heartily at the joke.—*Goldsmith's Statistics of France.*

TORTOISE-SHELL.

The following singularly barbarous process for obtaining the tortoise-shell is abstracted from an Indian newspaper, called the Singapore Chronicle:—This highly-prized aquatic production, when caught by the Eastern islanders, is suspended over a fire, kindled immediately after its capture, until such time as the effect of the heat loosens the shell to such a degree that it can be removed with the greatest ease. The animal, now stripped and defenceless, is set at liberty, to re-enter its native element. If caught in the ensuing season, or at any subsequent period, it is asserted that the unhappy animal is subjected to a second ordeal of fire, rewarding its capturers this time, however, with a very thin shell. This, if true, shows more policy and skill than tenderness in the method thus adopted by the islanders; it is, however, a proof of the want of tenacity of life in the animal, and must further be accounted a very singular fact in natural history.

USE OF FORKS.

A foreigner remarks, in his work on Great Britain, that an Englishman may be discovered anywhere if he be observed at table, because he places his fork upon the left side of his plate; a Frenchman by using the fork alone without the knife; and a German by using the knife particularly into his plate; and a Russian by using it as a toothpick. Holding the fork is a national custom, and nations are characterised by their peculiarity in the use of the fork at table. An affectation of the French usages in this respect seems now to be gaining ground in this country.

MONSIEUR LE CHAT.

Mr Shaw, an agent of one of the Fur Trading Companies, had passed many years in the interior of the North-West Territory, and was the voyageur called *Monsieur Le Chat*. On quitting the Indian country, he married a Canadian lady, by whom he had several children. Some years after this event, one of his old foremen, named Louis La Liberté, went to Montreal to spend the winter. He had heard of his old *bourgeois's* marriage, and was anxious to see him. Mr Shaw was walking on the Champ de Mars with the young couple, and as they were about to cross the bridge, he immediately ran up, and seizing him by both hands, began as follows:—"Ah, mon cher Monsieur Le Chat, comment vous portez-vous?"—"Très bien, Louison."—"Et comment se porte Madame La Chatte?"—"Bien, bien, Louison! elle est très bien."—"Et tous les petits Chatsons?"—"This was too much for Mr Shaw, who answered shortly, that *kittens* and *cats* were well, and telling him to go, he turned away with a queer expression of the face. The *Catechistical* Louison quite astonished at the abruptness of his departure.—*Ross Cox's Adventures.*

FRANCE.—CHEAP LITERATURE.

Cheap literature is becoming even more prevalent in Paris than in London; that is to say, literature of a particular class. I have now before me five prospectuses of works of this nature; the first a collection of the principal works, comprising *Le Génie, l'Art, l'Anquet, l'Esprit, &c.* beautifully printed, and illustrated by maps and portraits; it is published in weekly volumes, containing about two hundred pages each, at twelve sous, or sixpence per volume; the next comprises the complete works of Buffon, edited by Cuvier, and published in the same manner, and at the same price; the third is a translation of Sir Walter Scott's works, published in the same manner, but at fifteen sous per volume; the fourth is a collection of the most celebrated voyages in every country, and will form two hundred volumes, in 18mo., published in a similar manner, at thirteen sous per volume; and the fifth comprises an admirable selection of all the best authors in the French language, at twelve sous per volume; the whole are got up in a style which would make them admissible to any library, while the price and mode of publication render them accessible to those to whom otherwise they would be for ever forbidden fruit. In the last-mentioned work, *L'Histoire de Charles XII.* is comprised in one volume for sixpence, and his *Siecles de Louis XIV.* and *Louis XV.* in another. The importance of publications of this description is most perceived with reference to the rising generation. Young people allowed to appropriate sixpence per week in this manner, instead of squandering it as formerly, feel at once the pride of seeing their own library accumulate around them, and shame, if they are not masters of its contents. Hence the mind is early stored with materials for thinking, and it is easy to give a proper direction to the use of these materials when collected. The importance of general education becomes every more universally felt and acknowledged; even those who at first opposed it, find themselves carried away by the strong current of opinion, and are compelled (reluctantly, indeed, and not without some insidious efforts to poison the springs of truth) to lend their assistance to the great work.—*New Monthly Mag.*

THE PASHA.

However familiar this title may be to European ears, its real meaning and its derivation are scarcely familiar even to the "erudite few." The word itself is compounded of the Persian "pashaw," or the shah's foot, and is a standing memorial of the designations which, according to Xenophon, Cyrus bestowed on his officers of state, calling them his feet, hands, eyes, and ears. Those entrusted with domestic affairs were styled "the eyes"; the secret emissary was termed "the ear"; the tax-gatherer "the hands"; the warrior "the foot"; and the judge, as mouth-piece of the law, the "tongue of equity."

* It was overlooked in our last number, that the Duke of Richmond alluded to in the anecdote near the end, was the late Duke.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Extra is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Junr. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

* Gas is now, or was lately, manufactured at Brussels, but on a scale which is surpassed by any Scottish country town.

CHAMBERS EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 42.

SATURDAY, NOVEMBER 17, 1832.

PRICE THREE HALFPENCE.

MONSIEUR MOLLIN.*

ABOUT the end of the last war, a considerable number of the French officers, who had been taken prisoners and sent to the dépôts in Scotland, were liberated upon their word of honour, and permitted to reside in the neighbouring towns, upon a certain small allowance made to them by our government. Amidst a host of dashing fellows who resided on this footing at the ancient burgh of Cairnton, in the south of Scotland, there were a few old personages who had been captured in the earlier years of the war, and almost grown grey in this species of honourable imprisonment. Some of these latter personages were so different in age and habits from the others—were so entirely, as it were, of a different generation or fashion of Frenchmen (for every thing about this nation changes in ten years)—that they hardly seemed to belong to the same country. While the gay young officers of the Emperor went frolicking about in long surtouts and moustaches, turning the heads of all the girls, and running into as much debt as possible with all the tradesmen, the ancient subalterns of the Republic and First Consul were a race of quiet, little, old, wind-dried men, with much of the *ancien régime* about them, wearing, in some cases, even the anti-revolutionary powder, and all of them as inoffensive as if they had been each sensible that he was in his own parish. A particular individual, called Monsieur Mollin, had become so perfectly assimilated with the people of the town, that he was not at all looked on in the light of a stranger. He lived in a small room, which he rented from a poor old "single woman," Lizzie Geddes by name, and nothing could be more simple or irreproachable than the whole tenor of his life. In the morning, before breakfast, he went to the public green, which he traversed in one particular direction exactly ten times. For the ducks which cruised along the neighbouring mill-race, he had a few crumbs: for the servant lasses, who spread their washings on the sod, he had a few complaisant observations. If Jamie Forbes, the shoemaker, happened to be leaning over the bottom-wall of his kail-yard, Monsieur Mollin would courteously salute him, and express a hope that Madame Forbes (otherwise called Kirsty Robertson) was well. If, in returning to breakfast, a group of weavers were found clustering about the head of the close, the benevolent old gentleman would join their conversation, and learn, perhaps, that Napoleon Bonaparte was about to set up a new kingdom, or that John Jamieson had got a new coat. After partaking of his frugal meal (consisting of the usual Scottish fare in humble life, porridge and milk), he would set out for a country walk, and perhaps return about one, with his pockets filled with *fir-tops*, which he made a practice of gathering in the plantations, in order that they might aid his landlady's little fire. He then ate his slender dinner, in company with Lizzie Geddes and her nephew, and had, it was said, as many polite observances in the matter of second-day's broth and a cold scrag of lamb, as if he had been seated at the table of a sovereign prince. In the evening, good Monsieur Mollin was to be seen, perhaps, mingling in the clamorous company who amused themselves in the bowling-green, or else enjoying another cool walk beside the mill-race, where, I well recollect, there was a little trodden footway, which I believed to have been solely formed by his own "constant feet," so exclusively, to my childish apprehension, did it seem appropriated to himself.

Lizzie Geddes, in whose humble garret Monsieur

Mollin occupied an apartment, was the daughter of a person who had been town-clerk in Cairnton, in an age far beyond the ken of the present generation; and an annuity of ten pounds was all that she could depend upon for her subsistence, the rent of her house being paid by what she got from Monsieur Mollin for his lodging. Though little removed above the condition of a pauper, she had had a good education, and possessed a mind of no vulgar cast. In her old age, she had been burdened with the duty of bringing up an orphan nephew, to which task, however, she applied with a zeal that went far beyond her humble means. As the boy showed an aptitude for learning, and as the school-fees at Cairnton were remarkably cheap, she was tempted to give him a classical education, instead of placing him at some trade by which he might have sooner begun to support himself. There was some hope of patronage from a distant relation, who, holding some inferior public office at Edinburgh, was looked upon at Cairnton as a person of immense consideration. But when application was made to this individual for the means of setting forward the youth at College, all those hopes were found to have been fallacious, and young Geddes, with the refined notions of a classical scholar, and at an age when ambition begins to bud in the human bosom, was obliged to abandon his books and become a shoemaker. Monsieur Mollin, who in all respects treated Miss Geddes as a sister, and took a sincere interest in the prospects of her nephew, was exceedingly chagrined at this sad reverse; but he was so poor himself that he could not help it. "If I ver not one poor prisoner," he would say, "if I ver once more in mine own cuntry, and had so much money as I once had, begar, Mademoiselle Geddes, your nephew should not stop till he ver one ministér, putting his head into one pulpit; but I am only one poor prisoner, with six shillings in de veek from your king—and what can I do with that?" The good old man was determined, nevertheless, that the youth should not forget his learning, or sink into the tastes and habits proper to his new condition. So, every evening after Thomas had returned from his work, he caused him to bring forth his books, and heard him execute a translation in Virgil or Livy before going to rest. Sometimes this was varied by other intellectual exercises, such as the reading of a novel from the circulating library. Cœlebs in Search of a Wife, or Thaddeus of Warsaw, or the Farmer of Inglewood Forest, or any other crack book of the year 1812, was borrowed at the cheap and easy price of eighteenpence a quarter, and read by Thomas to his aunt and her lodger, who generally became so much absorbed in the interest of the tale, that they heeded far less the progress of the war then going on in Russia, important as it was to the interests of both French and English, than they did the proceedings of the fictitious hero among a set of characters as shadowy as himself. Thus, while an ordinary person would have been apt to answer the common question of "what news?" by mentioning that Bonaparte had overthrown the Russian army at the Borodino, poor Lizzie Geddes would have been apt to state that Robert Bruce had just made his escape from the English court, with his horse's shoes put on backwards; her mind, in fact, running upon the last chapter she had heard read of the Scottish Chiefs.

For several years this little family lived in humble peace and general affection, with hardly an incident to ruffle the habitual calm. Monsieur Mollin daily exhibited his thin shanks, in white cotton stockings, on the beaten foot-path in the green, and every evening enjoyed mental pleasures beside his landlady's fire. Sunday after Sunday, he was to be seen gallant-

ing Miss Geddes to church; himself rigged out in a clean shirt, exhibiting a profusion of frill, and a large New Testament under his left arm; while she, on her part, tried to look as well as possible in a well-saved cardinal, first put on about forty years ago; Thomas bringing up the rear, in his leather cap and corduroys, with almost as much linen folded over his shoulders and back as what could be supposed to be in contact with his skin. Few persons in Cairnton lived a more blameless life, or were more generally respected.

At length, the tranquil contentment of this scene was broken up by the peace of 1814, which afforded to Monsieur Mollin, for the first time since his capture, an opportunity of returning to his native country. Had it been the old man's fate to live on and on as a prisoner till death, he would have been perfectly happy in his bonds, for time had so completely reconciled him to the present scene and manner of his existence, that he never formed a wish respecting any other. When it came to pass, however, that a residence in Cairnton was no longer a matter of necessity, when a possibility of returning to France actually arose, that which, in ordinary circumstances, ought to have been hailed as a blessing, became to him a bitterness and a misery. "Mademoiselle," said he, "I must leave you—I must go back *au ma patrie*: your king will give me no longer any money to live upon, and I must see what I can do in mine own cuntry. It is *tres grand malheur*—one great distress; for I do not expect that I vil find any one in Francé to love as much as you and your nephew. But vat can I do? how shall I pay my lodging? how shall I live?" The case was too clear to admit of argument; and Monsieur Mollin, therefore, packed up his baggage in an old satchel that had once held Thomas's books, and prepared to take his leave. In the first place, however, he made *two* walks each day for a week, to gather *fir-tops*, of which he was thus able to store up as many as promised to serve for a week after his departure. He then spent as much money as he possibly could spare, in purchasing a stock of sugar and tea for Miss Geddes; as likewise a few drugs, which she occasionally required for a particular malady to which she was subject. On the day when he and his fellow prisoners were appointed to march, it happened that Miss Geddes was confined to bed with this indisposition—a circumstance that added greatly to his distress. "Ah, pauvre Mademoiselle," said he, as with his own hand he mixed and brought forward her medicine, "*je suis bien fâché* at your *maladie*—that is, I am not vat you call *fashed*, but I am sorry—I am *penetré* with grief, that I should have to leave you on your bed of indisposition. Come now—*prenez votre medicin*, and make yourself better. Here is de cup; and I vil leave it on de little table, and you must take von other tea-spoonful in two hours more, and de good fille, Peggy Dickson, down stairs, she say she vil come soon and see if you vant any thing. I have myself taken de dirty vater away, and swept in de hearth-stone, and now let me put in de clothes at your back, and make you comfortable. One kiss, Mademoiselle—now adieu—God bless you for ever—adieu!" And they separated, with tears more bitter, perhaps, than any ever shed by youthful lovers when parting to meet no more.

About two months after the departure of Monsieur Mollin, his friends at Cairnton received a letter from him, informing them that he had got back to his native city of Bourdeaux, where he had the satisfaction to find that he had recently been left heir to a small property, which promised to maintain him in comfort during the remainder of his life. He was distressed, however, to learn that hardly any of his relations

* Our late article, entitled "ATTACHMENTS," serves, in some measure, as an introduction to the following tale, which is from real life.

were alive. The only one in whom he felt the least interested was a young girl, who had for some years been an orphan—the daughter of a niece who had once been his favourite, and a person, as he described her, of the most agreeable properties—quite fitted, he said, to become, in a few years, the wife of his young friend Thomas, provided they had an opportunity of seeing each other. He complained, however, of the change that had taken place in his absence, the effect of which was to render his native country far less kindred to him than even Scotland; and “it is not impossible,” he added, “that I may come back to Cairnton, and spend the remainder of my days with you.”

This was destined to be the actual consummation of his story. About six months after having left his humble lodging at Cairnton, Monsieur Mollin reappeared on the street, with a sprightly young Frenchwoman leaning on his arm. Quite disappointed with his native country and its new regime, he had made up his mind to return to the quiet little Scottish burgh, where he had spent so many happy years, and where dwelt almost the only two individuals of his race in whom he felt the slightest interest. The joy of the Geddases, as may be supposed, was boundless, more especially as Monsieur Mollin took an early opportunity of declaring his intention to complete the education of his friend Thomas, and push him forward in the profession he originally contemplated. In a few days the whole of the little party was established in a neat house in the suburbs, where it soon became apparent, to the delight of the benevolent Frenchman, that his niece and Thomas were exceedingly taken up about each other. In the process of time, the young man obtained a manse, and Eloise as his companion in its occupancy; and the latter days of Mollin and Miss Geddes have been spent in serenity and happiness.

POMPEII AND HERCULANEUM.

THE Mountain of Vesuvius, celebrated in ancient and modern times for the number and terrific violence of its volcanic eruptions, stands upon the shores of the Bay of Naples (an inlet of the Mediterranean Sea, on the west side of Italy), and is distant about eight miles from the Neapolitan metropolis. It is at present about 3400 feet high, having lost 800 feet of its height by the last eruption, which happened in 1822. Five miles from Vesuvius, and thirteen from Naples, stands, or rather stood, Pompeii, at the bottom of the above-named bay; and on the same coast, between Pompeii and Naples, but nearer to the latter city, and also to Vesuvius, was situated Herculaneum. Of the early history of these devoted cities, nothing certain is known: their origin is enveloped in the common and impenetrable darkness which hangs over remote ages. Strabo, however, has the following passage:—“This city (*i. e.* Herculaneum) and its next neighbour, Pompeii, on the river Sarnus, were originally held by the Osci, then by the Tyrrhenians and Pelasgians, then by the Samnites, who were in their turn expelled by the Romans.” Farther than this, it will be in vain to inquire.

SITUATION.

Both Pompeii and Herculaneum were sea-ports. The latter town is still very near the shore, but a mile of land now intervenes between Pompeii and the bay which formerly washed its buildings. This gain of land is owing to the filling up of the bed of the sea with volcanic matter. Pompeii occupied a small eminence, composed of the ancient effusions of lava from Vesuvius. Flights of stairs led down to the water's edge, and the lowest steps of these are said to be still on a level with the sea. The adjacent country was distinguished in all ages for its romantic loveliness and beauty. The whole coast as far as Naples was studded with villas, and Vesuvius, whose fires had been long quiescent, was itself covered with them. Villages were also thickly scattered all along the shores, and the scene presented the appearance of one vast city, cut into a number of sections by the luxuriant vegetation of the paradise in which it was embosomed. The following epigram of Martial gives an animated view of the scene previous to the dreadful catastrophe which so bloated this fair page of Nature's book:—

Here verdant vines o'erspread Vesuvius' sides;
The generous grape here poured her purple tides.
This Bacchus loved beyond his native scene;
Here dancing satyrs joyed to trip the green.
Far more than Sparta this in Venus' grace;
And great Alcides once renowned the place;
Now flaming embers spread dire waste around,
And gods regret that gods can so confound.

ERUPTION OF VESUVIUS, IN THE YEAR 79.

The scene of luxurious beauty and tranquillity above described was doomed to cease, and the subterranean fire, which had been from time immemorial extinct in this quarter, again resumed its former channel of escape. The long period of rest which had preceded this event seems to have augmented the energies of the volcano, and prepared it for the terrible explosion. The first intimation of this was the occurrence of an earthquake in the year 63 after Christ, which threw down a considerable portion of Pompeii, and also did great damage to Herculaneum. In the year following, another severe shock was felt, which extended to Naples, where the Roman Emperor Nero was at the time exhibiting as a vocalist. The building in which he performed was destroyed, but, unfortunately, the musician had left it. These presages of the approach-

ing catastrophe were frequently repeated, until, in A.D. 79, they ended in the fatal eruption. Fortunately we are in possession of a narrative of the awful scene by an eye-witness, Pliny the younger, who was at the time at Misenum, with the Roman fleet commanded by his uncle Pliny the elder. The latter, in order to obtain a nearer view of the phenomena, ventured too far, and was suffocated by the vapours.* His nephew remained at Misenum, and describes the appalling spectacle in a very lively manner.

A dense cloud was first seen to ascend from Vesuvius to a great height, and, spreading itself out laterally as it rose, bore a strong resemblance (says Pliny) to a pine-tree. Darkness more profound than night enveloped the land for many miles round the mountain, occasionally alleviated by columns of blood-red fire, which were belched forth by the raging phlegmon, and appeared far more terrible than the utter gloom which they pierced. Showers of ashes and volumes of steam were spouted for miles into the sky, and then rained down again in torrents upon the earth, which, convulsed in every part, reeled and staggered like a sinking ship. The sea receded from the shore, as if it shrunk from the appalling scene, and left numbers of the finny tribes upon dry land. These horrors were augmented by the shrieks of the women and children, and the cries of the men—some lamenting their own fate, others that of their family—now “howling to their gods”—and anon finding consolation in the miserable belief that they were about to perish with the world itself.

No lava appears to have flowed from Vesuvius during this eruption; and hence Pompeii was buried under the shower of ashes and sand which continued to pour down for eight days. Much of this matter was deposited in a liquid state; which is accounted for by supposing that the steam projected into the air was condensed, and descended in torrents of rain. Proofs of this fact will be afterwards noticed. It was not by one eruption alone that the cities were covered to their present depth. Successive layers are clearly to be traced, and the lowest has evidently been moved while the others remained untouched—a proof that some time had elapsed between their deposition, and that the inhabitants had made excavations in search of their property. This is further established by the fact, that few articles of intrinsic value have been found. But let us hasten to a period nearer our own, when the long-forgotten cities of antiquity were to be reclaimed from the sepulchre where they had lain unknown and undisturbed for nearly seventeen centuries, and again revisited by the glimpses of the moon.

DISCOVERY OF HERCULANEUM.

Herculaneum, though buried many feet deeper than the other city which shared its fate, was the first discovered, by the accidental circumstance of a well being sunk in 1713, which came down upon the Theatre, where the statues of Hercules and Cleopatra were soon found. It may well be conceived with what interest the intelligence was received, that a Roman city had been discovered, which, safely entombed under ground, had thus escaped the barbarian Goths and Vandals who ravaged Italy, or the sacrilegious hands of modern pillagers. The process of excavation began; but it was found so excessively tedious, from the depth and hardness of the volcanic products beneath which the city lay, that places formerly cleared it was found necessary to fill up again with the rubbish of new excavations. The Theatre alone is open to inspection, and it can only be seen by artificial light. Several articles of use or luxury were, however, obtained, which at present adorn various museums. But the disappointment felt at the obstacles opposed to the exhumation of Herculaneum, was repaired by the

DISCOVERY OF POMPEII.

This city, as was formerly observed, stood at a greater distance from Vesuvius than the companion of its fate; and hence the streams of lava which have successively flowed over the latter have never reached the former. The ashes, &c. under which it was buried, are of a loose and friable description, and, therefore, easily removed. The upper stories of the buildings, which were probably composed of wood, were either burned by the red-hot stones which fell upon them, or borne down by the weight of matter which collected on their roofs and floors. With this exception, the city may be said to stand as it did nearly two thousand years ago—the buildings unaltered from their original designs; furniture standing in all the disarrangement of recent use; paintings apparently fresh from the easel; articles of value abandoned in the precipitation of flight, as if they had dropped from the trembling hands of some fugitives, who, like Orpheus, were not permitted to look back even upon their dearest treasures. Memorials of a more impressive kind, the skeletons of some sufferers, also bear sad testimony to the suddenness of the doom which overtook them. One-fourth of Pompeii has

* The death of this celebrated naturalist was probably occasioned by carbonic acid gas. This noxious vapour must have been generated to a great extent during the eruption. It is heavier than common air, and, of course, occupies in greater proportion the substrata of that circumbient fluid. The supposition is greatly strengthened by the fact, that the old philosopher had lain down to rest; but the flames approaching him, he was compelled to rise, assisted by two servants, which he had no sooner done than he fell down dead.

now been rescued from its subterranean darkness, and laid open to the sun. Of this portion we shall endeavour to give as minute an account as our limits will permit.

GENERAL CHARACTER OF POMPEII.

The city was surrounded with walls, the greater portion of which has been traced; and six gates and twelve towers have also been counted. Its greatest length is little more than three quarters of a mile, its breadth less than half a mile, and its circuit nearly two miles. It occupied an area of about one hundred and sixty-one acres. The general figure of the city is something like that of an egg. There have been excavated about eighty houses, an immense number of small shops, the public baths, two theatres, two basilice, eight temples, the prison, the amphitheatre, with other public buildings of less note, and also fountains and tombs.

The streets are paved with large irregular pieces of lava, neatly dovetailed into each other. This pavement is rutted with the chariot wheels, sometimes to the depth of one inch and a half. In general, the streets are so narrow that they may be crossed at one stride. Where they were of greater breadth, a stepping-stone was placed in the middle for the convenience of foot passengers. On each side of the street there is a foot-path, the sides of which are provided with curbs, varying from one foot to eighteen inches high, to prevent the encroachments of the biga, or chariot. But to proceed to the public buildings: and first, let us enter the

FORUM.

A Roman Forum was the focus of business, and the arena of political and legal contention. As the city of Rome itself increased in wealth and splendour, it was found necessary to have two classes of fora—*Venalia*, mere markets, and *Civilia*, those devoted to the other purposes of a public assembly. The Forum of Pompeii answered for both. It is situated at the north-west corner of the city, and is entered by a flight of steps, leading downwards through an arch in a brick wall, still partly covered with stucco. Upon entering, the spectator finds himself in a large area, surrounded by columns, the ruins of temples, triumphal arches, and other public erections; there are also a number of pedestals for the support of statues. The wall by which we have thus entered, is connected with the back of a building called by some the Temple of Jupiter, and by others the *Senaculum*, or Council-chamber. It stands upon an elevated basement, which was ascended by a flight of steps. Those near the columns, which served both for ornament and for supporting the upper part of the building, run along the whole front of the portico. The interior has been painted; red and black are the prevailing colours. Fragments of a colossal statue were discovered upon the pavement; a sundial was also found.

Near this temple are the ruins of what has been conjectured was the Granary, from the public measures being found near them. Adjacent to this building is the prison, where were found the skeletons of two soldiers, their leg bones still within the shackles. These are preserved in the museum at Portici.

PANTHEON.

One of the buildings surrounding the Forum has received this appellation, from there being found in the centre of its area an altar encircled with twelve pedestals, on which it has been presumed stood the statues of the mythological deities. The area is one hundred and twenty feet in length, by ninety in breadth. Numerous cells attached to this building have been found; these in all probability were for the accommodation of priests. Near to the Pantheon, ninety-three brass coins were discovered, and also statues of Nero and Messalina.

On the north side of the Pantheon, there runs a street named the Street of Dried Fruits, from the quantity of fruits of various kinds preserved in glass vases which have been found. Scales, money, moulds for pastry and bread, were discovered in the shops, and a bronze statue of Fame, small and well executed, having bracelets of gold upon the arms. In the entrance which conducts from this street to the Pantheon, a box was found, containing a gold ring with an engraved stone set in it, forty-one silver, and a thousand and thirty-six brass coins. On the walls are representations of Cupids making bread. The mill stands in the centre of the picture with a ass on each side, from which it may be inferred that these animals were employed in grinding the flour. There are a great number of other paintings in this building, some of which are very beautiful.

Adjoining to the Pantheon is a building supposed to have been the *Senaculum*, or place for the meeting of the Senate or Town Council. In the centre is an altar, and on each side of this, in two large recesses, stand two pedestals, which most likely supported effigies of the gods to whom the place was sacred. Near this is a small temple elevated on a basement. On the altar there is an unfinished bass-relief, representing a sacrifice. In the cells attached to this building were found a number of vessels in which wine was kept. The liquor was brought to the door in large skins, and then drawn off into these vases.

Adjacent to this is a large building, which, from various inscriptions, appears to have been erected at the expense of a lady named Eumachia, for the benefit of the public. Amongst other relics found, was a statue of the lady, five feet four inches high, and painted green and red.

Along the south side of this building runs a broad street, which, from various articles of jewellery being found there, is called the Street of the Silversmiths. On the walls of the shops several inscriptions appear, one of which has been thus translated—"The scribe Issus beseeches Marcus Cerrinius Vatia, the Edile, to patronise him: he is deserving." This is somewhat analogous to our own—"Patronised by his Royal Highness," &c. At the end of this street was discovered a skeleton, supposed to have been a priest of Isis. In the hand was a bag of coarse linen, not entirely destroyed, containing three hundred and sixty silver coins, forty-two of copper, and six of gold. Near him were also found various articles belonging to the worship of Isis.

The next building of importance connected with the Forum is the Temple of Venus, in one of the apartments of which was found a very beautiful painting of Bacchus and Silenus, in a state of perfect preservation. In most of the paintings, the colours are as vivid as when first laid on.

These are the principal edifices which surround the Forum. An account of the baths, theatres, amphitheatres, manuscripts, and other interesting relics of antiquity, which have been discovered, will be comprised in another article.

THE PLANTER.

A WEST INDIAN STORY.

FIFTY—sixty—seventy (any given number of) years ago, the West Indies were not as they are now.

The colonists themselves were not what they are at present; that is to say, they were not then humane, temperate, independent people; on the contrary, they were boastful, and loved Scheidam and pine-apple rum, worshipped their superiors in station, and despised every body below themselves. Thus the newly-imported Englishers held the regular colonists in utter contempt: the colonists (a white race) requited themselves, by contemning the mustees and quadroons: these last, on their parts, heartily despised the half-caste, who, in turn, transmitted the scorn on to the heads of the downright blacks. Whom the blacks despised, I never could learn; but probably all the rest: and, in fact, they seem to have had ample cause for so doing, unless the base, beggarly, and cruel vanity imputed to their "superiors," be at once a libel and a fable.

Such was the state of things in the colony of Demerara, in the year 17—, when a young Englishman went there, in order to inspect his newly acquired property. His name was John Vivian. He came of a tolerably good family in —shire; possessed (without being at all handsome) a dark, keen, intelligent countenance; and derived, from his maternal uncle, large estates in Demerara, and from his father, a small farm in his own country, a strong constitution, and a resolute, invincible spirit. Perhaps he had too much obstinacy of character—perhaps, also, an intrepidity of manner, and carelessness of established forms, which would have been unsuitable to society as now constituted. All this we will not presume to determine. We do not wish to extenuate his faults, of which he had as handsome a share as usually falls to the lot of young gentlemen who are under no control, though not altogether of precisely the same character. In requital for these defects, however, he was a man of firm mind, of a generous spirit, and would face danger, and stand up against oppression, as readily on behalf of others as of himself; and, at the bottom of all, though it had lain hid from his birth (like some of those antediluvian fossils which perplex our geologists and antiquaries), he had a tenderness and delicacy of feeling, which must not be passed by without, at least, our humble commendation.

Exactly eight weeks from the day of his stepping on board the good ship "Wager," at Bristol, Vivian found himself standing on the shore of the river Demerara, and in front of its capital, Stabroek. In that interval he had been tossed on the wild waters of the Atlantic—had passed from woollens to nankeens—from English cold to tropic heat—and now stood eyeing the curious groups which distinguish our colonies, where creatures of every shade, from absolute sable to pallid white, may be seen—for the trouble only of a journey.

But we have a letter of our hero's on this subject, written to a friend in England, on his landing, which we will unfold for the reader's benefit.

"Well, Dick—here am I, thy friend John Vivian, safely arrived at the country of cotton and tobacco. Six months ago I would have ventured a guess that nothing on this base earth could have tempted me to leave foggy England: but the unkenning of a knave was a temptation not to be resisted; and accordingly I am here, as you see.

"Since I shook your hand at Bristol, I have seen somewhat of the world. The Cove of Cork—the Madeira—the Peak of Teneriffe—the flying fish—the nautilus—the golden-finned dorado—the deep blue seas—and the tropic skies—are matters which some would explain to you in a chapter. But I have not the pen of a ready writer; so you must be content with a simple enumeration.

"My voyage was, like all voyages, detestable. I began with sea-sickness and piercing winds. I ended with headache and languor, and weather to which your English dog-days are a jest. The burning, blazing heat was so terrific, that I had well nigh oozed

away into a sea-god. Nothing but the valiant army of bottles which your care provided could have saved me. My mouth was wide open, like the seams of our vessel; but, unlike them, it would not be content with water. I poured in draught after draught of the brave liquor. I drank deep healths to you and other friends; till, at last, the devil, who broils Europeans in these parts, took to his wings and fled. Thus it was, Clinton, that I arrived finally at Demerara.

"But now comes your question of 'What sort of a place is this same Demerara?' 'Faith, Dick, 'tis flat enough. The run up the river is, indeed, pretty; and there are trees enough to satisfy even your unbragous-loving taste. It is, in truth, a land of woods—at least, on one side—and you may roam among orange and lemon trees, and guavas and mangoes, amidst aloe and cocoa-nut, and cotton and mahogany trees, till you would wish yourself once more on a Lancashire moor. Stabroek, our capital, is a place where the houses are built of wood; where melons, and oranges, and pine-apples, grow as wild as thyself, Dick; and where black, brown, white, and white-brown people, sangaree and cigars, abound. Of all these marvels I shall know more shortly. I lodge here at the house of a Dutch planter, where you must address me under my travelling cognomen. John Vivian is extinct for a season; but your letter will find me, if it be addressed to 'Mr John Vernon, to the care of Mynheer Schlachenbruchen, merchant in Demerara.' That respectable individual would die the death of shame, did he know that he held the great 'proprietor,' Vivian, in his garret. At present, I am nothing more than a poor protégé of Messrs Greffulhe, come out to the hot latitudes for the sake of health and employment."

Vivian was, in truth, tolerably pleased with the banks of the river, fringed as it was with trees, and spotted with cottages; but when he actually trod upon the ground of the New World, and found himself amidst a crowd of black and tawny faces—amidst hats like umbrellas, parquets, and birds of every colour of the rainbow, and children, almost as various, plunging in and out of the river like water-dogs or mud-larks—he could not conceal his admiration, but laughed outright.

He was not left long to his contemplations, however, for the sea-port of a West Indian colony has as many volunteers of all sorts as Dublin itself. A score of blacks were ready to assist him with his luggage, and at least a dozen of free negresses and mulattoes had baskets of the best fruit in the world. He might have had a wheelbarrowful for sixpence, and the aid of a dozen Samboes for an insignificant compliment in copper. Neglecting these advantages, Vivian made the best of his way to the house of the Mynheer Schlachenbruchen, the Fleming, which was well known to all the clamorous rogues on the quay. The merchant was not at home, having retired, as usual, to sleep at his plantation house, a few miles from town. Our hero, however, was received, with slow and formal respect, by his principal clerk, Hans Wassel, a strange figure, somewhat in the shape of a cone, that had originally sprung up (and almost struck root) somewhere near Ghent or Bruges. Holding Vivian's credentials at arm's length, this "shape" proceeded to decypher the address of the letter through an enormous pair of iron spectacles. In due time he appeared to detect the hand-writing of the London correspondent; for he breathed out, "Aw! Mynheer Franz Greffulhe!" and proceeded to open a seal as big as a saucer, and investigate the contents. These were evidently satisfactory; for he put on a look of benevolence, and welcomed the new comer (who was announced as Mr Vernon) to Stabroek. "You will take a schnap?" inquired he, with a look which anticipated an affirmation. "As soon as you please," replied Vivian; to which the other retorted with another "Aw!" and left the room with something approaching to alertness, in order to give the necessary orders.

The ordinary domestics of the Fleming were much more rapid in their movements; for Vivian had scarcely time to look round and admire the neatness of the room, when a clatter at the door compelled him to turn his eyes to that quarter. He saw a lively-looking black come in, with a large pipe of curious construction, and a leaden box containing tobacco, followed close by his co-mate Sambo (another "nigritude"), who bore, in both hands, a huge glass, almost as big as a punch-bowl, filled to the brim with true Nantz, tempered, but not injured, by a small portion of water. Sambo appeared justly proud of his burden, which he placed on the table in its original state of integrity; for, after looking for a moment lovingly at the liquid, he turned round to Vivian, and said, exultingly, "Dear massa!"

But we will not detain the reader with any detail of our hero's movements on his arrival in the colony, excepting one or two, which have direct reference to our present narrative. He was introduced to Mynheer Schlachenbruchen and his wife, each of whom, were our limits larger, might fairly lay claim to commemoration. As it is, we must pass them by, and content ourselves with stating the fact of their (the merchant, at all events) treating Vivian with more consideration than his ostensible rank demanded, and introducing him to their acquaintance. The person, however, into whose society Vivian was more especially thrown, was a young girl, who performed the offices of governess, &c. &c. in the house of the Mynheer Schlachenbruchen. The visitors of the family

avoided her, as though she had the plague (even the Mynheer himself preserved a distance); and the consequence was, that Vivian—himself rather looked down upon by the colonial aristocracy—felt himself drawn nearer to the friendless girl, and assiduously cultivated her good opinion.

This, however, was not a thing to be easily attained. Sophie Halstein (for that was her name) had few of the qualities commonly ascribed to thriving governesses: she was, indeed, an acute-minded, and even accomplished girl; but she was as little supple, demure, or humble as Vivian himself. In fact, she received our hero's advances with indifferent cordiality at first; but the magic of sincerity will win its way, and they accordingly, at last, became excellent friends. The thing which surprised our hero the most was—how it was possible for the dull, gross, unenlightened blockheads of the colony to feel, or even affect, a disdain for one who was evidently so much their superior. At last the truth came upon him; she was the child of—a *quadronee*! She was lovely, graceful, virtuous, intellectual, accomplished, modest—a model for women; but she had a particle—(scarcely apparent, indeed, but still there *was* a particle or two)—a few drops of blood of a warmer tinge than what loiters through the pallid cheeks of an European; and hence she was visited by universal contempt.

"But she *shall* be my friend," was Vivian's exclamation, "my—my—sister. The senseless brutal wretches!—they little think that, under the mask of Vernon, the wealthiest of their tribe is amongst them, and that he respects the little Pariah beyond the whole of their swollen and beggarly race." A very short time was sufficient for him to form a determination to rescue the object of his admiration from her painful state of servitude. Not being accustomed, however, to deal with the delicacy of ladies, he plunged at once into the matter with headlong rashness.

"You are badly off, Miss Halstein?" said Vivian to her one morning, in his very bluntest tone.

"I do not complain, sir," replied she coldly.

"I am sorry for you," said he hesitatingly, "and would help you."

"Spare your pity," returned the lady; "we have neither of us much to thank Fortune for. Yet you are content, or seem so; and so also can I be. We will talk on another subject."

"S'death!" exclaimed the other, recollecting his incognito: "I had forgot. Pardon me—I was a fool. You will think me mad, with my offers of help, and my show of pity; but it is not so: I am sane enough, and some of these days you shall confess it. Come, will you not go with us up the river? We are to run up almost as far as the Sandhills to-morrow, to visit the Reynestein estate and the Palm-Groves, which belong to the rich Englishman, Vivian. Perhaps you were never there?"

"I was born there," was the reply; and it was somewhat tremulously uttered.

"Ha! then you will be delighted to visit the spot, no doubt. Did you know the late proprietor?" "Too well," said she; "he was—a villain."

"How, madam?" Vivian was forgetting himself again, at this attack on his uncle's memory; but he hastened to recover. "I mean the *last* owner," he resumed, "whose name was, I think, Morson."

"I knew him, sir; and, as I have said, too well. Do you know by what luck it was that he obtained the Palm-Groves?" "No." "Then I will tell you, sir. His predecessor was a careless, easy, and very old man. By a series of unforeseen reverses, by the failure of correspondents, and the roguery of friends, he became involved at last. All that he wanted, however, was a little money for present exigencies; with that, and a course of economy for a few years, he might have retrieved his broken fortunes. His most intimate friend and neighbour was this Morson. Who, then, was more likely than he to help him with a loan of money? He was rich and childless; but the old planter whom I have spoken of had one single child—a girl. Pity, therefore, as well as friendship, might move Morson to aid him in his extremity. And he *did* aid him—at least, he lent him money, at the instigation of his manager."

"Seyton?" asked Vivian, interrupting her.

"Yes, Seyton," replied she, "who coveted the old planter's daughter for a wife, and who thought, that, if the parent was ruined, his child would be glad of any refuge. He dreamed that she, who had interfered often between him and his victims, would forget all her old abhorrence, and unite her fate with that of the most barbarous tyrant that ever disgraced even a West Indian colony. Well, sir, to end this tedious story—"

"It is most interesting to me," said Vivian—"deeply, deeply interesting;" and his glowing eyes and earnest attention were sufficient proofs that he spoke truly.

"Well, sir, the end was, that Morson advanced the money; that Seyton intrigued with the slaves, and caused many of them to revolt and run away into the woods; and that the poor old man fell from trouble into want, and from want into absolute despair. His plantations were useless; his crops perished on the ground for want of slaves; his mills and buildings were burnt by unknown hands; and, finally, his hard and avaricious creditor, the relentless Morson, came upon him, and took possession of all his estates, for a debt amounting to one-sixth of their value. The old man (Miss Halstein's voice shook at this part, and

betrayed great agitation)—the old man soon afterwards died, and his only child was cast upon the world to earn her bitter bread. This is all, sir. I have given you the history of one-half of Mr Vivian's property; perhaps the other (she spoke this with some acrimony) is held upon a similar tenure."

"God forbid!" said Vivian. "But Seyton? Did he urge his suit?"—"He did, and was refused. And therefore it is (for he is a bad and revengeful man) that I am fearful of coming upon an estate of which he is essentially the master. In the absence of Mr Vivian, his power is uncontrolled; and there is no knowing what claim he might urge against me. He once hinted that I was born a slave on the Palm-Grove estate, and, as such, belonged to his master—I, who am the only daughter of Wilhelm Halstein, to whom all, but a few years ago, belonged."

"You?" exclaimed our hero; "are you the person whom Vivian intercepts? He shall do it no more. Rest content, Miss Halstein. Vivian is not the man to injure any one, and least of all yourself. Go with us to-morrow—I beg, I pray, that you will. I pledge my honour, my soul, that you shall not be a sufferer."

The lady still refused, however, and it was not till the old merchant (Schlachtenbruchen, to whom Vivian had spoken in the meantime) had also given his solemn promise to protect her, that she consented to go. She was a little surprised, indeed, at Vivian's urging the matter so vehemently; but as the merchant seconded his requests, she could not continue to refuse.

A row up the river Demerara—past Diamond Point, to the Sandhills, needs not call for any particular description. We will suppose that the party had arrived at the Palm-Grove estate, which the merchant (authorised by a power transmitted by Vivian from England) had come to overlook.

The party were introduced to Seyton, a ferocious looking man, of middle age, who, with a mixture of self-consequence and ambiguous civility, welcomed the merchant and his companions. He took no notice of Vivian, indeed; but when he saw Miss Halstein (who leant on our hero's arm), his eyes sparkled and his lip curled, and, turning to the merchant, he said hastily, "Before you leave the estate, there is a point of some consequence that I must take leave to mention, respecting this young person;" and he touched her, as he spoke, with the point of the cane that he carried in his hand.

"Stand off, fellow!" said Vivian, angrily; "another touch, or another insolent word, and I will lay you at my feet."

The other started, and examined our hero's appearance cautiously and sullenly. He saw nothing, however, except an athletic figure and a resolute countenance, and retreated from collision with so formidable an opponent. He did not, however, retreat from his demand.

"Observe, Mynheer," said he, addressing the merchant once more, "I speak as the agent only of Mr Vivian. This gentleman will scarcely blame me for insisting on the rights of my principal."

"By no means, by no means," replied the merchant. "All in good time. We will talk of that presently. In the meantime, we will look at the balances. After that, we will ask what your larder contains; and then—for the rights you speak of. Eh, Mr Vernon—is not that the way?"

"Certainly, certainly," said Vivian. "Miss Halstein will leave all to you: I am quite sure that she may do so safely."

Two or three hours were sufficient to overlook the accounts, and to dispose of the refreshments, which were offered with some degree of parade to the visitors, at the expense of the estate. Vivian ate heartily, and without scruple, of the produce of his own property; and every thing unpleasant seemed forgotten, except by Miss Halstein, when the party (which had been augmented, as agreed upon, by the arrival of the Syndic, from Stabroek) prepared to go.

"Now," said Seyton, "I must once more draw your attention to my demand. I claim this—lady, if you will—as a slave. She was born on the estate, has never been made free, and belongs of right to my principal, Vivian."

"Bah! man," exclaimed the merchant; "I thought all that was past. Surely good wine and excellent Nantz must have washed all such bad thoughts out of your head. Come, let us go. Sophie, girl, take hold of Mr Vernon's arm, and —"

"By your leave, it must not be so," said Seyton, imperatively. He rung a bell, and eight or ten black slaves appeared. "You are at liberty to go, gentlemen; but the lady remains with me. Have I not the law with me?" added he, addressing the Syndic.

That officer assented, adding, however, that all depended on the will of Vivian. The lady might, indeed, be entitled to her liberty; but until she proved her freedom, she must remain the property of the planter.

"That is sufficient," said Seyton; "I am Vivian's representative."—"Then I am lost," exclaimed Sophie.

"Pardon me," replied the Syndic; "Mr Seyton is superseded. Mynheer, here, has the power of appointing a manager over this property. Besides which, Mr Vivian himself has arrived at Stabroek."

"Ha!" said Seyton, then no time is to be lost. Superseded or not, Mr Vivian shall not lose his property. Do your duty, fellows," added he, addressing the slaves. "Seize upon that woman, in the name of your master, Vivian."

"Back, I say," said our hero, pulling out a brace of pistols, and pointing them towards the advancing negroes. "Back, men, and be wise. And you, Mr Manager, or whatever you are, take heed how you overstep your duty. Know, Sirrah, that your master does not think your false accounts the worse part of your bad history. Your cruelty to these poor slaves beneath you has come to his ears; and for that he dismisses you his service. For your impudent and unfounded claim upon this lady, whom your master loves —"

"What!" exclaimed Sophie; but the merchant restrained her surprise.

"Whom your master loves, woos, and whom, if heaven is propitious (he says this doubtfully and humbly), he will win—for this atrocious insult there is no punishment great enough. Yet if any attempt be made upon her, you shall at least be chastised to your heart's content. Be satisfied that I do not jest, and remain quiet."

"We are all armed, Mr Seyton," said the merchant; "you had better let us depart quietly."

"She shall not go," replied Seyton, foaming with rage. "Once more seize upon her, men; seize upon her for your master, Vivian. Till he comes, I will be obeyed at least."

"He is here!" said Vivian, rushing between Sophie and her adversaries; "he is here: he overlooks you, and will punish you. Look, slaves, I AM Vivian, your master! Obey me, as you value the liberty which every man on my estate shall have if he deserve it."

"What he says is true. This is, indeed, Mr Vivian," said the merchant; and the Syndic corroborated his tale. All was quiet in an instant. Yet Sophie Halstein still looked overcome. "What is this?" inquired the merchant; "you ought to be rejoiced."

"I am," she replied. "But, Mr Vivian, you have something to forget. Can you forgive me?"

"I cannot," answered Vivian; "unless with the Palm-Groves (which from this moment is all your own), you take an incumbrance with it."

"And that is —" said Miss Halstein, inquiringly.

"It is myself, Sophie," replied Vivian, tenderly. "Prithee, be generous; and think what a way I have wandered from home. Take pity on me, and give me shelter with you at the Palm-Groves."

"We will talk of this hereafter," said Miss Halstein gently, and dropping her eyes upon the ground.

"What a strange lover he is!" whispered the Syndic to the merchant.

"That is true enough," answered the other. "Yet would I wager a grosschen that he succeeds. He is a fine, intrepid, persevering young fellow; and such men seldom fail in any thing that they set their hearts upon."

The old merchant was a true prophet. For before three months had elapsed, the pretty Sophie became lawful mistress of the heart and household of Vivian. The Reynestine flourished; but the Palm-Groves became their home. In the course of time, the blacks on their estates were enabled, in pursuance of a system equally wise and generous, to emerge from the condition of bondmen; but they still remained as cultivators, attracted equally by kind treatment, and an equitable share of the profits of their labours.

"After all—the greatest pleasure in the world," said Vivian, one day to his wife, "is conferring pleasure; and the greatest pleasure which one can confer, is to give Freedom to one's fellow men."—*Abridged from "Friendship's Offering" for 1831.*

ANAGRAMS.

ANAGRAMS are now hardly known as efforts of wit, but in ancient times they formed the subject of learned disquisition, and were ranked among the cabalistic sciences. The paltry process of anagramatising sentences and proper names was also extremely fashionable in the sixteenth and seventeenth centuries, occupying that place now enjoyed by conundrums, and other small means of amusement among the idle. The French are reputed to have been exceedingly fond of anagrams. On one occasion an anagram was made on the mistress of Charles IX., which threw the nation into an ecstasy of delight. The name of the lady was *Marie Touchet*, the letters of which words were transformed into *Je charme tout* (or, *I charm all*)—an anagram said to be historically just. But this anagram was perhaps surpassed by the following: The assassin of Henry III. was *Frere Jacques Clement*, and it was soon discovered that the letters of these three words could form the appalling sentence, *C'est l'enfer qui m'a crée* (or, *It is hell which created me*.)

Various anagrams were appropriately formed on the name and titles of our own King James VI., one of which was, *James Stuart—a just master*. One on the same monarch, but referring to his complete name, was, *Charles James Stuart—claims Arthur's Seat*. Of the poet Waller it was said—

His brows need not with laurel to be bound,
Since in his name with Laurels he is crowned.

And *Randle Holmes*, a person who wrote a book on heraldry, was complimented by the expressive anagram, *Lo Men's Herald!* Perhaps the happiest of all anagrams, says D'Israeli, "was produced on a singular person and occasion. Lady Eleanor Davies,

the wife of the celebrated Sir John Davies, the poet, was a very extraordinary character: she was the Cassandra of her age; and several of her productions warranted her to conceive she was a prophetess. As her prophecies in the troubled times of Charles I. were usually against the government, she was at length brought by them into the Court of High Commission. The prophetess was not a little mad, and fancied the spirit of Daniel was in her, from an anagram she had formed of her name, *Eleanor Davies—to Reveal O Daniel*. The anagram had too much by an *l*, and too little by an *s*; yet *Daniel* and *Reveal* were in it, and that was sufficient to satisfy her inspirations. The court attempted to dispossess the spirit from the lady, while the bishops were in vain reasoning the point with her out of the Scriptures, to no purpose, she poising text against text. One of the Deans of the Arches, says Heylin, took up a pen, and at last hit upon this excellent anagram: *Dame Eleanor Davies—Never so mad a lady!* The happy fancy put the solemn court into laughter, and Cassandra into the utmost dejection of spirit. Foiled by her own weapons, her spirit suddenly forsook her; and either she never afterwards ventured on prophesying, or the anagram perpetually reminded her hearers of her state. No more was heard of the prophetess."

COLKITTOCH.

[Some years ago, a series of interesting papers appeared in that respectable weekly report of literature, the London Literary Gazette, entitled "Traditions of the Western Highlands." "They were communicated," says the Editor of the Gazette, "by a gentleman intimately acquainted with the language and the manners of the Highlanders in the present times—who was indeed born and bred among them—and who, with the advantages of learning and a very extensive acquaintance with general history, had rare opportunities of collecting materials to throw light on the history of the Highlanders." We propose to do ourselves an honour, which we are sure Mr Jerdan will not object to, by giving one or two of these traditions a circulation more germane to their character than what they have hitherto had, in the columns of the Edinburgh Journal. The following refers to a very remarkable person:—]

THE name of Colkitch often occurs in the history of the great rebellion in the reign of Charles I. By some he is denominated Macdonald of Colkitch, by others Colkitch, and by many he is confounded with his son. His name was Coll, or Colle, Macdonald: he was a native of Ireland. His father was Archibald Macdonell, who was an illegitimate son of the Earl of Antrim. With the aid of his partisans, Coll took violent possession of the island of Colonsay, one of the Hebrides, having driven away the Macfees, who had held it for many centuries. Coll was denominated Kitch, or, more correctly, Ciotach, from his being left-handed. Coll had distinguished himself in the unhappy disturbances in Ireland; and when Lord Antrim sent troops to Scotland as auxiliaries in the royal cause, he served as an officer under his own son, Allister, or Alexander, who had the chief command of the corps. The father and son were well qualified for this service, both of them being well known in the Highlands, and connected by blood or marriage with some of the best families in that country.

Coll was noted for his strength and prowess, though tainted with the cruelty too familiar to his countrymen at that time. He fought in all the battles in which the Irish auxiliaries were engaged under Montrose; he was also concerned in their plundering expeditions in Argyleshire, where private revenge was unfortunately added to the horrors of war. Many of the lyric compositions of those days extol his bravery and his bloody vengeance on his antagonists, the Campbells, though it seems he was on very friendly terms with some of that name.

Coll had possession of the Castle of Duntroom, and having placed a garrison in it, he went to another quarter; but in his absence it was taken by stratagem. He was ignorant of this misfortune, and on his return he steered his boat direct for the castle. His own piper was then a prisoner there; and knowing his master's boat, to warn him of his danger, he played a tune which he composed for the purpose; and so accurately did the sound correspond with the meaning, that Coll understood the intention, and avoided the castle.

After the defeat of Montrose at Philiphaugh, and the retreat of his son Alexander to Ireland, Coll was left in command of the Castle of Dunaovagh, the ancient seat of the Macdonalds of Islay. The garrison consisted of 150 men; but the pipes which conveyed the water being cut by the enemy, on the assurance of Sir David Leslie, who commanded the parliamentary forces, Coll was induced to go out of the castle, to hold parley with his old friend Campbell of Dunstaffnage. Leslie basely broke his word, and made Coll prisoner. The Marquis of Argyre was present on this occasion, and was blamed for this. After the Restoration, when Argyre was brought to trial, he was accused of the heinous crime of having ordered this garrison to be put on a rock, surrounded by the sea, to perish without food or water. He denied all knowledge of any such thing; and the proof on this point does not appear satisfactory, nor could we find any tradition in that country of such an atrocious action.

Coll was committed to the custody of the captain of Dunstaffnage, in whose castle he was confined, and the tower where he lay is still named after him. That gentleman being no doubt sensible of the dishonourable treatment his prisoner had received, gave him every possible indulgence. He permitted Coll to walk about the place, but he had cause to repent his lenity.

The Marquis of Argyre charged him with misconduct; and dreading the well-known severity of his chief, Dunstaffnage denied it. Argyre swore that if Coll should be found at large, the captain would be severely punished, and a messenger was dispatched to ascertain the fact. Dunstaffnage being at Inverary at the time, ordered his foster-brother to set off with all speed, and outrun the other, which he did; and on coming in sight of the castle, he cried out, *Coll in irons! Coll in irons!* Coll was occupied in superintending the shearing of corn at the time, and was the first who heard the cries. Conjecturing what the cause might be, he instantly retired to his dungeon, and with his own hands put on the irons. He was soon after this brought to trial before the Sheriff of Argyre, in the castle where he was confined. Maclean of Ardgour, who originally had been on the royal side, was one of the jury; and wishing to display his zeal for the republican cause, which, with many others, he then espoused, asked Coll if he had been present at the battle of Inverlochy; the prisoner boldly replied, "By my baptism! I was so, Carle, and did more service there than thyself." He was condemned to die, and was executed, by hanging from the mast of his own boat, laid across the cleft of a rock. He suffered death without dismay, requesting that his body might be laid so near that of his friend the captain of Dunstaffnage, that they might exchange snuff-boxes in their graves; and this request was complied with. The fate of Colkittoch was amply avenged: at the Restoration, his death and sufferings formed some of the most serious and fatal charges against the Marquis of Argyre.

Coll's execution took place in 1647.

THE PATRIOTIC SHOEMAKER.

MR TIMOTHY BENNETT, a shoemaker, resided in the village of Hampton-Wick, near Richmond, in Surrey. The first passage from this village to Kingston-upon-Thames, through Bushy Park (a royal demesne), had been for many years shut up from the public. This honest Englishman, "unwilling," as he said, "to leave the world worse than he found it," consulted a lawyer upon the practicability of recovering this road, and the probable expense of a legal process. "I have seven hundred pounds," said this honest patriot, "which I should be willing to bestow upon this attempt. It is all I have, and has been saved through a long course of honest industry." The lawyer informed him that no such sum would be necessary to produce this result; and Timothy determined accordingly to proceed with vigour in the prosecution of this public claim. In the meantime, Lord Halifax, ranger of Bushy Park, was made acquainted with his intentions, and sent for him. An excellent engraving of Mr Bennett is still extant, which represents him of a firm and complacent aspect, sitting down in the attitude of his conversation with his Lordship. The inscription beneath the engraving is, "Timothy Bennett, of Hampton-Wick, Middlesex, Shoemaker, aged 75." "And who are you?" inquired his Lordship, "that have the assurance to meddle in this affair?" "My name, my Lord, is Timothy Bennett, shoemaker, of Hampton-Wick. I remember, an't please your Lordship, when I was a young man, sitting at my work, the people cheerfully pass by to Kingston market; but now, my Lord, they are forced to go round about, through a hot sandy road, ready to faint beneath their burdens, and I am 'unwilling' (it was his favourite expression) to leave the world worse than I found it." This, my Lord, I humbly represent, is the reason of my conduct." "Begone, you are an impatient fellow," replied his Lordship. However, upon more mature reflection, being convinced of the equity of the claim, and anticipating the ignominy of defeat, "LORD HALIFAX, the NOBLEMAN, nonsuited by TIMOTHY BENNETT, the SHOEMAKER," he desisted from his opposition, and opened the road, which is enjoyed, without molestation, to this day: he died 1756.

Such a disinterested instance of public virtue is highly worthy of being recorded; and though it may not be in the power of every one to suggest valuable improvements, or to confer lasting benefits on posterity, yet each may, like the patriotic Bennett, endeavour, at least, not to leave the world worse than he found it.—*Crispin Anecdotes.*

THE ORIGINAL ROBINSON CRUSOE.

WHEN Captain Watling and his company escaped from Juan Fernandez three years before, they had left a Mosquito Indian on the island, who was out hunting goats when the alarm came. This Mosquito-man, named William, was the first and the true Robinson Crusoe, the original hermit of this romantic solitude. Immediately on approaching the island, Dampier and a few of William's old friends, together with a Mosquito-man, named Robin, put off for the shore, where they soon perceived William standing ready to give them welcome. From the heights he had seen the ships on the preceding day, and, knowing them to be English vessels by the way they were worked, he had killed three goats, and dressed them with cabbage of the cabbage-tree, to have a feast ready on the arrival of the ships. How great was his delight, as the boat neared the shore, when Robin leaped to the land, and running up to him, fell flat on his face at his feet! William raised up his countryman, embraced him, and in turn prostrated himself at Robin's feet, who lifted

him up, and they renewed their embraces. "We stood with pleasure," says Dampier, "to behold the surprise, tenderness, and solemnity of their interview, which was exceedingly affecting on both sides; and when these their ceremonies of civility were over, we also that stood gazing at them drew near, each of us embracing him we had found here, who was overjoyed to see so many of his old friends, come hither, as he thought, purposely to fetch him."

At the time William was abandoned, he had with him in the woods his gun and knife, and a small quantity of powder and shot. As soon as his ammunition was expended, by notching his knife into a saw he cut up the barrel of his gun into pieces, which he converted into harpoons, lances, and a long knife. To accomplish this he struck fire with his gun-flint and a piece of the barrel of his gun, which he hardened for this purpose in a way he had seen practised by the Buccaneers. In this fire he heated his pieces of iron, hammered them out with stones, saved them with his jagged knife, or grinded them to an edge, and tempered them; "which was no more than these Mosquito-men were accustomed to do in their own country, where they make their own fishing and striking instruments without either forge or anvil, though they spend a great deal of time about them." Thus furnished, William supplied himself with goats' flesh and fish, though, till his instruments were formed, he had been compelled to eat seal. He built his house about a half-mile from the shore, and lined it snugly with goat-skins, with which he also spread his couch or *barbecue*, which was raised two feet from the floor. As his clothes wore out, he supplied this want also with goat-skins, and, when first seen, he wore nothing save a goat's skin about his waist.—*Edinburgh Cabinet Library.*

THE EARTHQUAKE.

TRAVELLING through the Barrens of Kentucky, in the month of November, I was jogging on one afternoon, when I remarked a sudden and strange darkness rising from the western horizon. Accustomed to our heavy storms of thunder and rain, I took no more notice of it, as I thought the speed of my horse might enable me to get under shelter of the roof of an acquaintance, who lived not far distant, before it should come up. I had proceeded about a mile, when I heard what I imagined to be the distant rumbling of a violent tornado, on which I spurred my steed, with a wish to gallop as fast as possible to the place of shelter; but it would not do; the animal knew better than I what was forthcoming, and, instead of going faster, so nearly stopped, that I remarked he placed one foot after another on the ground with as much precaution as if walking on a smooth sheet of ice. I thought he had suddenly foundered, and, speaking to him, was on the point of dismounting and leading him, when he all of a sudden fell a-groaning piteously, hung his head, spread out his four legs, as if to save himself from falling, and stood stock still, continuing to groan. I thought my horse was about to die, and would have sprung from his back had a minute more elapsed, but at that instant all the shrubs and trees began to move from their very roots, the ground rose and fell in successive furrows, like the ruffled waters of a lake, and I became bewildered in my ideas, as I too plainly discovered that all this awful commotion in nature was the result of an earthquake.

I had never witnessed anything of the kind before, although, like every other person, I knew of earthquakes by description. But what is description compared with the reality? Who can tell of the sensations which I experienced when I found myself rocking, as it were on my horse, and with him moved to and fro like a child in a cradle, with the most imminent danger around, and expecting the ground every moment to open, and present to my eye such an abyss as might engulf myself and all around me? The fearful convulsion, however, lasted only a few minutes, and the heavens again brightened as quickly as they had become obscured; my horse brought his feet to the natural position, raised his head, and galloped off as if loose and frolicking without a rider.

I was not, however, without great apprehension respecting my family, from which I was yet many miles distant, fearful that where they were the shock might have caused greater havoc than I had witnessed. I gave the bridle to my steed, and was glad to see him appear as anxious to get home as myself. The pace at which he galloped accomplished this sooner than I had expected, and I found, with much pleasure, that hardly any greater harm had taken place than the apprehension excited for my own safety.

Shock succeeded shock almost every day or night for several weeks, diminishing, however, so gradually as to dwindle away into mere vibrations of the earth. Strange to say, I for one became so accustomed to the feeling as rather to enjoy the fears manifested by others. I never can forget the effects of one of the slighter shocks which took place when I was at a friend's house, where I had gone to enjoy the merriment that, in our western country, attends a wedding. The ceremony being performed, supper over, and the fiddles tuned, dancing became the order of the moment. This was merrily followed up to a late hour, when the party retired to rest. We were in what is called, with great propriety, a *log-house*, one of large dimensions, and solidly constructed. The owner was a physician, and in one corner were not only his lan-

cets, tourniquets, amputating knives, and other sanguinary apparatus, but all the drugs which he employed for the relief of his patients, arranged in jars and phials of different sizes. These had some days before made a narrow escape from destruction, but had been fortunately preserved by closing the doors of the cases in which they were contained.

As I have said, we had all retired to rest, some to dream of sighs and smiles, and others to sink into oblivion. Morning was fast approaching, when the rumbling noise that precedes the earthquake began so loudly, as to waken and alarm the whole party, and drive them out of bed in the greatest consternation. The scene which ensued it is impossible for me to describe, and it would require the humorous pencil of Cruickshank to do justice to it. Fear knows no restraints. Every person, old and young, filled with alarm at the creaking of the log-house, and apprehending instant destruction, rushed wildly out to the grass enclosure fronting the building. The full moon was slowly descending from her throne, covered at times by clouds that rolled heavily along, as if to conceal from her view the scenes of terror which prevailed on the earth below. On the grass-plot we all met, in such condition as rendered it next to impossible to discriminate any of the party, all huddled together in a state of almost perfect nudity. The earth waved like a field of corn before the breeze; the birds left their perches, and flew about not knowing whither; and the Doctor, recollecting the danger of his gallipots, ran to his shop-room, to prevent their dancing off the shelves to the floor. Never for a moment did he think of closing the doors, but, spreading his arms, jumped about the front of the cases, pushing back here and there the falling jars, with so little success, however, that before the shock was over, he had lost nearly all he possessed.

The shock at length ceased, and the frightened females, now sensible of their dishabille, fled to their several apartments. The earthquakes produced more serious consequences in other places. Near new Madrid, and for some distance on the Mississippi, the earth was rent asunder in several places, one or two islands sunk for ever, and the inhabitants fled in dismay towards the eastern shores.—*Audubon's American Ornithology.*

SCOTTISH DUKES.

GORDON.

THE Gordon family affords a lively instance of what is by no means uncommon in Scottish family history—a race of Norman lineage, which has gradually acquired, in no very remote times, the character of Highland chieftainship. The founder of the race, a settler from England, possessed, in the reign of David I. (1123-56), the lands of Gordon, in Berwickshire, from which he probably took his name. Sir Adam de Gordon, in the time of Bruce, is found a powerful Baron. In reward for his services to Bruce, he obtained a royal grant of the lands of Strabogie, in Banffshire, which has ever since been the principal residence of the family. With a natural attachment to local prepossessions, the names Gordon and Huntly, which belonged to their lands in Berwickshire, were transferred to places in their northern territory. The last of the line, another Sir Adam de Gordon, fell at the battle of Homildon Hill, in 1402, and his memory is embalmed in the drama by Sir Walter Scott, styled (*pro euphonia gratia*) "Halidon Hill." His daughter and heiress marrying a Seton, the true line of the Gordons was lost, though the name was still retained. Alexander, the son of this pair, was elevated from his territorial style of Lord of Gordon, to the title of Earl of Huntly, by King James II., in 1449. He was a conspicuous adherent of the royal cause against the rebellious Douglasses and Crawfords. Having obtained a grant of the lordship of Badenoch, which forms a large district in the centre of the Highlands, he laid the foundation of that influence in the country of the Gael, by which his successors have been so much distinguished; an influence derived exclusively, it will be observed, from the possession or superiority of lands, and from no pretensions of birth or lineage. George, second Earl of Huntly, married the sister of the King, and was the father of that Lady Catherine Gordon who became the wife of Perkin Warbeck, as well as of Sir William Gordon of Gight, whose family ended in the person of Lord Byron. The immense estates of the Earls of Huntly, with the power they possessed of marshalling all their tenants and dependants in warlike array, rendered them so very powerful, that, but for the remoteness of their residence alone, they must have been at all times the leading noblemen of the country. George, the fourth Earl, was at the head of the Catholic interest in Queen Mary's time, and offered to that Princess to place her in the government without any toleration of the reformed doctrines; but she thought it safest to go in with the Protestants, and entrust her affairs to her brother James, Earl of Moray. The consequent turbulence of the Earl of Huntly ended fatally; he was killed in rebellion by Murray. Notwithstanding this unhappy incident, his son, the fifth Earl, was a partisan of the Queen in her latter and evil days. Nor for a hundred and fifty years did they forsake this faith, or abandon the Tory politics which formerly used to be always connected with it. George, the sixth Earl, occasioned infinite troubles in the reign of James VI., by his endeavours to obtain toleration for the ancient faith, and his in-

triques with foreign Catholic powers for that purpose. He it was who killed the young Earl of Murray—a dreadful piece of feudal revenge. Though frequently in open arms against King James, he was in reality rather the enemy of the royal counsellors, than of the royal person. James loved him very much, gave him his cousin Lady Henrietta Stewart to wife, and in 1599 created him Marquis of Huntly, being the first Peer of that rank in the kingdom. This nobleman was as great a favourite with Charles I. as he had been with King James, but was not so well fitted to shine in the more polished court of the former monarch. Having arrived there after a long absence, he excited the surprise of the glittering circle, by omitting that gesture which Sir Pertinax MacSycophant has caused the greater part of Englishmen to believe in the highest degree characteristic of their northern neighbours. On being reminded of the omission, he begged the King's pardon, and excused his want of respect by saying, "he was just come from a place where every body bowed to him." The Cock of the North was in those days, as it has been since, the popular and highly appropriate title for this Highland potentate and his descendants. In 1636, the first Marquis left his honours and estates to George, second Marquis, who, after many zealous efforts in favour of King Charles I., was beheaded by the Maiden at Edinburgh, March 23, 1649; chiefly, it was said, at the instigation of his brother-in-law, the Marquis of Argyll. Four sons of this nobleman distinguished themselves in the cause of royalty; and one of his daughters, marrying a Polish nobleman, was ancestress to the unfortunate Prince Czartorinski. His grandson George, the fourth Marquis, proved his loyal zeal by holding out Edinburgh Castle, after the Revolution, in favour of King James; and his wife afterwards, in the easy times of Queen Anne's Tory ministry, created a vast sensation by presenting a Jacobite medal openly to the Faculty of Advocates. This Marquise was, in 1684, converted by Charles II. into a Dukedom, when the title was changed from Huntly to Gordon. The family throughout all the last century, and to the present hour, professed those Tory principles which it has advocated, with such extraordinary consistency, ever since the division of opinion at the Reformation. The Catholicism, however, was resigned about a century ago, in consequence, it is said, of a rustic jest. A tenant on the estate had experienced some neglect at the hands of his Grace's factor; at last, he applied to the Duke personally, by whom he was very quickly redressed. Catching a glimpse, on this occasion, of the images within the family chapel, he asked what they were. The Duke answered that these were the representations of certain holy men, to whom good Catholics were accustomed to apply for intercession with the Deity. "Such nonsense!" said the honest farmer; "would it not be far better to do as I have been doing—speak to the laird himself?" It is said that this was the proximate cause of the conversion of the family. The late Duke, Alexander, who died in 1823, was the fourth possessor of the ducal title; and it is remarkable, that he had possessed it for the space of about seventy-six years, having succeeded his father in 1752. He married, in 1767, his celebrated Duchess, Jane, second daughter of Sir William Maxwell of Monreith—one of the most sprightly, elegant, and fascinating women of her time; an eminent favourite of the highest class of British society for nearly half a century, and who lived to see three daughters married, each to an English Duke, and one to a Marquis. The present Duke, who, as Marquis of Huntly, distinguished himself highly in the late war, and was, in 1807, created a British Peer, is a High Tory. As a man and a landlord, he is greatly respected. From his want of issue, the title, discovered from a large portion of the estates, will probably descend to the Earl of Aboyne, a cadet of the ducal house.

BIOGRAPHIC SKETCHES.

WASHINGTON.

Our young readers who have followed us through the various accounts presented to their notice, of men of genius and perseverance rising from the most humble situations in life to places of honourable distinction, will now be gratified in perusing a sketch of the life of one who, from the condition of a private gentleman, attained the highest situation in his country, and died with the extraordinary reputation of having preserved integrity of principle and genuine simplicity of character to the close of his career.

George Washington was born in Westmoreland county, in the North American colony of Virginia, on the 22d of February 1732, and was great grandson of John Washington, a gentleman of the south of England, who, about the middle of the seventeenth century, emigrated to this province. The education of young Washington extended only to the reading of English, and some of the more practical branches of mathematics. His inclinations, it seems, led him to adopt a sea life, and, when very young, he obtained the commission of midshipman in the British navy, but was soon induced to relinquish that service, by the pressing entreaties of his mother. After this, he entered upon the business of land-surveying, and was remarked for his diligence and expertness, but particularly for a certain gravity and dignity of demeanour, that would have graced riper years, and a more elevated station. In this humble sphere, however, his countrymen seem early to have discovered his capa-

city; for, when only nineteen years of age, he was appointed one of the adjutants-general of the Virginia militia, with the rank of major. But the opinion of his prudence and capacity was still more conspicuously displayed by his appointment as envoy to the French commandant on the Ohio, to remonstrate against certain encroachments of his troops upon the province of Virginia. Upon his return, he published a very clear and interesting account of this arduous mission, and was immediately appointed lieutenant-colonel of a regiment which had been ordered to proceed against the French, the answer of the commandant not having proved satisfactory. He had not proceeded far, when the command devolved upon him by the death of the colonel, and his services in this campaign obtained the thanks of the legislature of Virginia. Soon after, he resigned his commission, in consequence of certain regulations which he thought derogatory to the officers of the provincial troops, and retired to Mount Vernon, an estate on the banks of the Potomac, to which he had lately succeeded by the death of his brother, purposing to devote himself to the occupations of a country life.

His military bias, however, did not permit him to remain long in retirement. He was invited once more to defend the frontiers of the provinces from the invasions of the French, and his conduct, during the whole expedition, was so much approved, that, though only twenty-three years of age, he was soon made commander of all the provincial troops of Virginia. The frontiers being in some measure secured from invasion, he again, in 1758, resigned his commission, amidst the applauses and regrets of his soldiers.

Here might have terminated the military career of George Washington, and he might have passed the remainder of his days in the quietude of rural affairs, but for the unfortunate quarrel which took place between Great Britain and her American possessions. It will here be necessary to explain to our juvenile friends the origin and nature of this distressing dispute. For a considerable period Great Britain possessed a large tract of territory in the North American continent, divided into colonies or separate jurisdictions, the inhabitants of which being chiefly emigrants from this country, were governed by English laws, and guaranteed that civil and religious liberty common to ordinary British subjects. Each of these colonies had a local parliament or assembly of delegates of its own, presided over by a governor appointed by the British ministry. One of the understood regulations in managing these distant countries was, that they should contribute no taxes to Britain; but it having happened in the course of time, that the British treasury stood much in need of a supply of money, our ministry and parliament resolved on exacting certain taxes or duties from the American colonists. These taxes, we are informed, would have been freely contributed by the Americans, provided they had been granted the power of sending representatives to Britain to sit in parliament; but this proposal being strenuously refused, through a fear of its leading to further changes in the British legislature, the result was, that the Americans refused to pay any taxes whatever, and in a short time opposed their exaction by force. All men are now of opinion that the British government at this period acted with extreme impropriety; nevertheless, the nation at the time rushed heedlessly into a war with the colonies, expecting speedily to quell all opposition to the laws. As for the Americans, they sagaciously prepared for the struggle.

In constructing an army for the defence of the provinces, the Americans bestowed the command of the forces on George Washington, of whose military talents and prudence they had already seen many proofs. No man in any age or country ever filled a more arduous station than that in which he was now placed. He was called to defend an extensive country just beginning the perilous experiment of self-government, altogether unpractised in war on a great scale, and with no other resources than his spirit, against a nation possessed of all the means, and strong with all the sinews of war, and able, by its command of the ocean, to carry its hostilities against any part of that extensive coast, which had drawn towards it the best part of the wealth and industry of the country. For a considerable period, his troops had no fire-arms but what they provided themselves; they had no tents, no magazines, no cavalry, no artillery, and scarcely any ammunition. So provided, or rather unprovided, the best troops in the world would not have been able to do much; but when we consider the nature and description of the American armies, we must wonder that he was able to keep the field for a single campaign against the well-trained forces of Britain.

The history of the war in America may be summed up in a few words. Instead of transporting large masses of men capable of crushing in an instant the united force of the colonists, the British ministry dispatched small detachments of troops, who were invariably cut up in detail as they marched through the country, and on some occasions whole regiments had ignominiously to lay down their arms. In this species of inglorious war, which has afforded our American brethren some cause for boasting, Washington was equally conspicuous for his cool determination and courage in the heat of conflict, and his mercy after victory, so as to win the applause of both friend and foe. The situation of the general was, moreover, one of peculiar difficulty. He experienced languor, insubordination, and desertion in his followers; and it was,

only after he had the address to induce his countrymen to establish a standing army, on something like regular principles, that success crowned his exertions. It is allowed by all parties that the services of Washington in this grand struggle against oppression were as great as ever performed by any man to any nation. History is full of far more brilliant exploits; but it must always be recollected that in Washington's situation, not to be defeated was victory. In the arrangements on the day of battle, we should discover but a small portion of those happy endowments which gave him an unrivalled ascendancy over the minds of his countrymen; which enabled him to keep a powerful enemy in awe with fluctuating levies, whose defective constitution forbade the necessary severities of discipline; which enabled him to awaken sentiments of honour and patriotism in hearts divided by animosities and jealousies. In criticising his military conduct, we must always keep in view his means; and if we cannot discover any single achievement of peculiar brilliancy, we shall yet be forced to admire a long series of arduous operations, which display penetration and energy, combined with uniform and unerring sagacity. Although it was simply the redress of grievances relative to taxation which prompted them to take up arms, as they began to feel their strength, they aspired to higher views.

The war was commenced on the 14th of June 1774, and, with greater or lesser vigour, was carried on for about eight years. Two years after its breaking out, on the 4th of July 1776, the colonists declared their independence of the English crown, which was acknowledged by France in 1778, by Holland in 1782, but not by the British parliament till the 30th of November 1783. Yet, in thus securing the blessing of national liberty, the colonists, it seems, were by no means satisfied. They broke out into parties; disaffection spread on all sides; and had not the wisdom and patriotism of Washington suggested expedients to allay the ferment and avert the danger, the Union of States would have been dissolved, and national ruin and disgrace the consequence.

Having given liberty to his country, Washington once more retired from public life to his paternal roof, followed by the fervent admiration of his countrymen. Unlike Cromwell, or Napoleon in later times, he had no desire to take advantage of his situation or popularity, and so secure the office, for life, of emperor, king, or protector. He freely renounced all official distinction, thereby offering an example of moral virtue quite unparalleled in the history of modern times, and retaining no other reward for his extraordinary services than his country's love. The following letter to La Fayette—a distinguished French nobleman, who assisted in establishing the independence of the States, and who still survives—written soon after his arrival at Mount Vernon, gives a lively picture of his feelings, and breathes a fine spirit of philosophy.

"At length, my dear Marquis, I have become a private citizen on the banks of the Potomac, and under the shadow of my own vine and my own fig-tree. Free from the bustle of a camp, and the busy scenes of public life, I am solacing myself with those tranquil enjoyments, of which the soldier, who is ever in pursuit of fame—the statesman, whose watchful days and sleepless nights are spent in devising schemes to promote the welfare of his own, or the ruin of other countries, as if this globe was insufficient for us all—and the courtier, who is always watching the countenance of his prince, in the hope of catching a gracious smile, can have very little conception. I have not only retired from all public employments, but am retiring within myself, and shall be able to view the solitary walk, and tread the paths of private life, with heartfelt satisfaction. Envious of none, I am determined to be pleased with all, and move gently down the stream of life, until I sleep with my fathers."

During his retirement, objects of public utility still occupied his thoughts; and it was not long before he formed, with his characteristic sagacity, a plan of improving the internal navigation of the country. This plan was, to open as high as possible the great eastern rivers, and to connect them, by means of intermediate streams, with the Ohio: and his object in this magnificent undertaking was to draw the States beyond the Alleghany mountains into a closer connexion with those upon the Atlantic; and thus, by multiplying their commercial relations, to give stability and unity to those of a political nature. These beneficent schemes of Washington have been fully accomplished. He was soon, however, called upon by a sense of duty into more burdensome labours. The jealousies prevailing among the States threatened again to wreck the newly-formed republican government. When at last it became evident to all that some alteration of the general system was indispensable to the preservation of its parts, a convention was held under his auspices; and the constitution which it formed having been adopted by the greater part of the States, he was, in April 1789, called to the office of First President, by the unanimous voice of the confederation. There is abundance of evidence that he accepted this office of chief magistrate of the United States with the greatest reluctance. He had no ambition of high place; and, free from all presumption, this truly great man felt diffident of his capacity to administer, in peace, the affairs of a country which, in war, he had saved from ruin. "I bade adieu to Mount Vernon, to private life, and domestic felicity," says he, in

an entry in his diary; "and, with a mind oppressed with more anxious and painful sensations than I have words to express, set out for New York, with the best dispositions to render service to my country, but with less hope of answering its expectations."

The duties of Washington's civil administration, though far less arduous than those of his military command, yet required much of that fortitude and sagacity which that command so conspicuously displayed. To re-establish credit, and provide for the debts of the Union, when there was every desire to profit by injustice, and where taxation was both difficult and odious—to give stability and energy to a new government, encountered in its first operations by the contending interests of thirteen separate States—and to preserve the blessings of peace to a rising community, when the misguided feelings of the people would have precipitated a war, were efforts which statesmen are seldom called to make, and which but few would have been equal to perform. In his public conduct, we look in vain for any of those vices which oppose the prosperity of nations, and the peace of the world. In choosing the officers of his government, in virtue of the powers committed to him by the constitution, he is universally allowed to have displayed the utmost disinterestedness. No prejudices, no affections, no interests, were seen to interfere with his great duty, to call to the management of a nation's concerns the talents from which a nation has most to hope. His addresses to the people and to Congress—as the parliament of the American States is called—afford indubitable proofs of the purity, as well as the solidity of his principles; and it is impossible to read them, and to trace them, as exemplified in the whole course of his public career, without admitting "that he performed justly, skilfully, and magnanimously, all the offices, both public and private, of peace and war." General Washington survived his retirement from the Presidency, which he twice enjoyed, only two years. He died on the 14th of December 1799, of an inflammation in the throat, occasioned by a slight rain to which he had been exposed the preceding day. Soon after the disease commenced, he foresaw he would die; and he met his fate with his accustomed fortitude.

The personal appearance of this lamented statesman was noble and commanding; and it has been frequently remarked, that the impression of awe which it was calculated to produce, was never effaced by frequency of intercourse. He was reserved in his manners, and unaffectedly modest. He was hospitable, and his establishment expensive, but under exact regulation. He spoke with diffidence; but his letters to Congress, and his written addresses, are admirable for clearness and solidity. His personal habits were exceedingly temperate, and the purity of his morals was never questioned. In short, to use the words of Mr Fox, "a character, of virtues so happily tempered by one another, and so wholly unalloyed with any vices, is hardly to be found in the pages of history." By all classes of citizens in the United States, the memory of George Washington is cherished above that of all other patriots, while his name serves as a lasting incitement to the nation to preserve its institutions unimpaired to a distant posterity.

SCOTTISH CRIMINAL TRIALS.

WITCHCRAFT AND POISONING—KATHERINE ROSS
LADY FOWLIS.

THIS woman, daughter of Ross of Balnagown, was the second wife of the fifteenth Baron of Fowls; and the object of her crimes was to destroy her stepsons Robert and Hector Monro, with about thirty of their principal kinsmen, in order that her own children might succeed to the possessions of their father, which were considerable, and lay in the counties of Ross, Sutherland, and Inverness. Her brother, George Ross, seems to have been in league with her for the accomplishment of this diabolical purpose—a participation the more atrocious in his case, because his wife, Marjory Campbell, called the young Lady Balnagown, was marked out as a victim, whose removal, with that of the persons already named belonging to the Fowls family, might pave the way for his marriage with the wife of Robert Monro, the young laird. Their schemes were brought into active operation in the summer of 1577. In the end of November of that year, four of their accomplices, Agnes Roy, Catherine Ross in Canorth, William MacGillivorie-dam, and Thomas MacKane More MacAllan MacEvoh, were arraigned in a justice court held in the cathedral kirk of Ross, convicted, and burnt. One of the judges who presided at this trial was Robert Monro, the husband of the principal instigator of the crimes, and father of the family whose lives were practised against. Lady Fowls, upon the discovery of her wickedness, fled into the county of Caithness. After remaining there for the space of three quarters of a year, her husband was persuaded, "be lauburrows," and by the influence of the Earl of Caithness, to receive her home again. What kind of "lawburrows" it was that existed at that time, of force enough to effect a reconciliation in such circumstances, is not explained, and we are totally at a loss to conjecture. Lady Fowls seems to have lived unmolested during the rest of the life of the old baron; and even the young laird, for whose destruction she had perseveringly laboured, made no exertion to bring her to justice. He, however, en-

joyed the family estates only from November 1588 to October 1589. His brother Hector, on succeeding him, procured a commission for the punishment of certain witches and sorcerers, which was understood to be aimed at his stepmother; but before he had time to act upon the power thus granted, she had influence enough to obtain a suspension of the commission; and it was not till the July of 1590, thirteen years after the perpetration of the crimes, that she was brought to trial at his instance. The evidence mainly rested upon seems to have been the notoriety of the facts, and the confession of the accomplices; each count of the indictment closes with a reference to the record of the process before the provincial court, with the occasional addition of "as is notour," "as is manifest be the hail countrie of Roiss," or words to that effect. The verdict was favourable to the accused; but Mr Pitcairn is of opinion that her escape was owing to her powerful interest. "The inquest, he says, 'bears all the appearance of a selected or packed jury, being in a very inferior rank and station of life to the panel, contrary to the usual custom.' It is also to be remarked, that several individuals who had been summoned as jurymen did not come forward, and were, in consequence, 'unlawit,' or fined in the sum of forty pounds (Scots). Their failure to answer the citation may not improbably have been a discreet way of avoiding the inconveniences that might have followed, had they passed upon the assize and given their voice against a person of influence like the Lady Fowls. The ditty or indictment is the only part of the proceedings which is preserved; indeed the reading of it seems to have constituted the whole case of the prosecutor, and the simple denial of the 'samin and the hail poyntis thereof,' the whole case for the accused; after which the jury retired to consider their verdict. The acquittal which followed was no doubt such as any modern jury, with no better proof before them, would instantly acquiesce in; but this can scarce be held a presumption of the innocence of the party, because we are now habituated to an entirely different manner of leading evidence; and if the whole tribe of ancient evildoers, whose crimes were neither few nor trivial, were arraigned, according to the forms and practice of their own times, before a court of the nineteenth century, not a single conviction could be obtained. But to come to the matter against Lady Fowls.

The first method adopted to compass the deaths of the persons who stood in the way of her ambition, was to form figures to represent the young Laird of Fowls and the young Lady Balnagown, which were shot at with elf-arrows, in conformity with the belief that, if these charmed weapons struck the typical bodies, the wounds would be felt in their real bodies, and produce invisibly the desired effect. For the performance of the necessary rites, a meeting of three witches took place in the house of Christian Ross at Canorth, Christian herself being one of them, Lady Fowls another, and third, Marjory MacAllester, a hag of peculiar eminence, distinguished also by the name of Loskie Loncart, which was probably conferred upon her by the second or diabolic baptism, to which the rest had not attained. Having constructed two images of clay, they placed them on the north side of the western chamber, and Loskie, producing two elf-arrows, delivered one to Christian Ross, who stood by with it in her hand, while, with the other, Lady Fowls shot twice at the figure of Lady Balnagown, and Loskie three times at that of Robert Monro, without success. In the meantime the images, not having been properly compacted, crumbled to pieces; and their purpose being thus thwarted for the present, the unhallowed convocation broke up, Loskie Loncart having engaged, at the command of Lady Fowls, to make two other figures. MacGillivorie-dam seems now to have been taken into their counsels; and, by his advice, an image in butter of the young Laird of Fowls was placed by the side of the wall in the same western chamber of Canorth, and shot at eight times with an elf-arrow by Loskie, without effect. This was on the 2d July 1577; and, nothing discouraged by repeated failures, a clay figure of the same person was constructed on the 6th, when the indefatigable Loskie discharged the elf-arrow twelve times, sometimes reaching the image, but never wounding it. The other two hags stood by, anxiously watching for a successful shot, Christian Ross having provided three quarters of fine linen cloth to be bound about the typical corpse, which was to have been interred opposite the gate of the Stank of Fowls, in order to complete the enchantment by a full representation of every circumstance which they were desirous of producing as its consequence. The main part of the rite, however, consisted in the infliction of a wound; and this not having been accomplished, they desisted from the vain labour.

What are called elf-arrow heads, as the reader is probably aware, are pieces of flint chipped into the shape of a barb with serrated edges, used by our barbarian ancestors for mutual destruction in the absence of the more effective weapons which civilization contrives for the same purpose. They are sometimes dug up in considerable quantities together, and were long thought by the vulgar to be of fairy origin, and to possess destroying powers without the infliction of a visible wound; thus, if a man or beast were seized with any disease attended with unusual symptoms, it was immediately concluded that they were elf-shot. Even till within a few years of the present day, when cattle were grievously tormented with flies in the summer, and galloped about in a distracted manner to get rid

of them, it was no unusual thing to hear exclamations of "What can be the matter with the beasts? They're surely elf-shot!" the impression being, that they were consumed by some invisible smart that preyed upon the vitals, and drove them about in maddened flight. Lady Fowls was so eager to obtain one of these arrow heads, that she sent four messengers to John MacNilland in Dingwall, who possessed one, and who was at last induced to pay her a visit at Fowls, and dispose of it for four shillings (Scots). Another messenger was dispatched to Tain, and procured a second from two women there, reputed witches, who had it in keeping.

The more secret arts of witchcraft having failed to effect the desired ends, Lady Fowls next had recourse to poison; and numerous were the consultations held to concoct drugs, and devise means for administering them. The same assistants figured as the chief agents in this equally abominable work. A stoupful of poisoned ale was first mixed in the barn of Drumhryn; but opportunity not serving for its immediate use, it was kept three nights in the kiln; and the stoup being leaky, the liquor was lost, all but a very small quantity, to prove the strength of which, Lady Fowls caused her servant lad, Donald Mackay, to swallow it. The three confederates were assembled upon this occasion, and as the draught did not kill the boy, but only threw him into a state of stupor, Loskie Loncart was dismissed with an injunction to "mak ane pig-full of ranker poysonne." The obedient hag prepared the potion, and sent it to her patroness, by whom it was delivered to her nurse, Mary More, to be conveyed to Angus Leith's house, where the young Laird then was, that it might be employed for his destruction. Night was the time chosen for dispatching her on this errand; she broke the vessel by the way, spilt the liquor, and wishing probably to ascertain the nature of what had been entrusted to her under such circumstances of mystery, tasted it, and paid the forfeit of her curiosity with her life; and what helps to show the deadly qualities of this preparation, the indictment adds, that "the place quhair the said pig brak, the gers that grew upon the samin wes so heich by (beyond) the natour of uther gers, that nather cow, ox, nor scheip ewir preavit (tasted) thairfor." It were endless to detail all the traffickings and messengers kept scouring the country to collect the requisite quantity of poison. Loskie Loncart was lodged and maintained a whole summer in Christian Ross's house, for the greater convenience of assisting to drug drinks, and devise means of administering them—MacGillivorie-dam was sent to consult the gipsies about the most effectual way of poisoning the young laird. He also purchased a quantity of the powder used to destroy rats, from a merchant in Elgin, and another portion in Tain, and was strictly questioned by Lady Fowls whether it would suit best to mix the ingredient with eggs, brose, or kale. No fitting opportunity seems to have occurred for administering any of the potions to Robert Monro; but, after three interviews, John MacFarquhar, young Balnagown's cook, was prevailed upon, by the present of two ells of grey cloth, a shirt, and twelve shillings and fourpence (Scots), to lend them his aid in accomplishing their purpose on his mistress. That young lady being to entertain a party of friends one night at her house of Ardmure, a witch named Katherine Neynday carried poison thither to MacFarquhar, who strewed it on the principal dish, which was kidneys. This woman remained to witness the effects, and afterwards declared that she "skunnerit," or revolted, at the sight, which was "the sarest and maist cruell that evir scho saw, seing the vomit and vexacioun that was on the young lady Balnagown and her company." The victim of these horrible practices did not die immediately, but contracted a deadly sickness, "quhairin," says the indictment, "scho remanis yet [that is, upwards of twelve years after taking the poison] incurable."

Such were the desperate means adopted by a lady of the 16th century to elevate her own children to the birthright of the elder sons of her husband. We might be apt to think that the affection was at least very strong which prompted her, for the benefit of her offspring, to engage in these odious practices, and to incur so great hazards. But this is a supposition founded solely upon modern notions of the atrocity of her guilt. If a woman *now* were to meditate murder for the space of a year, and to use all that time in unwearied endeavours to carry her purpose into execution, risking constantly, for so long a time, the infamy and the penalty of discovery, while, even if her design succeeded, the principal advantage was to be reaped by her son and brother, we must accord to her the character of being disinterestedly and heroically wicked. But in the time of Lady Fowls, crime was not so repulsive in itself, nor so fatal in its consequences. The daring requisite for its perpetration was, therefore, not so great. Men's minds, in place of revolting at the idea of depriving a fellow-being of life, were familiar with every form of murder: it was the business of the next of kin to revenge it; but it exposed the guilty individual to the execration of no one beyond the limits of blood-relation to the sufferer. Hence the ease with which accomplices were found in the basest crimes. The persons named as privy to the designs of Lady Fowls were numerous, and included the daughter of a baronet of her own name, whose interest in the matter seems to have been merely that of a connection, "or, at most, of a clanswoman; and the bribes with which she purchased assistance and secrecy were of the paltriest kind. She provided

lodgings in the houses of her adherents, for some whom she wished to have near her, for the better maturing of her schemes. The cook of young Lady Balnagown was bribed, as we have seen, with little more than a shirt, and a shilling sterling! The fidelity of Christian Ross was bespoken, by reminding her that she ought not to reveal any thing against one who was her lady and mistress. Another of the gang was paid with "ane half furett of meill." MacGillivrie-dam got four ells of linen for his trouble, but, besides, appropriated six and eightpence (Scots) of the money given him to be expended in the purchase of poison; at other times, however, this person was conciliated with 20s., a firlof of meal, five ells of linen, and 16s. The brother of Lady Fowles is also said to have promised to Thomas MacKane More MacAllan MacEvoch "ane garmounthe of clais" (suit of clothes) for his services in the same base plot.

From a review of this whole case, with others of the same date, it will appear that the crimes of former times were distinguished from those of the present, not so much by the greater atrocity of any single act, as by the length of time for which they were meditated, and the number of persons admitted to a knowledge of them without any fear of disclosure. They were the offspring of habitual thoughts rather than the effects of sudden starts of passion. Before the eye of sober investigation, the romance with which many of the bloody deeds of the olden time and of savage life are invested must vanish. The villain then had not to brave the risk of certain punishment, nor to cut himself off, as it were, from sympathy with his kind. The villain of civilized times acquires the courage to do both. If we desire, therefore, to admire the *beau idéal* of a bold ruffian, let us not take the trouble to search into antiquity. There we find only the exercise of habitual ferocity, with the necessity of breaking through few restraints. It is our own day that gives birth to peculiar monstrosity of crime, where the impulse of passion, or the dogged purpose of an impenetrably hardened heart, finds itself withstood by almost every conceivable restraint, and sets them all at naught.

SIR M. HALE.

THE character of Sir Matthew Hale as a judge was splendidly pre-eminent. His learning was profound; his patience unconquerable; his integrity stainless. In the words of one who wrote with no friendly feeling towards him, "his voice was oracular, and his person little less than adored." The temper of mind with which he entered upon the duties of the bench is best exemplified in the following resolutions, which appear to have been composed on his being raised to the dignity of Chief Baron at the Restoration:—

"Things necessary to be continually had in remembrance:

"1. That in the administration of justice I am intrusted for God, the King, and country; and therefore,

"2. That it be done, 1. Uprightly; 2. Deliberately; 3. Resolutely.

"3. That I rest not upon my own understanding or strength, but implore and rest upon the direction and strength of God.

"4. That in the execution of justice I carefully lay aside my own passions, and not give way to them, however provoked.

"5. That I be wholly intent upon the business I am about, remitting all other cares and thoughts as unreasonable and interruptions.

"6. That I suffer not myself to be prepossessed with any judgment at all, till the whole business and both parties be heard.

"7. That I never engage myself in the beginning of any cause, but reserve myself unprejudiced till the whole be heard.

"8. That in business capital, though my nature prompt me to pity, yet to consider there is a pity also due to the country.

"9. That I be not too rigid in matters purely conscientious, where all the harm is diversity of judgment.

"10. That I be not biassed with compassion to the poor, or favour to the rich, in point of justice.

"11. That popular or court applause or distaste have no influence in any thing I do, in point of distribution of justice.

"12. Not to be solicitous what men will say or think, so long as I keep myself exactly according to the rule of justice.

"13. If in criminals it be a measuring cast, to incline to mercy and acquittal.

"14. In criminals that consist merely in words, where no more harm ensues, moderation is no injustice.

"15. In criminals of blood, if the fact be evident, severity is justice.

"16. To abhor all private solicitations, of what kind soever, and by whomsoever, in matters depending.

"17. To charge my servants, 1. Not to interpose in any matter whatsoever; 2. Not to take more than their known fees; 3. Not to give any undue precedence to causes; 4. Not to recommend counsel.

"18. To be short and sparing at meals, that I may by the fitter for business."

Under the influence of resolutions like these, the conduct of Hale on the bench appears to have been almost irreproachable.

CORK.

MANY persons see corks used daily without knowing whence come these exceedingly useful materials. Corks are cut from large slabs of bark of the cork-tree, a species of the oak which grows wild in the countries in the south of Europe. The tree is generally divested of its bark at about fifteen years old, but before stripping it off, the tree is not cut down, as in the case of the oak. It is taken while the tree is growing; and the operation may be repeated every eighth or ninth year, the quality of the cork continuing each time to improve as the age of the tree increases. When the bark is taken off, it is singed in the flame of a strong fire; and, after being soaked for a considerable time in water, it is placed under heavy weights, in order to render it straight. Its extreme lightness, the ease with which it may be compressed, and its elasticity, are properties so peculiar to this substance, that no efficient substitute for it has yet been discovered. The valuable properties of cork were known to the Greeks and Romans, who employed it for all the purposes for which it is used at present, with the exception of stopples for bottles—the ancients mostly employing cement for closing the mouths of vessels. The Egyptians are said to have made coffins of cork, which, being spread on the inside with a resinous substance, preserved dead bodies from decay. In modern times, cork was not generally used for stopples to bottles till about the close of the seventeenth century, wax being till then chiefly in use for that purpose. The cork imported into Great Britain is brought principally from Italy, Spain, and Portugal. The quantity annually consumed is upwards of 5000 tons.

AN ADVENTURE.

As Mr Thomson, with his companion, was proceeding across the uninhabited desert in South Africa, he met with the following adventure:—

"We proceeded on our course, over extensive plains, sprinkled with numerous herds of game—quaggas, elands, gnooks, koodoos, hartebeests, gemsboks, and smaller antelopes, the movements of which helped to relieve our lonely journey. The gnook here was of a larger size, and apparently different from that on the other side of the Cradock, being of a dark blue colour, and having a black bushy tail, instead of a white one. I observed also two sorts of hartebeests. As we travelled along, I observed my Hottentot continually looking out for the *spoor* (track) of human feet, being exceedingly anxious to get to some kraal before night; but the only tracks he could discover were those of the wild animals above mentioned, and of their pursuer, the lion. The foot-prints of the latter were so frequent and so fresh, that it was evident these tyrants of the desert were numerous and near to us. Frederick also remarked to me, that wherever such numbers of the large game were to be seen, we might be certain lions were not far distant. The numerous skeletons of animals scattered over the plain, presented sufficient proofs of the justness of our apprehensions, and these were soon confirmed by ocular evidence. We were jogging pensively along, the Hottentot with two horses about ten yards before me, I following with the other two. Frederick was nodding on his saddle, having slept little, I believe, the preceding night. In this posture, happening to cast my eyes on one side, I beheld, with consternation, two monstrous lions, reclining under a mimosa bush, within fifteen yards of our path. They were reclining lazily on the ground, with half-opened jaws shewing their terrific fangs. I saw our danger, and was aware that no effort could save us, if these savage beasts should be tempted to make a spring. I collected myself, therefore, and moved on in silence, while Frederick, without perceiving them, rode quietly past. I followed him exactly at the same pace, keeping my eyes fixed upon the glaring monsters, who remained perfectly still. When we had got about seventy or eighty yards from them, I rode gently up to Frederick, and, desiring him to look over his shoulder, shewed him the lions. But such a face of terror I never beheld, as he exhibited, on perceiving the danger we had so narrowly escaped. He was astonished, too, that he had not previously observed them, being, like most of his countrymen, very quick-sighted. He said, however, that I had acted very properly, in not speaking or evincing the least alarm, while passing the lions; for, if I had, they would probably not have let us pass so quietly. Most likely, however, we owed our safety to their hunger being satiated, for they appeared to have been just devouring some animal they had killed, a quagga, as it seemed to me, from the hurried glance I had in passing."

WATCHMEN OF STOCKHOLM.

THE appearance of the watchmen in Stockholm is most grotesque. Their dress consists entirely of the skins of animals, and they walk constantly in pairs, carrying in their hands a curious instrument for seizing culprits who may endeavour to escape from them. It is so contrived as to shut fast about the neck, being applied below the back part of the head, and becomes tighter the more the person caught struggles to get free.

STANZAS

Written in the Churchyard of Richmond, Yorkshire.
By HERBERT KNOWLES.

"It is good for us to be here; if thou wilt, let us make here three tabernacles, one for thee, one for Moses, and one for Elias."—St Mal.

Methinks it is good to be here,
If thou wilt let us build—but for whom?
Nor Elias nor Moses appear;
But the shadows of eve that encompass with gloom
The abode of the dead, and the place of the tomb.

Shall we build to Ambition? Ah, no!
Afrighted, he shrinketh away;
For see, they would pin him below
In a dark narrow cave, and, beset with cold clay,
To the meanest of reptiles a peer and a prey.

To Beauty? Ah, no! she forgets
The charms which she wielded before;
Nor knows the foul worm that frets
The skin that, but yesterday, fools could adore,
For the smoothness it held, or the tint which it wore.

Shall we build to the purple of Pride,
The trappings which dizen the proud?
Alas! they are all laid aside,
And here's neither dress nor adornment allowed,
Save the long winding-sheet and the fringe of the shroud.

To Riches? Alas, 'tis in vain;
Who hid in their turns have been hid;
The treasures are squandered again;
And here, in the grave, are all metals forbid,
Save the tinsel that shines on the dark coffin lid.

To the pleasures which Mirth can afford,
The revel, the laugh, and the jeer?
Ah! here is a plentiful board!
But the guests are all mute as their pitiful cheer,
And none but the worm is a reveller here.

Shall we build to Affection and Love?
Ah, no! They have withered and died,
Or fled with the spirit above that
Friends, brothers, and sisters, are laid side by side,
Yet, none have saluted, and none have replied.

Unto Sorrow? The dead cannot grieve;
Not a sob, not a sigh, meets mine ear,
Which Compassion itself could relieve.
Ah! sweetly they slumber, nor love, hope, or fear,
Peace! peace! it is the watchword, the only one here.

Unto Death, to whom monarchs must bow?
Ah, no! for his empire is known,
And here there are trophies snow!
Beneath the cold head, and around the dark stone,
Are the signs of a sceptre that none may disown.

The first tabernacle to Hope we will build,
And look for the sleepers around us to rise!
The second to Faith, which ensures it fulfilled;
And the third to the Lamb of the great sacrifice,
Who bequeathed us them both when he rose to the skies.

ANECDOTE OF BURNS.

One Sunday morning, some time before Burns commenced author, when he and his brother Gilbert were going to the parish church of Tarbolton, they got into company with an old man, a Moravian, travelling to Ayr. It was at that time when the dispute between the Old and New Light Burghers was making a great noise in the country; and Burns and the old man, entering into conversation on the subject, differed in their opinions about it, the old man defending the principles of the Old Light, and Burns those of the New Light. The disputants at length grew very warm in the debate, and Burns, finding that with all his eloquence he could make nothing of his antagonist, became a little acrimonious, and tauntingly exclaimed, "Oh! I suppose I have met with the Apostle Paul this morning." "No," replied the old Moravian coolly, "you have not met the Apostle Paul; but I think I have met one of those wild beasts which he says he fought with when at Ephesus."

ANIMAL LIFE.

The following is a scale of the average duration of animal life from the most celebrated writers on natural history:—A hare will live 10 years, a cat 10, a goat 8, an ass 30, a sheep 10, a ram 15, a dog from 14 to 20, a bull 15, an ox 20, swine 25, a pigeon 8, a turtle-dove 25, a partridge 25, a raven 100, an eagle 100, a goose 100.

THE ODD FAMILY.

In the reign of William the Third, there lived in Ipswich, in Suffolk, a family, which, from the number of peculiarities belonging to it, was distinguished by the name of the *Odd Family*. Every event remarkably good or bad happened to this family on an odd day of the month, and every one of them had something odd in his or her person, manner, and behaviour; the very letters in their Christian names always happened to be an odd number. The husband's name was Peter, and the wife's Rahab; they had seven children, all boys, viz. Solomon, Roger, James, Matthew, Jonas, David, and Ezekiel. The husband had but one leg, his wife but one arm. Solomon was born blind of the left eye, and Roger lost his right eye by accident; James had his left ear pulled off by a boy in a quarrel, and Matthew was born with only three fingers on his right hand; Jonas had a stump foot, and David was hump-backed; all these, except David, were remarkably short, while Ezekiel was six feet high at the age of nineteen; the stump-footed Jonas and the hump-backed David got wives of fortune, but no girl would listen to the addresses of the rest. The husband's hair was as black as jet, and the wife's remarkably white, yet every one of the children's was red. The husband had the peculiar misfortune of falling into a deep swamp, where he was starved to death in the year 1701, and his wife, refusing all kind of sustenance, died in five days after him. In the year 1703, Ezekiel enlisted as a grenadier, and although he was afterwards wounded in twenty-three places, he recovered. Roger, James, Matthew, Jonas, and David, died at different places on the same day in 1713, and Solomon and Ezekiel were drowned together in crossing the Thames, in the year 1723.

CATS.

The first couple of cats which were carried to Cuyaba sold for a pound of gold. There was a plague of rats in the settlement, and they were purchased as a species, which proved an excellent one. Their first kittens produced thirty *litares* each; the next generation were worth twenty; and the price gradually fell, as the inhabitants were stocked with these beautiful and useful creatures. Montenegro presented to the elder Almagro the first cat which was brought to South America, and was rewarded for it with six hundred pesos.—*Southey's Brazil*.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

67 Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 15s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Junr. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

PRICE THREE HALFPENCE.

A TURN FOR BUSINESS.

NEXT to a thorough grounding in good principles, perhaps the thing most essential to success in life is a habit of communicating easily with the world. By entering readily into conversation with others, we not only acquire information by being admitted to the stores which men of various modes of thinking have amassed, and thereby gain an insight into the peculiarities of human character, but those persons into whose society we may be accidentally thrown are gratified to think that they have been able to afford instruction. Seeing that we appreciate their favourite subject, they conceive a high opinion of our penetration, and not unfrequently exert themselves wonderfully to promote our interests. Men in business, particularly, who have this happy turn of being able to slide as it were into discourse, and to throw it into that train which is best suited to the capacities and humours of others, are wonderfully indebted to it for the run of customers it entices to their shops. A stately, grave, or solemn manner, is very inappropriate in measuring stuffs by the yard; and though a man be penetrated by the deepest sense of gratitude, if his bow be stiff, and his countenance not of a relaxing cast, he makes not half so favourable an impression as another who may not perhaps be a more deserving person in the main, but has a more graceful method of acknowledging his obligations. It is astonishing, too, at how cheap a rate good will is to be purchased. An insinuating way of testifying satisfaction with the pleasantness of the weather, is often a very effectual way of extending popularity; it is regarded as an act of condescension when addressed to some, while with others it is received as the indication of a happy temperament, which is at all times attractive. A person who "has little to say," or, in other words, who does not deign to open his mouth except when it is indispensably necessary, never proves generally acceptable. You will hear such a one described as "a very good sort of man in *his way*;" but people rather avoid him. He has neither the talent of conversing in an amusing vein himself, nor of leading on others to do so; and they are only the arrantest babblers who are contented with an inanimate listener. I remember a striking example of the various fortune of two persons in the same profession, who happened to be of those different dispositions.

Two pedlars made their rounds in the same district of country. The one was a tall, thin man, with a swarthy complexion. Nothing could exceed this fellow's anxiety to obtain customers; his whole powers seemed to be directed to the means of disposing of his wares. He no sooner arrived at a farm-house than he broached the subject nearest his heart—"Any thing wanted in my line to-day?" He entered into a most unqualified eulogium on their excellency; they were all unequalled in fineness; he could sell them for what might be said to be absolutely nothing; and as for lasting, why, to take his word for it, they would wear for ever. He chose the table where the light was most advantageous, proceeded immediately to undo the labyrinth of cord with which his goods were secured, and took the utmost pains to exhibit their whole glories to the eyes of the admiring rustics. If the farmer endeavoured to elicit from him some information concerning the state of the crops in the places where he had been travelling, he could only afford a brief and unsatisfactory answer, but was sure to tack to the tail of it the recommendation of some piece of west of England cloth which he held in his hand ready displayed. Nay, if the hospitality of the goodwife made him an offer of refreshment before he entered upon business, he most magnanimously, but unpeddler-like, resisted the tempta-

tion to eat, animated by the still stronger desire to sell. There was no possibility of withdrawing him for a moment from his darling topic. To the master he said, "Won't you buy a coat?"—to the mistress, "Won't you buy a shawl?"—to the servant girls, "Won't you buy a gown a-piece?" and he earnestly urged the cowherd to purchase a pair of garters, regardless of the notorious fact that the ragged urchin wore no stockings. But all his efforts were ineffectual; even his gaudiest ribbons could not melt the money out of a single female heart; and his vinegar aspect grew yet more meagre as he restored each article untouched to his package.

The rival of this unsuccessful solicitor of custom was a short, squat man, fair-haired and ruddy. He came in with a hearty salutation, and set down his pack in some corner, where, as he expressed himself, it might be "out of the way." He then immediately abandoned himself to the full current of conversation, and gave a detail of every particular of news that was within his knowledge. He could tell the farmer every thing that he desired to know—what number of corn-stacks appeared in the barn-yards wherever he had been, and what quantity of grain still remained uncut or in shock, and he took time to enumerate the whole distinctly. He was equally well prepared in other departments of intelligence, and so fascinating was his gossip, that when the duties of any member of the family called them out of hearing, they were apt to linger so long, that the goodwife declared he was "a perfect offput to a' wark." This, however, was not meant to make him abate of his talkative humour; and neither did he: the whole budget was emptied first, and he received in turn the narratives of all and sundry. Then came the proposal from some of those whom he had gratified with his news, to "look what was in the pack." The goods were accordingly lugged from their place of concealment, and every one's hand was ready to pick out some necessary or some coveted piece of merchandise. The master discovered that, as he would be needing a suit ere long, it was as well to take it now. The mistress was just waiting for Thomas coming round to supply herself with a variety of articles, "for," quoth she, "mony things are needit in a house." The servants exhorted each other to think whether they did not require something, for it was impossible to say when another opportunity of getting it might occur. The ellwand was forthwith put into diligent requisition, the scissors snipt a little bit of the selvage, and an adroit "scored" separated the various cloths from the rapidly diminishing webs. The corners of many chests gave up their carefully hoarded gains, with which cheap remnants were triumphantly secured. In the midst of this transfer of finery, the poor herd boy looked on with a countenance so woefully expressive of the fact that he had not a farthing to spend, that some one took compassion on him, and, having laid out a trifling sum, had the satisfaction of making him perfectly happy with the equivalent, flinging it into his unexpectant arms, and exclaiming, "Here, callant, there's something for you!" What a multiplicity of pleasing emotions had this trader the tact of calling into exercise, all of them redounding tenfold to his own proper advantage! It was impossible to say whether he cultivated his powers of talk from forethought, as knowing that they would produce a crisis favourable to his own interests, or if he indulged in them because gossiping was congenial to his own disposition. He had a sharp eye enough to what is called the main chance; but at the same time he did not possess that degree of intellectual depth, which we might expect to find in one who could calculate upon exciting the purchasing propensities by a method so

indirect. Most probably, therefore, his success in business was more the result of an accidental cast of mind than of wisdom preposse, or any aptitude beyond common for the arts of traffic, as considered by themselves.

Such, also, in most cases, is that talent which gets the name of "a fine turn for business." The possessor exerts his powers of pleasing, alike when engaged in the concerns of his profession, and in society when there is no object to serve but that of passing time agreeably. His engaging address is productive of commercial advantages, but it is not a thing acquired and brought into exercise solely for that end. Some people, no doubt, finding themselves to have a prepossessing manner, do employ it systematically to promote their views of business; but by far the greater number employ it because they have it, and without reference to the pecuniary profit that may accrue. The pecuniary profit, however, follows not the less as its consequence; and we have the satisfaction of seeing urbanity of manners almost uniformly rewarded by attaining to easy circumstances, while the man of a gruff unsocial humour has usually to maintain a hard struggle with fortune. The mere packing of knowledge into the heads of children is not the only thing required to ensure their future respectability and happiness—the qualities of the heart also demand the fostering care of the instructor; and since so much depends on their temper and behaviour to those around them, parents cannot be too assiduous in the cultivation of affability, the possession of which virtue is the grand secret that confers "a fine turn for business."

NATURAL HISTORY.

ANIMALS WITH A BACKBONE.

MAN is the most perfect of all vertebrated animals; from him down to the lowest fish, the brain is protected by a skull, and the spinal marrow is inclosed in a bony column, consisting of small bones articulated together, which is called the spine or backbone. The ribs are attached to the sides of the spine, as well as the bones of the legs and arms; there is no instance of their having more than four limbs. These are technically called the upper and lower extremities. Above the bones are built the muscles, or fleshy substance which gives action to them. The alimentary, or nourishing system of the body, is inclosed within the cavity of the ribs, and belly.

All animals with a backbone have a muscular heart; their blood is of a red colour; their mouth consists of two horizontal jaws. Organs are situated in their head, through which they enjoy what is called the senses; namely, seeing, hearing, smelling, and tasting.

By a knowledge of comparative anatomy, we are enabled to trace a similarity of the various parts of man through the whole animals which are provided with a backbone. Fishes are vertebrated animals, the most remote from man in their external structure. Yet comparative anatomists can trace in these, different series of bones, which correspond to or represent the bones of the arms, legs, hands, fingers, feet, and toes of man. The knowledge of these facts has tempted many philosophers to hazard the absurd opinion that man had his beginning in a minute animalcule, and has attained his present perfect condition from progressive improvement by reproduction. These opinions first originated with the ancients, from their want of knowledge of facts which are now universally established. It is not to be wondered at, therefore, that they should have been deceived into these views; but when we find, so late as the year 1773, that Lord Monboddo, a learned and philosophi-

cal senator of the Scottish College of Justice, should have adopted such opinions, we must feel surprise; and we learn with astonishment that even so late as the year 1803, one of the greatest scholars, and ablest medical man of his day, Dr Darwin, espoused these false doctrines. He says—

"Hence, without parent, by spontaneous birth,
Rise the first specks of animated earth;
From Nature's womb the plant or insect swims,
And buds, or breathes, with microscopic beings."

He is of opinion that life first commenced in the ocean. On this point he says—

"Organic life, beneath the shoreless waves,
Was born and nurs'd in Ocean's pearly caves;
First forms minute, unseen by spheric glass,
Move on the head, or pierce the watery mass;
These in domestic generations bloom,
New powers acquire, and larger limbs assume;
Whence countless groups of vegetation spring,
And breathing realms of fin, and feet, and wing.
Thus the tall oak, the giant of the wood,
Which bears Britannia's thunders on the flood;
The whale, unmeasured monster of the main,
The lordly lion, monarch of the plain;
The eagle soaring in the realms of air,
Whose eye, undazzled, drinks the solar glare;
Imperious man, who rules the bestial crowd,
Of language, reason, and reflection proud,
With brow erect, who seems this earthly sod,
And styles himself the image of his God;
Arise from rudiments of form and sense,
An embryon point, or microscopic ens!"

The acute anatomical knowledge of the Doctor, and his deeply sophisticated arguments, have a strong tendency to seduce the less philosophical reader into his baseless doctrines.

But views like these can never be entertained by healthy minds, and it requires but little reflection to dispel such absurd theories. Xenophon, who flourished 550 years before Christ, in his "*Treatise De Re Equestri*," describes Arabian horses exactly as they are found at the present day; and pedigrees are preserved of horses by the Arabs for upwards of five hundred years; and we have never heard of a horse becoming another animal. In short, this theory is too absurd to require a serious refutation.

There is a law in nature completely opposed to these doctrines, which is, that wild animals, of different species, while in a state of freedom, never commix; and thus the purity of their race is preserved in an unsullied and uninterrupted stream. In a state of domestication, man has so far changed the habits of some nearly allied species, as to induce them to propagate a spurious breed, but the produce are invariably mules; that is, they are barren, and incapable of continuing their kinds, with the exception of a few solitary instances; and these have never extended beyond the second generation, seldom living long, and always incapable of reproduction. But for this wise law, the world would become a scene of hideous monstrosity.

The organs of sense, in all animals with a backbone, consist in two eyes, two ears, two nostrils, the tongue, and all the muscles which cover the skeleton. The nervous system takes its rise in two masses situated in the cavity of the skull; the essential part is called the medullary substance or marrow; and anatomists have remarked, that its quantity is proportioned to the intellectual energy. The true nature of the marrow has not yet been ascertained. When minutely examined, it appears a soft matter, of a cream-coloured white, and seems to consist of innumerable infinitely minute globules. It appears itself to be devoid of motion; but from it are transmitted to the mind the impressions of the senses, whether in man or animals, and from the brain are conveyed the impulses of the will to the different muscles of the body.

The brain itself seems to be principally composed of marrow; and the spinal cord, or marrow, is the great stem leading from it, which conducts the numerous branches of the nerves through every part of the body. It is from the nerves we enjoy sensation or feeling.

The flesh, or what is termed the muscular fibre, is composed of many series of fleshy threads, whose distinctive property consists of contraction, arising either from the contact of an external body, or the agency of the will carried along the nerves.

The whole ingredients of the body are derived from the food which is taken into the stomach; this is termed the vegetative system. All the substances taken into the stomach are converted into fluids, of which the blood is the principal, and contains the general ingredients of the animal system. It is composed of carbon, or the essence of charcoal; hydrogen, or one of the constituent parts of which water is composed; oxygen the acid principle, another constituent of water; and azote or nitrogen, or that gas which has the quality of extinguishing flame. They are all combined with a substance called fibrin; gelatin, or jelly, and a compound substance named albumen; these combine to form constituent parts of the animal solids and fluids; there are, besides, phosphorus and lime, of which the bones are principally composed; also iron, and oily or fatty matter.

Hence it is evident that the fluids derived from food sustain and supply the waste of all the solid parts of the body, which are subject to perpetual change, from respiration, perspiration, and other causes.

The intestines, or what is termed the alimentary or intestinal canal, extends from the mouth to the opening of the rectum; and its length comprises various degrees of expansion, which anatomists have

designated by different names. The food, after it has been digested, is, in its passage through this alimentary canal, converted into a fluid substance, called chyle. This substance enters a series of vessels, or tubes, which have their opening into the large vessel called the thoracic duct, and are called the lymphatics, whose cavities are contracted at small and unequal distances; they are carried into the glands of the mesentery. In the words of the poet—

"The glands
All artful knots, of various hollow threads,
Which lymphducts, an art'ry, nerve, or vein,
Involv'd and closed together wound, contain."

Chyle is conveyed by these vessels to the heart, and it mixes with the mass of blood.

The blood, after having served the end of nourishment, is returned to the heart by the veins. This blood, for the purpose of restoring its arterial character, must pass, either wholly or in part, through the lungs, or organs of respiration, before it is conveyed by the arteries to the various parts of the body. In the three first classes of animals with a backbone, the lungs consist of a number of small cells, through which the external air passes as it is breathed.

The quantity of respiration, or breathing, depends on two causes: first, the relative portion of blood contained at every instant of time, in the breathing organ; and, secondly, the quantity of oxygen which enters into combination with the surrounding fluid.

The blood receives its red colour, in its passage through the lungs, by being exposed to the oxygen contained in the air, which is drawn into them while breathing.

In animals which suckle their young, the circulation is double, and is performed by means of their capacious lungs alone. The volume of their breathing is, consequently, greater than in reptiles, or fishes, whose organs of respiration are less.

Birds breathe in greater quantity than quadrupeds, in consequence of their double circulation and aerial respiration, with the addition of cavities, which penetrate through almost every part of their bodies.

Hence, in quadrupeds, which are designed for walking and running, the respiration is moderate. Birds which are lightly formed, and which require strength of muscle to support them in the air, have a greater degree or extent of respiration. Reptiles, which crawl along the earth, have more restricted powers of breathing; and fishes, which move through a fluid so much heavier than themselves, breathe by means of gills.

OF THE MAMMALIA, OR ANIMALS WHICH SUCKLE THEIR YOUNG.

These are placed at the top of every system, as possessing a superiority of structure, and a higher degree of intelligence. Their organs are more perfect, their faculties more numerous, and their sensations more delicate—thus entitling them to a higher rank in the scale of animal life.

They all produce their young in a living state, which are nourished after their birth by milk secreted within the breasts of the female; hence the name of the CLASS, from the Latin word *mamma*, a breast.

The animals of this class have but moderate powers of breathing, and are, with a few exceptions, only fitted for progressive motion on the earth, which, however, they can sustain for a great length of time. A few species, such as bats, can mount into the air by means of extensible membranes, in the form of wings. These are attached to their limbs, and are usually greatly lengthened. Animals of this construction may be considered as the connecting links betwixt the feathered tribe and quadrupeds. On the other hand, whales, and all that tribe of marine animals which breathe by lungs, seem to be the connecting links betwixt quadrupeds and fishes. These suckle their young in the same manner as quadrupeds. They are formed for moving in the water only, from the shortness of their limbs.

Most of the distinctions of the genera of quadrupeds are founded on the number and structure of their teeth, together with the size and shape of the bones of the skeleton. Man is the most perfect of organised beings; his skeleton contains all the bones of other animals. His teeth are of three kinds, namely, the incisory or cutting teeth, which are the four ceatre ones in both jaws; next to these on each side, are the four canine teeth, being one above and below in each jaw; all the other teeth are called the molars or grinders.

We would recommend to all who wish to have a thorough knowledge of the natural history of animals, to make themselves acquainted with the bones of the skeleton, and also of the several muscles which form the outer covering of the body.

Genus MAN.

Generic Character.—Man has eight incisory or cutting teeth, four above and four below; four canine teeth, one above and below, on each side of the cutting teeth; and twenty grinders or molars, five above and five below, further into the mouth than the other teeth; being in all thirty-two. The angle of his face varies in different nations.

MAN, who ranks at the head of created beings, consists but of one species. When he enters the world, he is a helpless and defenceless creature, and continues in a state of infancy longer than any other animal, and arrives at maturity from the years of twelve to twenty, according to the latitude in which the individual lives. Speech and reason, which place

man above all other creatures, are but germs, which do not ripen of themselves, but are evolved by the aid of culture and education. His instinct seems inferior to that of most other animals; for they possess internal impulses, peculiar to their kinds, by which they can provide for themselves almost immediately on entering the world, and in maturity are capable of forming habitations for their young, while man is entirely destitute of these instincts. The Almighty has, however, given him in their stead reason and reflection. He is also provided with a soul, by which he can give utterance to infinite modifications of articulate sounds; and thereby has constructed language, which enables him to communicate his ideas to his fellow-men. These qualities are possessed by every known race of mankind. Man, besides, differs from all other creatures in his upright gait, and in the admirable construction of his hands, which enable him to perform actions and to form instruments with much nicety. These, in connection with his intellectual qualities, have enabled him to make discoveries beyond the sphere of this earth.

The specific distinction betwixt man and all other animals consists in his upright posture, and in the bones of his legs and arms being so constructed that it is impossible for him to walk with ease on his four extremities. The length of the thigh bone would bring the knee in contact with the ground, and the short inflexible structure of his feet disqualify him for this sort of action. The arms, being so far separated from the central line and the articulations of the shoulder joints, together with their distance from each other, show that he could not support himself in a horizontal position. The muscles, which act as a binder betwixt the shoulders, are small in man compared to those of other animals; his head is heavier, and the bones and muscles of his neck are weaker, so that he could not possibly long support himself in this posture. In the quadruminous animals, or those having four hands, such as apes and monkeys, the arteries which supply the brain with blood are subdivided, while in man they are entire; and would, consequently, in the horizontal position, flow with such force and rapidity as soon to produce stupor. Man is the only true biped, his feet being exclusively formed for walking, and his hands for higher and more varied purposes. In one particular they differ widely from those of all other animals, namely, in the structure of the thumb, which, being entirely independent from the fingers in its action, gives a facility and power in grasping, greatly superior to the orang-outang or chimpanzee, whose structure approaches most nearly to that of man.

But what raises man far above every other creature, is his brain. Several of the inferior animals, as the elephant and whale, have larger brains in absolute size than man; various species of monkeys, and in the sparrow, canary, linnet, and redbreast, the brain is larger in proportion to the size of the body than in him. But man is distinguished from the inferior creatures by the possession of several cerebral parts, which are wanting in them. For example, in man there are several convolutions lying transversely in the upper region of the brain, under part of the parietal bones; and also a variety of convolutions in the anterior lobe, which do not present themselves in the brains of the inferior animals. These would appear to be connected with certain moral feelings and intellectual faculties which are denied to brutes.

Man, under all his varied modifications, is but of one species. Cuvier has reduced these changes to three distinct varieties, which, he considers, preserve uniformity of character; namely, the white, or Caucasian; the yellow, or Mongolian; and the negro, or Ethiopian. These, however, we conceive too limited, and agree with Blumenbach, that they may be divided into five races or varieties; namely, the Caucasian, Mongolian, Ethiopian, American, and Malayan.

For a more detailed account of the varieties of the human race, we beg to refer the reader to an article on that subject in Number 34, of the Journal.

ONE NIGHT IN ROME.*

DURING those extraordinary times when Nero waned in every species of atrocity, a young man, by name Agenor, was brought up in one of the provinces of Italy. He lost both his parents, and finding himself his own master, set out to visit Rome.

It was at dusk, after a fatiguing journey, when he first made his approach to that immense labyrinth of wonders and of crimes. Lights were seen scattered all over the city. The sound of chariot wheels, vociferations, and musical instruments, reached him before his entry, and soon after stunned him, in passing along the streets, where senators and women of rank, flamens, gladiators, knights, thieves, matrons, orators, and debauchees, were strolling together in companies, and conversing in a thousand different tones, of drunkenness, derision, kindness, resentment, vulgarity, and high breeding. In short, it was the festival of Cybele, the mother of the gods, and all Rome was in an uproar.

Our youth feels abashed in the metropolis. The number of countenances that wear a look of intelligence and penetration, without any stamp of moral goodness, dismays and confounds him. He falls into reveries upon the subject, and tries to conceive what

* From "Fragments and Fictions."

* Darwin's *Temple of Nature*, Canto I., line 247, &c.

† Ibid., line 293, &c.

style of manners would best protect him from ridicule in dealing with such men; or how he could endeavour to match their shrewdness, when it was accompanied by no respect for justice or truth.

In the meantime, a scuffle took place among some slaves. One of them was wounded, and retired among the pillars of a temple, where he lay down, without receiving the least notice or comfort from any passenger. Agenor went up to the spot and spoke to him. After inquiring into the nature of his hurt, he learned the name and abode of his master, who was a prætor, and whom he next went to seek, for the purpose of procuring assistance.

It was a magnificent house to which the slave had directed him. The master was out at supper, but his lady was giving an entertainment in his absence, and, ere long, came in person to learn what intelligence our youth had to communicate. She was a noble figure, had some beauty, with a gay look, and an eye full of a thousand meanings. While Agenor was telling his story, she regarded him attentively. Indeed his cheek had a fine bloom, and his locks were as rich and exuberant as what we now behold on the forehead of the charming Antinous. As for his manner, it implied the most unbroken simplicity, so that after giving orders for bringing home the wounded slave, she begged, in a matronly tone, that he would come up stairs, and partake of a repast along with some of her friends, "because," added she with a smile, "it is the festival of Cybele." Agenor complied.

There was a good deal of company in her saloon. Among others, a centurion, who did not appear so devout as Cornelius; an old senator, toothless and half blind; a Greek belonging to the theatre; several married women of the city; and a beautiful young girl, with dark eyes and modest lips, whose name was Phrosine, a niece of their absent host.

It was upon this young person that our hero's thoughts were principally fixed during supper: although the lady of the house never allowed much time to pass without asking him some question, or sending a smile to meet his eye as it wandered over the table; and although she presented him with a sweatmeat where there was a sprig of myrtle floating in the juice. Phrosine spoke little, but Agenor could observe she never missed any thing he said. This made him talk with animation, and gave his voice that sort of mellowness which quiets the female bosom into a delicious languor, while it penetrates to its very core. An easy gaiety prevailed throughout the company. The perfumes which were burned in the chamber, together with the occasional strains of music performed by attendants, operated in producing that luxurious indolence which is averse to any sort of contention. Every disagreeable thought was turned aside by some dexterous pleasantry. No altercation had time to occur before it was solved by a jest. The choicest wines of the prætor were circulated with a liberal hand; and the old senator, from time to time, poured forth unmeaning gallantries, without knowing exactly to whom they were addressed. Agenor began to perceive the beauty of nonsense, which is almost the only thing that can relax the vigilance of our self-love, and enable us to live harmoniously together.

In the meantime, a great deal of gossip took place among the married women. Nero's conduct was examined with freedom; but more as an object of ridicule than of detestation. The Greek enlarged upon some fine panthers then at the circus. The centurion drank assiduously, and lay in wait for any ambiguities of language that might happen to drop from the company. These he regularly followed up with such remarks as implied his adoption of their worst meaning; and he showed an expertness in this exercise, which long practice only could have taught him. Indeed, not one sentence escaped from the senator which he did not mould into some equivocal declaration or proposal. The reverend father himself had no suspicion of this, although shouts of laughter were constantly breaking forth among the male part of the company; and therefore he continued slowly bungling forward from one subject to another, while the long chasms between his ideas were filled up and garnished by the centurion at his own discretion. In those days an old senator was considered as the finest butt in the world.

When the party broke up, Agenor came near Phrosine, and said, for the pleasure of speaking to her, "How long does the festival of Cybele continue?" Any question will serve to accompany the looks of a lover. Phrosine replied, "Only two days more; but in that time you will see much of the nature of Rome;" and then added with a girlish ignorance of her own feelings, "What a pleasant companion that old senator is! I never spent a night so happily." "Nor I," said Agenor, who knew the reason better.

A servant was waiting at the door of the saloon. Agenor followed him; but instead of being shown down to the street as he expected, he was left in a solitary chamber, enriched with furniture and paintings of exquisite beauty. Here was an ivory couch, lined with purple; two Etruscan vases full of roses; and a Cupid of Parian marble, by one of the first sculptors in Greece. The paintings were all of an amorous description. Satyrs gambolled along the walls, and thoughtless nymphs were seen very much exposed among the dark recesses of an ancient forest. Agenor endeavoured to find out the meaning of his situation, but could not. Presently the prætor's wife entered.

She took his hand with much cordiality, and said, "My dear Agenor, pardon me for this detention. I cannot let you depart, without some advice concerning the perils of this bad city; for I perceive you are a stranger. Young men sometimes endeavour to get near the Emperor in public places, in order to see his person. Beware of doing so. It is impossible to say what might happen if you should attract his notice; for his power is absolute, and mischief is always in his thoughts. Do not associate with gladiators and charioteers, who seldom leave an obolus in the pockets of their companions; nor with Greeks, who are sad impostors. Again, your handsome person may chance to captivate some of our matrons, who love gallantry; but although they should smile on you from their windows, and beckon with a look of insinuation, do not stop to talk with them, otherwise you will get entangled in a thousand scrapes. You will be left in the lurch, while they go to intrigue with some other person. Avoid all this, and come often back to visit me," said the prætor's wife, laying her hand upon his shoulder: "Be assured I will prove as good a friend as can be met with in Rome."

Agenor was a good deal astonished. Perhaps he would have been at a loss what to say; but the prætor himself was that moment heard lumbering up stairs, and hemming at intervals, in a state of intoxication. His wife started up, and bade Agenor good night. She then opened a private passage down to the street, and gently pushed him out, saying, with a smile, "Farewell at present; come back to-morrow, and I shall introduce you to the prætor, who is a very worthy man."

When Agenor came away, the streets were still as crowded as ever, but afforded more examples of the debaucheries and vices of Rome. The town which Cato loved was now sadly altered. Every god and every virtue had left the place; and although their temples remained as beautiful as in better times, they were filled with scoffing instead of prayer. Agenor had lived as yet uncontaminated; and the conduct of the prætor's wife that night had not seduced him, because he thought of Phrosine. Phrosine's image engrossed his attention so much that he could scarcely find the house where he meant to sleep; and when he lay down, the fantastic dreams of youth continued hovering about his pillow.

Next morning he took a walk through the town. He viewed the public buildings, the places noted in history, the books of the Sybils, which he could not understand, and the charming productions of the fine arts, worth all the rest put together. Many a beautiful head, and many a voluptuous form of alabaster, awoke in him the softest feelings of delight; many a group of Bacchanals taught him a jovial indifference; and many a picture bore a motto from the songs of Horace, which told him that life is short, and that we should gather its roses while fate leaves them in our power. Xeno's philosophy had once been his pride; but a softness of heart now crept in upon him, and the feelings of the Stoics died away before other feelings, which rendered him a fitter inhabitant for modern Rome. In the morning he had scrupled about returning to the prætor's house, but now, he said, "I must go back to see Phrosine."

In the meantime, as it was yet early in the forenoon, he repaired to the circus, where he found the citizens already placed in thousands along its far-spreading benches, and some of them distinguished by very magnificent attire. The games began. Racers and combatants appeared on the vast arena. Trumpets were sounded. A number of tigers, newly brought from confinement, scattered the dust in their terrific gambols. Blood began to be shed, and acclamations to rise from the populace. The wild animals increased the noise in receiving their mortal stabs, and the gladiators fought and died with enthusiasm; for the sweet music of applause rung in their ears until they could not hear it any longer.

Agenor grew much interested in these fatal sports. Nevertheless, he fell sometimes into reveries about Phrosine; and in glancing his eye over the long rows of the circus, observed the prætor's wife, attended not only by her husband, who was a corpulent figure with a red nose, and a countenance full of good-natured sensuality, but also by some of the handsomest men in Rome.

Agenor thought there was no need of increasing the number. He therefore left the circus, and went to see if Phrosine had been left at home. Fortunately this was the case. He found her watering some plants in an open gallery, and removing such of their leaves as had withered by too powerful a sun. She recognised him with blushes of gladness; and after a short time, Agenor engaged in dressing the flowers along with her. These young people found this occupation a very pleasing one. Their smiles met every moment over hyacinths and myrtles; and their words were breathed in a low voice among exhalations of perfume. When Phrosine thought the jars were ill arranged, Agenor transposed them so as to produce a finer grouping of the blossoms; and when their pitcher of water was exhausted, this languishing boy and girl, who had already forgotten all conventional forms of behaviour, went, arm in arm, to the fountain down in the garden to get more. There, at a basin of marble, which foamed to the brim, they replenished their vessel. Some drops of the spray came dashing on Phrosine's white shoulders, and Agenor used the freedom to wipe them off with a corner of her gar-

ment. Phrosine submitted with a slight struggle; but all this took place in silence, for the feelings of the parties were by far too serious to suit with jests and compliments. Afterwards they leant for a long time, side by side, against the trunk of a chestnut. Their souls were lost in musing, and their eyes were fixed on the shadows of branches that played over the sunny ground before them. "Ah, how pleasing is a country life!" said Phrosine. "I sometimes wish that I could get leave to spend my time in Calabria, or Apulia, or some of those delightful provinces where the ground is covered with yellow sheaves, and where the days are so beautiful, that if a person merely walks about in the open air, it is enough to make him regardless of all other pleasures. I do not like the town, or its inhabitants. Our visitors are so cold-hearted, that I am treated as a child if I behave kindly to them. They laugh at any person who is simple enough to feel attachment even for themselves. Again, there is no peace or security in Rome; for every one is afraid of being cruelly insulted by the Emperor, or some of his favourites; and their brutality renders so many precautions necessary, that I am inclined more and more to envy the inhabitants of those distant provinces, who are out of its reach. Pray, from what province do you come?" "From no other than Calabria," replied Agenor. "I have a small farm there; but a country life is sometimes insipid, and I came to Rome from curiosity and desire of change. Ah, Phrosine! if I had not come to Rome, I should never have enjoyed the happiness of being near you; and, now, if I go back to Calabria, I shall not know what to do with my heart."

"Keep your heart with sufficient care," said Phrosine, blushing, "and it will give you no trouble. Those deep and lasting attachments which have been described by the poets, are no longer to be found in Rome. It is now the fashion to change rapidly from one object of admiration to another, and, indeed, never to allow the feelings to be seriously engaged at all. The example of Nero and his detestable court has annihilated every thing amiable, and left us nothing but selfishness, profligacy, and indifference."

"Then you must seek elsewhere," said Agenor, "for a heart which is worthy of you. Rome, as you describe it, can never be the theatre of your happiness."

"Oh! I could endure it well enough," said Phrosine, "provided I were agreeably situated at home. But the prætor's wife is jealous of the attention I receive from her visitors, and sometimes treats me with a degree of harshness which it is difficult to support. She is still fond of admiration, as you may observe, and imagines that I wish to encroach upon her share."

"There can be no doubt of it," replied Agenor.

"It is evident she wishes you out of her family." "But what is worse," said Phrosine, with tears in her eyes, and at the same time laying her hand upon his shoulder; "would you believe it, Agenor? I can hardly be sure that my own uncle, if circumstances should entice him, will not deliver me up to this monster who calls himself the Emperor. It seems he had observed me with particular attention somewhere in public, and has repeatedly inquired about me since. The prætor is at present in favour; but if he were to evade any of Nero's orders, there would at once be an end to his farther good fortune, and perhaps to his life."

"Then why, my beautiful Phrosine," said our youth, gently encircling her waist, "why do you remain here to endanger your uncle's life? Would it not be much wiser, and more consistent with your duty, to marry a poor husbandman who adores you, and set out for Calabria, where you will enjoy all the pleasures of a charming climate, and never hear of this wicked Emperor any more? Surely this proposal need only be stated, to make you at once perceive its propriety."

"Oh! but my aunt," said Phrosine, sobbing, in great agitation; "she would not approve of my conduct."

"Nor would you approve of hers, if you knew all the particulars of it," replied Agenor. "Wrap your veil about your head, and we shall get out by the garden door, which opens into some of the back lanes. A couple of mules can soon be purchased; and in a short time we will be far from Rome."

"Oh, no! it is impossible," said Phrosine; "I cannot go just now."

"Just now is the very best time," replied Agenor. "Every person is at present in the circus, where Nero performs as a charioteer; and neither the prætor nor his wife can return till the games are finished. Come along," said our youth, employing a little gentle violence.

"Oh, no! it is impossible," said Phrosine, weeping and struggling, and gradually allowing herself to be dragged away.

The moral of the story is, that a great deal may be done with young ladies, if they are taken by surprise.

ANECDOTE.

An English gentleman travelling in the north of Scotland, was told, when he came to Edinburgh, that he would not be able to understand the Aberdeenshire dialect, and was advised to take an Edinburgh servant as an interpreter, which he did; and upon his arrival at Lady F——'s, an old Scottish countess, he was desired by the hospitable lady, when seated at dinner, to "fa' lee, fa' lee and eat." Upon his application to the interpreter for an explanation, the servant said, "Hoot, man, her ladyship means, fa' tu eat, eat." "And pray what the devil," replied his master, "is fa' tu?"

IMPROVEMENTS IN THE HIGHLANDS.

THE improvement of the Highlands of Scotland, the change from barbarity and poverty to civilization and comparative comfort, have been almost magical, and cannot be too widely made known. The grand improvement of the district has been its intersection with roads, any one of which is as good as is to be found in the southern part of the island. Along these commodious ways, which have been constructed by parliamentary commissioners, and extend in length upwards of 900 miles, there are now suitable inns, affording good accommodation for travellers, both as regards lodgings, and the hire of horses, chaises, and gigs. Regular carriers of goods also travel in all directions, conveying intelligence, personal comforts, and luxuries, to the most remote regions. Formerly there were few or no carts used in agriculture; now they are numerous in every quarter, and serve to introduce the use of ploughs, and other cumbersome instruments of husbandry. As an instance of the improvement that has taken place in Ross-shire, now the most beautiful and highly cultivated county in the Highlands, it may be mentioned, that more wheat is now grown on certain farms than was produced in the whole shire thirty or forty years since. It was not until 1813 that the first barley mill, north of the Cromarty Firth, was erected; and it was not till 1821 that the first flour mill was established. To such an extent, however, has cultivation of late years been carried, that the growth of wheat alone is now estimated at 20,000 quarters annually. Among other exports may likewise be mentioned the produce of various extensive whisky distilleries, and a considerable quantity of salted pork, bacon, &c. A marked improvement is every where observable in domestic animals. Since the communication with the south has been opened up, considerable attention has been recently paid to the breed of horses, both for the purposes of agriculture and draught; and, in some instances, those of the finest description have been successfully reared. The improvements in many parts of Inverness-shire have been scarcely upon a less extensive scale than in the county of Ross, although the field for agricultural operations in that county is naturally more limited. In the county of Sutherland, the objects of the commissioners have been promoted in an extraordinary degree, by the liberal exertions of the Marquis of Stafford, and other heritors, who have effected a complete revolution in the state of that extensive district of the Highlands. Agriculture is there conducted on the most approved plans, and farm buildings, and other establishments of husbandry, have been erected on a scale equally extensive and complete as in the most improved parts of the kingdom. This is the more remarkable, as, not twenty years ago, nothing of the kind existed; and until that period the great body of the inhabitants were confined to the upper parts of the county, and had undergone little change from their primitive and uncultivated habits, living in huts of the most wretched description, and strangers to every species of industry or comfort. Latterly, however, crofts, or small portions of ground, were gradually allotted out for them near the coast, in such positions as were best calculated to employ their labour with advantage to themselves and to the country; and every encouragement was given for the improvement of the lands, and the erection of comfortable and suitable cottages, while the upper parts were converted into extensive farms for the rearing of cattle and sheep, to which they are naturally adapted, and in which way only they can prove valuable to the proprietors or to the community.

Certainly a more striking example of what roads do effect, and effect, too, in an extremely poor country, has rarely been seen than in Sutherlandshire; such a quick development of what natural wealth lay latent in such a country, is unexampled. From this wild and mountainous territory about 80,000 fleeces of wool and 20,000 Cheviot sheep are annually exported, besides a good many droves of well-fed cattle, and from 30,000 to 40,000 barrels of herrings and other fish. The effects of the different improvements are particularly exhibited in the usages of the people:—the pigs and cattle are treated to a separate table; the dunghill is turned to the outside of the house; the tartan tatters have given place to the produce of Huddersfield and Manchester, Glasgow and Paisley; the Gaelic to the English. Thanks to the exertions of the Scottish ecclesiastical establishment, under the immediate direction of the very Rev. Principal Baird of Edinburgh, few of the inhabitants, comparatively speaking, are now found who cannot both read and write—accomplishments yet unknown to thousands of individuals in England, who, perhaps, never think of the Highlands but as ignorant savages.

The various improvements in the Highlands have had the effect of raising the rental and value of property to a most remarkable degree. Estates which were lately let for L.70 or L.80, now bring about L.600. In 1790, a property on the Beaulieu Firth was sold for L.25,000, and in 1824 was again sold for L.135,000. Estates in the romantic district of Strathglass have risen, since 1785, from L.700 of rental, to be worth now upwards of L.5000. When Donald Macdonell of

Glengarry died in 1788, his yearly income did not exceed L.800; the same lands now yield from L.6000 to L.7000 a-year. But instances of this nature are so numerous that they need not be particularised. It will not be unimportant to remark, says the writer of a Report to Parliament, from which these details are extracted, that the formation of roads has also led to the advantageous establishment of great sheep and cattle fairs in the north. At Inverness, which has in various ways become the central point in Highland commerce, there is one of these markets at which an astonishing amount of business is now transacted. Thither all the sheep farmers resort from the remotest parts of the country, to meet the wool-dealers and manufacturers of the south. There, nearly the whole fleeces and sheep of the north of Scotland are generally sold, or contracted for in the way of consignment. At a recent yearly fair, upwards of 100,000 stones of wool, and 150,000 sheep, were thus disposed of.

BISSET, THE ANIMAL TEACHER.

FEW individuals have presented so striking an instance of patience and eccentricity as Bisset, the extraordinary teacher of animals. He was a native of Perth, and an industrious shoemaker, until the notion of teaching animals attracted his attention in the year 1759. Reading an account of a remarkable horse shown at St Germain's, curiosity led him to experiment on a horse and a dog, which he bought in London, and he succeeded in training these beyond all expectation. Two monkeys were the next pupils he took in hand, one of which he taught to dance and tumble on the rope, whilst the other held a candle in one paw for his companion, and with the other played the barrel organ. These antic animals he also instructed to play several fanciful tricks, such as drinking to the company, riding and tumbling on a horse's back, and going through several regular dances with a dog. Being a man of unwearied patience, three young cats were the next objects of his tuition. He taught those domestic tigers to strike their paws in such directions on the dulcimer, as to produce several regular tunes, having music-books before them, and squalling at the same time in different keys or tones, first, second, and third, by way of concert. He afterwards was induced to make a public exhibition of his animals, and the well known *Cats' Opera*, in which they performed, was advertised in the Haymarket Theatre. The horse, the dog, the monkeys, and the cats, went through their several parts with uncommon applause to crowded houses; and, in a few days, Bisset found himself possessed of nearly a thousand pounds, to reward his ingenuity and perseverance.

This success excited Bisset's desire to extend his dominion over other animals, including even the feathered kind. He procured a young leveret, and reared it to beat several marches on the drum, with its hind legs, until it became a good stout hare. He taught canary birds, linnets, and sparrows, to spell the name of any person in company, to distinguish the hour and minute of time, and perform many other surprising feats: he trained six turkey cocks to go through a regular country dance; but, in doing this, confessed he adopted the eastern method, by which camels are made to dance, by heating the floor. In the course of six months' teaching, he made a turtle fetch and carry like a dog; and having chalked the floor and blackened its claws, could direct it to trace out any given name in the company. He trained a dog and a cat to go through many amazing performances. His confidence even led him to try experiments on a goldfish, which he did not despair of making perfectly tractable. But, some time afterwards, a doubt having started to him, whether the obstinacy of a pig could be conquered, his usual patient fortitude was devoted to the experiment. He bought a black sucking pig, and trained it to lie under the stool at which he sat at work. At various intervals, during six or seven months, he tried in vain to bring the young boar to his purpose; and, despairing of every kind of success, he was on the point of giving it away, when it struck him to adopt a new mode of teaching; in consequence of which, in the course of sixteen months, he made an animal, supposed the most obstinate and perverse in the world, to become the most tractable. In August 1783, he once again turned itinerant, and took his learned pig to Dublin, where it was shown for two or three nights at Ranelagh's. It was not only under full command, but appeared as pliant and good natured as a spaniel. When the weather made it necessary that he should move into the city, he obtained the permission of the chief magistrate, and exhibited the pig in Dame Street. "It was seen," says the author of *Anthologia Hibernica*, "for two or three days by many persons of respectability, to spell, without any apparent direction, the names of those in the company; to cast up accounts, and to point out even the words thought of by persons present; to tell exactly the hour, minutes, and seconds; to point out the married, to kneel, and to make his obeisance to the company," &c. &c. Poor Bisset was thus in a fair way of "bringing his pig to a good market," when a man, whose insolence disgraced authority, broke into the rooms without any sort of

pretext, assaulted the unoffending man, and drew his sword to kill the swine, an animal that, in the practice of good breeding, was superior to his assailant. The injured Bisset pleaded in vain the permission that had been granted him; he was threatened to be dragged to prison. He was now constrained to return home, but the agitation of his mind threw him into a fit of illness, and he died, a few days after, at Chester, on his way to London.

THE HEADLESS CUMINS.

IN the parish of Edinkellie, a place towards the centre of Morayshire, in the northern part of Scotland, there is a romantic and fearful chasm, supposed to have been at one time the bed of the river Divie. It has two entrances at the upper end, and the ancient courses which led the river into these successively, are easily traceable. The lower extremity of the ravine terminates abruptly about forty feet high above the Divie, that flows at its base. This spot is one of a very interesting nature. Its name in Gaelic signifies "the Hollow of the Heads," a name originating, it is said, in the following transaction:—

Near the upper end of the ravine there is a curious cavern, formed of huge masses of fallen crags, that cover the bottom of the place. It enters downwards like a pit, and the mouth, which is no more than wide enough to admit a man, is not easily discovered. Here it was that the brave Allister Bane secreted himself after the battle of the Lost Standard. At this time the Castle of Dunphail was besieged by Randolph, Earl of Moray; and Allister Bane, who could no longer make head against him in the open field, contented himself with harassing the enemy. Knowing that his father and his garrison were reduced to great want, he and a few of his followers disguised themselves as countrymen, and, driving a parcel of horses yoked in rude sledges, laden with sacks, they came to the edge of the glen where Randolph's beleaguering party lay, and, pretending to be peasants carrying meal from the low country to the highlands, they entreated their protection from one Allister Bane, of whom they were afraid. Their prayer being granted, they unyoked their horses, and took care to leave their sledges at the brink of the precipice, so that, on a given signal agreed on with the garrison, they tumbled sledges, sacks, and all, over into the glen below, and the garrison, making a sally at the same time, each man bore off a sack on his back, whilst the pretended peasants sprang on their horses, and were out of sight before the astonished sentinels of the enemy had well given the alarm.

Randolph was so provoked on learning who the author of this trick was, that he set a price upon his head. A certain private pique led a Cummin to betray his master's lurking place. His enemies hurried to the spot to make sure of their game; but when they saw the small uncouth-looking aperture, they paused in a circle around it. One only could descend at a time, and the death of him who should attempt it was certain; for the red glare of the Cummin's eye in the obscurity within, and the flash of his dirk-blade, shewed that he had wound up his dauntless soul to die with the "courage" of the lion on his crest. They called on him to surrender at discretion. He replied by hurling a deep note of defiance from the dark womb of the rocks—"Let me but come out, and, with my back at that crag, I will live or die like a Cummin!" "No!" exclaimed the leader of his foes; "thou shalt die like a fox as thou art!" Brushwood was quickly piled over the hole, but no word of entreaty for mercy ascended from below. Heap after heap was set fire to, and crammed blazing down upon him. His struggles to force a way upwards were easily repelled by those above, and, after a sufficient quantity of burning matter had been thrust in to insure his suffocation, they rolled stones over the mouth of the hole.

When the cruel deed was done, and the hole opened, Allister Bane was found reclining in one corner, his head muffled in his plaid, and resting on the pommel of his sword, with two or three attendants around him, all dead. To make sure of them, their heads were cut off, and thrown, one after another, into the fortress, with this horrible taunt to the old man—"Your son provided you with meal, and we now send you flesh to eat with it." The veteran warrior recognised the fair head of his son. "It is a bitter morsel indeed," said he, as he took it up, kissed it, and wept over it; "but I will gnaw the last bone of it before I surrender."—From Sir T. Dick Lauder's *Account of the Moray Floods*.

WITTICISM OF KING JAMES.

THE following pleasant joke of the witty King James has seldom been in print. In his first journey to London, his Majesty was treated with a splendid entertainment by the mayor of an English town, whose liberality was such that he kept an open house, in honour of the new sovereign, for several days. Some of the English courtiers took occasion from this to hint, that such examples of munificence must be very rare among the civic dignitaries of a certain other kingdom. "Fient a bit o' that are they," cried King James; "the provost o' my burgh of Forfar, whilk is by nae means the largest town in Scotland, keeps open house a' the year round, and aye the mae that comes the welcomer!" The secret was, that the chief magistrate of Forfar kept an ale-house.

THE BRITISH IRON TRADE.

GREAT BRITAIN has been particularly fortunate in possessing inexhaustible mines of coal and iron—two natural products which give the country a prodigious superiority over the adjacent continental nations. By means of these valuable materials, and the skill of the inhabitants, we are able to export hardware goods and machinery of every description, on the most advantageous terms, to all parts of the world. From an early period the natives have enjoyed a high reputation for the manufacture of warlike weapons; and, what is justly esteemed a compliment to the people, it has more than once occurred that they have supplied fire-arms, bayonets, swords, and daggers, to the very nations with which they were at war: thus furnishing instruments for their own annoyance and destruction.

The iron trade of England is one of the chief staples in the country, and gives employment to a vast body of labourers and artisans. Every where our observation is attracted towards the combinations and results of this extensive branch of traffic, and we find that there is even less to create astonishment in the multitude and variety of the products, than in the exquisite perfection of the machinery employed—machinery seeming almost to usurp the functions of human intelligence. "No one, for instance," says a writer in the Quarterly Review, "can adequately comprehend the mighty agency of the steam-engine, who has not viewed the machinery of some of our mining districts, where it is employed on a scale of magnitude and power unequalled elsewhere. In Cornwall especially, steam-engines may be seen working with a thousand horse power, and capable (according to a usual mode of estimating their perfection as machinery) of raising nearly 50,000,000 pounds of water through the space of a foot, by the combustion of a single bushel of coals. No Englishman, especially if destined to public life, can fitly be ignorant of these great works and operations of art which are going on around him; and if time can be afforded in general education for Paris, Rome, and Florence, time is also fairly due to Manchester, Glasgow, Leeds, Birmingham, and Sheffield. Nor, speaking of the manufactures of England, can those be neglected which depend chiefly or exclusively on chemical processes. It may be conceded, that the French chemists have had their share in the suggestion of these processes; but the extent, variety, and success with which they have been brought into practical operation in England, far surpass the competition of any other country. These are, perhaps, from their nature and from their frequent need of secrecy, the least accessible of our manufactures to common observation; yet they, nevertheless, offer much that is attainable and valuable. Connected with our manufactures are the great works of the civil engineer, which cover every part of the kingdom; the canals, roads, docks, bridges, piers, &c.; works which attest more obviously than any other the activity, power, and resources of the country."

It was lately computed that about 700,000 tons of iron are annually made in Great Britain, a very large proportion of which are the produce of South Wales and Staffordshire. In Scotland, 36,500 tons were, at the same time, made. The chief consumption of this immense quantity of metal is in the island itself, there being little more than 100,000 tons exported. The value of that which was exported was, for British iron, £1,226,617, and for hardware and cutlery, £1,387,204.

The great seat of the iron manufacture in Scotland is at Carron, a place in Stirlingshire, situated on the north bank of the river Carron, about three miles from the south shore of the Firth of Forth, and a short way north of Falkirk. The Carron iron-works, which are reckoned one of the greatest wonders in North Britain, are the property of a chartered company, established in 1760. They are employed in smelting ores, and the manufacture of all kinds of cast iron goods, whether used in war or agriculture, domestic economy, or any other purpose. Cannon, mortars, howitzers, and carronades of every description, are here made in the greatest perfection. The carronade now used in warfare was first made at Carron, and hence assumed its name. Shot and bombshells of every sort and size are also made, and on a scale which rivals the manufactories of Germany and Russia. This large establishment is placed in the midst of a country, possessed of inexhaustible stores of the materials of its manufacture, and has every facility of export. Besides these qualifications, the country is rich in every species of produce, and able to support a dense population. Including those employed in the works, and those engaged in the mines and pits, with the individuals employed in the coasting and carrying trade, the whole will amount to between 2000 and 3000 persons, who subsist directly by the works. To a stranger, the approach to the establishment from the north, in a calm night, is striking and terrible, from the illumination of the atmosphere, which is seen at a great distance, the noise of the weighty hammers resounding upon the anvils, the groaning of blast machines, and the reflection of the flames in the reservoir which bounds the works on the north, as in a large mirror. The scene is much admired, and often resorted to, in "the calm summer even," even by the local inhabitants.

THE AURORA BOREALIS IN ORKNEY.

[We borrow the following short, but vividly descriptive article, from a volume entitled "Orcaian Sketches; Legendary and Lyrical Pieces, by David Vedder," Edinburgh, 1832. The volume appears to contain the first literary efforts of a strong, graphic, and poetical mind, and foreshadows, we are persuaded, better things to come.]

To the contemplative mind, which, enthusiastically fond of the sublime and beautiful, gazes on nature with the eye of a poet, and lists with rapture to the howling of the deep-toned winds—the moaning of the ocean—the never-ceasing murmur of a hundred mountain streamlets—the irresistible Atlantic rushing with inconceivable velocity into countless subterranean gios or helyers, with a noise louder than thunder, and anon receding with equal rapidity, few places are equal to the island of Hoy, in Orkney.

Towering over the neighbouring islands, like the fragment of some huge Gothic cathedral over the humble cottages of the peasantry, this insulated mountain may be seen from forty to sixty miles' distance, according to the state of the atmosphere, from every point of the compass, whilst its rocky base is deeply immersed in, and lashed by a tremendous

wilderness of waves
Where all the tribes of earth might sleep
In their uncrowded graves!

But the freshness of spring, the glories of summer, the sere and yellow leaves of autumn, and the vapours, clouds, and storms of winter, dwindle into insignificance when compared with certain celestial phenomena which very frequently occur in these wild regions during the winter months.

Let the reader imagine himself standing alone in the midst of such desolate scenery, surveying the azure vault of heaven, bespangled with stars innumerable, whose scintillating rays converge and blend, apparently throwing a gossamer veil of silver over the blue expanse.

Let him turn his eyes northward, and what must be his feelings, when, in a moment, in the twinkling of an eye, ten thousand rainbows rush into a glorious existence, and fill the celestial arch with their radiance, shifting their positions with the velocity of a sunbeam, blending into a circular halo round the concave of heaven, mounting to the zenith like squadrons of cherubim, diving into the profound like bright but fallen spirits, and vanishing with the speed of thought, leaving the stars and planets glowing in tranquil sublimity, and the spectator, if he possesses a particle of the *vidua vis animi*, entranced with the recollection of the glories by which he had been surrounded? Again and again, in my school days, have such visions of celestial grandeur floated before my delighted eyes, and many a chilly hour have I passed amidst the rigour of a hyperborean winter night, watching the progress, the advance, the retreat, the *melee*, and the final extermination of these celestial armies; and I do aver, that no object in nature can illustrate the wars of the

Thrones and dominions, potentates and powers, of Milton, half so well as the splendid sight which I have been attempting to describe.

It is rather humiliating to human nature when I observe, that the majority of the peasantry regard this beautiful phenomenon with frozen apathy.—Though its splendours are beyond the power of pen to delineate, though its glories, on particular occasions, are absolutely overpowering, yet I have frequently mingled in the groups, made one in their parties, and never heard an impassioned exclamation escape a single individual of them, though the aurora borealis was flickering and flaming, and glowing, nay, actually hissing, as if in scorn of the frigid feelings of those who were so happy as to witness the jousts and tournaments of these aerial revellers.

THE SACRED HISTORY OF THE WORLD.

A WORK with this title, written by Sharon Turner, and published, in an octavo volume, by Longman and Company, London, has recently made its appearance, and we feel bound to state, that a more valuable production could not be brought under the perusal of families requiring instruction on the great topics treated of in its pages. The creation of the world, as narrated to us in the most ancient history and book now existing, and which has been universally venerated in the Christian world for its truth and its origin, from the commencement of the Christian faith, is naturally the first subject of investigation to this erudite author, while the opinions he expresses throughout seem of the soundest description. The following observations on the origin of the earth which we inhabit, and the universe of which our globe forms but a mere unit, as well as on the nature of the Being who created and sustains the whole, will be perused with edification by our young readers.

"Our globe consists of its earthly structure—of the ethereal fluids which move upon it and above it—of the watery masses and effusions of the vegetable kingdom—and of the animated races. It is subjected to the potent and varied agencies of the sun and moon. It rolls, with undisputed and unsupported freedom, through a boundless space; and it is connected by immediate relations with the planets of our system; more remotely with the splendid stars, whose

nature and numbers we have not yet ascertained; and occasionally, at intervals, some of which are recurrent, with the rapidly-moving comets. These rush suddenly and unexpectedly, for the most part, into our visible heavens, by laws and for purposes yet unknown; rather advertising us of their existence, and amazing us by their appearance, than exercising any perceptible effect or imparting any knowledge of their composition, of the causes of their journey, or of the places from which they come, and to which they so mysteriously depart. In this grand system of existence, man is the most intelligent being that is visible to our material sense; and we have as yet no decisive evidence that any thing, below the Creator, will be ultimately his superior.—The sacred history of the world is built on the grand truth expressed in the first verse of the Pentateuch:—

'In the beginning, God (*Elohim*) created the heavens and the earth.'

This is the foundation of all religion, whether popular or philosophical. The intellectual world possesses an invaluable treasure in this simple, but emphatic, information. It deserves the epithet invaluable, because it is a fact which could be certainly known to us only from revelation, as no human eye could have witnessed the event; and because the greatest minds of antiquity were in doubt and darkness, and in opposition to each other, on this subject, as we should still be, if the book of Genesis had not descended to us. Instead of deriving the world from God, it was more common among the classical nations to derive their gods from the world. Hesiod, as well as Epicurus, makes his divinities to be an order of beings springing out of the material universe. Several Pagan nations, even in our own times, thus account for their existence. Few have thought the Deity to be the Creator of the earth or of the heavens; and the mind had become so confused on this point, that it was more generally supposed, that either these were eternally what they are, or that they were united into what we see them to be, by a fortuitous concourse of self-moving atoms. Such ideas were highly patronized in ancient times; and until the prevalence of Christianity diffused the knowledge and authenticity of the Mosaic record as to the origin of things, nothing was positively known or rationally believed about it. The more we investigate the conflicting and chimerical opinions of mankind on this great topic, the more we shall appreciate the first chapter of Genesis. On no subject of its thought has the human mind been more fantastic, than in its suppositions on the origin of the gods whom it chose to worship, and of the material world in which it was residing. Revelation has banished these, by giving to us the desirable certainty.

The theory, that the component atoms or particles of things could have moved themselves into the beautiful forms and scientific arrangements and motions of visible nature, was felt to be incredible by some of the finest minds of antiquity, and finds no patronage now from the true philosopher. Design, contriving thought, the adaptation of things to each other, and the skilful production of important ends by the application and co-operation of the fittest means, are so manifest in the structure of the earth, in the formations of the animal and vegetable kingdoms, and in all the astronomical phenomena, that no judicious inquirer will attempt to support the Lucretian reveries. The more favoured opinion of some, who desire to remove the Creator from the material universe, is the arbitrary assumption, that the system and course of things which we admire, has had no origin at all, but has been eternally what we see it to be. This is no new conception of the human mind, but it is that to which those who are adverse to religion, and who discredit revelation, seem to be now most inclined to adopt. For this reason, it may be useful to suggest an observation, which seems to prove it to be an impossible hypothesis.

If the material world had been one uniform homogeneous mass, its eternal existence would have been always a possibility. It would then not have contained any evidence in itself to contradict the supposition. But the actual fact is, that all visible nature is a multifarious association of very compounded substances. Nothing is simple—nothing is uncompounded. Every thing we see, feel, or handle, is a composition, a mixture or union of more particles or of more elements than one. Not merely the grosser earthly bodies are so, but even the water, the air, and the light, are in this compounded state. Now, it is impossible that any compound can have been eternally a compound. Composition and eternity are as incompatible, as to be and not to be. The particles of which compounds consist, must have been in some other state before they were compounded together. The single condition of the elements must have preceded their union in the composition; and thus it is physically impossible that a compound can have been eternal. The schoolboy perceives at once that his plum-cake cannot have been eternal. The plums, the flour, the butter, the eggs, and the sugar, of which it is composed, must have been in some other places and state, before they were brought together to make the substance which gratifies him. So the mighty world we live on, the rocks, the mountains, the minerals—so every substance around us, animate and inanimate—cannot have been eternal, because every one is a combination of numerous particles, usually very heterogeneous, and the primary elements of each must have been in their elementary state, and in some other position, before they moved and joined into their compound one.

The process of creation, in the primitive construction of our earthly fabric, has not been detailed by the Hebrew legislator. He mentions no more of its massive composition than this short sentence:—

'The earth was without form, and void; and darkness was upon the face of the deep. And the Spirit of Elohim moved upon the face of the waters.'

'The earth was without form.' It had therefore to be put into form. Its material substance had been created, but had not been arranged into any specific formation. It was also 'void;' it was therefore empty; vacant of all that now adorns its surface, or that was afterwards made within it. It had to receive and to be replenished, both internally and externally, with all those additional and organized things and beings, or more specific metals and minerals, which were intended to be within it and upon it. As 'darkness was upon the face of the deep,' there was in its primeval state a deeper abyss—a vast obscure concavity; and as 'the Spirit of God moved upon the face of the waters,' its surface must have been covered with the aqueous fluid. Thus the first state of our earth which is noticed to us after the general creation, is that of a dark mass, unformed and void, with an abyss within, and whose surface was covered with moving waters, but on which the Divine Spirit was operating. The effects of this operation are not stated, but we may presume them to have been to produce those formative arrangements which constitute its present structure—its great masses of rocks and strata—its geological system and construction.

At this point of time, when its specific composition was taking place, the Divine command was issued for the appearance of the luminous fluid. The introduction of this grand agent of the creative process is mentioned with that sublimity of diction which arises from the emphatic conciseness of imperative dignity:—

'And Elohim said, "Licht! be," and light was.'

It came instantaneously, pouring on and pervading the terrestrial mass; and the operations of this beautiful element, whose penetrating, universal, and marvellous agencies are yet so little understood, fulfilled its author's wishes:—

'Elohim saw the light, that it was good.'

The next act of the Deity was to make a boundary, or division, between the effect of the visible presence or action of light, and that darkness which arises from its latent state or disappearance; calling the duration of our luminous sense of it 'day,' and the time of its absence 'night.' Their succession was made to constitute that portion of time which we designate by a natural day. 'The evening and the morning were the first day.' Our earthly day is that space of time in which our globe turns once completely round. This section of time, which we subdivide into twenty-four parts, or hours, does not depend upon the sun, nor arise from it. As it is only an entire rotation of the earth, it could occur as well without a solar orb as with one.

The annual circuit, or a year, which is the completed orbit of the earth round this luminary, could not take place without a sun; but a day requires the existence and revolving motion of the earth alone. This is mentioned by Moses as beginning before the sun was made the centre of our astronomical system. As this fact denotes the diurnal movement to be distinct from the sun, and independent of it, it is another instance of the correctness of the Mosaic account. The first rotation of the earth round its own axis made the interval of the first day, and each subsequent revolution constituted the several days which succeeded. Our planet might cease to turn round in this diurnal continuity, and might yet circle round the sun in its yearly course. The moon moves in this way about our earth; for it has no rotatory motion. The cause of our earth's revolving round its axis is quite distinct from the double and mutually counter-acting forces which produce its annual orbit. Physics have not discovered, nor can rational conjecture assign any reason for the diurnal rotation, except the commanding will and exerted power of the Divine Creator. Nor is it a mere revolution alone which makes our day; but it is a revolution with that particular, chosen, specifically assigned, and limited and yet marvellous velocity, in which this movement is and ever has been performed. To occupy that portion of time which composes our day, it must move precisely, and with constant and undeviating exactness, at the rate of about 1000 miles an hour, or above 16 miles every minute; a stupendous celerity for a massy globe nearly 8000 miles in diameter! A greater velocity would make our day so much the shorter; a slower progress would as much prolong it. But this revolving force has been continued and has acted for nearly 6000 years with a precision which has never varied. In all the ages of which history has preserved any memorial, the natural day has always exhibited every where the uniform duration; a proof that the rolling power which actuates it has never undergone any alteration or diminution, but has still the same measured and governed proportion or agency with which it was first attached to our terrestrial habitation.

When sufficiently arranged and consolidated, our earth was placed, with the planets, at those immensely distant points and scientifically calculated intervals, both from each other and from the sun, which would accomplish the purposes to be fulfilled in each. A mighty impulse was then added to each, apparently differing in amount, which, if it had been unchecked,

would have propelled them through the endless expansion of the universe; but an attractive force was at the same time attached to the sun, which drew them, by a mysterious gravitating tendency, down to his centre. A marvellous adaptation was then skillfully and most exactly settled between these counter-acting forces, and according to their individual diversities; by which, while the attraction of gravitation was made by an invariable law to be ever equal to the masses of each planet, the centrifugal or projectile impulsion, precisely proportioned in every one to that attraction, was given to each planet: so that in no one it should exceed the solar attraction, and yet that it should be always sufficient to prevent that commanding power from pulling any one out of its appointed orbit down to the absorbing centre. On this nicely balanced adjustment of two most mighty and ever struggling and opposing forces, all the movements of our planetary system are daily proceeding, ever on the verge of the most destructive danger, by either energy mastering the other; and yet such a powerful and vigilant superintendence is constantly governing both, that this perilous contest has continued nearly 6000 years without the balance varying in the slightest degree. The most scientific harmony continues to regulate them with unabated constancy and unrelaxing exactitude—ceaseless battle with as unceasing equalization of force and energy; the most marvellous activity with the most steady maintenance of undeviating order. Nothing but the Divine wisdom could have composed such a finely-balanced system of tremendous forces; nothing but the Divine power could command them, or perpetuate their indispensable equality; and nothing but the Divine will can dissolve what it is upholding. We may again repeat, and on high human authority, that it is impossible that this can be the meaningless result of unmeaning chance; for it is La Place who has said, 'One of the most remarkable phenomena of the solar system is the rigorous equality which is observed to subsist between the angular motions of rotation and revolution of each satellite. It is INFINITY TO UNITY that this is not the effect of hazard.'

YANKEE COURTSHIP.

AFTER my sleigh-ride last winter, and the slippery trick I was served by Patty Bean, nobody would suspect me of hankering after the women again in a hurry. To hear me jump and swear, and rail out against the whole feminine gender, you would have taken it for granted that I should never so much as look at one of them again to all eternity. O, but I was wicked. Tear out their eyes, says I; blame their skins; and torment their hearts. Finally, I took an oath, that if I ever meddled or had any thing to do with them again, I might be hung and choked.

But swearing off from women, and then going into a meeting-house choke-full of gals, all shining and glistening in their Sunday clothes and clean faces, is like swearing off from liquor and going into a grog-shop—it's all smoke.

I held out, and kept firm to my oath for three whole Sundays—forenoons, afternoons, and intermissions complete. On the fourth, there were strong symptoms of a change of weather. A chap about my size was seen on the way to the meeting-house, with a new patent hat on; his head hung by the ears upon a shirt collar; his cravat had a pudding in it, and branched out in front into a double-bow knot. He carried a straight back and a stiff neck, as a man ought to do when he has his best clothes on; and every time he spit, he sprang his body forward like a jack-knife, in order to shoot clear of the ruffles.

Squire Jones's pew is next but two to mine, and when I stand up to prayers, and take my coat-tail under my arm, and turn my back to the minister, I naturally look right straight at Sally Jones. Now, Sally has got a face not to be grinned at in a fog. Indeed, as regards beauty, some folks think she can pull an even yoke with Patty Bean. For my part, I think there is not much boot between them. Any how, they are so nigh matched that they have hated and despised each other, like rank poison, ever since they were school girls.

Squire Jones had got his evening fire on, and set himself down to reading the great Bible, when he heard a rap at his door. "Walk in. Well, John, how der do? Get out, Pompey." "Pretty well, I thank ye, Squire, and how do you do?" "Why, so as to be crawling—ye ugly beast, will ye hold yer yop? Haul up a chair, and sit down, John."

"How do you do, Mrs Jones?"—"O, middlin'; how's yer marm? Don't forget the mat there, Mr Beedle." This put me in mind that I had been off soundings several times, in the long muddy lane; and my boots were in a sweet pickle.

It was now old Captain Jones's turn, the grandfather. Being roused from a doze, by the bustle and racket, he opened both his eyes, at first with wonder and astonishment. At last he began to halloo so loud that you might hear him a mile; for he takes it for granted that every body is just exactly as deaf as he is.

"Who is it? I say, who in the world is it?" Mrs Jones, going close to his ear, screamed out, "It's Johnny Beedle."—"Ho, Johnny Beedle, I remember he was one summer at the siege of Boston."—"No, no, father, bless your heart, that was his grandfather, that's been dead and gone this twenty

year."—"Ho; but where does he come from?"—"Daown taown."—"And what does he follow for a livin'?" And he did not stop asking questions, after this sort, till all the particulars of the Beedle family were published and proclaimed in Mrs Jones's last scream. He then sunk back into his doze again.

The dog stretched himself before one handiron; the cat crouched down upon the other. Silence came on by degrees like a calm snow storm, till nothing was heard but a cricket under the hearth, keeping tune with a sappy yellow-birch forestick. Sally sat up prim, as if she were pinned to the chair-back—her hands crossed genteelly upon her lap, and her eyes looking straight into the fire. Mammy Jones tried to straighten herself too, and laid her hands across in her lap; but they would not lie still. It was full twenty-four hours since they had done any work, and they were out of patience with keeping Sunday. Do what she would to keep them quiet, they would bounce up now and then, and go through the motions, in spite of the fourth commandment. For my part, I sat looking very much like a fool. The more I tried to say something, the more my tongue stuck fast. I put my right leg over the left, and said, "hem." Then I changed, and put the left over the right. It was no use—the silence kept coming on thicker and thicker. The drops of sweat began to crawl all over me. I got my eye upon my hat, hanging on a peg, on the road to the door—and then I eyed the door. At this moment, the old captain all at once sung out, "Johnny Beedle!" It sounded like a clap of thunder, and I started right up on an end.

"Johnny Beedle, you'll never handle sich a drumstick as your father did, if yer live to the age of Methusalem. He would toss up his drumstick, and while it was whirlin' in the air, take off a gill er rum, and then ketch it as it come down, without losin' a stroke in the tune. What d'y'e think of that, ha? But skull your chair round, close er long side o' me, so yer can hear. Now, what have you come a'ter?" "I a'ter? O, jest takin' a walk." "Pleasant walkin', I guess." "I mean, jest to see how you all do." "Ho!—That's another lie. You'd've come a-courtin', Johnny Beedle—you're a'ter our Sal. Say, now, d'y'e want to marry, or only to court?"

This was what I call a choker. Poor Sally made but one jump, and landed in the middle of the kitchen; and then she skulked in the dark corner, till the old man, after laughing himself into a whooping-cough, was put to bed.

Then came apples and cider; and, the ice being broke, plenty chat with Mammy Jones, about the minister and the "sarmon." I agreed with her to a nicety upon all the points of doctrine; but I had forgot the text, and all the heads of the discourse but six. Then she teased and tormented me to tell who I accounted the best singer in the gallery that day. But, mum—there was no getting that out of me. "Praise to the face is often disgrace," says I, throwing a sly squint at Sally.

At last, Mrs Jones lighted t'other candle; and, after charging Sally to look well to the fire, she led the way to bed, and the Squire gathered up his shoes and stockings, and followed.

Sally and I were left sitting a good yard apart, honest measure. For fear of getting tongue-tied again, I set right in with a steady stream of talk. I told her all the particulars about the weather that was past, and also some pretty 'cute guesses at what it was likely to be in future. At first I gave a hitch up with my chair at every full stop. Then, growing saucy, I repeated it at every comma and semicolon; and at last it was hitch, hitch, hitch, and I planted myself fast by the side of her.

"I vow, Sally, you looked so plaguy handsome to-day that I wanted to eat you up." "Pshaw, git along you," says she. My hand had crept along, somehow, upon its fingers, and began to scrape acquaintance with hers. She sent it home again with a desperate jerk. "Try it agin"—no better luck. "Why, Miss Jones, you're gettin' upstropulous—a little old maidish, I guess." "Hands off is fair play, Mr Beedle."

It is a good sign to find a girl sulky. I knew where the shoe pinched. It was that are Patty Bean business. So I went to work to persuade her that I had never had any notion after Patty, and to prove it I fell to running her down at a great rate. Sally could not help chiming in with me, and I rather guess Miss Patty suffered a few. I now not only got hold of her hand without opposition, but managed to slip an arm round her waist. But there was no satisfying me—so I must go to poking out my lips after a buss. I guess I rued it. She fetched me a slap in the face that made me see stars, and my ears rung like a brass kettle for a quarter of an hour. I was forced to laugh at the joke, though out of the wrong side of my mouth, which gave my face something the look of a gridiron.

The battle now began in the regular way. "Ah, Sally, give me a kiss, and have done with it." "No. I won't, so there, nor tech to." "I'll take it, whether or no." "Do it, if you dare." And at it we went, rough and tumble. An odd destruction of starch now commenced. The bow of my cravat was squat up in half a shake. At the next bout, smash went shirt collar, and, at the same time, some of the head fastenings gave way, and down came Sally's hair in a flood, like a mill-dam broke loose, carrying away half a dozen combs. One dig of Sally's elbow, and my blooming ruffles wited down to a dishcloth. But she had no

time to boast. Soon her neck tackling began to shiver; it parted at the throat, and whorah, came a whole school of blue and white beads scampering and running races every which way about the floor.

By the hokey, if Sally Jones isn't real grit, there's no snakes. She fought fair, however, I must own, and neither tried to bite or scratch; and when she could fight no longer, for want of breath, she yielded handsomely.

The upshot of the matter is, I fell in love with Sally Jones head over ears. Every Sunday night, rain or shine, finds me rapping at Squire Jones's door, and twenty times have I been within a hair's breadth of popping the question. But now I have made a final resolve; and if I live till next Sunday night, and I don't get choked in the trial, Sally Jones will hear thunder!

[This humorous specimen of the off-hand style of a New-England, originally appeared in one of the newspapers under the signature Y. Y.]

LIFE IN INDIA.

Young men who enter the Indian army as cadets are peculiarly situated. They at once join regiments composed of foreigners, to whose language and habits they are entire strangers; who form a class of men remarkable for superstitious attention to habits, and bigoted attachment to the manners and religious ceremonies of their ancestors. Among these people the European officer is probably destined to pass the greater part of his life; and one of the first objects of his duty, as regards himself individually, as well as the men to be placed under his command, must be to acquire their language, and to become familiar with their customs.

Indian cadets are usually like yourself, youths from sixteen to eighteen years of age, who have seen very little of the world, and know nothing beyond what they have acquired at the schools in which they have been educated. It is not surprising, therefore, to find, that on their first arrival they are struck with astonishment at all they see, nor that they should at first dislike, and become even disgusted with, the habits of nations so essentially different from their own. In addition to these circumstances, there is another feeling, which, in India, tends to create a contempt towards the natives, and, however absurd the notion, it is, nevertheless, true, that their dark complexions convey to the mind of a European a sensation of inferiority. It is a well known fact that most of the barbarous nations in the universe, and the savages found on the several islands discovered by modern navigators, are dark, and that the unhappy and debased slaves conveyed from the western coast of Africa are also black. From this circumstance, which renders them the objects of commiseration, probably arises the contempt we feel for men of that colour, and which leads us to consider them as a degraded race, whose minds are incapable of energy, or of the nobler passions of mankind. This prejudice, so commonly prevalent among Europeans towards all dark men, makes us too apt to identify fairness of complexion with intellectual powers and civilization, and to associate with the term "black man," the idea of barbarism and brutality.

These notions are usually brought to India by every cadet, and they frequently receive confirmation by an association with the officers of the ship, who see and know little of the natives of India in general. Their intercourse is confined to those interested and mercenary individuals abounding at sea-ports in every part of the world, and who, feeding on the necessities and ignorance of seafaring men, make unfavourable impressions on their minds of the whole nation. Yet it would not be more unfair in a foreigner to judge of the whole English people by the casual communication he maintains with the boatmen, and others concerned in clearing ships at Liverpool, Blackwall, or Portsmouth, than to draw unfavourable conclusions of the Hindoo race from the specimens which an Englishman sees of the natives of Calcutta, Madras, or Bombay. There is, however, an additional reason why a person arriving from on shipboard should, on his first landing in this country, be more shocked with every strange object he sees, than a traveller would in Europe. In the latter case, although he meets with great varieties of dress, of modes of worship, and of manners, yet there is a general similarity to what he has always been accustomed. For instance, though the costumes in Europe vary, still there is no absolute nakedness, such as strikes every person on arriving in India. This is observable at Madras in particular, where, with the exception of a small stripe of linen round his girdle, and a sharp-pointed skull-cap, made of leaves, fitting the head, the men in the canoes are absolutely naked. To a European the sight is hardly human, to see a black animal kneeling on three bits of wood, connected only with the fibres of the cocoanut, paddling away, alone, several miles from land. Yet, strange to say, these men, on their rude skiffs, pass through a tremendous surf on the coast, into which no English seaman or English boat dares venture. The natives, however, fearlessly attend the country boats, filled frequently with European passengers, in order to save their lives; and they encounter, night and day, not only the risk of drowning, but the more serious chance of being carried away by sharks, to which animals many of them frequently fall victims. As rewards for their services, however, we see these naked Indians adorned with medals, presented by government for their brave exertions in

saving the lives of shipwrecked persons, of which they are justly as proud as any military and naval heroes who may have fought for their king and country.

In Europe, the climate every where requires that the human body should be clothed, which is by no means necessary in India. Religion, too, though it assumes various forms among the numerous sects of Protestants, Roman Catholics, &c., and the disciples of the Greek church, still none of these differences shock us by their extravagances. We have, in some degree, become familiar with them by our education; and, in the course of passing from one country to another, a traveller in Europe becomes gradually introduced to the novelties which occur on his journey. With regard to customs, too, though in some respects different, yet there is a general similarity preserved throughout the European and Christian nations. The same habit every where prevails of saluting by uncovering the head; of sitting on chairs and couches; of entering houses, and even palaces, with shoes; of eating all sorts of flesh, fish, and fowl, and of using knives, forks, and spoons at our meals. All these customs are so common, and so universal with us, that when we find the whole of them neglected, we are naturally disposed to think such a people sunk into the lowest state of barbarism. Our surprise is not less than that of an Indian chief, who one day asked me if we had abundant rice crops in England; but was surprised to hear that neither rice, nor any other of the Indian grains, wheat excepted, grew in England. You will be equally astonished, no doubt, to learn that a great part of a population of a hundred millions of inhabitants, exists, for the most part, without eating wheaten bread, flesh, fish, or fowl, or drinking fermented liquors of any sort. Both the Indian and the European would very naturally ask of each other, "Then what is it you do subsist on?"

What, then, must be the feelings of a person landing fresh from London, without having witnessed any intermediate state of society between the height of European civilization in the finest city in the universe, and that to which he is so suddenly brought!

All the several shades of similarity which exist in European society, are lost in this hemisphere.

The climate, as I have already observed, requires the natives to use very little clothing, and the labouring classes, consequently, hardly use any. The middling and upper classes, instead of being clad in close broadcloth garments, are habited in long flowing linen robes, giving them, in our eyes, an air of effeminacy. The men shave their heads, both for cleanliness and comfort, and use cotton turbans of various colours, instead of hats. These it is rude to take off on any pretence; so that what we do out of courtesy, must to them appear ill-bred. The women have their heads uncovered, and wear their hair after the fashion of the Greeks. The eyelids of the Mahomedans are tinged with antimony, to give the eyes brilliancy; the complexions of the Hindoos are not unfrequently dyed yellow with saffron; and the teeth of the Mahomedan females are stained black as ebony after they marry.

The dryness and the heat of the climate render it unnecessary to use chairs or couches, as in Europe. The floors of the rooms of the upper classes are covered with carpets, brocades, or fine linens. Upon these they sit, eat, and lie down; hence the custom throughout the East of taking off the shoes before entering on them, which, soiled by the dirt of the streets, would not only injure the furniture, but also pollute the linen garments in which they are clad. The custom of removing the shoes from off the feet, on coming into houses and temples, and on approaching superiors, is very ancient; and a stronger proof of the fact need not be adduced, than by consulting the third chapter of Exodus, when God commands Moses "to put off his shoes, for he stands on holy ground;" and yet, till we become accustomed to this habit, it is extremely repugnant to our feelings to see men walking about our houses with naked feet; and it is the more extraordinary, that we know it is done purely out of respect.

—Briggs' Letters to a Young Person in India.

LIFE AND TRAVELS OF JOHN LEDYARD.

LEDYARD was an American. He was first designed for the law, a study which did not suit his romantic turn of mind; secondly, for a missionary among the Indians, which proved as uncongenial to his habits and dispositions. While prosecuting his theological studies at College, to relieve the tedium of the chapel and the lecture-rooms, he introduced the acting of plays, occasionally performing himself in a long grey beard. The missionary scheme was soon abandoned, and he made his escape from college in a canoe which he hollowed from the trunk of a tree; sailing alone, and dressed in a bear-skin, he reached home after performing a voyage of 140 miles on a dangerous river. His next profession was that of a common sailor on board a vessel bound for Gibraltar. Having heard his grandfather speak of some wealthy relation in England, he resolved on a journey to London; and accordingly setting out from New York, he was landed at Plymouth without a shilling or a single acquaintance. In company with an Irishman as thoughtless and poor as himself, and agreeing to take their turn in begging along the road, he reached London, where he discovered the house of his rich relation. His story, however, was discredited, and himself treated as an impostor, which roused his indignation to such

a pitch that he abruptly left the house, resolved never to return. Upon further inquiry his friend became satisfied of the truth of the connexion, and sent Ledyard a kind invitation, which he haughtily declined. He even rejected a sum of money which his relation, on hearing of his distressed situation, had sent; desiring the servant to tell his master that he belonged not to the race of the Ledyards. His next function was that of a corporal of marines, on board the ship of Captain Cook, then preparing for his third and last voyage round the world; in which capacity he made the tour of the globe. He was present at Cook's death, and published a short narrative of the voyage. From a marine he was next converted into a fur-merchant, having his head full of romantic projects about a trading voyage to Nootka Sound. His main difficulty was in procuring a ship. He applied to various individuals in New York and Philadelphia, but all he got was a promise. Finding himself disappointed, and cursing the lack of enterprise among his own countrymen, he resolved to try his fortune in Europe. He visited Cadiz, Brest, L'Orient, and Paris, with no better success. At Paris he got acquainted with Paul Jones, an adventurer as enthusiastic as himself, and with Sir James Hall, who generously gave him fifteen guineas, as he was now reduced to a sort of wandering vagabond, without employment, motive, or means of support. His next plan was a journey, by land, through the northern regions of Europe and Asia, then to cross Behring's Straits to the continent of America. While waiting for the permission of the Empress of Russia, he received an invitation to London from Sir James Hall, who had procured him a free passage in an English ship, bound for the Pacific Ocean, and to be put on shore at any spot he chose on the north-west coast. Sir James, moreover, gave him twenty guineas, with which Ledyard "bought two great dogs, an Indian pipe, and a hatchet," the only companions of his journey. The happy moment seemed now arrived when he was to open to his blinded countrymen the path to unbounded wealth; but, on reaching Deptford, the vessel was seized by a custom-house officer, brought back, and exchequered. This was a severe blow, but Ledyard was never without a resource: "I shall make the tour of the globe (says he), from London eastward, on foot." A subscription was raised by Sir Joseph Banks, Sir James Hall, and others, by which means he got over to Hamburg, which he reached, he tells us, "in perfect health, and with ten guineas exactly," with which he had to traverse the vast continents of Europe and Asia. His ten guineas, however, were otherwise disposed of. His host, at the tavern where he lodged, having informed him that a Major Langhorn, an American officer, and "a very good kind of man," had left Hamburg for Copenhagen, "with only one spare shirt, and very few other articles of clothing," Ledyard concluded that the man must necessarily be in distress; and, moreover, that a person in this situation was just suited to be the companion of his travels. The sympathy was irresistible. "I shall fly to him (says he) and lay my little all at his feet." Accordingly, though it was the dead of winter, and Copenhagen several hundred miles out of his way, he set out on this charitable expedition. After a tedious journey through Sweden and Finland, he reached the Danish capital, and discovered his countryman, the Major, shut up in his room, where he had been some time detained in captivity for want of money and a clean shirt. Ledyard's countenance glowed with joy as he disbursed the remains of his ten guineas into the palm of this needy adventurer. After staying a fortnight, he propounded to his friend the other grand object of his visit, viz. that the Major should accompany him to St Petersburg. The proposition met with an abrupt refusal. "No," was the reply; "I esteem you, but no man on earth shall travel with me the way I do." This dissolved the intended association; and Ledyard, having parted with his friend and his last shilling, set out alone for the Russian capital. The passage by sea being impracticable, he was obliged to perform a journey of twelve hundred miles, round the Gulf of Bothnia, which, in a direct line, did not exceed fifty. We cannot here follow him in his route from St Petersburg across the regions of snow and desolation which he traversed on his way to Okotsk. After many hardships and delays, he reached Irkutsk, where he was apprehended as a French spy, and put under arrest by an order from the Empress. Accompanied by a guard of soldiers, he was conveyed back to the frontiers of Poland, a distance of six thousand versts, in six weeks! "Thank Heaven!" he exclaimed, as he approached the boundaries of civilized Europe, "petticoats appear, and the glimmerings of other features." Here the soldiers set him at liberty, giving him to understand that he might go where he pleased, only if he again returned to the dominions of the Empress, he would certainly be hanged. He contrived, by drawing on his friends, to reach London, where he was introduced to Mr Beaufoy, Secretary to the African Association. In a short time he set out on a mission of discovery to that ill-fated country; and was among the first that fell a victim to the cause of African geography. His plan was to proceed up the Nile as far as Senaar, and from thence to strike across the African continent to the coast of the Atlantic. He died, however, at Cairo, of a bilious complaint, about the end of November 1788, in the thirty-eighth year of his age.

ANECDOTES

PICKED UP IN CONVERSATION.

MODERN INQUISITION ANECDOTE.

MR G—, a native of Xeres, near Cadiz, from the commercial intercourse his family carried on with Britain, had imported a number of English books, which he was fond of perusing. While residing in the house of his uncle, a considerable merchant at Xeres, the parish priest was a frequent visitor. This man, with a little more erudition, though not honesty, than usually falls to the lot of Spanish ecclesiastics, had acquired some knowledge of our language, and was in the practice of borrowing from Mr G— some of the best English authors. Blair's Sermons, in particular, attracted his attention, as a work which he could turn to account. By way of precaution, he observed to Mr G—, that no other but a Catholic clergyman could produce such elegant compositions. Mr G—, though he knew better, took care to agree with him for obvious reasons. Not long after, on a Palm Sunday, which is observed by the Catholics with more than usual solemnity, the priest regaled his parishioners with a Spanish version of one of our countryman's most flowery discourses. Every body was charmed at such an unexpected display of pulpit eloquence. "My uncle, in particular," said Mr G—, "expressed himself highly delighted with the preacher's exertions. I could not help remarking to him," added Mr G—, "that I could point out the source from whence all these fine sentiments and imagery were derived—in plain language, that the friar was a downright plagiarist." Mr G— was then challenged to make a translation himself of the sermon in question. This task, after some delay, he performed, and his uncle failed not instantly to recognise the striking likeness which it bore to the subject treated by the friar, on Palm Sunday. In the fullness of his heart, he seized the first opportunity of triumphing over the dishonesty of the priest, who was accordingly, for this purpose, forthwith invited to dinner. "Pray, father," every body is in raptures with your Palm Sunday sermon; have you all the merit of that wonderful discourse?" "I certainly consider it as my masterpiece," replied the other, "having employed some months in its composition." "Why, my nephew here alleges he read a sermon remarkably like it in an English book." The friar was mute—he felt mortified, but took care to conceal his chagrin, and parted with the company seemingly in good humour. "Next day," added Mr G—, "to the great surprise of the family, the house was beset with the officers of the Inquisition, who had a warrant to seize my person, and all the English books." "I made my escape to Port St Mary, where a relation concealed me for a fortnight. By that time the sacrifice of a considerable sum enabled me to make my peace with the Holy Office; but upon the whole, the detection of this glaring imposition cost me rather dear."

INGENIOUS RECTIFICATION OF AN OMISSION.

DR S—, after realizing a considerable fortune abroad, having no near relations, left the bulk of his fortune to endow an hospital near Edinburgh. It happened, in the latter part of his life, that he became acquainted with a mason of his own name, who proved to be a distant kinsman. This man, who was rather in confined circumstances, had a family of twelve children, all of whom had arrived at maturity. To each of eleven of these, the twelfth being probably omitted by oversight, the Doctor bequeathed a legacy of one hundred pounds. The mason having got notice of the particulars of this will, was naturally anxious that his children should partake equally of the Doctor's bounty. He took an early opportunity, therefore, of calling his whole family together, and, having informed them that Dr S— had left £100 to each of them except one, whom he did not name, he recommended them to sign an agreement that the £1100 should be equally divided among the twelve. To this proposal all parties cheerfully consented, as no one could tell on whom the loss would fall, if any one should refuse to concur in such a measure. Thus the whole twelve were very nearly as well provided for as if each had been left £100.

TITLE APPROPRIATE.

MR Matthew Ross, who some years ago bore the honourable distinction of Dean of the Faculty of Advocates, though a lawyer of reputation, was rather of diminutive stature. About the time General Kerr's estate of Littledean was advertised for sale, Mr John Clerk made up to Mr Ross, and told him that this property would be a very desirable purchase for him, "as you know, in that case, you would be Little Dean of that ilk."

FLOOD EXTRAORDINARY.

An inhabitant of an upper flat in the highest part of the town of Glasgow, was in company one evening, where a good deal of conversation passed on the subject of the Clyde overflowing its banks, and inundating the lower part of the houses of the Bridgegate (the street next the river). Next morning when he awoke, it being quite dark, and the former night's discussion still engrossing his thoughts, the first step he made out of bed was into a tub of water, which had, accidentally, been misplaced. He could not help exclaiming, "If the water is come to this height, Heaven have mercy upon the folks of the Briggate."

DISADVANTAGE OF A WRY NECK.

The postman who went between Perth and Dundee formerly happened one day to fall from his horse into a ditch, and was a good deal hurt. A stranger passing by, and observing what had happened, endeavoured to give him what assistance he could. Not knowing, however, that the postman was wry-necked, he laboured hard to make his neck straight, thinking this part of his body had got a wrong twist by the fall. The poor man, thus tortured by his benefactor, exclaimed, "Ay, ay, that way," meaning that his neck had been always in that position; but the other, supposing he wished him to persist in his attempts to rectify what was wrong, redoubled his efforts; and before the matter could be explained, the patient had suffered not a little by the well-meant exertions of the operator.

VALUE OF LONG NAILS.

At Batavia, the Chinese used to pay the Dutch for a licence to wear their nails long.

THE LADY THAT I LOVE.

Were I a doughty cavalier,
On fire for high-born dame,
To win her smile, with sword and spear,
I'd seek a warrior's fame;
But since no more stern deeds of blood
The gentle fair may move,
I'll woo in softer—better mood,
The lady that I love.

For helmet bright with steel and gold,
And plumes that flout the sky,
I'll bear a mind of harder mould,
And thoughts that sweep as high.
For scarf about my corset cast,
With her fair name y-wove,
I'll have her pictured in my breast—
The lady that I love.

No mettle steed through battle-throng,
Shall bear me bravely on,
But pride shall make my spirit strong,
Where honours may be won:
Among the great of mind and heart,
My prowess I will prove;
And thus I'll win, by gentler art,
The lady that I love.

R. C.

"TAKE HIM, DEAD OR ALIVE."

The late Lord H—, whose irritable disposition, eccentricities, and facetiousness, have been so aptly portrayed by the author of the Scrap Book in his story of "The Man," had his natural propensities called into action on another occasion, when presiding in a criminal court in the north. A trial, where life or death was at stake, was proceeding with that solemnity which distinguishes our justiciary courts over those of our neighbours, when a wag (for there are some characters who must have their joke, however solemn the occasion) entered the Court, and set a musical snuff-box a-playing "Jack's Alive" upon one of the benches. In the silence of conducting the inquiry, the music struck the ears of the audience, and particularly the venerable judge, whose auricular organ was to the last most admirably acute; and a pause to the business was the immediate consequence. He stared for an instant at a sound so unusual in a court of justice, and with a frantic demeanour exclaimed, "Macer, what, in the name of God, is that?" The officer looked around him in vain to answer the inquiry, when the wag exclaimed, "It's 'Jack's Alive,' my Lord." "Dead or alive, put him out this moment," "We canna grup him, my Lord." "If he has the art of hell, let every man assist to arraign him before me, that I may commit him for this outrage and contempt." Every one endeavoured to discover the author of the annoyance, but he had put the check upon the box, when the sound for a time ceased, and the macer informed his Lordship that the person had escaped. The judge was indignant at this, but not being able to make a better of it, the trial proceeded, when, in about half an hour, sounds of music again caught the ears of the Court. "Is he there again?" exclaimed his Lordship. "By all that's sacred, if he shall escape me this time; fence, bolt, bar the doors of the Court, and, at your peril, let a man, living or dead, escape." All was now bustle, uproar, and confusion; but the search was equally vain as before. His Lordship, who had lived not long after the days of witchcraft, began to imagine that the sound was something more than earthly, and exclaimed, "This is a *deceptio auris*; it is absolute delusion, necromancy, phantasmagoria;" and to the hour of his death never understood what had occasioned the annoyance that day to the Court.

LIBERTY OF THE PRESS.

If nothing may be published but what civil authority shall have previously approved, *power must always be the standard of truth*; if every dreamer of innovation may propagate his projects, there can be no settlement; if every murmurer at government may diffuse discontent, there can be no peace; and if every sceptic in theology may teach his follies, there can be no religion. The remedy against these evils is to punish the authors; for it is yet allowed, that every society may punish, though not prevent, the publication of opinions, which that society shall think pernicious; but this punishment, though it may crush the author, *promotes the book*; and it seems not more reasonable to leave the right of printing unrestrained because writers may be afterwards censured, than it would be to sleep with doors unbolted, because by our laws we can hang a thief.—*Dr Johnson*.

ANTS.

Among the foreign ants, we may mention a small yellow ant of South America, described by Dampier, which seems, from his account, to construct a nest of green leaves. "Their sting," he says, "is like a spark of fire; and they are so thick among the boughs in some places, that one shall be covered with them before he is aware. These creatures have nests on great trees, placed on the body between the limbs: some of their nests are as big as a hog's head. This is their winter habitation; for in the wet season they all repair to these their cities, where they preserve their eggs. In the dry season, when they leave their nests, they swarm all over the woodlands, for they never trouble the savannahs. Great paths, three or four inches broad, made by them, may be seen in the woods. They go out light, but bring home heavy loads on their backs, all of the same substance, and equal in size. I never observed any thing besides pieces of green leaves, so big that I could scarcely see the insect for his burden; yet they would march stoutly, and so many were pressing forward, that it was a very pretty sight, for the path looked perfectly green with them." Ants observed in New South Wales, by the gentlemen in the expedition under Captain Cook, are still more interesting. "Some," we are told, "are as green as a leaf, and live upon trees, where they build their nests of various sizes, between that of a man's head and his fist. These nests are of a very curious structure: they are formed by bending down several of the leaves, each of which is as broad as a man's hand, and glueing the points of them together, so as to form a purse. The viscous matter used for this purpose is an animal juice which nature has enabled them to elaborate. Their method of first bending down the leaves we had no opportunity to observe; but we saw thousands uniting all their strength to hold them in this position, while other busy multitudes were employed within, in applying this gluten that was to prevent their returning back. To satisfy ourselves that the leaves were bent and held down by the efforts of these diminutive artificers, we disturbed them in their work; and as soon as they were driven from their stations, the leaves on which they were employed sprang up with a force much greater than we could have thought them able to conquer by any combination of their strength. But though we gratified our curiosity at their expense, the injury did not go unrevengeed, for thousands immediately threw themselves upon us, and gave us intolerable pain with their stings, especially those which took possession of our necks and hair, from whence they were not easily driven. Their sting was scarcely less painful than that of a bee; but, except it was repeated, the pain did not last more than a minute."—*Library of Entertaining Knowledge*.

THE SPIRITED SHOEMAKER.

The following pleasant anecdote used to be told by the eccentric Dr Monsey:—The Duke of Leeds, the Doctor, and his Grace's Chaplain, being one morning, soon after breakfast, in his library, Mr Walkden, of Pall Mall, his Grace's shoemaker, was shewn in with a pair of new shoes for the Duke. The latter was remarkably fond of him, as he was at the same time clerk of St James's church, where the Duke was a constant attendant. "What have you there, Walkden?" said the Duke. "A pair of shoes for your Grace," he replied. "Let me see them." They were handed to him accordingly. The chaplain, taking up one of them, examined it with great attention. "What is the price?" asked the chaplain. "Half a guinea, sir," said the shoemaker. "Half a guinea! what, for a pair of shoes!" said the chaplain. "Why, I could go to Cranbourn Alley and buy a better pair of shoes than they ever were or ever will be, for five and sixpence." He then threw the shoe to the other end of the room. Walkden threw the other after it, saying, that, as they were fellows, they ought to go together; and at the same time replied to the chaplain—"Sir, I can go to a stall in Moorfields and buy a better sermon for twopenny than my Lord gives you a guinea for." The Duke clapped Walkden on the shoulder, and said, "that is a most excellent retort, Walkden; make me half a dozen pairs of shoes directly."—*Crispin Anecdotes*.

A STAGE-STRUCK HERO.

About the time when Murphy so successfully attacked the stage-struck heroes in the pleasant farce of *The Apprentice*, an eminent poulterer went to a spouting-club in search of his servant, who, he understood, was that evening to make his debut in Lear; he entered the room at the moment when Dick was exclaiming, "I am the king—you cannot touch me for coining!" "No, you dog," cried the enraged master, catching the mad monarch by the collar; "but I can for not picking the ducks."

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS, stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 44.

SATURDAY, DECEMBER 1, 1832.

PRICE THREE HALFPENCE.

CONTROLLERS-GENERAL.

It is a prevailing notion, that people are all so exclusively engrossed with their own concerns in this world, as to have no time or opportunity to take the least interest in those of their neighbours. No idea could be more mistaken. The truth is, a great many people—perhaps a *third* of the population of large towns, and *three-fourths* of those in small ones—are far more anxious about the concerns of their neighbours than about their own. In fact, society in this respect resembles the ape department in a menagerie, where, it is said, every individual chatterer neglects his own pan of meat (opposite his cage), and stretches with all his might to reach the mess of some distant companion in captivity, who, on his part, tries, with equal straining and exertion, to rob some other friend. The case, however, differs immensely as to intention. The monkeys, as we seriously believe, act thus from a wish to eat all the neighbouring pans of meat in the first place, after which they think it will be time enough to attend coolly to their own. But human beings look after each other's morals and worldly prosperity through the most generous impulses. They think it selfish to be always attending to their own affairs, and that it would be an utter defiance of the greatest law of nature, if they were only to look after themselves. Our own business requires, perhaps, the first attention, but common justice to our race demands that all our *spare* time, at least, should be devoted to a supervision of the concerns of other people, and a surveillance of their moral conduct. We are to love our neighbours as ourselves, and, in order to testify that we love them, we are to do as we do with children, castigate them properly whenever they misbehave.

It is lamentable to think how negligent some large classes of society are respecting the affairs of their neighbours. In large cities, the more actively engaged citizens go on from year to year in the pursuit of their own advantage, never casting a single thought upon their next door neighbours, unless, perhaps, to make a transient inquiry into the state of their credit. Is it not fortunate, that, while the men are thus apt to get wrapped up in their own sordid interests, the fairer and more generous part of the race are still in general sufficiently at leisure to see after their neighbours? What *would* society do without these amiable controllers-general?—or what would society do, if these amiable controllers were to get so much engaged too, as to have no time for the affairs of their friends? It is dreadful even to think of such a calamity. How many poor improvident wretches would, in such an event, be left to sink or swim as chance directed! How naughty the world at large would become!

Let us contemplate the delightful picture of one of these friends of society. She is generally a person very much at leisure; for without leisure, that natural preference of our own concerns to those of others precludes all exertion of the faculty: she is also, in general, placed in a tolerably secure position in the world, whence she may survey, with compassionate and patronising eyes, the poor strugglers beneath her. Virtuous she is, as virtuous can be; and that is to say, she is altogether beyond temptation. Herself and all her own immediate friends have been fortunate; therefore she has a kind of prescriptive title to speak freely of the misfortunes of others. It is incredible what exertions this amiable person will make to procure data for her remarks. or, to speak more properly, grounds whereon she may proceed in her benevolent exertions. Charity being an excuse for every thing, she will even descend so far from her dignity as to institute inquiries, through servants and children, into the concerns of those persons whom she has taken un-

der her patronage. Her own Betty, having the same turn with herself, takes frequent opportunities of visiting the kitchens of her friends; and all the remarks that the girl has been able to make upon the external state of things there, and all the prattle she has been able to pick up from the servants in that house, is brought home and faithfully detailed to her mistress, who accidentally, for that purpose, opens a conversation with her. Nor is this all. Through the impulse of her benevolent wishes, the good lady will often take information from her servant, which *she* has learned from another servant, respecting the concerns of a family in which that other servant has perhaps a sister or a friend; her sincere desire of doing good being so strong as to reconcile her to every possibility of misrepresentation, which a story may be supposed to undergo in its progress through so many mouths. It is also to be observed, that she is not exclusively attentive to the concerns of those whom she actually knows. The acquaintances of her acquaintances, and their acquaintances again, even to the third generation, she will inquire about with equal solicitude; and if she knows any thing disagreeable connected with your friends, or any thing that might be thought to unfit them for your acquaintance, she always very kindly lets you hear of it, so that you may be *quite upon your guard*.

"What do you think?" the talk, perhaps, thus proceeds; "they say she is such a *fine lady* that she never enters her kitchen: she never knows any day what is to be for dinner: all that kind of thing she leaves to her servants. And such quantities of company they keep! Hardly a night but what there are more or less visitors. A neighbour of ours, Mrs Blackwell, has an aunt who lives opposite them; and *she* says that the racket is without end. I'm sure I was just saying to our Goodman the other day, that if *we* were to go on in such a way [he it marked, the speaker is reputed to be in infinitely better circumstances than the party commented on], we could not go on long. Puir young things! I'm greatly concerned about them—although, to be sure, it's not *my* business. I was at the school with her mother, and I would like to see them keep right, if it were possible. Young folk are often newfangled about things at first. They think every body that they see is their friend—and its 'this one, come to your supper,' and 'that one, come to your dinner,' as if they could not get past it. When they come to my time o' life, they'll not be sae flush."

"They say she's highly accomplished," thus runs another strain of remarks; "plays on the piano-forte and harp—draws—speaks French and Italian. That would be all very well if *he* had a fortune to keep it up; but a poor man's wife! Commend me to a woman that can darn her husband's stockings, and help to get ready his dinner. I think there's naething like a gude plain education—reading, writing, and sewing—what mair does a woman need? The gude-man and I were often advised to send our girls to learn music, but I never thought it their station. It just puts a parcel o' nonsense into a girl's head. Our lasses never learned ony thing but what they could mak a gude use o'; while, there's Mary Foster does nothing but read novells from morning till night: she's one o' your fine misses. If our girls were to bring a novell into our house, I would put it at the back of the fire, though there was na another novell i' the world."

It is said that in nunneries, where there is neither vice, nor the possibility of it, the ladies, if unable to talk real scandal, make up for it by censorious remarks upon the most trifling foibles in their compa-

nions, or upon the most unimportant failures in the performance of the most unimportant duties. If a holy sister has been observed to smile at a wrong moment, if she has miscounted a bead, or tripped in her gown while walking in a procession, there is as much prattle about it as if she had committed a real offence. Just so, in a country town, every trivial incident becomes a subject of comment for those amiable people who make a point of attending to every body's business but their own. The consequence is, that every person moves in a country town as if he were upon an ambuscading party: he sends by stratagem for every necessary of life which he requires: he takes all kinds of byways and back roads to escape observation, and cannot so much as cross the street without fearing he will be circumvented. Any thing like a good round thumping impropriety is hailed in such a place like rain in a drought. The most of the matters of remark are very small deer, hardly worth hunting down. When one of a more important character arises, it is quite a godsend. Suppose, for instance, the failure of some unfortunate merchant, who has been ruined by mere simplicity of character. The country people, somehow, have a most exaggerated idea of the mischiefs of bankruptcy. A bankrupt, in their eyes, is a person of distinguished criminality—almost enough to make him be regarded as a world's wonder. In proportion, therefore, to their previous remarks for the edification of the unhappy man, is their wholesome severity afterwards. They are surprised to find that, after such an event, he still bears the ordinary shape of a human being—that he has not become signalled by some external transfiguration, of a kind sufficiently awful to indicate his offence. Another thing they are astonished at—that the family of a bankrupt should continue to have the usual appetites of human beings—that they should not, indeed, have altogether ceased to eat, drink, or sleep. The following is very nearly a conversation which really occurred, on such an occasion, in a somewhat humble rank of mercantile life.

"Weel, hae ye heard the news?"

"What news, woman?"

"Ou, hae ye no heard it?—James Sinclair's shop's no open this mornin'—that's a'."

"Aih, weel, has it come to that at last? I aye thocht it. It was easy seeing *yon* could na stand lang. Sic on-gauns as they had for a while—sic dresses—sic parties! But every thing comes to its level at last. I wonder folk dinna think shame to gang on sae wi' other folk's siller. It's a perfect black-burning disgrace. And *she's* just as muckle to blame as *him*. There was hersell, just last Sunday eight days, at the kirk wi' a new pelisse and a bannet, and the laddies ilk ane o' them wi' new leather caps. I'se warrand there was nae bannocks ever seen in their house—naething but gude wheat bread. Whenever a bairn whinged for a piece, it buid to get a shave o' the laiff. I't-weel her grandfather, auld George Morrison, was na sae ill to serve. Mony a claut o' cauld parritch he gat frae my aunty Jess, and was thankfu' to get them."

"Na, but, woman, I saw Jamie himsell gaun up the street this mornin', and a superfine coat on his back just the same as ever. Na, the lass was seen this forenoon getting a leg o' lamb—a fifteenpence leg it was, for our Jenny got the neebor o't—the same as if naething ava had happened. But, of course, this'll no gang on lang. They'll be roupt out, stab and stow, puir thochtless creatures; and I'm sure I dinna ken what's to come o' them. She has nae faither's house to gang back to now. They'll hae to set up some bit sma' public, I reckon."

"Heaven keep us a' frae extravagance—I had never

ony brow o' that new plan she had o' pitting black silk ribbands round the callants' necks, instead o' cotton napkins."

Such are a few of the remarks of our good friends the controllers-general of society; and we are very sure that few people alive but what must look upon them as a most useful, most exemplary, and most benevolent class of persons.

POPULAR INFORMATION ON SCIENCE.

METEOROLITES,

OR STONES WHICH HAVE FALLEN FROM THE SKY. AMONGST the few instances in which vulgar belief has outstripped philosophy in the explanation of natural phenomena, the fact of stones having really fallen from the atmosphere is perhaps the most remarkable. It is strange, that, after an accumulation of facts of such occurrences, merely to give the dates of which would fill more than a page of this Journal, the scientific world should have looked on with callous indifference, and maintained the utter impossibility of such events.

So late as the year 1790, an iron tempest which fell in a parish of France, and was authenticated by a great number of individuals, some of whom were of the highest respectability, was treated in the most contemptuous manner by the journalists of the time, and said to be calculated to excite not only the pity of the learned, but of all rational beings. Meanwhile Mr Howard, an able English chemist, was prosecuting the study of the subject, and pursuing the only route which could lead to a solution of the problem. He collected specimens of stones which had fallen at different times, and in various places. His researches led to the important conclusion, that they are all composed of the same principles, and in nearly the same proportions. This remarkable circumstance has since been proved by the investigations of philosophers of the highest authority, both in chemistry and mineralogy.

A thin crust, of a deep black colour, covers the whole of them. They have no gloss, and the surface is roughened with small asperities. When broken, they are internally of a greyish colour, and are of a granulated texture, amongst which, four different substances can be discovered by a lens. Those which occur most frequently vary from the size of a pin's head to that of a pea. They are of a greyish colour, sometimes inclining to brown; opaque, with a little lustre, and capable of giving faint sparks with steel. The second kind is of a reddish yellow colour, and black when powdered. A third consists of small particles of iron, in a perfectly metallic state. From the presence of these, the mass possesses the quality of being attracted by the magnet. The fourth is in general of an earthy consistence, and crumbles when pressed between the fingers. These bodies are composed of iron and nickel, both in a metallic and oxidized state; sulphur, silice (an earth), magnesia, and about one per cent. of chrome.

The chronicles of almost every age and country record the fall of these bodies. The Chinese and Japanese noted down with great care every thing connected with the appearance of these extraordinary phenomena. The Chinese actually made catalogues of them, believing they were connected with contemporary events. There is no occasion for laughing at this oriental superstition, since there were not wanting, half a century ago, philosophers in enlightened Europe, who declared the impossibility of stones falling from the atmosphere at all.

One of the most remarkable cases of antiquity is that mentioned by Pliny, in his Natural History. This stone fell near Egopotamos, in Thrace, about 465 years before the Christian era. Pliny informs us that it was still shown in his day, and that it was the size of a cart, and of a burnt colour. The Greeks believed it to have fallen from the sun, and that the philosopher Anaxagoras had predicted the exact period when it should arrive on the earth's surface. According to the historians who have recorded the event, its fall was preceded by a meteoric appearance of a very unusual character. We are told that a large fiery body, like a cloud of flame, careered through the heavens with a vague, uncertain motion. By its violent agitation, several fragments were projected from it in various directions, sweeping with the velocity of "shot stars down the troubled sky." On examining it after its fall, no trace of combustible matter was found, and the stone, although large, did not at all correspond to the dimensions of the meteor. Various other instances are recorded of the fall of meteoric stones in ancient times, but we prefer giving an account of the better authenticated cases which belong to a modern date.

On the 7th of November 1492, between eleven o'clock and noon, there arose a furious storm at Ensisheim, a town of France. The sky was inlaid with sheeted flame, and loud thunder "pealed in the blood-red heaven." We are told by a contemporary that there were also other sounds of a strange confused description; these probably arose from the rapid passage of the falling body through the atmosphere. In the midst of this "hurling in the air," a large stone was seen to fall in a field of wheat; and, on examination, it was found to have sunk between five and six feet into the ground; its weight was about 260 lbs. In the true spirit of the times, this event was considered an indubitable miracle, and the meteorolite was ac-

cordingly, by order of the king, suspended in the church of Ensisheim, all persons being prohibited from touching it. At all events, this was a wise prohibition, and was probably the cause of its preservation. It is now in the library at Colmar, but has been reduced in weight to 150 lbs.

The celebrated Gassendi informs us, that, on the 29th November 1637, about 10 o'clock A.M., while the sky was perfectly serene and transparent, he saw a flaming stone, apparently about four feet diameter, fall on Mount Vaison, an eminence situated between the small towns of Perne and Guillaumes, in Provence. This stone was encircled with a zone of various colours, like a rainbow, and accompanied in its fall with a noise resembling the discharge of artillery. It was of a dark metallic colour, extremely hard, and 59 lbs. in weight.

In June 1668, two stones, one of which weighed 300, and the other 200 lbs., fell near Verona. The event took place during the night, and when the weather was perfectly serene and mild. They appeared to be all on fire, descending in a sloping direction, and with a tremendous noise. The phenomenon was witnessed by a great number of people, who, when the sounds had ceased, and their courage sufficiently re-established, ventured to approach these celestial deposits, and found that they had formed a ditch, with such a velocity and force had they descended from the heavens.

In July 1790, another case occurred at Barbotan, a place in the vicinity of Bourdeaux, which is thus described by Lomet, a respectable citizen who witnessed the phenomenon:—"It was a very bright fire-ball, luminous as the sun, of the size of an ordinary balloon, and, after inspiring the inhabitants with consternation, burst, and disappeared. A few days after, some peasants brought stones, which they said fell from the meteor; but the philosophers to whom they offered them laughed at their assertions as fabulous. The peasants would have now more reasons to laugh at the philosophers." So they would, Monsieur Lomet. One of these stones, fifteen inches in diameter, broke through the roof of a cottage, and killed a herdsman and a bullock. After reading the above statement, we cannot refrain from wondering at the slow belief of philosophers as to the heavenly origin of these stones. Where was the body to come from, a body of the dimensions described, which was capable of breaking through the roof of a cottage, and committing such deadly havoc, if it did not come from the atmosphere, ay, and from an immense height too?

The following shower of meteorolites is not only remarkable in itself, but because, though slighted by many eminent philosophers at the time, it ultimately led to the conversion of most of them. This phenomenon occurred in August 1790, near Juillac, a small town of France. It is described, amongst others, by two credible witnesses nearly as follows:—"About nine o'clock in the evening, while the air was calm and the sky cloudless, they found themselves suddenly surrounded by a pale clear light, which obscured that of the moon, though then nearly full. On looking up, they observed, almost in the zenith, a fire-ball, in size exceeding the diameter of the moon, with a tail five or six times longer than itself, which gradually tapered to a point, the latter approaching to blood-red, though the rest of the meteor was of a pale white. It proceeded with amazing velocity from south to north, and in two seconds split into portions of considerable size, like the fragments of a bursting bomb. Two or three minutes after, a dreadful explosion was heard, like the simultaneous firing of several pieces of ordnance. The concussion of the atmosphere shook the windows in their frames, and threw down household utensils from their shelves; but there was no sensible motion felt under foot. The sound continued for some time, and was prolonged in echoes for fifty miles along the mountain chain of the Pyrenees. At the same time a strong sulphurous smell was diffused in the atmosphere. The fragments of the exploded meteor were found scattered in a circular space of about two miles in diameter. Some of them weighed eighteen or twenty, and a few, it is said, even fifty pounds.

We pass over several interesting details of these phenomena, and proceed to notice the great shower of stones which fell at Aigle, in Normandy, in April 1803. The best account is that given by Biot, the celebrated French philosopher, who was appointed by the Institute of France to proceed to Aigle, and collect all the information possible upon the subject. He says—"On Tuesday, 6th Floréal, year 11 (April 26, 1803), about one o'clock P.M., the weather being serene, there was observed from Caen, Pont d'Audemer, and the environs of Alençon, Falaise, and Verneuil, a fiery globe, of a very brilliant splendour, and which moved in the atmosphere with great rapidity. Some moments after, there was heard at l'Aigle, and in the environs of that town, in the extent of more than 30 leagues in every direction, a violent explosion, which lasted five or six minutes. At first there were three or four reports, like those of a cannon, followed by a kind of discharge which resembled the firing of musketry; after which there was heard a dreadful rumbling, like the beating of a drum. The air was calm, and the sky serene, except a few clouds, such as are frequently observed. This noise proceeded from a small cloud which had a rectangular form, the largest side being in a direction from east to west. It appeared motionless all the time that the phenomenon

lasted; but the vapours of which it was composed were projected momentarily from different sides, by the effect of the successive explosions. This cloud was about half a league to the north-north-west of the town of l'Aigle. It was at a great elevation in the atmosphere, for the inhabitants of two hamlets, a league distant from each other, saw it at the same time above their heads. In the whole canton over which this cloud was suspended, there was heard a hissing noise, like that of a stone discharged from a sling, and a great many mineral masses exactly similar to those distinguished by the name of meteor-stones were seen to fall. The district in which these masses were projected forms an elliptical extent of about two leagues and a half in length, and nearly one in breadth, the greatest dimension being in a direction from south-east to north-west, forming a declination of about 22 degrees. This direction, which the meteor must have followed, is exactly that of the magnetic meridian, which is a remarkable result. The greatest of these stones fell at the south-eastern extremity of the large axis of the ellipse, the middle-sized in the centre, and the smaller at the other extremity. Hence it appears that the largest fell first, as might naturally be supposed. The largest of all those that fell weighs seventeen pounds and a half. The smallest which I have seen weighs about two gros (a thousandth part of the last). The number of all those which fell is certainly above two or three thousand."

In the same month and year as the preceding fall, a fire-ball struck the White Bull Inn, at East Norton, in England, and left behind it several meteoric fragments. Exactly twelve months after the above, a stone fell with a loud hissing noise at Possil, near Glasgow. In 1810, a great stone fell at Shahabad, in India. It burned five villages, and killed several people.

Such are a few instances of the descent of meteoric stones. In a late number of a French periodical, above two hundred falls are enumerated. That they occur frequently is evident. How many relations of the phenomena may have passed into oblivion from the contempt with which they were treated by the learned! How many showers may have fallen in desert and unexplored tracts of country, on the tops of inaccessible mountains, and in the pathless expanse of the sea!

With respect to the ultimate origin of these stones, no perfectly satisfactory theory has yet been propounded. Some have supposed them to be merely projected from volcanoes. This doctrine, however, appears to us untenable; first, because the phenomena have sometimes taken place at such immense distances from any volcano, that the possibility of their being transmitted so far can scarcely be entertained; secondly, nothing ever thrown out by these safety-valves of the globe, has, in its composition, borne any resemblance to meteoric stones. Indeed, the latter have nothing similar to them on the surface of the earth, as far as man has yet been able to investigate. This is a very extraordinary circumstance, and, when taken in connection with the fact already noticed, that the whole of them consist of the same substances, or nearly so, it seems to favour the hypothesis that they were thrown from our satellite, the moon. The profound La Place demonstrated the possibility of this, and Dr Hutton, with great ingenuity, has reasoned upon the probability of it. Others have followed in the same wake, but the subject is still involved in great obscurity. Some have maintained that their origin is to be ascribed to the combinations of gases in the higher regions of the atmosphere. In chemistry, many cases might be enumerated where two gases combine, and form a solid substance. This theory, therefore, involves no impossibility; but there are almost insuperable difficulties opposed to its probability. It would hence be an unfruitful task for us to speculate upon a subject which so few scientific men have formed any definite opinions upon; indeed, they have been singularly cautious in offering any—a clear proof that they were not themselves perfectly satisfied with any solution of the problem hitherto given. The fact, however, that stones have fallen from the atmosphere, is now an established philosophical truth.

GOING TO THE RACES.—A TALE.

A MEMORABLE day was the third of last June to Mary and Henrietta Coxe, the young daughters of Simon Coxe, the carpenter of Aberleigh, for it was the first day of Ascot races, and the first time of their going to that celebrated union of sport and fashion. There is no pleasure so great in the eyes of our country damsels as a jaunt to Ascot. In the first place, it is, when you get there, a genuine English amusement, open alike to rich and poor, elegant as an opera, and merry as a fair; in the second, this village of Aberleigh is situate about fourteen miles from the course, just within distance, almost out of distance, so that there is commonly enough of suspense and difficulty—the slight difficulty, the short suspense, which add such zest to pleasure.

All people love Ascot races; but our country lasses love them above all. It is their favourite wedding jaunt, for half our young couples are married in the race week, and one or two matches have seemed to me got up purposely for the occasion; and of all the attentions that can be offered by a lover, a drive to the races is the most irresistible. In short, so congenial

is that gay scene to love, that it is a moot point which are most numerous, the courtships that conclude there in the shape of bridal excursions, or those which begin on that favoured spot in the shape of parties of pleasure; and the delicate experiment called "popping the question" is so often put in practice on the very course itself, that when Robert Hewitt, the young farmer at the Holt, asked Master Cox's permission to escort his daughters, not only the good carpenter, but his neighbours the blacksmith and the shoemaker, looked on this mark of rustic gallantry as the precursor of a declaration in form; and all the village cried out on Hetta Cox's extreme good luck, Hetta being supposed, and with some reason, to be the chief object of this attention.

Robert Hewitt was a young farmer of the old school, honest, frugal, and industrious; thrifty, thriving, and likely to thrive; one of a fine yeomanly spirit, not ashamed of his station, and fond of following the habits of his forefathers, sowing his own corn, driving his own team, and occasionally ploughing his own land. As proud, perhaps, of his blunt speech and homely ways as some of his brother farmers of their superior refinement and gentility, nothing could exceed the scorn with which Robert Hewitt, in his market cart, drawn by his good horse Dobbin, would look down on one neighbour on his hunter, and another in his gig. To the full as proud as any of them was Robert, but in a different way, and perhaps a safer. He piqued himself, like a good Englishman, on wearing a smock frock, smoking his pipe, and hating foreigners, to our intercourse with whom he was wont to ascribe all the airs and graces, the new fashions, and the effeminacy, which annoyed him in his own countrymen. He hated the French, he detested dandies, and he abhorred fine ladies, fine ways, and finery of any sort.

Henrietta Cox was a pretty girl of seventeen, and had passed the greater part of her life with an aunt in the next town, who had been a lady's maid in her youth, and had retired thither on a small annuity. To this aunt, who had been dead about a twelvemonth, she was indebted for a name, rather too fine for common wear—I believe she wrote herself Henrietta-Matilda; a large wardrobe, pretty much in the same predicament; an abundant stock of superfine notions, some skill in mantua-making and millinery, and a legacy of a hundred pounds, to be paid on her wedding-day. Her beauty was quite in the style of a wax doll; blue eyes, flaxen hair, delicate features, and a pink and white complexion, much resembling that sweet pea which is known by the name of the painted lady. Very pretty she was certainly, with all her airs and graces; and very pretty, in spite of her airs and graces, did Robert Hewitt think her; and love, who delights in contrasts, and has an especial pleasure in oversetting wise resolutions, and bending the haughty self-will of the lords of the creation, was beginning to make strange havoc in the stout yeoman's heart. His operations, too, found a very unintentional coadjutrix in old Mrs Hewitt, who, taking alarm at her son's frequent visits to the carpenter's shop, unwarily expressed a hope, that if her son did intend to marry one of the Coxes, he would have nothing to do with the fine lady, but would choose Mary, the elder sister, a dark haired, pleasant looking young woman of two-and-twenty, who kept the house as clean as a palace, and was the boast of the village for industry and good humour. Now, this unlucky caution gave Robert, who loved his mother, but did not choose to be managed by her, an additional motive for his lurking preference, by piquing his self-will; add to which, the little damsel herself, in the absence of other admirers, took visible pleasure in his admiration; so that affairs seemed drawing to a crisis, and the party to Ascot appeared likely to end like other jaunts to the same place, in a wedding. It is true that the invitation, which had been readily and gratefully accepted by her sister, had been received by Miss Hetta with some little demur. "Going to the races was delightful; but to ride in a cart behind Dobbin was odious. Could not Mr Hewitt hire a phaeton, or borrow a gig? However, as her sister seemed to wish it, she might perhaps go, if she could find no better conveyance." And with this concession the lover was contented; the more especially as the destined finery was in active preparation. Flounces, furbelows, and frippery of all descriptions, enough to stock a milliner's shop, did Hetta produce for the adornment of her fair person; and Robert looked on in silence, sometimes thinking how pretty she would look; sometimes, how soon he would put an end to such nonsense when once they were married; and sometimes, how odd a figure he and Dobbin should cut by the side of so much beauty and fashion.

Neither Dobbin nor his master were fated to be so honoured. The evening before the races there happened to be a revel at Whitley Wood: thither Hetta repaired; and there she had the ill fortune to be introduced to Monsieur Auguste, a young Frenchman, who had lately hired a room at B., where he vended eau de Cologne, and French toys, and essences, and did himself the honour, as his bills expressed, to cut the hair and the curls of the nobility and gentry of the town and neighbourhood. Monsieur was a dark, sallow, foreign looking personage, with tremendous whiskers, who looked at once fierce and foppish, was curled, and perfumed in a manner that did honour to his double profession, and wore gold rings in his ears and on his fingers, a huge bunch of seals at

his side, and a gaudy brooch at his bosom. Small chance had Robert Hewitt against such a rival, especially when, smitten with her beauty or her hundred pounds, he devoted himself to Hetta's service, made fine speeches in most bewitching broken English, braved for her sake the barbarities of a country dance, and promised to initiate her into the mysteries of the waltz and the quadrille; and, finally, requested the honour to conduct her in a cabriolet, the next day, to Ascot races. Small chance had our poor farmer against such a Monsieur.

The morning arrived, gloomy, showery, and cold, and at the appointed hour up drove the punctual Robert, in a new market cart, painted blue with red wheels, and his heavy but handsome horse Dobbin (who was indeed upon occasion the fore horse of the team), as sleek and shining as good feed and good dressing could make him. Up drove Robert with his little sister (a child of eleven years old, who was to form one of the party) sitting at his side; whilst equally punctual, at Master Cox's door, stood the sisters ready dressed, Mary in a new dark gown, a handsome shawl, and a pretty straw bonnet, with a cloth cloak hanging on her arm; Hetta in a flutter of gauze and ribbons, pink and green, and yellow and blue, looking like a parrot tulip, or a milliner's doll, or like anything under the sun but an English country girl. Robert looked at her and then at Mary, who was vainly endeavouring to persuade her to put on, or at least to take, a cloak, and thought for once without indignation of his mother's advice; he got out, however, and was preparing to assist them into the cart, when suddenly, to the astonishment of every body but Hetta, for she had said nothing at home of her encounter at the revel, Monsieur Auguste made his appearance in a hired gig of the most wretched description, drawn by an equally miserable jade, alighted at the house, and claimed Mademoiselle's promise to do him the honour to accompany him in his cabriolet. The consternation was general. Mary remonstrated with her sister mildly but earnestly; Master Cox swore she should not go; but Hetta was resolute; and farmer Hewitt, whose first impulse had been to drub the Frenchman, changed his purpose when he saw how willing she was to be carried off. "Let her go," said he; "Monsieur is welcome to her company; for my part, I think they are well matched. It would be a pity to part them." And, lifting Mary rapidly into the cart, he drove off at a pace of which Dobbin, to judge from his weight, appeared incapable, and to which that illustrious steed was very little accustomed.

In the meanwhile, Hetta was endeavouring to introduce her new beau to her father, and to reconcile him to her change of escort; and the standers by, consisting of half the men and boys in the village, were criticising the Frenchman's equipage. "I could shake the old chaise to pieces with one jerk, it's so ramshackle," cried Ned Jones, Master Cox's foreman. "The wheel will come to pieces long before they get to Ascot," added Sam, the apprentice. "The old horse has a spavin in the off fore leg, that's what makes him so lame," said Will Ford, the blacksmith. "And he has been down within the month. Look at his knees!" rejoined Jem, the carter. "He's blind of an eye," exclaimed one urchin. "He shies," cried another. "The reins are rotten," observed Dick, the collarmaker. "The Frenchman can't drive," remarked Jack, the drover, coming up to join the crew; "he'd as nearly as possible run foul of my pigs." "He'll certainly overturn her, poor thing," cried one kind friend, as, overcome by her importunities, her father at length consented to her departure. "The chaise will break down," said another. "Break! he'll break her neck," added a third. "They'll be drenched to the skin in this shower," exclaimed a fourth; and amidst these consoling predictions the happy couple departed.

Robert and Mary, on their side, proceeded for some time in almost total silence.—Robert too angry for speech, and Mary feeling herself, however innocent, involved in the consequences of her sister's delinquency; so that little passed beyond Anne Hewitt's delighted remarks on the beauty of the country, and the hedge-rows, bright with the young leaves of the oak, and gay with the pearly thorn blossoms and the delicate briar rose.

Anne and Mary enjoyed the races much. They saw the line of carriages, nine deep—more carriages than they thought ever were built; and the people—more people than they thought the whole world could hold; had a confused view of the horses, and a distinct one of the riders' jackets; and Anne, whose notions on the subject of racing had been rather puzzled, so far enlarged her knowledge and improved her mind as to comprehend that yellow, crimson, green, and blue, in short, all the colours of the rainbow, were trying which should come first to the winning post; they saw Punch, a puppet-show, several peep-shows, and the dancing dogs; admired the matchless display of beauty and elegance when the weather allowed the ladies to walk up and down the course; were amused at the bustle and hurry-scurry, when a sudden shower drove them to the shelter of their carriages. In short, they had seen every thing and every body, except Hetta and her beau; and nothing had been wanting to Mary's gratification, but the assurance of her sister's safety; for Mary had that prime qualification for a sight-seer, the habit of thinking much of what she came to see, and little of herself. She made light of

all inconveniences, covered little Anne (a delicate child) with her own cloak during the showers, and contrived, in spite of Robert's gallant attention to his guest, that Anne should have the best place under the umbrella, and the most tempting portion of the provisions; so that our farmer, by no means wanting in moral taste, was charmed with her cheerfulness, her good humour, and the total absence of vanity and selfishness; and when, on her ascending the cart to return, he caught a glimpse of a pretty foot and ankle, and saw how much exercise and pleasure had heightened her complexion, and brightened her hazel eyes, he could not help thinking to himself, "My mother was right. She's ten times handsomer than her sister, and has twenty times more sense; and, besides, she does not like Frenchmen."

But where could Hetta be?—what had become of poor Hetta? This question, which had pressed so frequently on Mary's mind during the races, became still more painful as they proceeded on their road home, which, leading through cross country lanes, far away from the general throng of the visitors, left more leisure for her affectionate fears. They had driven about two miles, and Robert was endeavouring to comfort her with hopes that their horse's lameness had forced them back again, and that her sister would be found safe at Aberleigh, when a sudden turn in the lane discovered a disabled gig, without a horse or driver, in the middle of the road, and a woman seated on a bank by the side of a ditch—a miserable object, tattered, dirty, shivering, drenched, and crying as if her heart would break. Was it—could it be Hetta? Yes—Hetta it was. All the misfortunes that had been severally predicted at their outset had befallen the unfortunate pair. Before they had travelled three miles, their wretched horse had fallen lame in his near fore leg, and had cast the off hind shoe, which, as the blacksmith of the place was gone to the races, and nobody seemed willing to put himself out of the way to oblige a Frenchman, had nearly stopped them at the beginning of their expedition. At last, however, they met with a man who undertook to shoe their steed, and whose want of skill added a prick to their other calamities; then Monsieur Auguste broke a shaft of the cabriolet by driving against a post, the setting and bandaging of which broken limb made another long delay; then came a pelting shower, during which they were forced to stand under a tree; then they lost their way, and owing to the people of whom Monsieur inquired not understanding his English, and Monsieur not understanding theirs, went full five miles round about; then they arrived at the Chequers public house, which no effort could induce their horse to pass, so there they stopped perforce to bait and feed; then, when they were getting on as well as could be expected of a horse with three lame legs and a French driver, a waggon came against them, carried away their wheel, threw Monsieur Auguste into the hedge, and lodged Miss Henrietta in the ditch; so now the beau was gone to the next village for assistance, and the belle was waiting his return on the bank; and poor Hetta was evidently tired of her fine lover and the manifold mis-adventures which his unlucky gallantry had brought upon her, and accepted very thankfully the offer which Anne and Mary made, and Robert did not oppose, of taking her into the cart, and leaving a line written in pencil on a leaf of Mary's pocket-book, to inform Monsieur of her safety. Heartily glad was poor Hetta to find herself behind the good steed Dobbin, under cover of her sister's warm cloak, pitied and comforted, and in a fair way to get home. Heartily glad would she have been, too, to have found herself reinstated in the good graces of her old admirer. But of that she saw no sign. Indeed, the good yeoman took some pains to show that, although he bore no malice, his courtship was over. He goes, however, oftener than ever to the carpenter's house; and the gossips of Aberleigh say that this jaunt to Ascot will have its proper and usual catastrophe—a merry wedding; that Robert Hewitt will be the happy bridegroom, but that Hetta Cox will not be the bride.—*Abridged from OUR VILLAGE, by Miss Mitford.*

HIGHLAND LAKES.

IN our various excursions through the romantic regions in the northern district of Scotland, we do not recollect of having seen a prettier or more interesting lake, of the class to which it belongs, than one lying in the bosom of the mountainous country of Badenoch, entitled Loch Laggan. This beautiful expanse of water, which, after Lochness, is the only lake of any great extent in Inverness-shire, was made known to the amateur tourist only within the last twenty years, by the opening of the branch of the great Highland road which pursues its way westward to Fort William.

Loch Laggan lies nearly east and west, and is fed by numberless mountain torrents, the most considerable of which, the Pattaig, usually distinguished by the designation of a river, brings down with it the drainage of a great tract of country extending as far as the borders of Rannoch in Perthshire. The surplus of this large assemblage of water is carried off by the Spean, which, leaving the lake at the west end, passes through the extensive vale of Glen Spean, and finally loses itself in the Lochy, to which it contributes a great portion of the waters which the latter discharges into the Western Sea. Loch Laggan is embos-

somed in hills of vast elevation, particularly those on the south side, two of which are known by the name of Easter and Wester Binnean, a term in the Celtic tongue denoting a *peak*. These mountains are covered with verdure to their very summits, and afford summering to numerous flocks of sheep, which have now in a great degree supplanted the aboriginal natives of these wilds, the red-deer. A few straggling parties and individuals, however, of this magnificent species, are occasionally to be found venturing, like their brother vagrant of the American forest, the Red Indian, upon a stolen visit to their early haunts, and, like him too, experiencing the common result of the progress of civilization, in the baying of the hound, or the salutation of a bullet. Not many months ago the remains of no less than six of these fugacious creatures were discovered at the foot of an almost inaccessible precipice near the top of Wester Binnean, while, a little way above them, lay bleaching the bones of their ruthless pursuer. Gruim, the son of Oscar—both sire and son the finest specimens of their kind—chancing to fall on the scent of the deer, had given his conductor the slip, and his fate continued a matter of mystery and wonderment till the accidental discovery of his remains and those of his luckless intended prey. The lake is nearly nine miles in length, by about one in breadth, having its banks densely clothed with wood, chiefly the fragrant birch, one of the few remnants now to be met with of the forests with which the whole face of the country is understood to have been covered of old; a conjecture countenanced by the name of the district, Badenoch in Gaelic implying *woody*. The attractions of this beautiful sheet of water appear not to have been unacknowledged in pristine times. King Fergus, the venerable founder of the Scottish monarchy—probably long before the period when the Castle of Inverlochy was the seat of royalty, or when the Fingalean engineers were employed, according to the theory of a late worthy Lochaber parson, in contributing to the diversion of their chiefs, by framing, with pick and shovel, the triple parallels of Glenroy—made this lake and the surrounding hills the scenes of royal pastime. A favourite spot on the south bank is yet known by the name of Ardmerrigie, or *the Height of Fergus*. Of several islets in the lake, two are consecrated to the memory of the same prince; one by the name of *Ilan na Righ*, or *the King's Island*, which still exhibits traces of rude masonry; the other by that of *Ilan na Conn*, or *Island of the Dogs*, where Fergus is understood to have kept those indispensable accompaniments of Highland sport. On the adjoining hills the unfortunates of 1746 found security, if not shelter; and there is a well-authenticated tradition that the royal fugitive himself, while roving with some ill-fated companions in arms, condescended to honour Macdonald, the tacksman of the farm of Tullochchrombie, by accepting a portion of dress to replace some exhausted habiliment. Loch Laggan abounds in excellent trout, and it would be unfair to conclude this sketch without apprising the angling sportsman that he will find a boat at his service at the little inn lately built by Cluny Macpherson, the proprietor, near the head or east end of the lake. Here, too, besides sundry other comforts, the adventurous Southron may be accommodated with abundance of good English, a commodity not always attainable in a Highland inn, as well as with a profusion of civility from the learned professor, who performs the part of master of the ceremonies to all who honour his *hospitium* with a visit.

The other lakes of this district of Inverness-shire are so insignificant in point of size, and so entirely destitute of interest otherwise, that they may be disposed of summarily with little more than a mere enumeration. Loch Spey, the parent of the "rapid Spey," is a miserable reedy marsh on the borders of Glenroy. Lochnalarig and Dearg Loch, amidst the Monieá hills, between Badenoch and Stratherrick, are known only for their trout—a distinction common to every collection of water in that country. Loch Pat-taig, on the high ground near the borders of Rannoch, has an air of wild grandeur, which can find admirers only in a class of people who have seldom leisure or taste to turn aside in quest of the picturesque, the sportsman and the shepherd. Loch Inch and Loch Alvie, on the line of the great Highland road between Pitmain and Aviemore, are indebted for what attractions they present rather to the operations of man than to the hand of nature.

From this enumeration is intentionally excluded Loch Erich, famed in song, which, though situated in the midst of that gigantic range of mountains which separates Badenoch from Rannoch, may claim to be reckoned a Perthshire lake—a pretension the more readily allowed when it is known that it discharges its waters into the German Ocean by the Tay, the common receptacle of all the streams of Perthshire.

EFFECTS OF CERTAIN EMPLOYMENTS ON HEALTH.

An interesting little work, entitled "The Effects of the Principal Arts, Trades, and Professions, on Health and Longevity," written by C. Turner Thackrah, has just fallen under our notice, and as it abounds in curious matter, suitable for the entertainment and instruction of our readers, we take the liberty of inserting the following details relative to that description of operatives who approach nearest to the perfection of the physical state, or whose employments are chiefly in the open air:—

BUTCHERS stand at the head of this division. They are much in the open air, and take strong exercise. Most of the masters ride on horseback to the neighbouring markets, and often traverse the surrounding country to buy cattle. They are well known to ride fast, and to take often long journeys. Drovers of cattle for the butchers, though their action is generally less violent, have great distances to travel. They walk twenty, thirty, or forty miles a-day. Butchers, and the slaughter-men, their wives, and their errand-boys, almost all eat fresh cooked meat at least twice a-day. They are plump and rosy. They are generally also cheerful and good-natured. Neither does their bloody occupation, nor their beef-eating, render them savage, as some theorists pretend, and even as the English law presumes. They are not subject to such anxieties as the fluctuations of other trades produce; for meat is always in request; and butchers live comfortably in times as well of general distress as of general prosperity. They are subject to few ailments, and these the result of plethora (overfulness of blood).

The atmosphere of the slaughter-house, though sufficiently disgusting to the nose, does not appear to be at all injurious to health. The mere odours of animal substances, whether fresh or putrid, are not apparently hurtful; indeed, they seem to be often decidedly useful. Consumption is remarkably rare among the men employed in the slaughter-house.

CATTLE AND HORSE DEALERS, leading an active life in the open air, are generally healthy, and would be almost exempt from ordinary maladies, were it not for their habit of drinking. Wet and cold would rarely produce even temporary ailment to temperate men in an employment so conducive to vigour. Horse-dealers' grooms or riders are a sickly set of men. Their appearance indicates those diseases of the stomach and liver which result from a debauched and irregular life.

FISHMONGERS, who bring fish from the coast, are of course greatly exposed to the weather. They are not, however, subject to rheumatism or other inflammatory disease. Generally hardy and temperate, they enjoy health, and attain considerable age. Different is the state of the retailers of fish in towns. These are often addicted to dram-drinking, and are consequently sickly and short-lived.

CART-DRIVERS, though exposed to atmospheric vicissitudes, are healthy in proportion to their temperance and the nourishment they take. Their wages, however, are low; they are often indifferently fed; and many, particularly among the coal-leaders, congregate and spend at the alehouse that money which would be better employed in buying solid food. The attention of masters might do much to correct the evil.

LABOURERS IN HUSBANDRY, SAND LEADERS, AND MEN EMPLOYED ON THE ROADS, would be healthy, were their means of subsistence adequate to their wants. A man who has himself, his wife, and family, to support on twelve or sixteen shillings a-week, cannot be well fed. Hence this body of men are far less robust in figure than we should expect from the nature of their employ. They are subject to disorders of the digestive organs, and generally suffer also greatly from epidemics.

BRICKMAKERS, with the advantage of full muscular exercise in the open air, are subject to the annoyance of cold and wet. These, however, appear little, or not at all injurious. Brickmakers, half naked, and with their bare feet in the puddle all day, are not more liable to catarrh, pneumonia (inflammation of the lungs), and rheumatism, than men whose work is under cover and dry. Of twenty-two brickmakers of whom we made personal inquiry, only one had been affected with rheumatism, or could state himself subject to any disease. All declare that neither rheumatism, nor any inflammatory complaint, is frequent among them. Individuals of great age are found at the employ.

CHAISE-DRIVERS, POSTILIONS, STAGE-COACHMEN, AND GUARDS OF COACHES, with an equal advantage of fresh air, are differently situated in reference to exercise. Postilions, of course, have great and continued exertion; but the kind is objectionable. Their position on the saddle is bad, and they use the arms unequally; hence curvature of the spine. They are moreover said by Morgagni to be particularly subject to aneurism of the aorta (a diseased condition of the principal artery of the body). The drivers of chaise and hackney-coaches have more moderate and equal exercise; but their position subjects them to popliteal aneurism (a swelling of the artery in the ham). They, as well as postilions, suffer from irregular living, and the habit of frequent potation. They are subject to disorders of the head and the stomach. Still worse is the state of stage-coachmen and guards. With an equal or greater degree of intemperance, they have less muscular exercise to counteract its effects. In addition to morning sickness, and other affections, indicating gastric disease (disease of the juices of the stomach), they have venous congestion of the abdomen; then of the head; finally, apoplexy and palsy.

Gentlemen's coachmen often suffer from excess of nourishment; they eat more than they work. Having often to wait for their masters—to use Dr Good's phrase—"they fill up their time, by filling up their stomach." They also take ale too frequently.

COACH-BUILDERS may be divided into three classes—carpenters, smiths, and painters. In the first, the

only injurious circumstance is the common atmospheric impurity of a town. The men work in open sheds, have full and varied muscular exertion, and are temperate in their habits. They are consequently healthy, and frequently attain advanced age. The smiths are often drunken, and neglect their work for days at once. They labour, consequently, under disorder of the digestive organs, and die comparatively young. The painters, steady in their habits, suffer, though in a less degree, from the disorders which we shall have to notice when we speak of house-painters.

CARPENTERS, JOINERS, WHEELWRIGHTS, and MILLWRIGHTS, appear to receive no injury from their respective employments. I must state, however, that although temperate millwrights are healthy, and continue their employ to a great age, often even to that of 60, there is another class, who fit up the shafts and wheels to convey the power from the steam-engine to the machinery, and who suffer from their debauched habit of life. These men earn high wages, take much of that pernicious compound called ale, and sometimes even drams in addition, and are, moreover, off work at the pouthouse two or three days in the week. Such men, of course, are unhealthy and short-lived.

COOPERS have good muscular exercise. When lads enter the employ, the stooping posture affects the head; and the noise, the hearing. This, indeed, is often permanently, though not greatly impaired. The men are annoyed also by pain in the loins, the result of posture. On the whole, the employment is healthy.

ROPEMAKERS, though they have exercise in the open air, suffer inconvenience from their stooping posture. A similar observation applies to **GARDENERS**.

PAVIERS are well known to have strong muscular exercise in the open air of the town. Though exposed to the weather, they are not subject to acute diseases. Their chief complaint is pain in the loins, which increases with their age. It is probably the effect of long standing and labour. Though addicted to dram-drinking, they often live to an advanced period.

A GLANCE AT GLASGOW.

It has been remarked in some of our papers of statistical information, that no country on this side of the Atlantic has exhibited so speedy a rise from poverty and idleness, to opulence and habits of industry, as Scotland. Within the last sixty or seventy years this naturally poor, and by no means fortunately situated country, has undergone a perfect revolution in its appearance and character. So striking and gratifying an instance of what can be accomplished by perseverance under difficulties and peaceful pursuits, is particularly exemplified in the history and present condition of the city of Glasgow. This large and populous town, which enjoys a pleasant situation on the north bank of the Clyde, at the head of the navigation of that beautiful river, originated in the sixth century as the seat of a pious ecclesiastic, named Mungo, and continued for many ages little else than an episcopal village. So long did it continue to be a place of small consideration, that it was not till the year 1630 that it possessed a printing press, and it was only at the revolution of 1688 that a regular quay was erected for the reception of the vessels which navigated the Clyde. Until the year 1707, when the highly advantageous measure of the Union took place, the traffic carried on by export was confined to transactions with the Continent of Europe, but, even at the best, on a small scale. It was not till the Union took effect, that any thing like a real and advantageous system of commerce was instituted. At this auspicious epoch, Glasgow rose on the ruins of many small towns on the east coast of Scotland, particularly those of Fife, whose trade it acquired. As *Bailie Nicol Jarvie* was pleased to express himself—"name were keener against the Union than the Glasgow folk, wi' their rabblings, and their risings, and their mobs," and none have profited to such an extent by this judicious measure. In short, the Union opened up a trade with the American and other colonies, induced the manufacture of lawns, cambrics, muslins, and other articles of similar fabric, and created that energy of mind in the people that has placed them in the highest rank of commercial enterprise and intelligence.

Though this great emporium of the commerce and manufactures of Scotland possesses not either the picturesque or the elegance of the legal and aristocratic capital, it is nevertheless an impressive and fine city. The number of its spires, and the judicious arrangement of its public buildings—the more general prevalence of a moderate degree of elegance in the private structures, and the grace given to the whole by the Clyde, are points in which it surpasses the more ambitious city of the east. It possesses various other advantages in point of outward appearance. Its cathedral gives a solemn dignity to the more ancient district. The college buildings, the finest in Scotland before the erection of those of Edinburgh, and still possessing the superior merit of more nearly resembling the splendid models of Oxford, have also a highly dignifying effect. The Tron-gate, which, with its continuations, intersects the whole city from east to west, is a noble piece of street scenery, indeed one of the finest things of the kind in Europe. Few of the streets are irregular or mean, while many of them may be called fine; and what must add greatly to the pleasure experienced by a stranger contemplating them, is, that all are filled during the whole day by

crowds of prosperous and happy-looking people, who walk at a lively pace, and in whose eyes some animating piece of business or of pleasure may constantly be read.

The men of Glasgow—for by this appellation are they distinguished, in popular phraseology, from the *folk* of Greenock and the *bodies* of Paisley—shine peculiarly in the walk of social hospitality. There is an openness of heart about them, that at once wins the affection and admiration of strangers. They are prosperous, and prosperity disposes them to take the world well, and view aliens with a kindly aspect. They often hold wealth by an uncertain tenure, and therefore lay the less stress upon its possession. There is also an ease in the fitness of all the individual parts of Glasgow society, which enables a stranger to join its ranks without in aught disarranging them. There is plenty of wealth for all, and no one need be jealous lest another pull the morsel from his mouth. And as there is little distinction of ranks in the commercial republic, no occasion exists for jealousy on the score of pretension. All this has a beauty in it which we look for in vain among such towns as Edinburgh, where society consists of two distinct classes, both of which are kept in a state of continual irritation and fret, by the reserve on the one hand of the upper ranks, and on the other by the forward ambition of the lower. While in Edinburgh there prevails a perpetual straining to appear members of the higher ranks of society, often at a ruinous expense, and where the glare of outward show frequently covers much secret poverty and want of substantial comfort, in Glasgow there is comparatively none of these peculiarities. There the internal abundance and comfort of the domicile ordinarily supersedes the reliance on outward architectural splendour, and the satisfaction of being in good circumstances leaves little to be desired as to the vanities of an ideal superiority of rank. The social interchange of friendly communication, which is produced by the simplicity of character in the people of Glasgow, has been highly advantageous to the general interests of the citizens. The remarkable hauteur of manner which is so observable among the mass of the population of Edinburgh, and which amounts to a species of horror of coming in contact with fellow-citizens supposed to be in the slightest degree inferior as to worldly circumstances or family connection, has been unfortunately the cause of leading the town into the most ridiculous projects, and the most grievous debts, as, by the total want of concert, in almost all cases, the inhabitants have been imposed upon by small factions of designing individuals. The opposite freedom of intercourse, which, as we say, is pursued in Glasgow, gives at all times room for a very thorough investigation of all public matters, which generally stand or fall by the prevalent opinion. The voice of all, moreover, is concentrated by a species of representation in two large reading-rooms or Exchanges—a mode of collecting general sentiment unknown in Edinburgh, where institutions of this kind have never succeeded, principally from the existing dread of a collision of ranks.

Although such are the characteristics of society in Glasgow in comparison with that of Edinburgh, it has to be stated, that before this mercantile capital arrived at its present pitch of prosperity, and ere wealth had been so universally diffused throughout all parts of its community, there seems to have existed in it as marked a division of ranks as may be observed in all less commercial cities at the present day. Many of the earlier merchants of Glasgow were younger sons of the neighbouring gentry, and traded at a time when ideas of birth were still fondly clung to by even lowlanders. When the Virginia and other foreign trades, therefore, prospered in their hands, and enabled them to hold up their heads perhaps a little higher than even the cousins, or brothers, or nephews, who represented their own families, they did not fail to comport themselves as became men who had not only a little blood, but, moreover, a good deal of money. Assuming the complete air proper to Scottish gentlemen of what is now called the old school, they wore, it is said, fine scarlet cloaks deeply trimmed with gold or silver lace, cocked hats, and canes, not forgetting under-clothes of costly velvet, and silver buckles at knee and instep. In the pride of their wealth and birth, they could be compared, we believe, to no race of men but to the merchant princes and nobles of Venice. In fact, they formed among themselves a class distinct from all their fellow-townsmen—a sort of mercantile aristocracy. Such were the Walkinshaws, the Crosses, the Stirlings, and the Glassfords, of whom it is recorded by the tradition of Glasgow, that they usually walked upon a particular side of the Tron-gate, and took it ill if any inferior persons presumed to approach or jostle them. They considered it a vast condescension to a shopkeeper or retailer if they acknowledged him in passing upon the street; and if they were graciously pleased to walk a little way with him along the pavement, they thought they had put him in a fair way of making his fortune. Though this superciliousness of manner be long since gone, and though there prevails throughout the present community of Glasgow that system of equality already noticed, society is not altogether deficient now, any more than formerly, in what may be considered an aristocracy. Among the active manufacturers of Glasgow are to be found men of prodigious wealth, and, at the same time, highly elevated and enlightened minds, who form a sort of nobility. These men, though in general raised from

a very humble rank in life, display a munificence of disposition, and a proud feeling of honour in their dealings, which might add lustre to coronets and garters. It is perhaps their noblest characteristic, that whatever may be their superiority over the rest of the citizens in point of capital, they exhibit no disposition to withdraw themselves from, or, to use other language, lord it over their less eminent brethren. They, on the contrary, disdain not to attend daily to the minutest details of their business, and, on the agitation of any public measure, are usually the first to take any interest in it, and the most active in carrying it into effect. Altogether, their public spirit and their talent, their well-won and well-used wealth, their greatness and their humility, entitle them to the admiration of even those who may be least disposed to applaud greatness in the first generation.

ANECDOTES OF SIR WALTER SCOTT.

“THE following lines were written by Walter Scott when he was between ten and eleven years of age, and while he was attending the High School, Edinburgh. His master there had spoken of him as a remarkably stupid boy, and his mother with grief acknowledged that they spoke truly. She saw him one morning in the midst of a tremendous thunder storm standing still in the street, and looking at the sky. She called to him repeatedly, but he remained looking upwards without taking the least notice of her. When he returned into the house, she was very much displeased with him: ‘Mother,’ he said, ‘I could tell you the reason why I stood still, and why I looked at the sky, if you would only give me a pencil.’ She gave him one, and, in less than five minutes, he laid a bit of paper on her lap with these words written on it:—

‘Loud o’er my head what awful thunders roll,
What vivid lightnings flash from pole to pole,
It is thy voice, my God, that bids them fly,
Thy voice directs them through the vaulted sky;
Then let the good thy mighty power revere,
Let harden’d sinners thy just judgments fear!’

The old lady repeated them to me herself, and the tears were in her eyes: for I really believe, simple as they are, that she values these lines, being the first effusion of her son’s genius, more than any later beauties which have so charmed all the world besides.”
—*Extract from an Original Letter.*

About the year 1820 or 21, when in the very zenith of his supposed prosperity, and engaged in building Abbotsford House, he one day discovered the sense he entertained of his extraordinary fortunes (a thing generally hid in the simplicity of his manners), by saying to a very familiar friend, “Lo, I passed the river Tweed with my staff and scrip, and now I am become a great nation.” He probably intended to adapt to his own case the expression of Jacob, Genesis xxxii. 10, “for with my staff I passed over this Jordan, and now I am become two bands.”

Mr Tegg, the London publisher, was taken by a Galashiels manufacturer to Abbotsford, and the latter, having been informed, jestingly, by Mr Tegg, that he was the author of Jokeby, introduced him to Sir Walter with that designation attached to his name. “The more jokes the better,” said Sir Walter, as he bustled about for a chair; and in the whole course of the interview he never made further allusion to the burlesque poem, but, after his usual manner, or it may be called policy, conversed generally upon the profession of the individual whom he was addressing.

It is on all hands confessed that nothing ever spoilt this great man. Through all his exaltations, both of fortune and reputation, he never lost the original good, easy, kind, and benignant man—never for a moment ceased to be what he naturally was. Mr Dugald Stewart, in his life of Dr Robertson, relates that that eminent writer “used frequently to say, that in Mr Hume’s gaiety there was something approaching to *infantine*; and that he had found the same thing so often exemplified in the circle of his other friends, that he was almost disposed to consider it as characteristic of genius.” This remark derives great additional force from the example of Sir Walter Scott, who seemed to prefer natural affections and natural feelings above all things, and could sympathize in all the levities and simple ideas of childhood. The individual who relates these anecdotes recollects well with what true *grandfatherly* feeling he spoke, in the end of the year 1824, of the precocious talent of his grandson, John Hugh Lockhart, then a child of hardly four years of age. John, he said, had composed a verse in imitation of a certain nursery riddle, to the following effect:—

“The waters of Tweed have broken the law,
And they’ve come roaring down the haugh;
Grandpapa and all his men
Cannot turn them back again.”

Whether we are to believe that the child really performed this feat of versification without assistance, may be matter of debate; but certainly Sir Walter spoke of the thing quite seriously, and with no little pride, as a composition of his grandson.

As another illustration of the extreme familiarity and simplicity of his manners, the following may be related:—He was sitting one evening after dinner, with a friend who has been oftener than once alluded to in these anecdotes. They were no longer drinking, neither were they talking; both were in that state of partial somnolence which sometimes occurs after

the second tumbler or first bottle has been emptied, and while as yet the candles have not been introduced to stir the company afresh with the excitement of light. All at once, amidst the twilight stillness of the hour, a hen got up a most vivacious cackle in the courtyard, so as to rouse them both effectually; and Sir Walter, to the great amusement of his friend, burst out with a musical, or rather most unmusical, imitation of the cheerful sound, which he perhaps recollected for the first time since his childhood, being a human interpretation of what the hen is supposed to say to the old woman, her mistress, when she cackles:—

“Buy tobacco—buy tobacco—I’ll pay a’!”

the “I’ll pay a’” terminating in a *scraugh* in alt, exactly after the manner of the hen. Perhaps some of our old readers will remember the time when boys used thus to give verbal expression to the parturient exultations of Dame Partlet.

In the *Album* at the Bell Rock Light-house are the following lines by Sir Walter Scott:—

PHAROS LOQUITUR.

Far in the bosom of the deep,
O’er these wild shelves my watch I keep;
A ruddy gem of changeable light,
Bound on the dusky brow of night:
The seaman bids my lustre hail,
And seems to strike his tim’rous sail.

July 30, 1814.

WALTER SCOTT.

THE VALLEY OF THE MISSISSIPPI.

ON the Continent of America the works of nature are on a great and extensive scale; and in estimating their magnitude, the mind is actually lost in wonder. When we think of the valley of any river in this country, we have only in view a district of ground measuring at most a hundred miles in length by less than the third of that extent in breadth; but in speaking of the valleys in America, we are called on to remember that they sometimes include a territory far more extensive than the whole island of Britain. The chief wonder of this description in North America is the valley of the Mississippi, which is the natural drain of the central part of that vast continent, and embraces all that tract of country of which the waters are discharged into the Gulf of Mexico. It is bounded on the north by an elevated country, which divides it from the waters that flow into Hudson’s Bay, and the northern lakes and St Lawrence; on the east by the table land from whence descend the waters that fall into the Atlantic; and on the west by the Rocky, or Chippewau Mountains, which separate the waters of the Atlantic from those of the Pacific.

This great central vale of America is considered the largest division of the globe, of which the waters pass into one estuary. It extends from the 29th to the 49th degree of north latitude, or about 1400 miles from south to north, while the breadth across is about the same dimensions. To suppose the United States and its territory to be divided into three portions, the arrangement would be—the Atlantic slope, the Mississippi basin or valley, and the Pacific slope. A glance on any map of North America will show that this valley includes about two-thirds of the territory of the United States. The Atlantic slope contains 390,000, the Pacific slope about 300,000, which, combined, are 690,000 square miles; while the valley of the Mississippi contains at least 1,300,000 square miles, or four times as much land as the whole of England. This great vale is divided into two portions, the Upper and Lower Valley, distinguished by particular features, and separated by an imaginary intersecting line at the place where the Ohio pours its waters into the Mississippi. This large river has many tributaries of first rate proportions besides the Ohio. The chief is the Missouri, which indeed is the main stream, for it is not only longer and larger, but drains a greater extent of country. Its length is computed at 1870 miles, and upon a particular course 3000 miles. In its appearance it is turbid, violent, and rapid, while the Mississippi, above its junction with the Missouri, is clear, with a gentle current. At St Charles, 20 miles from its entrance into the Mississippi, the Missouri measures from five to six hundred yards across, though its depth is only a few fathoms.

The Mississippi Proper takes its rise in Cedar Lake, in the 47th degree of north latitude. From this to the Falls of St Anthony, a distance of five hundred miles, it runs in a devious course, first south-east, then south-west, and, finally, south-east again; which last it continues, without much deviation, till it reaches the Missouri, the waters of which strike it at right angles, and throw the current of the Mississippi entirely upon the eastern side. The prominent branch of the Upper Mississippi is the St Peter’s, which rises in the great prairies in the north-west, and enters the parent stream a little below the Falls of St Anthony. The Kaskaskia next joins it, after a course of 200 miles. In the 36th degree of north latitude, the Ohio (formed by the junction of the Alleghany and Monongahela) pours in its tribute, after pursuing a course of 750 miles, and draining about 200,000 square miles of country. A little below the 34th degree the White River enters, after a course of more than 1000 miles. Thirty miles below that, the Arkansas, bringing in its tribute from the confines of Mexico, pours in its waters. Its last great tributary is Red River, a stream taking its rise in the Mexican dominions, and flowing a course of more than 2000 miles.

Hitherto the waters in the wide regions of the west have been congregating to one point. The “Father

of Waters" is now upwards of a mile in width, and several fathoms deep. During its annual floods it overflows its banks below the mouth of the Ohio, and sometimes extends thirty and forty miles into the interior, laying the prairies, bottoms, swamps, and other low grounds under water for a season. After receiving Red River, this vast stream is unable to continue in one channel; it parts into separate courses, and, like the Nile, finds its way to the ocean at different and distant points.

The capabilities of the Mississippi for purposes of trade are almost beyond calculation, and are hardly yet developed. For thousands of years this magnificent American river rolled its placid and undisturbed waters amidst widely-spreading forests, rich green prairies, and swelling mountain scenery, ornamented with the ever-varying tints of nature in its wildest mood, unnoticed save by the wandering savage of the west, or the animals which browse upon its banks. At length it came under the observation of civilized men, and now has begun to contribute to their wants and wishes. Every part of the vast region irrigated by the main stream and its tributaries can be penetrated by steam-boats and other water craft; nor is there a spot in all this wide territory, excepting a small district in the plains of Upper Missouri, that is more than one hundred miles from some navigable water. A boat may take in its lading on the banks of the Chatague Lake, in the state of New York—another may receive its cargo in the interior of Virginia—a third may start from the Rice Lakes at the head of the Mississippi—and a fourth may come laden with furs from the Chippewau Mountains, 2800 miles up the Missouri—and all meet at the mouth of the Ohio, and proceed in company to the ocean.

Reader, you probably inhabit the island of Great Britain, where the traffic of every sea-port, every branch of inland navigation, has been pushed to its utmost limits—where every art is overdone, and where the heart of the ingenious almost sinks within them for want of scope for their enterprise. But, reader, here, on this wide-spread ramification of navigable streams, there is an endless, a boundless field for mercantile adventure. Within the last twenty-four years, the Mississippi, with the Ohio, and its other large tributaries, have been covered with steam-boats and barges of every kind, and populous cities have sprung up on their banks. There are now sea-ports at the centre of the American continent—trading towns, each already doing more business than some half dozen celebrated ports in the Old World, with all the protection which restrictive enactments and traditional importance can confer upon them.

The valley of the Mississippi, one of the greatest natural wonders of the world, will one day possess and comfortably sustain a population nearly as great as that of all Europe. Let its inhabitants become equally dense with England, including Wales, which contains 207 to the square mile, and its numbers will amount to 179,400,000. But let it become equal to the Netherlands—which its fertility would warrant—and its surface will sustain a population of two hundred millions. What reflections ought this view to present to the philanthropist and the Christian!*

POMPEII AND HERCULANEUM.

SECOND ARTICLE.

BATHS.

It is well known, that, amongst the Romans, bathing formed a part of every day's occupation. It was a luxury universally indulged in by both sexes; and the buildings erected for the accommodation of the public were generally remarkable for their costliness and splendour. In the year 1824 the baths of Pompeii were excavated. They are admirably arranged, spacious, highly decorated, and superior to any thing of the kind in modern cities. They are, fortunately, in good preservation, and throw considerable light on what the ancients have written upon the subject.

It was customary with the Romans to solemnize the completion of a public work by dedicating it, which consisted simply in opening the building to the people in a solemn manner, and gratifying them with largesses and the exhibition of spectacles, to which that extraordinary people were exceedingly partial. Various circumstances prove that the completion of the baths only a short while preceded the destruction of the city. They occupy a considerable space, and are divided into three separate compartments. One of these was set apart for the fire-places and the accommodation of the servants; and the other two were each occupied by a set of baths, one of which was appropriated to the men, and the other to the women. The apartments and passages are paved with white marble in mosaic, or alternate white and black squares. The chambers are ornamented with various devices, and highly finished. Above one thousand lamps were discovered during the excavations.

There were three kinds of baths; the frigidarium, or cold baths; the tepidarium, or tepid baths; and the caldarium, or warm baths. The frigidarium is a round chamber, encrusted with yellow stucco, with indications here and there of green. The walls are ornamented with figures modelled in stucco. The ba-

sin is twelve feet ten inches in diameter, and two feet nine inches deep, and is entirely lined with white marble. The plan for emptying and filling it was similar to that adopted amongst ourselves. This frigidarium is remarkable for its preservation and beauty.

The tepidarium was so called, because its temperature was of a mild warmth, and which prepared the bodies of the bathers for the more intense heat which they were to undergo in the vapour and hot baths, and also softened the transition from the hot bath to the external air. It is divided into a number of compartments by Telamones,* two feet high, carved in high relief, placed against the walls, and supporting a rich cornice. They are composed of baked clay, encrusted with the finest marble stucco. They have been originally painted of a flesh colour, with black hair and beards. The basket on their heads, and the moulding of the pedestal, were in imitation of gold. The pedestal itself, the wall behind, and the niches for the reception of the bathers' clothes, were an imitation of red porphyry. The ceiling is worked in stucco, and ornamented with figures, and carvings. The window of this room is two feet six inches high, by three feet wide, in the bronze frame of which were four beautiful panes of glass, fastened by small nuts and screws, so that they could be removed at pleasure. From this, it is evident that windows of glass were in use amongst the ancients. Glass-blowing seems to have been better understood by them than the learned seem inclined to admit of. This is proved from the quantities of bottles, vases, glasses, and other utensils which have been discovered at Pompeii. Amongst other articles found in this bath was a large and handsome bronze brasier.

The caldarium had on one side the laconicum, where was placed a vase, called labrum, for washing the hands and face. On the opposite side was the hot bath, called lavacrum. The labrum was a great round basin of white marble, into which the hot water bubbled up through a pipe in its centre, and served for the partial ablutions of those who took the vapour bath. This apartment like the others is well stuccoed, and painted yellow. These details, although necessarily circumscribed, afford us some idea of the value which the Romans attached to bathing.

In a street which conducts to the Forum, called the street of Fortune, an immense number of utensils have been found. Amongst other articles were vases, basins with handles, bells, elastic springs, hinges, buckles for harness, a lock, an inkstand, gold earrings, a silver spoon, an oval cauldron, a saucepan, a mould for pastry, and a weight of alabaster, used in spinning, with its ivory axis remaining; a number of lamps, three boxes, with a slit to keep money in, in one of which were found several coins of Titus, Vespasian, and Domitian, &c. &c. Among the most curious things discovered were seven glazed plates packed in straw. A pair of scales and steelyard were likewise found.

Gell informs us that the skeleton of a Pompeian was here found, "who, apparently, for the sake of sixty coins, a small plate, and a saucepan of silver, had remained in the house till the street was already half filled with volcanic matter." From the situation in which he was found, he had apparently been arrested while in the act of escaping from the window. Two others were also found in the same street.

THEATRES.

There have been two theatres excavated, a large and a small one; both display the remains of considerable magnificence. They are constructed after the usual plan of a Roman theatre. The seats for the audience were semicircular, and sloped downwards like those in the galleries of our own theatres. At the bottom was the orchestra, and in front the stage. Within the orchestra were circular ranges of seats set apart for the senate, and other distinguished individuals. The theatre is formed upon the side of a hill, the corridor being the highest part, so that the audience on entering descended at once to their seats. There is space to contain about five thousand persons. This theatre appears to have been entirely covered with marble, although only a few fragments remain—another proof that the ancients had visited Pompeii after the eruption, and despoiled it of what was most valuable.

The small theatre nearly resembles the large one in plan and disposition of parts, but there is this remarkable difference: it appears from an inscription to have been permanently roofed. It has been computed that it accommodated fifteen hundred persons.

Adjoining to the theatres, a building has been excavated, called, from the style of its architecture, the Greek Temple, otherwise, the Temple of Hercules. The date of its erection some have supposed to be as far back as eight hundred years before the Christian era. It is in a very dilapidated state. Before the steps in front there is an enclosure supposed to have been a pen to contain victims for the sacrifice, and by its side two altars. Near to the small theatre, a large angular enclosure has been excavated, which has been called the Provision Market by some, by others the Soldiers' Quarters. It contains a number of small chambers, supposed to have been occupied by butchers, and vendors of meats, liquors, &c. In one of these, utensils for the manufacture of soap were discovered;

in another, an oil mill; in a third, supposed to have been a prison, stocks were found; and in a fourth were pieces of armour, whence it has been called the Guard Room. In this quarter of the city a bronze helmet was found, enriched with bas-reliefs relating to the principal events of the capture of Troy. Another helmet found represents the triumphs of Rome; greaves of bronze, highly ornamented, were also found. Contiguous to the little theatre the house of a sculptor has been cleared. Here were found statues, some half finished, others just begun, with blocks of marble, and all the tools required by the artist.

The Temple of Isis is here situated. It is one of the most perfect examples now existing of the parts and disposition of an ancient temple. The skeleton of a priest was found in one of the rooms. Near his remains lay an axe, from which it would appear that he had delayed his departure till the door was closed up, and so attempted to break through the walls with his axe. He had already forced his way through two, but, before he could pass the third, was suffocated by the vapour. Within the sacred precincts lay a number of skeletons, probably those of priests, who, reposing a vain confidence in their deity, would not desert her temple, until escape was hopeless. Several paintings of the priests of Isis, and the ceremonies of their worship, together with a statue of the deity herself, were found.

AMPHITHEATRE.

A Roman amphitheatre was a building of an oval form, having its area encompassed with rows of seats, one above another, where spectators might witness gladiatorial and other exhibitions. In the Street of Tombs, which is situated without the principal gate of the city, there is a bas-relief on one of the tombs, which represents the amusements of the amphitheatre. These, it would appear, consisted of combats of various kinds between men and wild beasts—as bears, lions, panthers, &c.; and also between two gladiators, some of which were equestrian.

The Amphitheatre of Pompeii does not differ in any particular from other Roman buildings of the same kind. Its form, as usual, is oval. The extreme length, from outside to outside of the exterior arcade, is 430 feet; its greatest breadth is 335 feet. The spectators were admitted by tickets, which had marks and numbers on them corresponding with similar signs on the arches through which they entered. The seats are elevated above the arena upon a high podium or parapet, upon which, when the building was first opened, there were several inscriptions, containing the names of duumvirs who had presided upon different occasions. There were also paintings in fresco—one representing a tigress fighting with a wild boar; another, a stag chased by a lioness; another, a battle between a bull and a bear. There were other representations besides these; but the whole disappeared upon exposure to the atmosphere. The Amphitheatre comprises twenty-four rows of seats, and is calculated to have accommodated ten thousand people, exclusive of those who were obliged to take up with standing room.—To be continued.

THE POINT OF HONOUR.

"He would find it another guess story, Would bring his bare back to the cat."

"I SAY he was a Tartar," said an old pensioner, turning round the quadrangle of the building, and advancing upon the terrace, near the spot where I was standing, contemplating the beauties of a summer evening—"I say he was a Tartar." "Then you are mistaken, Harry," replied his companion; "he was a lad who did his duty, and saw that every one did theirs. I allow that he was strict, but always a sailor's friend." "Ay, ay, for tarring a rope's end, or rope's ending a tar, 'twas all the same to him. His cats were often fed, Tom." "That's poor wit, Harry; I sailed with him captain and admiral some years, and ought to know a little about him." "Well, well, messmate, mayhap you did so; let's hear, for I love to talk about past times and old commanders. There's old Jarvis has dowed his coach-whip, and gone out of commission, and Lord Keith has resigned his command to harbour in a better world. I've sailed with 'em both, but I'll not say more till you've told me of Seymour." "Why then, d'ye see, where could there be a stronger attachment shown to our officers then when we arrived at Spithead during the mutiny? Ah, Harry, you old cartridge! you was then in that rebel ship the *Triumph*—but howsoever I won't blow you up. You must know Lieutenant Q—was commanding-officer when the delegates came on board. 'Well, my men,' says he, 'what do you want here?' 'We want to speak to the ship's company, sir,' said the foremost. 'Oh, certainly, certainly,' replied the lieutenant. 'Here, boatswain's mate, pass the word, and walk forward my men.' Well, Harry, you old rogue, didn't we all muster on the fore-castle, and listen to their lingo? Ay, that we did. And says our spokesman, says he, 'Mayhap, gemmen, you have had bad treatment, and are dissatisfied with your officers?' 'Yes, yes,' said the leader, 'you're right.' 'Then all we have to say is,' said our spokesman, 'that we are not. We like our ship, like our captain, like our officers, and like one another—and so, gemmen, good day.' There was reasoning for you, you old swab. Ah, Harry, you ought to have been taken in *twice* for a mutineer; and, now I'm in the line, I'll tell you more. D'ye see, every order was exposed publicly for

* The facts in this article have chiefly been gleaned from a small American publication, entitled "Peck's Guide to Emigrants, containing Sketches of Illinois, Missouri, and the adjacent Parts. Boston, 1831."

* Figures of men, usually in a slightly stooping position, and supporting cornices in buildings.

the ship's company to read, so that every man fore and aft knew what he had to do. This was his plan: "Do your duty, and no one shall wrong you; neglect it, and I'll punish." Among other orders, there was one, that no man should sing out, either in pulling a rope, or any other duty, but all were to be silent as death. One day we were mooring ship, when some one sung out, at the capstan, "Hurrah, my boys! heave!" The captain heard it—"Send that man on deck directly." The officer immediately pick'd him out, and he was ordered aft under the sentry's charge. As soon as the ship was moored, the hands were turned up for punishment. Well, up we goes, and there stood the captain with the Articles of War in his hand—by-the-by I don't think he was a lord then. However, there he stood, and the officers around him in their cocked hats and swords. The gratings were washed to the break of the poop, the quarter-masters ready with their foxes, and the boatswain's mates with the cats. "Come here, my man," said the captain.

"Was it not my orders that there should be silence fore and aft?" "Yes, sir." "And why did you disobey?" "It warn't me, sir; I never opened my lips." "Are you sure this was the man that sung out at the capstan?" said the captain, turning to the officer. "Yes, sir, confident: I removed him instantly from the bar." "Indeed, sir, Mr — is mistaken—I never spoke." "Are you certain, Mr —?" "Yes, sir, quite certain." "Strip, then." It was complied with. The poor fellow was seized up—hats off—the article for disobedience of orders read—and 'boatswain's mate, give him two dozen,' was heard. The tails of the cat were clear'd, the arms was lifted up, and the blow just falling, when a man rush'd from amongst us, and call'd out, "Avast! it was I that sung out at the capstan!" and in an instant his shirt was over his head, and his back bare. "Stop," said the captain to the boatswain's mate; and then, turning to the seaman, "Why didn't you come forward before?" "Because, sir, I was in hopes you would have taken my messmate's word, for he never tells a lie, axing your pardon; but when I saw him likely to suffer for me, no, no, I couldn't stand that." "And did he know it was you?" "Yes, your honour, he knew it well; I was alongside of him at the bar—but he scorn'd to flinch." "Cast him off, and pipe down," said the captain. But oh, Harry, if you had seen the two bare-backed dogs stand and look at each other for more than a minute without moving, and then, grasping each other's hands, after a hearty shake, walk off together—but I can't describe it, though I've got it all in my heart as strong now as I had then."

"And what became of the officer?"

"Why, the captain slued round to him, and —" Here they again turned the quadrangle; all was hush'd, and I sought my pillow.—*Greenwich Hospital.*

DOES THE SOUL ALWAYS THINK?

A FAVOURITE argument with the advocates for faith in dreams is, that, though the body be liable to exhaustion, and to a temporary suspension of its powers, while the repair of its wasted energies is going on, the soul, which is of an imperishable, and, therefore, indefectible essence, never relaxes its activity, but, while the limbs are sunk in repose, gladly seizes the opportunity of escaping from its mortal coil, and, roaming in the world of spirits, holds communion with kindred angels, and from them receives instruction in such knowledge as is suitable to its nature. A portion of the knowledge acquired in these excursions, penetrating the dull vapours which wrap our mortal being, is represented to reach us in dreams, the greater part, however, never being perceived at all; "for," says an old writer, "the thoughts of worldly affairs, and the intemperances most men commit in meats, drinks, labours, exercises, and passions, enfeeble and destroy the brisk, lively apprehensions, and stupify all the faculties of nature: and particularly the memory and retaining power are so dulled and rendered fluid and oblivious, as not to conserve any impressions made thereon—as we see in drunken men, who the next day remember none of those loud vociferations and mad pranks they played over night. And you may as well argue," continues he, "that such lewd people did not commit any such extravagancies, because very often they are not sensible of them after they come to be sober, as to think you do not dream, because sometimes you cannot remember it when you wake."

Addison, in the 487th paper of the *Spectator*, pursues the same fanciful train of thought. "Our dreams," says he, "are great instances of that activity which is natural to the human soul, and which it is not in the power of sleep to deaden or abate. When the man appears tired and worn out with the labours of the day, this active part in his composition is still busied and unwearied. When the organs of sense want their due repose and reparations, and the

body is no longer able to keep pace with that spiritual substance to which it is united, the soul exerts herself in her several faculties, and continues in the action till her partner is again qualified to bear her company."

Absolute proof that the soul does not always think, cannot perhaps be given; but, as far as the subject admits of investigation, we find every fact obtained to be arrayed against the supposition that it does. In the first place, if the soul be so resolute upon perpetual thought, and so well fitted for it that it never breaks off from the exercise, one would expect it not to flag or be overcome with fatigue, but to be at all times equally vigilant and able to perform whatever task of contemplation comes in its way. How does the experience of every man who has been accustomed to think at all contradict this! How worn out by long application to study, and, after an interval of relaxation, how invigorated to resume it is he whom the pursuit of knowledge has captivated! The soul must be very capricious indeed, if it be fit for continual motion, and yet get on at this halting pace; when, too, the goal in view is one which itself fervently desires to reach. In the second place, if the soul were occupied in thinking as well when we sleep as when we are awake, it would surely be a matter of indifference to it in which of these states the body is; and drowsiness, stealing heavily on the eyelids, should never be able to deaden the liveliness of our ideas. Now, in sinking to rest, we perceive the powers of thought gradually weakened till they approach the point of complete suspension. We should be still more sensible of this declension of their energies, if it were not that the effort necessary for observation counteracts the pleasing encroachments of oblivion, and banishes those symptoms which it is our object to examine. But, though we cannot, upon any single occasion, minutely scrutinize the steps by which sleep advances, their repeated occurrence makes us in time sufficiently aware of their nature, and teaches us how to invite them. Accordingly, many persons who, at the hour of rest, find their minds employed with mistimed activity on any subject which excites the attention strongly, have recourse to numbering, in order that, excluding those ideas we have from reflection and association, and confining themselves to a single exertion of memory, the current of thought may at last become so attenuated as to be easily got rid of altogether. The mind thus throws off its thoughts just as a man gives the slip to a crowd of troublesome companions, and, released from their pressure, delivers itself up to the enjoyment of the wished-for repose.

At some times, also, when we are not desirous to invite sleep, we find it induced by whatever tends to limit the range of our ideas; pleasing and monotonous sounds—the hum of bees, the murmur of a fountain, the chanting of music to which the ear is accustomed, the reading of an uninteresting discourse—withdraw the mind from other contemplations, and do not present it with any new theme of meditation. The consequence is, that, in this insidious manner, many an honest gentleman is stolen from his thoughts at very inconvenient seasons. "It is also matter of common observation," says Stewart, "that children, and persons of little reflection, who are chiefly occupied about sensible objects, and whose mental activity is in a great measure suspended as soon as their perceptive powers are unemployed, find it extremely difficult to continue awake when they are deprived of their usual engagements. The same thing has been remarked of savages, whose time, like that of the lower animals, is almost completely divided between sleep and their bodily exertions."

While we thus see that the absence of thought brings on sleep, it is no less true that the active exercise of the thinking powers keeps drowsiness aloof. Anxiety, in its various shapes, banishes long the desire of repose; the philosopher, intent on his favourite study, pursues it deep in the night; and even those who have no good will to watch, are often compelled to be awake, because they have become involved in a train of musing, from which they cannot escape till the whole current of thick-coming fancies be run out. If the soul can think as well without the assistance of the corporeal functions, is it not strange, that, when it has matters of contemplation on hand, it should detain them so long from yielding to the soft enticements of slumber? Its conduct in this respect would appear no less unreasonable than that of a mathematician who should insist upon his whole household sitting up until he solve his problem, although their doing so cannot help him a jot.

But the advocates for perpetual thought deny, that, in long application to business or study, it is the soul which fails. This principle of life and action, they say, would never relax its exertions, unless some de-

fect in the body forced it to desist, and abandon the material organ till the waste be repaired—just as a breach in the roof of his workshop obliges the artificer to desert it until the tiles be renewed. There is, however, we may remark, this difference between the two cases—that, while the artificer may pursue his trade elsewhere with little diminution of his profits, the soul, let it think ever so assiduously when absent from the body, derives no benefit from any of the stores of knowledge it may then accumulate. It might, therefore, as well avoid all this fruitless trouble. "To think often," says Locke, "and never to retain it so much as one moment, is a very useless sort of thinking; and the soul, in such a state of thinking, does very little, if at all, excel that of a looking-glass, which constantly receives varieties of images or ideas, but retains none; they disappear and vanish, and there remain no footsteps of them; the looking-glass is never the better for such ideas, nor the soul for such thoughts." And not only does the soul never bring back from its nocturnal flights any new discoveries, by which its own condition, or that of its companion, the body, might be elevated or improved, but it is wholly unconscious of having been engaged in them; inasmuch that, if a man were roused, and, with a sword pointed to his breast, commanded to tell what he was thinking of the moment before, he could not save his life by giving any manner of account of his sleeping contemplations—they have escaped him utterly, and without the smallest hope of recall. This is a degree of forgetfulness which we can find nothing to parallel. That produced by intoxication is, indeed, said to resemble it; but it can by no means be made to appear that it is the same, or even makes an approach to it: for, though the reveller may recollect but hazily in the morning that he broke a watchman's lantern overnight, he is conscious of it while the act is doing, and for some time after; so that, if it were possible for his drunkenness to be shaken off as instantaneously as sleep is dispelled, there seems no reason to suppose he would be at a loss to remember his riotous behaviour the moment before. The same thing may be said of persons, who, on recovering from delirium, brought on by fevers or otherwise, remember nothing of what they said or did, and yet were active and perceptive all the while.

Nor is it an argument to the purpose to say, that one may as well maintain a drunken man was guilty of no extravagancies, because he does not remember them when the fumes of the liquor have evaporated, as to think the soul is not employed during sleep, though all its transactions cannot be traced after waking. Watchmen with their shattered lanterns afford sufficient extraneous evidence of the midnight riot. But no testimony whatever can be brought to the fact of the soul's thinking; we are not conscious of it ourselves, and no man's soul ever perceived his neighbour's soul so engaged.

It is indeed said, that glimpses of the occupations of the soul during sleep are afforded by dreams; and that, since there are some dreams which we recollect imperfectly, and others, of which, though we are certain we had them, no particulars are retained, it is reasonable to conclude it is owing to defect of memory that the whole of the soul's midnight musings are not retained. But this is to offer conjecture for argument: as well might the judge hold it to be established against a reveller, that he continued breaking lamps the whole night without intermission, whenever it is established against him that he broke one or a couple.

Moreover, if we were to grant that dreams are the offspring of the soul at a time when it is independent of the body, and has an opportunity of exerting its native energies uncontrolled, what would be the consequence to the argument of those who maintain such a doctrine? The body is represented as being a clog upon its spiritual companion, restraining all its nobler aspirations, and keeping it to the drudgery of ordinary thinking; and dreaming, we are told, is a state in which the soul, released from this ignoble subserviency, rushes amid scenes worthy of itself, and engages in conceptions upon a magnificent scale, which prove the vastness of its powers, and the perfection of its original constitution. One would therefore naturally expect dreams to be the most rational things in the world—models which wise men should never for a moment lose sight of in training themselves to correct habits of thinking. Is it so? The case is entirely different; nor is there any thing which so readily suggests the idea of disorder and extravagance as the mention of a dream. To what a poor pass, then, would they reduce the soul, who would persuade us, that in dreams we have a glimpse of the excellent thoughts it might be expected to hit upon, if it were not for its unfortunate connection with the body! They appreciate dreaming better, who hold it to be a deteriorated kind of thinking—"an emunctory of the brain," as Fordyce expresses it, "by which the whole refuse of fancy is drained off."

Thus we see there is no proof nor tenable argument for the opinion that the soul spontaneously engages and continues engrossed in dreams or trains of thought during the whole time that the body is asleep. The only other conclusion is, that the soul, as well as the body, requires rest, and that, though they are so distinct in their nature, their union is arranged upon principles of mutual dependence so perfect, that they both need repose at the same intervals, and are equally refreshed by the same portion of it.

* A Treatise of Dreams and Visions, by Philotheus Physiologus.

Gardening.—DECEMBER.

FRUIT GARDEN.—Continue to prune and train wall trees and espaliers, and to prune all standard and dwarf trees and bushes in the orchard and garden. In looking over the espaliers, where any of the stakes are decayed they must be replaced with new ones, and the whole put into a thorough state of repair, previously to the commencement of training. Where the trees and bushes have been pruned in the quarters or on the borders, these places should be dug over, leaving the ground rough to be acted upon by the winter frosts; and, where the ground is hard, it ought to have been dug in, which will benefit the trees much more than it would if left till the spring.

KITCHEN GARDEN.—Trench and manure ground for spring crops. Force asparagus, Elford rhubarb, and sea kale. In the early part of the month lay in purple and white broccoli, unless it has been done already. Earth up peas and beans, where the tops are advanced from early sowing; also cardoons and celery, for the last time. The finest ridges of celery should now be covered with litter or soft meadow hay, to keep off severe frost, or the tops will rot, and this will in time extend down to the root. Cover the mushroom beds thickly with clean dry straw, and do not let the mushroom-house descend to a lower temperature than 50 degrees of Fahrenheit's scale. Look over the cauliflower plants in frames, and pick off all decayed leaves. Every day the weather is mild and dry, let the glasses be taken off, that the plants may have free air; but let the lights be put on every night. When the weather is very wet, keep the lights over them; but, at the same time, if mild, let them be raised at the back of the frames, to let in a large portion of air to the plants. In severe frosty weather, keep the plants constantly covered with the glasses, and other covering of mats, straw, fern, and other long litter; and apply long litter also round the outsides of the frames, when the frost is very rigorous. Cauliflower plants under hand-glasses must be treated in the same manner. Lettuces in frames and under hand-glasses require similar treatment.—*Lindley's Guide to the Orchard and Kitchen Garden.*

JEANIE MORRISON.*

I've wander'd east, I've wander'd west,
Through morn'g a weary way;
But never, never, can forget
The love o' life's young day!
The fire that's bly'n on Beltane e'en,
May weel be black gin Yule;
But blacker fa' awaits the heart
Where first fond love grows eulie.

O dear, dear Jeanie Morrison,
The thochts o' bygone years
Still fling their shadows ower my path,
And blind my een wi' tears:
They blind my een wi' saut, saut tears,
And sair and siek I pine,
As memory idly summons up
The blithe blinks o' langsyne.

'Twas then we luvit lik'er weel,
'Twas then wee did part;
Sweet time—sae time! Iwa baiths at schule,
'Twa baiths, and but ae heart!
'Twas then we sat on ae laigh bink,
To leir lik'er leir;
And tones, and looks, and smiles were shed,
Remember'd ever mair.

I wonder, Jeanie, afen yet,
When sitting on that bink,
Cheek touchin' cheek, loof loof'd in loof,
What our wee heads could think.
When baith bent down ower ae braid page,
Wi' ae buik on our knee,
Thy lips were on thy lesson, but
My lesson was in thee.

O mind ye how we hung ower heads,
How cheeks bren'd red wi' shame,
Whene'er the schule-weans, laughin', said,
We cleek'd t'gether hame?
And mind ye o' the Saturdays,
(The schule ween saill at noon),
When we ran aff to speel the braes—
The broomy braes o' June!

My head rins round and round about,
My heart flows like a sea,
As ane by ane the thochts rush back
O' schule time and o' thee.
Oh, mornin' life! Oh, mornin' luv!
Oh, lightsome days and lang,
When hinnied hopes around our hearts,
Like simmer blossoms, sprang!

O mind ye, luv, how aft we left
The deavin' dinsome toun,
To wander by the green burnside,
And hear its water croon;
The simmer leaves hung ower our heads,
The flowers burst round our feet,
And in the gloamin' o' the wud
The throssil whussit sweet.

The throssil whussit in the wud,
The burn sung to the trees,
And we with Nature's heart in tune
Concerted harmonies;
And on the knowe abune the burn,
For hours the birds sat
In the silentness o' joy, till baith
Wi' vera gladness gat!

Aye, aye, dear Jeanie Morrison,
Tears trinkled doun your cheek,
Like dew-beads on a rose, yet nane
Had ony power to speak!
That was a time, a blessed time,
When hearts were fresh and young,
When freely gush'd all feelings forth,
Unsyllabled—unsung!

I marvel, Jeanie Morrison,
Gin I ha'e been to thee
As closely twined wi' earliest thochts
As ye ha'e been to me!
Oh! tell me gin their music fills
Thine ear as it does mine;
Oh! say gin e'er your heart grows girt
Wi' dreamings o' langsyne?

I've wander'd east, I've wander'd west,
I've borne a weary lot;
But in my wanderings, far or near,
Ye never were forgot.
The fount that first burst frae this heart,
Still travels on its way;
And channels deeper as it rins,
The luv o' life's young day.

O dear, dear Jeanie Morrison,
Since we were sinder'd young,
I've never seen your face, nor heard
The music o' your tongue;
But I could hug all wretchedness,
And happy could I dee,
Did I but ken your heart still dream'd
O' bygone days and me!

* This poem—the most beautifully natural, the most elegantly expressed, the most replete with tender and mournful association, that we have read for a long time—is the composition of William Motherwell. Esq. a gentleman who promises to become a distinguished ornament of Scottish literature. It is borrowed from *Tail's Edinburgh Magazine*.

MARCH OF SCIENCE OVER IMPROVED ROADS.

Nearly all the plans for proposed new rail-roads set forth with proposals to carry goods and passengers at the rate of twenty miles an hour, including stoppages. It is the opinion of the most distinguished men of science, that this rate is only the first step in improvement, and that it is not extravagant to expect that this rate will in time be doubled with safety, and the cost of the conveyance at the same time cheapened. Compare this with the state of the roads until within fifty or sixty years ago. "It is not easy," says Mr M'Culloch, in his new and able Commercial Dictionary, "for those accustomed to travel along the smooth and level roads by which every part of this country is now intersected, to form any accurate idea of the difficulties the traveller had to encounter a century ago. Roads were then hardly formed, and in summer not unfrequently consisted of the bottoms of rivulets. Down to the middle of the last century, most of the goods conveyed from place to place in Scotland, at least where the distances were not very great, were carried, not by carts or waggons, but on horseback. Oatmeal, coal, turf, and even straw and hay, were conveyed in this way. At this period, and for long previous, there was a set of single-horse traffickers (cadgers), that regularly plied between different places, supplying the inhabitants with such articles as were then most in demand, as salt, fish, poultry, eggs, earthenware, &c.; these were usually conveyed in sacks or baskets, suspended one on each side of the horse. But in carrying goods between distant places it was necessary to employ a cart, as all that a horse could carry on his back was not sufficient to defray the cost of a long journey. The time that the carriers (for such was the name given to those who used carts) usually required to perform their journeys, seems now almost incredible. The common carrier from Selkirk to Edinburgh, thirty-eight miles distant, required a fortnight for his journey between the two places, going and returning! The road originally was among the most perilous in the whole country; a considerable extent of it lay in the bottom of that district called Gala-water, from the name of the principal stream, the channel of the water being, when not flooded, the tract chosen as the most level, and easiest to travel in. Even between the largest cities, the means of travelling were but little superior. In 1678, an agreement was made to run a coach between Edinburgh and Glasgow, a distance of forty-four miles, which was to be drawn by six horses, and to perform the journey from Glasgow to Edinburgh and back again in six days. Even so late as the middle of last century, it took a day and a half for the stage-coach to travel from Edinburgh to Glasgow, a journey which is now accomplished in four and a half or five hours. So late as 1763, there was but one stage-coach from Edinburgh to London, and it set out only once a month, taking from twelve to fourteen days to perform the journey! At present, notwithstanding the immense intercourse between the two cities by means of steam-packets, smacks, &c., six or seven coaches set out each day from the one for the other, performing the journey in from forty-five to forty-eight hours."—*Edinburgh paper.*

SINGULAR ANECDOTE OF GARRICK.

One afternoon, when Garrick expected Dr Monsey to call on him, he desired the servant to conduct the Doctor into his bed-room. Garrick was announced for King Lear on that night, and when Monsey saw him in bed, he expressed his surprise, and asked him if the play was to be changed. Garrick was dressed, but had his nightcap on, and the quilt was drawn over him, to give him the appearance of being too ill to rise. Monsey expressed his surprise, as it was time for Garrick to be at the theatre to dress for King Lear. Garrick, in a languid and whining tone, told him that he was too much indisposed to perform himself, but that there was an actor named Marr, so like him in figure, face, and voice, and so admirable a mimic, that he had ventured to trust the part to him, and was sure that the audience would not perceive the difference. Pretending to be worse, he requested Monsey to leave the room, that he might get a little sleep, but desired him to attend the Theatre, and let him know the result. As soon as the Doctor quitted the room, Garrick jumped out of bed, and hastened to the Theatre. Monsey attended the performance. Having left Garrick in bed, he was bewildered by the scene before him, sometimes doubting, and sometimes being astonished at the resemblance between Garrick and Marr. At length, finding that the audience were convinced of Garrick's identity, Monsey began to suspect that a trick had been practised upon him, and hurried to Garrick's house at the end of the play; but Garrick had been too quick for him, and was found by Monsey in the same apparent state of illness. Some friends of Garrick who had been let into the secret, and were present at the performance, witnessed and enjoyed Monsey's perplexity, who, when he discovered the deception, shared in the laugh at his own expense, determining, however, to retaliate on the first opportunity.—*Records of My Life, by the late John Taylor.*

CURIOUS CUSTOM IN SWEDEN.

It is an almost universal custom in Sweden, at Christmas time, to expose a sheaf of unthrashed corn on a pole in the vicinity of their dwellings, for the poor sparrows and other birds which at this inclement period of the year must be in a state of starvation.

EUROPEAN SHEEP.

Nearly every country in Europe has its own race of sheep. These, again, are subdivided into peculiar varieties, arising from difference of climate, food, treatment, and intermixture. European sheep vary considerably in size and form; but the most important difference is in the quantity and quality of the wool, it being thin in some, dense in others, coarse or fine, more or less elastic, &c. &c. Of the German sheep there are the following varieties:—The Friesland, about three feet high and four in length, producing a coarse wool about four or five inches long. It yields two lambs in the year, is strong, and endures winter even in the open air. It is found in the marshes of Schleswick, near Husum, in Friesland, in the environs of Bremen, in Holland, &c., and if put upon inferior pasture, soon degenerates, and becomes smaller. The Eyderstaedt, which is somewhat smaller, having long wool on the back, and very short hairs on the belly and thighs. The Suabian, also termed Zaubelschaff, found in different parts of Suabia and Franconia. It is small, lambs twice yearly, and produces about two pounds of fine wool, like flock silk. It is soon affected by the wet. The Heather sheep, also called Heidschnucke, one of the smallest kinds, found on the heath of Lunebourg, in the environs of Bremen, and the Mark. It is commonly horned, with black face and legs, and has a lively, wild disposition. It is clipped twice a-year, yielding each time about a pound and a half of long, coarse wool. This method of twice clipping has been generally adopted in large flocks, amongst sheep bearing a secondary quality of wool. The Spiegelschafe, found in Mecklinburg, Franconia, &c., with a blue woolly ring round the eyes, may be considered a species of German sheep, produced by intermixture. The Polish sheep resembles the German sheep in size and wool. The Danish is distinguished by a smooth head, erect ears, and wild disposition. The wool is coarse, mingled with stiff hairs. The Norwegian is said to be a description of it, but improved by a cross with the English and Spanish. The Swedish, a cross breed of the Spanish, has lately been much improved. It had originally but little wool, and that of a coarse quality. The Belgian, Flemish, and Flanders sheep, are nearly five feet in length, and weigh about two cwt. They originally came from the East Indies, and are remarkable for fecundity, producing several lambs in the year. The wool is middling. The Dutch sheep are a species of them. The Hungarian sheep, like the Moldavian, have a very long, coarse, and inferior wool, and the flesh is very fat and unpalatable.—*Newspaper.*

A NEGRO'S ANSWER.

A planter in St Domingo was one day disposing of a horse to a neighbour, and being questioned by the purchaser regarding its qualities, among the rest, whether it kicked, the disposer replied it was the quietest beast imaginable. He had however, hardly used the expression when it flung up its heels to the danger of the bystanders. The purchaser being irritated at the duplicity of the other, reproached him with his intended deception, when, to substantiate the peaceful character of the animal, he called one of his slaves, and demanded of him if he ever saw this fine animal kick before. "O, no me massa," smartly answered the negro, "never saw him kick before—always saw him kick behind."

ADVANTAGE OF SNUFFING CANDLES.

Count Rumford made various experiments to ascertain the relative expense of different inflammable substances for the production of light, and the results were, that a good wax candle, properly snuffed, and burning with a clear bright flame, consumed 100 parts in weight; a good tallow candle, burning under the same circumstances, consumed 101; but a similar tallow candle, burning very dim from the want of snuffing, consumed 220; so that the consumption of more than double the quantity of combustible matter yielded less light. This latter circumstance proves the advantage of snuffing candles frequently, both as regards the quantity of light, and the economy of the practice.

Along with the present number of the Journal, may be purchased the second number of a monthly record of events, under the title of CHAMBERS'S HISTORICAL NEWSPAPER, price three halfpence. This work regularly appears at the beginning of every month, and bears exactly the same appearance with a number of the Journal, to which it is designed to form a kind of supplement, though in every respect an independent work.

For the satisfaction of some individuals, who have expressed a doubt upon the subject, the Editors have to state, that every article in the Journal, to which no quotation is attached, is original, and composed expressly for the work.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

IN LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS A'LAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

EDINBURGH CHAMBERS JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 45.

SATURDAY, DECEMBER 8, 1832. PRICE THREE HALFPENCE.

WHERE IS MY TRUNK?

It is well known in Scotland that the road from Edinburgh to Dundee, though only forty-three miles in extent, is rendered tedious and troublesome by the interposition of two arms of the sea, namely, the Firths of Forth and Tay, one of which is seven, and the other three miles across. Several rapid and well-conducted stage-coaches travel upon this road; but, from their frequent loading and unloading at the ferries, there is not only considerable delay to the travellers, but also rather more than the usual risk of damage and loss to their luggage. On one occasion it happened that the common chances against the safety of a traveller's integuments were multiplied in a mysterious, but most amusing manner—as the following little narrative will show.

The gentleman in question was an inside passenger—a very tall man, which was so much the worse for him in that situation—and it appeared that his whole baggage consisted of a single black trunk—one of medium size, and no way remarkable in appearance. On our leaving Edinburgh, this trunk had been disposed in the boot of the coach, amidst a great variety of other trunks, bundles, and carpet bags, belonging to the rest of the passengers.

Having arrived at Newhaven, the luggage was brought forth from the coach, and disposed upon a barrow, in order that it might be taken down to the steam-boat which was to convey us across. Just as the barrow was moving off, the tall gentleman said—

"Guard, have you got my trunk?"

"Oh, yes, sir," answered the guard; "you may be sure it's there."

"Not so sure of that," quoth the gentleman; "whereabouts is it?"

The guard poked into the barrow, and looked in vain among the numberless articles for the trunk. At length, after he had nozzled about for two or three minutes through all the holes and corners of the mass of integuments, he drew out his head, like a terrier tired of earthing a badger, and seemed a little nonplussed.

"Why, here it is in the boot!" exclaimed the passenger, "snug at the bottom, where it might have remained, I suppose, for you, till safely returned to the coach-yard in Edinburgh."

The guard made an awkward apology, put the trunk upon the barrow, and away we all went to the steam-boat.

Nothing further occurred till we were all standing beside the coach at Pettycur, ready to proceed on the principal terraqueous part of our journey through Fife.

Every thing seemed to have been stowed into the coach, and most of the passengers had taken their proper places, when the tall gentleman cried out—

"Guard, where is my trunk?"

"In the boot, sir," answered the guard; "you may depend upon that."

"I have not seen it put in," said the passenger, "and I don't believe it is there."

"Oh, sir," said the guard, quite distressed, "there can surely be no doubt about the trunk now."

"There! I declare—there!" cried the owner of the missing property; "my trunk is still lying down yonder upon the sands. Don't you see it? The sea, I declare, is just about reaching it. What a careless set of porters! I protest I never was so treated on any journey before."

The trunk was instantly rescued from its somewhat perilous situation, and, all having been at length put to rights, we went on our way to Cupar.

Here the coach stops a few minutes at the inn, and

there is generally a partial discharge of passengers. As some individuals, on the present occasion, had to leave the coach, there was a slight discomposure of the luggage, and various trunks and bundles were presently seen departing on the backs of porters, after the gentlemen to whom they belonged. After all seemed to have been again put to rights, the tall gentleman made his wonted inquiry respecting his trunk.

"The trunk, sir," said the guard, rather pettishly, "is in the boot."

"Not a bit of it," said its owner, who in the mean time had been peering about. "There it lies in the lobby of the inn!"

The guard now began to think that this trunk was in some way bewitched, and possessed a power, unenjoyed by other earthly trunks, of removing itself or staying behind, according to its own good pleasure.

"The Lord have a care o' us!" cried the astonished custodian of baggage, who, to do him justice, seemed an exceedingly sober and attentive person. "The Lord have a care o' us, sir! That trunk's no canny."

"It's canny enough, you fool," said the gentleman sharply; "but only you don't pay proper attention to it."

The fact was, that the trunk had been taken out of the coach and placed in the lobby, in order to allow of certain other articles being got at which lay beneath. It was now once more stowed away, and we set forward upon the remaining part of our journey, hoping that there would be no more disturbance about this pestilent member of the community of trunks. All was right till we came to the lonely inn of St Michael's, where a side road turns off to St Andrew's, and where it happened that a passenger had to leave us to walk to that seat of learning, a servant having been in waiting to carry his luggage.

The tall gentleman, hearing a bustle about the boot, projected his immensely long slender body through the coach window, in order, like the lady in the fairy tale, to see what he could see.

"Hollo, fellow!" cried he to the servant following the gentleman down the St Andrew's road; "is not that my trunk? Come back, if you please, and let me inspect it."

"The trunk, sir," interposed the guard, in a sententious manner, "is that gemman's trunk, and not yours: yours is in the boot."

"We'll make sure of that, Mr Guard, if you please. Come back, my good fellow, and let me see the trunk you have got with you."

The trunk was accordingly brought back, and, to the confusion of the guard, who had thought himself fairly infallible for this time, it was the tall man's property, as clear as brass nails could make it.

The trunk was now the universal subject of talk, both inside and outside, and every body said he would be surprised if it got to its journey's end in safety. All agreed that it manifested a most extraordinary disposition to be lost, stolen, or strayed, but yet every one thought that there was a kind of special providence about it, which kept it on the right road after all; and, therefore, it became a fair subject of debate whether the chances *against*, or the chances *for*, were likely to prevail.

Before we arrived at Newport, where we had to go on board the ferry steam-boat for Dundee, the conversation had gone into other channels, and, each being engaged about his own concerns, no one thought any more about the trunk, till just as the barrow was

descending along the pier, the eternal long man cried out—

"Guard, have you got my trunk?"

"Oh, yes," cried the guard very promptly, "I've taken care of it now. There it is on the top of all."

"It's no such thing," cried a gentleman who had come into the coach at Cupar; "that's *my* trunk."

Every body then looked about for the enchanted trunk; the guard ran back, and once more searched the boot, which he knew to have been searched to the bottom before; and the tall gentleman gazed over land, water, and sky, in quest of his precious encumbrance.

"Well, guard," cried he at length, "what a pretty fellow you are! There, don't you see?—there's my trunk thrust into the shed, like a piece of lumber!"

And so it really was. At the head of the pier at Newport, there is a shed with seats within, where people wait for the ferry-boats; and there, *perdu* beneath a form, lay the enchanted trunk, having been so disposed, in the bustle of unloading, by means which nobody could pretend to understand. The guard, with a half-frightened look, approached the awful object, and soon placed it with the other things on board the ferry-boat.

On our landing at Dundee pier, the proprietor of the trunk saw so well after it himself, that it was evident no accident was for this time to be expected. However, it appeared that this was only a lull to our attention. The tall gentleman was to go on to Aberdeen by a coach then just about to start from Merchant's Inn; while I, for my part, was to proceed by another coach, which was about to proceed from the same place to Perth. A great bustle took place in the narrow street at the inn door, and some of my late fellow travellers were getting into the one coach, and some into the other. The Aberdeen coach was soonest prepared to start, and, just as the guard cried "all's right," the long figure devolved from the window, and said, in an anxious tone of voice—

"Guard, have you got my trunk?"

"Your trunk, sir!" cried the man; "what like is your trunk?—we have nothing here but bags and baskets."

"Heaven preserve me!" exclaimed the unfortunate gentleman, and burst out of the coach.

It immediately appeared that the trunk had been deposited by mistake in the Perth, instead of the Aberdeen coach; and unless the owner had spoken, it would have been, in less than an hour, half way up the Carse of Gowrie. A transfer was immediately made, to the no small amusement of myself and one or two other persons in both coaches who had witnessed its previous mis-adventures on the road through Fife. Seeing a friend on the Aberdeen vehicle, I took an opportunity of privately requesting that he would, on arriving at his destination, send me an account by post of all the further mistakes and dangers which were sure to befall the trunk in the course of the journey. To this he agreed, and, about a week after, I received the following letter:—

"DEAR —,"

"All went well with myself, my fellow travellers, and THE TRUNK, till we had got a few miles on this side of Stonehaven, when, just as we were passing one of the boggiest parts of the whole of that boggy road, an unfortunate lurch threw us over upon one side, and the exterior passengers, along with several heavy articles of luggage, were all projected several yards off into the morass. As the place was rather soft, nobody was much hurt; but, after every thing had again been put to rights, the tall man put some

* Not innocent—a phrase applied by the common people in Scotland to any thing which they suppose invested with supernatural powers of a noxious kind.

two-thirds of himself through the coach window, in his usual manner, and asked the guard if he was sure the trunk was safe in the boot.

"Oh, Lord, sir!" cried the guard, as if a desperate idea had at that moment rushed into his mind, "the trunk was on the top. Has nobody seen it lying about any where?"

"If it be a trunk ye're looking after," cried a rustic, very coolly, "I saw it sink into that well-ee" a quarter of an hour syne."

"Good God!" exclaimed the distracted owner, "my trunk is gone for ever. Oh my poor dear trunk!—where is the place—show me where it disappeared."

"The place being pointed out, he rushed madly up to it, and seemed as if he would have plunged into the watery profound to search for his lost property, or die in the attempt. Being informed that the bogs in this part of the country were perfectly bottomless, he soon saw how vain every endeavour of that kind would be; and so he was with difficulty induced to resume his place in the coach, loudly threatening, however, to make the proprietors of the vehicle pay sweetly for his loss.

"What was in the trunk, I have not been able to learn. Perhaps the title-deeds of an estate were among the contents: perhaps it was only filled with bricks and rags, in order to impose upon the innkeepers. In all likelihood, the mysterious object is still descending and descending, like the angel's hatchet in Rabbinical story, down the groundless abyss; in which case its contents will not probably be revealed till a great many things of more importance and equal mystery are made plain."

POPULAR INFORMATION ON HISTORY.

THE GREEKS.

THE north-eastern part of the Mediterranean is divided into two large bays or gulfs, which run far up into the European continent; that towards the west being called the Adriatic, and the other the Egean Sea. The peninsula, or tongue of land which lies between the two, is the original country of the Greeks: colonies of the same nation have, from times beyond the reach of history, occupied the whole coasts and islands of both these gulfs, from Sicily almost to Cyprus; but the parent states of the middle peninsula are those to which the Grecian name is indebted for all its splendour; and it is this country only which is properly called Greece.

From the situation of the Greeks in a region whose bays, headlands, and islands present a great extent of sea-coast, habits of adventure and mutual intercourse were produced among them in the earliest times, which had the greatest influence in cherishing a national activity of character, and making each community eager to rival the prosperity of the others. The people were early accustomed to make voyages, sometimes for traffic, sometimes for war, betwixt the opposite coast of their gulfs, guiding themselves by the stars from island to island; and a curious proof both of their adventurous spirit, and of the difficulties they encountered in their attempts at navigation, is afforded by the tradition which exists in some old poems concerning one of these isles called Delos, a huge pile of limestone rock, which was frequently used as a sea mark in the Egean: this island is said once to have floated about on the waves, and only to have been fixed in its place at last by Jupiter driving a stake through its centre. In the present age we can understand by this poetical flight that the Greek canoe-men sometimes lost their reckoning, and fell in with the island where they did not expect it, or, as happened once to a more scientific mariner with regard to St Helena, sailed over the ground where they reckoned on finding it, and declared that it had shifted from its place.

The early period of Grecian history has been made famous by Homer, a celebrated poet of that nation, whose works are still read and admired. The picture there given of the manners of the people at this time, affords but little promise of the elegance or philosophy of the ages that followed. The country was divided among a number of petty chieftains, whose incessant raids upon one another distracted the people, and maintained among them habits of idleness and mutual plunder, instead of the regular pursuits which afterwards made them powerful and celebrated. The names of some of these tyrants have been handed down for execration by the poets; while others of a better kind, who stood forward to oppose them, are enshrined, on the same authority, as heroes and demi-gods; among the latter are Theseus, Castor and Pollux, and Hercules. The religion of the Greeks consisted at this time in the worship of a set of imaginary beings dignified with the name of gods, but who fought, squabbled, made love, and cheated each other like the Greeks themselves; and who, indeed, seem to have differed from them in no respect, except that they were not subject to death, or to work for subsistence. The same legends were circulated concerning them in later periods, but were then chiefly taken up, like our fairy tales, as good subjects for poetry, and were believed only by the common people, who, in all countries, even while partaking of the comforts of civilization, have unhappily too little share in its knowledge. With regard to the progress of the Greeks at this time in other matters, we see, from the same poems, that any acquaintance which they had with the mechanical

arts was like the skill of the savage in making his boat or his hatchet, chiefly valued for its usefulness in war. Strength, swiftness, or dexterity in the use of weapons, were reckoned the only manly qualities among the young; and the leading of an expedition, or arranging an ambuscade, gave the chief title to wisdom in advanced life: like the savages of our own times, they only copied such of the arts of civilized life from the strangers who came among them, as were useful for carrying into effect their own projects. They had early learned, from Cadmus and Danaus, adventurers of Phenicia and Egypt, the art of working the metals, which was made instantly available for war. The same persons had also brought with them a knowledge of the alphabet; but this piece of information seems to have lain dormant, or known only to a few for many centuries; it is not doubtful that Homer himself was unacquainted with it. Some idea of the motions of the stars, and other elements of science, they seem to have gradually learned from persons of the same countries, as they became useful to them: and the fertility of many parts of Greece led them also to an early acquaintance with agriculture, on which Hesiod, an author to whom, like Homer, writing was perhaps unknown, has left a poem. From this work, it appears that the Greek farmers of his day paid nearly as much attention to lucky and unlucky days as to the state of the weather; a circumstance which says more for the steadiness of the climate than the industry of the people. The simpler labours of agriculture seem to have been understood; but it is not to be supposed that many improvements could originate in a country where, as we are told by one of these historians, the most barren district (Attica) became at last the most thriving, because the others were continually plundered on account of their fertility.

Such is a picture of the state of Greece in its early ages, a period which the poems of Homer have made as interesting as those in which the knowledge and real superiority of the country gave it an actual title to fame. A long period intervenes from the war of Troy (which was the subject of his work), 1184 years before Christ, till the Persian war, 700 years later, during all which time the Greeks continued to improve, and to acquire habits of civilization; so that, in the next writer who describes them (Herodotus), we find them a very different people indeed from that depicted by the poets. Their governments had now been changed from turbulent chieftainships to orderly magistracies; most of the states had begun to see the advantage of protecting those of the people who were making profit by the ordinary occupations of peace; much riches had been acquired by trade; and some of the states had foreign colonies subject to them. Those districts which were most celebrated in the heroic times (as Thessaly), and which still retained the same habits, had fallen into the rear; while others, such as Athens, that were hardly known in the early period, had now, by their industry and better form of government, begun to take the lead in every national affair. As a proof both of the wealth of the country, and of its increasing taste for the arts, it is mentioned that there were in the different temples a hundred ivory statues of the gods, all larger than life, and many of them covered with gold. The treasures of one temple alone, that of Delphi, were reckoned equal to a year's revenue of the Persian empire. Public games were celebrated yearly in different parts of the country, which were also attended as great annual fairs, and drew together vast numbers of people. The games were contests in wrestling, leaping, running, horse-racing, and chariot-racing, and trials of merit in literature and the fine arts. They afforded thus equal interest to all classes of the community, and were the means both of keeping up among the young a useful bodily training, and of diffusing a thirst for knowledge. The first and most interesting history of Greece that ever was written, was read (after this period, however) at the games called Olympian, by its author Herodotus, and the venerable historian was listened to there by thousands of his countrymen, who learned, by this means, both to emulate the deeds of their ancestors, and to feel the value of the learning which preserved their memory.

Such was the state in which we find Greece at the time of the Persian invasion, about 500 years before Christ. The Persian king sent three successive armies against it, and came himself in command of the last, which consisted of more than a million of men. All his efforts were discomfited by the bravery of a handful of patriots, fighting in defence of their national independence; and the vain tyrant was obliged to make his escape in shame and confusion, leaving the bones of his army strewn over the countries through which he had led them.

Greece was now left secure from foreign enemies (before Christ 470 years), and a splendid period followed, which is adorned by some of the greatest names in history. The different Grecian communities arrived at a pitch of wealth and influence which, in such small states—for none of them was larger than a middling county—appears extraordinary. Athens, which had a territory only about 40 miles long by 30 broad, brought under her dominion great part of the coasts and islands of the Egean Sea, and added to her wealth daily by the trade and revenue of many opulent cities. A new harbour was made for the protection of her shipping, and the road to it from the city was formed by walls five miles long, on which

two chariots could pass abreast, and which were built of the largest stones fixed together with bars of iron. Many public edifices were erected, whose ruins continue to be the admiration of ages for their grandeur and architectural beauty; while the sculptures of Phidias, and of the artists who wrought under his direction in their decoration, are dug out of the falling edifices with almost religious care, and preserved as models of elegance and skill in the most splendid museums of Europe. The philosophers and poets who flourished in Athens during the same century, still attract the admiration and reverence of the world; and the high qualities of their writings are even now—at the distance of twenty-two centuries—reckoned a reward sufficient for learning the language of Greece, though it has long ceased to be spoken, except by a barbarous people. Of the philosophers who taught morals, Socrates, though he left no writings of his own, deserves the highest place, for the practical benevolence and good sense of his doctrines, and his patient forbearance under persecution in both of which respects he acted as if he had already been guided by the example of our Saviour. He was also the first, and almost the only heathen philosopher who taught, without reference to poetical fables, the doctrine of the soul's immortality. Different schools of philosophy were established in Athens, all of which attained high celebrity from the talents of their founders, and the curiosity of an opulent and acquisitive people. It deserves to be mentioned, as a remarkable trait of Athenian manners, that a public theatre, in which the plays of their great dramatists were performed, was maintained in the city; to which the whole people had access free of expense—the establishment being maintained out of the revenues of the dependent towns.

Sparta, the next considerable state in Greece, was, in every thing, the reverse of Athens. There is not a single Spartan writer or philosopher; not a stone remains of her public buildings; and her people cultivated no amusements but those which tended to fit them for war. The state of society here was highly artificial, the people properly named Spartans being comparatively few, and the rest consisting of slaves called Helots, who did all kinds of labour and drudgery. The Spartans were excellent soldiers, having performed prodigies of valour in the Persian war, and long contested the supremacy of Greece with Athens, which at one time they completely humbled. But their country only retained its consideration while it could do so by force; whereas the learning and arts of Athens rendered her respected even when she could not defend her own walls.

Of the other cities of Greece, Delphi was celebrated for its mysterious oracle of Apollo, and for being the seat of all that kind of learning which related to the worship and history of the gods. Elis was famous as the site of the Olympian games, and possessed a temple whose magnificence, in days when less money is expended on temples, almost surpasses belief. Its statue of Jupiter is said to have been 60 feet high, of gold and ivory, the later material being then almost as precious as gold. Many of its decorations were also of gold; and the sculpture in all was of the highest character. The front of the temple presented a splendid marble colonnade, 68 feet high and 230 long, all points of which were adorned with the most elaborate sculpture, or with statues of the divinities.

After the Persian war, though the country was not disturbed by foreign enemies, the several states harassed one another with continual hostility. First, Athens (before Christ 405 years), and then Sparta (before Christ 371 years), were brought to the very brink of destruction, by quarrels which spread the misery of war through all the states and colonies of Greece. The jealousies of the several states, though they promoted a kind of useful emulation among their citizens, had the effect of retarding the general prosperity, by keeping up a continual civil war. Some of the greatest of the Grecian generals, such as Epaminondas, are only famous for victories gained over a different clan of their own countrymen.

The next great epoch in the history of Greece (before Christ 360 years) begins with the reign of Philip of Macedon, the most northern of the Grecian countries. This prince, by artifice, bribery, and by his talents as a general, thwarted all the councils of the independent states, took advantage of their divisions, defeated their armies, and, finally, reduced them to a state of dependence on his own power. After his time, the boasted liberties of Greece existed only in name, or by the toleration of his successors. But the country seems to have lost little happiness by the loss of its ill-regulated independence. His son, Alexander the Great (before Christ 330 years), carried a conquering army to the centre of India; and under his command the valour and discipline of the Greeks, which had long been wasted in quarrels among themselves, were employed in rendering the name of their country respected over the whole eastern world. Their arms and regular order seem to have made an impression on the ignorant orientals, like that which the gunpowder of the Spaniards produced on the natives of America. And out of the fragments of his empire, his generals were able to form for themselves three great kingdoms, which endured for several centuries. His conquests, which were the conquests of Greeks, had a more beneficial effect than those which had yet been made by any other power; for, as Greece was far advanced in civilization, and had both cultivated lite-

* The orifice of a deep pool in a morass is so called in Scotland.

ature and the elegant arts, the influence of the conquerors rendered the pursuit of these both creditable and easy, where otherwise they were despised, and, perhaps, unattainable. European knowledge was thus naturalized, both in Asia and Africa; and those arts, which had during many centuries been growing slowly to maturity in the little peninsula of Greece, were diffused, with sudden splendour, over a great part of the east. It is to the conquests of Alexander, and the thirst for knowledge which they diffused, that we owe the first translation of the Bible; and the splendid ruins of Palmyra, Petra, and other deserted cities, which were raised in those eastern countries to which Grecian knowledge had penetrated, still show the powerful effects which the influence of that people produced through the means of Alexander's conquests.

After this period the Greeks continued for a time subject to the kings of Macedon, sometimes struggling bravely against their dominion, but never able altogether to throw it off. About 200 years before Christ, the Romans took occasion to interfere in their national affairs; and after a gallant but ineffectual struggle, the country became a province of that empire, and thenceforth took no part in the affairs of the world, except under its guidance.

But though her independence was destroyed, the influence of the superior knowledge and civilization of Greece became now more powerful than ever. The Romans, though they were rude and ignorant in comparison with the people whom they had conquered, had still a kind of blind respect for the knowledge in which they excelled; and as a proof both of the fame of Greece and the ignorance of Rome, it is mentioned that the Roman general who took Corinth seized several pictures, which were prized as the highest works of Grecian art, and in order to secure their safe transport to Italy, told the persons who were sent in charge of them, that if they damaged one, they should be obliged to produce another as good. As Greece had formerly sent her knowledge and arts over the east by the arms of one of her own kings, she now diffused them through the western world under the protection of Rome. Athens, which was the emporium of Grecian learning and elegance, became the resort of all who were ambitious of excelling either in knowledge or the arts; statesmen went thither to improve themselves in eloquence; philosophers to learn the tenets of the sages of Greece; and artists to study models of excellence in building, statuary, or painting: natives of Greece were also found in all parts of the world, gaining an honourable subsistence by the superior knowledge of their country. That country, in the meantime, was less disturbed by intestine feuds than formerly, but was not exempt from the usual fate of conquests, being subject to the continual extortions of governors and lieutenants, who made the conquered provinces the means of repairing fortunes which had been broken by flattering the caprices of the populace at home.

Greece has passed through many stages of fortune since the days of her celebrity. It has been the singular fortune of the country to give rulers to many powerful kingdoms, and to impose her language and manners upon one of the largest empires of the world—the Greek empire of Constantinople—while the native region of all this influence remained an unnoticed and dependent province. Greece herself has in later times been repeatedly the theatre of action for contending armies, and, amid the quarrels of the great powers by whom she has been surrounded, has seldom had her fate at her own disposal. The period of her independence, during which all those great deeds were performed which have attracted the attention of the world, may be reckoned from the era of the first Persian war to the conquest of Macedon, the last independent Greek state, by the Romans. This period reached from 490 to 190 years before Christ, and thus includes only 300 years. It is not therefore from the duration or the extent of her political power, that her fame arises. Even the patriotism of her soldiers, and the heroism of Thermopylae and Marathon, have been emulated elsewhere, without attracting much regard; and we must therefore conclude that it is chiefly from the superiority of her poets, philosophers, historians, and artists, that she has gained such an empire over the minds of men. It was not from the warlike qualities of the Greeks, but from the manner in which they improved their intervals of peace, that their fame arose. Even in their late wars, the modern people of the country could emulate all the martial virtues of their ancestors, and performed many actions which were worthy of the best days of Sparta; but they knew not how to unite for any of the useful purposes of peace. The fiercest savages may be easily trained to the blind discipline of war, and if they have indeed only a few well-informed men to command them, they make the best soldiers; but it requires higher qualities in a people to turn a time of peace to advantage. It was this in which the ancient Greeks excelled, and it is the want of this which now marks out their descendants as a semi-barbarous people.

Greece has been long under the power of the Turks, a people themselves careless of improvement, and, therefore, bent on crushing it in all who are subject to them. All the natural capabilities of the country remain; its sunny hills and rich valleys, its magnificent bays and long fertile line of sea-coast, are still the same; but the spirit which animated the whole has been dormant for many centuries. A small

part of the Grecian country, consisting of the southern angle of the peninsula, has been lately declared independent, and is to have a king from one of the royal families of Europe; but it will take many years to restore proper feeling and national union to tribes who have been either slaves or rebels for many centuries.

HIGHWAYMEN AND HOUSEBREAKERS.

ONE of the most remarkable exemplifications of the changes in society within these few years, is found in the character of the crimes which are now committed in comparison with those prevalent half a century ago. There was a time, and it is not long since, when no man might securely travel, singly or in company, without fire-arms. Every horseman who appeared on the horizon was suspected to be a *Golden Farmer* or a *Sixteen-stringed Jack*; and every pedestrian you met, especially if the unfortunate wight carried a stick, which was, of course, considered to be a bludgeon, was looked upon as a footpad, and you prepared either to resist, or "stand and deliver," as suited your taste. Now all this is changed; paper money, stage coaches, and the police officer, have outwitted these heroes of the road, and you may travel any thoroughfare in Britain without having your journey signalized with an adventure of the least moment. An excellent paper, on the subject of crimes and criminals, has just appeared in that successful periodical, *Fraser's Magazine*, the writer of which appears fully aware of the alteration in the nature of crime we here allude to. "Highway robbery (says he), according to the usual acceptance of the term, is now an unknown crime, Haynes, of Hounslow Heath memory, being the last of those termed highwaymen. It is now only committed by occasional desperate men, and generally in the suburbs of the metropolis, or in a crowd, where a gang of persons sometimes surround the person, robbing the party in the face of all the standers-by. Nothing but the vigilance of the police can cope with those characters, as the recklessness and desperate state of the thief at the time, arising from want of money, places the offence out of the pale of all precautionary measures; and it may be relied on, that the generality of thieves have even an abhorrence of any violence committed on the person. They have a very unfavourable opinion of any of the fraternity who cannot carry on the business without it.

"I had an opportunity of seeing a remarkable instance of this last year. An Irish itinerant tinker knocked a captain of a vessel down in the neighbourhood of the London Docks, in a most brutal manner, in the dark, and robbed him of his money. When the fellow was committed to Newgate, he applied to me to make out his brief. From the desperate nature of his offence, I at first declined doing it, knowing he must suffer; but the man urged me so much that at last I consented, he saying, 'if I am found guilty, I know I am as dead as Henry the Eighth, and shall not blame you.' There were in the same yard where he was before his trial, nearly a hundred prisoners, one half of whom were transports, but not one of them would associate with him, in consequence of the nature of his offence; and when I went to take his instructions for making out his brief, they all called out for me not to do it, and I got some insults for having undertaken it. They afterwards led the man such a life, that he appeared to be relieved when he was condemned and sent to the cell. From this it may be seen that, as Lord Byron writes, 'none are all evil.'

On the morning of this man's execution, not a word of commiseration for him, or reproach on the practice of hanging, was uttered, by one hundred and twenty men who followed crime as a trade. On the contrary, they all, *nemine contradicente*, said he deserved his fate.

The explanation of this is, that the character and feelings of the public thief, as of all other classes of society, have undergone a visible and marked change within the last thirty years. Whether it has been for the better is another question. Formerly the heroes of their party were fellows conspicuous and famed for open and daring acts of plunder, in whom the whole body had a pride, and whom they all felt ambitious to imitate, failing only to do so from lack of the same quantum of courage. The more desperate and numerous the instances of robbery, the more were the parties lauded and admired. It was then the fashion among these men to boast of their conduct under punishment. In those times there must be no snivelling, no 'peaching, no contrition; and the malefactor must die bravely to entitle himself to fame. The Turpins and Jerry Abershaws of the day were the objects of their admiration; such men as, on the road to execution, would stop and drink gin, offering libations to the success of all highwaymen, and, when on the gallows, kick off their shoes, swearing with an oath they "always said they would never die with them on;" or, like Despard, who, when brought out for execution, remarked to the executioner that it was a fine morning, and wondered what sort of weather in the other country, adding, "but never mind, I shall soon know all about it." All this kind of heroism has subsided, and their leaders now are men rendered famous for scheming, subtlety, and astuteness. Formerly, the passport to enrolment under their banners was a name for boldness and mon-

strous acts of outrage; now a certificate must be brought of the man never having committed an indiscreet act in his calling, and that the party "is up to all the moves on the board, and knows something."

"Although not the largest body of offenders (continues this clever writer), the housebreakers are yet a numerous and a formidable party, and a greater proportion of them have eluded the vigilance of the law than any other species of criminal. None of the gangs under the heads of crime as stated above, confine their operations wholly to the metropolis. London is the head-quarters of the regular and practised delinquent—it is the centre to which they all gravitate, and whence they again diverge into the country to commit crime; many of them taking journeys as regularly as any mercantile house of business in the city of London. There is a gang of pickpockets who start regularly every spring to make the circuit of all the race-courses, cattle fairs, and other places of public resort, returning as the season closes to winter business in town. The housebreaker travels at all seasons, but his journeys are direct, for the accomplishment of some one specific object of robbery. Sometimes it is a *put-up affair*; that is, notice has been given them by some one on the premises intended to be robbed, or by an agent residing near the spot, of an opportunity to commit a robbery. When an intimation of this kind is given, hands are forthwith sent down with a vehicle, to accomplish the speedy removal of the property to town. Some of the parties are always in the country on the adventure and look-out for business. When the burglary is accomplished, one of the party drives with all possible speed to town, where the goods are either carried direct to a buyer, or deposited in a house kept for the purpose by one of their confederates, who takes no part in the business otherwise than keeping the premises for the reception of property, and making a respectable show of carrying on some kind of trade. As he is never seen in any transaction of actual robbery, they conceive no suspicion can ever be attached to him. Their wariness on this head is carried to an extreme. None of the operative burglars are ever allowed to go to the house, save for the purpose of depositing the goods when first stolen; and some of them are even deceived in this, as the property is sometimes, on its arrival in town, left at one place, and subsequently removed by the master-men to the depot. Some of them are so wealthy as to be enabled to keep their goods for years, and thus avoid any risk of immediate sale.

Many of these house robberies are through servant girls, who very simply give admittance to men of loose character, under the idea of courtship; and thus the localities of the premises and the habits of the family become known to the gang. Hundreds of burglaries are through sweeps, who, as they go occasionally into every room in the house, can give the necessary information. I can name several boys, now in custody, who have been actors in some of the most complicated schemes of burglary—one in particular, who began his career by robbing a gentleman in Mark Lane of plate to a considerable amount; and as it shows one method of committing a robbery, I will relate how it was accomplished. The boy was under sentence of death when I got the history of his life from him, he having been nine years in the successful commission of crime. Whilst in custody, his constant theme of regret was, that he had left the parties in whose services he had been so long and so securely employed, to join some of his own age, embarking in business for themselves, by which he was taken up. He was an orphan, and had been brought up in the poor-house, where he was apprenticed to a sweep in the city. He was a remarkably sharp boy, which no doubt was noticed by those who are always on the look-out for agents to aid them in their schemes. He was met one morning early, with the soot-bag on his back, by a man who pretended to be his uncle, and who gave him a half-crown piece, making another appointment for a meeting; the result of which was, that before he had served sixteen months of his time, he had given information by which fifteen robberies had been committed. He of course had been paid for his services, which soon made him disgusted with the sooty business; and he made an arrangement with the man who drew him into crime, to leave his master's service, and to commit with him a robbery on their own private account before he left. The house fixed on was the one above alluded to in Mark Lane. The premises had before been surveyed, and deemed impregnable; that is to say, they were considered too well guarded to be robbed without detection. They, however, got possession of the plate in the following manner:—The boy was a favourite with the cook of the house, and she would have no other to sweep her kitchen chimney, a matter of business which was performed the last Saturday in the month. It was concerted between the man and the boy that the former should dress himself in the character of a sweep, and accompany the latter as his overlooker or assistant. The real sweep overtook, of course, must be kept out of the way; and here lay all the difficulty. It cost the boy (to use his own expression) six months' longer punishment as a sweep, and the man six appearances, at an early hour of the morning, in the same character, before the object could be carried, namely, to get rid of the real sweep. At length, one Saturday, by pretending to forget the job until all the men were gone out upon other work, the boy, affecting suddenly to recollect it, persuaded the master to

let him go alone, saying he himself could perform the duty. It was five o'clock in the morning when he and the disguised robber reached the house; the cook opened the door, having nothing on save a blanket thrown over her shoulders. The arch young rogue said, 'it's only me and Harry; it's a very cold morning; if you like to go to bed again, cookey, we will do it well, and leave all clean, and shut the door fast after us.' She went to bed, and they went to the plate depository, which had been well noted oftentimes before. They put the whole of its contents into the soot-bag, and fearlessly walked through the streets with it on their backs. The boy, a few hours afterwards, was so metamorphosed, being dressed in the smartest manner, with cane in hand and fifty pounds in his pocket, that he walked the streets in full confidence that not even his master or his fellow apprentices would know him."

ELEMENTS OF HEALTH.

Sound health of body, which, next to an unburdened conscience, forms the greatest of earthly blessings, is defined to be that condition of the living body, when all its various functions are performed without either pain or any physical impediment. If we view the animal machine, we find it to be composed of a bony skeleton, upon which the whole of the locomotive organs are sustained; and in the cavities, formed by the bones, the vital softer parts are preserved, and protected from external injury; so also are the organs of sense, together with a variety of others, which are destined to perform certain important offices or functions. Now, these functions are absolutely necessary to animal existence, and, consequently, physiologists have given them the name of *vital functions*. If, therefore, any circumstance occurs which tends to their interruption or cessation, the life of the individual becomes endangered, and death is necessarily the result. The vital functions are, the circulation of the blood, the office of respiration or breathing, together with that irritability connected with the brain and the nervous system. If the human body only possessed these powers, this machine, the *chef d'œuvre* of the Almighty's works, would soon perish, inasmuch as the solid parts of the system would be materially injured by the constant exercise of these functions; they would be worn down, and its fluids dispelled from the incessant motion, or they would be corrupted spontaneously. But the Omnipotent Creator has constructed organs possessed with the power of repairing its various losses, and of counteracting its tendency to immediate death or destruction. These organs and their powers are denominated the *natural functions*, in contradistinction to the former which we have mentioned; they are the functions of digestion, nutrition, and secretion, and to which may be added that of discharge or excretion. These organs are constituted for the reception of food and drink, together with a series of vessels which extract the nutritious portions of the aliment, and convey it into the system through the medium of the blood-vessels (*i. e.* the subclavian vein, which lies under the left clavicle or collar-bone); by this means the waste occasioned by the performance of the vital functions, as well as the loss caused by the secretion of the fluids, is made up, and no injury to the constitution thereby sustained. Thus constructed, the vital engine would be devoid of all connection with the objects in the external world, if it had not what are denominated the *animal functions*—as the organs of sense, the powers of volition and of locomotion, and the mental faculties superadded; by means of the latter, we are enabled to acquire a knowledge of the physical circumstances of the globe, and to modify them in due accordance with our pleasures, desires, and necessities. The human body is said to be in a state of perfect health when all the functions we have enumerated are duly performed with freedom, ease, and regularity. This state of the system is compatible with a very considerable variety in the condition of the various functions, both mentally as well as bodily; whence we perceive the various temperaments and constitutions of different individuals. These are very frequently hereditary, inasmuch as we see them often descending from one generation to another; as also with different degrees of disposition and abilities, of magnitude, symmetry, and muscular strength in the corporeal structure. There are also great varieties of the particular functions, such as digestion, respiration, &c.

The most excellent health, however, is generally found to be connected with a peculiar conformation of the various organs of which the body is composed, and is marked by certain characteristic signs and qualities of the system. Thus the most powerful constitution, which possesses all the usual functions performed in the most healthy manner, is generally to be found in a well-formed and proportioned body, neither very tall nor yet very short; it must neither be lean nor loaded with fat—an accumulation of the latter is universally allowed (even by the least informed) as prejudicial to health. The frame must not be slender, but rather stout, and should be particularly endowed with a fine expanded and open chest, and a moderate breadth of shoulders. The bones forming the skeleton in such an individual are somewhat large; the muscles are fine and fleshy, as also firm, strong, and well marked; the skin on the surface of the body is soft, rather inclined to moisture, but never dry; the colour of the body, especially on

the face, is steady, and not inclined to vary, whether it verges to the fair or brown, if it does not exhibit an approximation, on the one hand, to a paleness, or to a yellowness, on the other. There is an open and cheerful countenance, the eyes are bright and quick, with sound and strong teeth. The step of the foot is firm, the limbs affording a strong support to the superincumbent weight of the body; a steady and erect walk; the various exercises of the body are performed with ease and freedom; and even severe and long-continued labour causes no exhaustion, or derangement of the constitution. The organs of sensation are capable of performing all their wondrous, though mysterious, functions; as there is neither a dullness on the one hand, nor a too great sensibility on the other; the nocturnal rest is calm and continued, inasmuch as it is not easily disturbed, and affords refreshment to the system, particularly after long fatigue; and if the sleep is not devoid of all dreams, at least they are not of that frightful nature to create disturbance or inquietude. In fact, the sleep of a person enjoying a sound state of health lays to repose all the cares of life in a calm and grateful oblivion, and soothes, with the agreeable phantoms of imagination, the mental faculties.

We may also enumerate among the symptoms of a healthy constitution, a steady, calm, and regular circulation of the blood; the pulse arising from the contractions of the arterial system being strong, full, soft, and equal, it is neither too frequent nor too slow, neither is it too easily excited to unusual quickness; the respiration is full, free, slow, and almost imperceptible, which is not much accelerated by exercise or bodily motion; the voice is powerful and sonorous, and in men it is grave in tone, not being easily rendered hoarse; the vapour, or breath, from the lungs, is not disagreeable, being destitute of any unpleasant smell; the mouth is moist, there being not too much saliva secreted, but only a sufficient quantity for the various offices of mastication, articulation, &c.; the tongue should not be too red, but, at the same time, destitute of fur; the appetite should be good, but not so as to require the aid of stimulants; the thirst moderate; the digestion of the various species of food easy and good, without flatulence, or any uneasiness in the stomach.

The health of both sexes principally consists not alone in the due performance of the mental and bodily functions, but likewise in a tenuity, if we may use the expression, of this regularity, and in an accommodation of the habit of body to many of the variations in the climate, weather, and seasons, species of diet, and method of life. Thus, although the human constitution may bear with impunity many causes of disease, which would altogether annihilate the weaker or less healthy system, or at least endanger its falling into a severe, and perhaps a malignant disease, yet, the health of the same individual, although it may continue good, is not always the same, inasmuch as very many important changes occur in the animal economy during life; so that one man can hardly be said to differ so much from others of the same age and stature as himself, as he differs from himself at various periods of his own existence, whether we consider his conformation, the muscular strength of his body, the faculties of his mind, or the internal composing parts and functions depending upon them.

Having described the body in the state of health, we shall now make a few observations on the best mode of preserving it. It is an old but trite saying, that *health is more valuable than wealth*, and one in which the general voice of mankind coincides. To obtain, then, this blessing, we must avoid all injuries to the various organs of the body, as also derangements of the important, and, in particular, the vital functions in the system, as far as possibly lies in our power, when consistent with the exertions and the various forms in which the human frame is exposed, either in the exercise of our various daily employments and avocations, or in the performance of the different acts of humanity which circumstances, or the misfortunes of others, thrust upon our attention, and demand our services; or, in common language, to avoid the exciting causes of disease in a constitution formed similar to the one which we have described, having all the qualities which are conducive to the healthy performance of its various functions. And at first sight such precaution may appear almost superfluous; but it must be borne in mind that mankind have not so often the happiness of enjoying such an inestimable blessing, inasmuch as the majority of the human race, in consequence of either hereditary weakness, or constitutional predisposition to certain diseases, or some acquired tendency to particular maladies, arising from intemperance, dissipation, or imprudence, and, in many instances, from the injurious effects of education, profession, or habits of life. It is to these individuals, in particular, that the preservation of health becomes an object of great care and interest, and by whom the precepts of the theologian, moralist, and the physician, are not to be scorned with impunity. In persons of this nature, there is in general some one function or other more easily impeded or deranged; and such is the concurrent sympathy or connection that exists between the functions and organs in the constitution, that, upon the least cause, the whole system is thus very easily and readily disordered.

In the habits of human existence, there are two circumstances by which the regularity of the functions is in particular well maintained; that is to say, tem-

perance in the due gratification of the appetites and passions, especially the appetite for food and exercise. For, as the poet justly remarks—

Think not, ye candidates for health,
That aught can gain the wished-for prize,
With pill or potion, power or wealth,
But temperance and exercise.

Great moderation in the employment of food is necessary, especially while it does not overload the stomach and organs of digestion, nor disturb the digestive powers; neither must the alimentary canal be stimulated to inordinate action, because, when properly taken, it affords a supply of excellent nutriment to the system, without annoying any of the nutritive and vital organs with a deposition of fat. Similar moderation in the use of drink is also of some importance, inasmuch as, while it contributes to the furthering of the digestive process, it does not exhaust the necessary excitability, and the system at large, by its stimulus; neither does it produce the morbid derangements of the biliary and other viscera, with which those dreadful maladies incidental to the frame of man frequently date their origin, as sickness, apoplexy, gout, dropsy, insanity, and numerous other affections. Temperance is in itself the art of avoiding the causes of one half, or nearly two-thirds of the diseases to which the human body is subjected, and the abuse of ardent spirits is unfortunately the cause of more diseases than the majority of mankind suppose; and, without entering into all the principles promulgated by the Temperance Societies, yet we are happy to say, that, though our knowledge of these institutions is but limited, yet there is not the least doubt but they will be the means of ultimately preserving numbers of the community from suffering one fiftieth part of the agony they now labour under from disease. We cannot but justly coincide with the remark made by Professor Dr Elliotson, in one of his able lectures in the University of London, who, after stating the effects of dropsy from an indulgence in spirituous liquors, observed, that "one of the best sermons for drunkards and regular tipplers would be to exhibit to them the heart, lungs, and liver of an inebriate, by the side of the same organs in a sound state." This he considers would do more in convincing mankind of their impropriety than by any other means.

Another method of preserving health is the due employment of exercise, and this should be gentle, not laborious, but merely sufficient to induce gentle fatigue, to excite a free circulation of the blood in the most minute ramification of the vascular system, and this to the extremest part and in every organ of the body. This it is that contributes to the more perfect performance of all their respective functions, or, in more familiar language, immediately conduces to the healthful condition of the human constitution. To these precautionary measures we must add, that the influence of heat and cold must be carefully guarded against, inasmuch as the transition from heat to cold is the more frequent cause of disturbance of the healthy functions than any other of the common vicissitudes of circumstances. We must also guard against this inconvenience by the employment of proper clothing, and the recruiting of the exhausted powers effected by proper intervals of sleep; all excessive play and mental emotions, and particularly those of the passions of the mind, must be shunned, by carefully avoiding the exciting causes; and here we must bear in mind the trite proverb, *remove the cause, and the effects will cease*; in short, we must prevent any stimulus that can exhaust the vital powers, or to avoid their recruit; the most delicate female frame can be supported, even through a long and unhealthful life, and, at the same time, with less chance of the pain and suffering arising from a great and almost fatal malady, than the strong and robust individual possessing, *à priori*, an excellent constitution, who is either negligent, or avoids these precautionary measures.

It is almost self-evident that it is next to an impossibility to prescribe rules for the preservation of health in every individual, inasmuch as these depend upon the peculiarities existing in the constitutions of different persons; their various and different methods of existence; the effects and differences in their respective climates, &c.; and much must, as a matter of course, be left to the judgment of the party to acquire a knowledge of those substances which are injurious to the habit and constitution under different circumstances. Most individuals, at least those who are advanced to an adult age, must have been instructed on this head by experience. Generally speaking, we seldom find that mankind err in this respect solely through ignorance, but in consequence of their being unable or unwilling to avoid the constant habits of intemperance, want of prudence, &c.; by this means they find it utterly impossible to assume a proper control over their habits; thereby they are unfortunately in the daily custom of destroying, or, to say the least, deranging the digestive and natural functions of the body. It is not the quality or pernicious nature of any of the substances employed as food that alone create disease, but, on the contrary, it is the quantity that is too often the bane; it is often from the excess in the proportion they are taken, that health becomes injured, and the constitution disturbed. We may apply the same remark to the great neglect in the other exciting causes of disease; for, unfortunately, mankind are too prone to prefer the present gratification of something that affords them immediate pleasure or interest, than to avoiding what may prove the source of future disease and consequent suffering.

NEW ORLEANS.

WHEN a traveller from Europe sails down any of the large western rivers of North America, he often finds reason to express his surprise at the manner in which the water flows. In Great Britain, and most other countries, the rivers seem to have worn a natural channel in the soil, so as frequently to leave high romantic banks on their margins; but in many places in the western and southern part of the United States, where the district is flat, the waters flow as it were in a canal on the top of a ridge, so that when floods are poured down, the river breaks over its banks, and spreads over the adjacent country, greatly to the distress of the unhappy agriculturist. This is particularly the case with the Mississippi in its lower division, and should carefully be borne in mind by intending emigrants.

As you descend the Mississippi from Natchez, or some other trading town in the interior, in one of the numerous water craft now incessantly sailing to and fro on that magnificent stream, you begin to remark the devastations which the river has from time to time committed, particularly as you approach New Orleans. For a hundred and fifty miles above this city the planters on the banks of the stream have raised a regular embankment or mound called a *levée*, which is elevated from six to ten feet above the natural surface of the banks. It is raised on both sides of the river, and continues below New Orleans, as far as plantations have been made. Casting your eye beyond this earthy barrier, you perceive a broad strip of land near the banks brought under cultivation, divided into beautiful plantations, producing sugar cane and rice in abundance. The extensive plantation houses, and the immense groups of negro huts, succeed each other, and form a singular and striking appearance. The dwelling houses of the planters are neat, some are splendid, and are all seated amidst groves of oranges and jessamine, and surrounded with the multiflora rose and other shrubs. This is probably the richest district in the United States, and presents a beautiful and delicious scenery, beyond almost any thing which can be conceived. Behind these cultivated grounds there appear dense dark green forests, or level swamps, stretching out as far as the eye can travel over the waste, and relieved only by the live oak and cypress which grow on their surface.

At the distance of a hundred and five miles above the chief mouth of the Mississippi, and something more than one thousand below that of the Ohio, stands the city of New Orleans, the great maritime capital of the valley of the Mississippi. New Orleans, which enjoys a commodious situation on the north bank of the river, was founded so late as the year 1719, and now possesses a fixed population of about 50,000, and in the winter, or trading season, perhaps 25,000 more. "This is one of the most wonderful places in the world. Take a little turn with me on the *levée* (says a native writer*), and first survey the river. As far as you can see, almost up and down, the margin is lined with flat-bottomed boats come from above, from every point almost in the valley of the Mississippi. Some are laden with flour, others with corn, others with meat of various kinds, others with live stock, cattle, hogs, horses, or mules. Some have travelling stores; occasionally some are to be found which are full of negroes; and some full of what is infinitely worse, 'Old Monongahela' whisky. Along the lower part, you will see a forest of masts; higher up, you may see twenty or thirty steam-boats, with their bows up against the *levée*, or else projecting over an 'up country' flat-bottomed boat. Every day some come from above and others depart, on short excursions of trade of a thousand or two miles, to St Louis, or Louisville, or Nashville, or Pittsburg, or hundreds of other places; for distance is no longer thought of in this region—it is almost annihilated by steam! And if you cast your eye down the river, you may see a whole fleet, sometimes, coming up without a sail stretched, or an oar manned, all carried along, and not at a slow rate, by a steam tow-boat, of tremendous power. I was perfectly amazed the first time I saw this spectacle. It was the *Grampus*, or *Porpoise*, or *Shark* tow-boat, marching up, having two large ships grappled to her sides, two or three brigs at a cable's length behind, and, still further in the rear, one or two schooners, and two or three sloops! all moving steadily along. And if you turn your back to the river, you will see wonderful 'sights,' as the Pennsylvanians say. In one place you will see the busy and anxious-looking merchant, receiving from the steam-boat, or putting on board his ship, his cotton, his sugar, his molasses, tobacco, coffee, boxes of goods, &c., which cover the *levée* far and wide. Along the whole line are the owners of the flat-bottomed boats trading with the citizen shop-keeper. Whole rows of English and Americans are to be seen peddling those valuable little stores which one can move about in a hand-barrow, or carry about in a basket. And then such crowds (especially along that part of the *levée* which is opposite the market-house) of negroes and quadroons [four removes from blacks], carrying on their bandanaed heads, and with solemn pace, a whole table, or platform, covered with goodies, such as cakes, and apples, and oranges, and figs, and bananas or plantains, and pine-apples, and cocoa-nuts, &c., which it would be tedious to enumerate. And then, if you go through the city, which is fast improving in its appearance, you may look at the steam saw-

mills, steam cotton compressing machines, the market house, the state-house of ancient appearance, the hotels, the theatres if you like, the cathedral, the jail, the charitable hospital, and last, as the terminating point to us all, the place where repose, in the stillness of the tomb, those who once inhabited this city, now so full of life, activity, and mirth. There is nothing more interesting to a reflecting man than the Catholic and Protestant burying grounds, which seem to be covered with beautiful white mausoleums, some of several feet in height, some standing solitary, and others crowded together."

The population of New Orleans is exceedingly various. A large portion speak the French language—this part of the Union having once been a French colony—some the Spanish, and the remainder the English. Those that speak the French are generally Catholics, and are, through all their conditions and complexions, a polite, agreeable, and interesting people—honest, frugal, and inoffensive. As for the Americans who reside here, they are devoted to the exclusive business of acquiring wealth. The place has its wickedness, as has every large city. Of the permanent population much might be said of an interesting character: there is much intelligence among them. Five daily papers are published, three of which are partly in French and partly in English, and all are conducted with tolerable ability. Much has been said of the intemperate habits of the inhabitants generally; but such a charge has chiefly to be brought against the "half-horse half-alligator" characters that come down the river, and lead a roving hard-working life. Yet even these have been partially reformed in recent times; and what is worthy of remark, they have been reformed by *steam*, which now relieves them of a great part of their labours, and gives them less reason to indulge in intoxicating liquids. Such is a sketch of New Orleans, now a place of great business and commerce, and which, from its fortunate situation at the outlet of the extensive valley of the Mississippi, or central division of North America, will assuredly increase in magnitude, and maintain its rank as the metropolis of the southern portion of the United States.

THE LANARKSHIRE SCULPTOR.

THE object of our present sketch is MR ROBERT FORREST, a native of the parish of Carluke, in the Upper Ward of Lanarkshire. He was bred a stone mason; that is to say, bred in the way that country masons generally are—to prepare mortar, cut a rybat, and level a lintel, little more being deemed necessary to entitle him to assume the distinguished appellation of a mason. About the year 1810, however, he had occasion to visit a number of noblemen and gentlemen's seats, where some specimens of art were to be seen, grown over with moss—such as Maunsie Castle (then the property of the Hyndford family), Craig Nathan Castle, and Douglas Castle, all of them within his native county. Having again and again examined those specimens of art, his self-esteem was roused; he thought he could fashion something as good; at all events he determined to make an attempt; but, as if ashamed of what he had resolved on, he selected as his *studio* a remote spot in a wood on the banks of the Clyde, and which was almost inaccessible to every creature save the winged inhabitants of the firmament above, and now and then a stray fox or a hare. In this sequestered spot he spent every hour not employed in his usual avocations—rising early and sitting up late—in cutting figures of the lower animals by which he was surrounded. He next essayed some miniature figures of the human species; but though he soon became possessed of a considerable variety of specimens, he almost wished, like Frankenstein, to undo what he had formed, not being satisfied with the "labour of his hands."

For some years he followed the bent of his fancy, exciting only the curiosity that might have been expected among his immediate neighbours and compeers, till, in the autumn of 1817, Colonel Gordon, of the Lanarkshire militia, when on a shooting excursion, in traversing the wood, to his infinite surprise stumbled on the *studio*—the roof of which was formed by the canopy of heaven—and discovered the embryo sculptor at work. The mutual exclamations of astonishment having subsided into sober conversation, the Colonel closed the interview by making a purchase of a small figure of Bacchus—this being the first sale the artist had made of his labour as a sculptor; and shortly after, a second figure, of a similar description, was cut for a gentleman in accordance to an order from Mr Gordon.

The productions of Mr Forrest now began to form a subject of general conversation in Lanarkshire; and Mr Robertson of Hallcraig wished Mr Forrest to make for him a figure of a Highland chief. This was the first full-sized human figure the artist had attempted; and, suffice it to say, Mr Robertson was highly pleased with it, and placed it in front of his mansion-house. The figure was six feet in height, in the full Highland costume, bonnet, plaid, and kilt, with a sword in the right hand, in the attitude of attack, and a targe in the left.

It is not our purpose, in this brief sketch, minutely to detail the early figures cut by Mr Forrest. It is sufficient to say, that he was drawn from the wood, and fixed his workshop at a quarry near Orchard, a few miles below Lanark. Here he attempted several historical

figures, such as Old Norval, Sir John Falstaff, and Rob Roy. About this time he cut, for the town of Lanark, a statue of Sir William Wallace, whose brief but eventful history commenced at that burgh. This was the first public work of art in which our sculptor was engaged, and the manner his efforts were received was to him highly flattering and encouraging. The figure, which is seven feet six inches in height, in Roman costume, with sword and buckler, is placed in a niche in the steeple of the church, fronting the principal street. The elevation of the statue of the patriotic knight to the place destined for its reception, was celebrated in Lanark as a day of public rejoicing; all classes seemed imbued with a spirit of general enthusiasm; and a proud day it was to the young sculptor, who was, whether he would or not, carried in triumph throughout the streets, preceded by music, and the banners of the different trades.

From the flattering manner in which his works had been received, Mr Forrest was induced, in 1823, to attempt depicting the passions, unfavourable as sandstone is for the development of the minute workings of the human mind; and the subjects he chose were Simon and Bauldy, from Allan Ramsay, and Tam O'Shanter and Souter Johnnie, from Burns; intending to represent surprise and terror, convivial mirth and quaint humour. Tam O'Shanter was the only one of the four that Mr Forrest found time to finish, as he was now engaged by the Committee of Subscribers to the Naval Monument in St Andrew's Square, Edinburgh, to cut, according to a design by Chantrey, a colossal figure of Viscount Melville, to be placed on the top of that conspicuous structure.

Tam O'Shanter and other rustic figures were now set aside in a quarry, neglected by all save the curious, and strangers, who made this spot a favourite resort. To give an idea of the importance certain individuals attached to this exhibition, although Mr Forrest himself seemed to consider it as next to nothing, the coach betwixt Lanark and Glasgow was advertised as being permitted to stop at this place for some time, for the gratification of those who had a desire to examine the *studio* of a native artist, and we believe the figure of "Tam" formed the subject of general commendation. To the statue of Lord Melville, which is about fifteen feet in height, and composed of nine blocks of stone, Mr Forrest devoted much time and great attention, adopting every suggestion which he thought would give due effect to the figure. He was now frequently visited by the Duke of Hamilton, Lord Belhaven, and others of the nobility and gentry of the neighbourhood; but from the manner this statue was finished, and other circumstances connected with it, Admiral Sir David Milne, Michael Linning, Esq. of Colzium, Mr Stevenson, civil engineer, and the other members of the Committee, became his warm patrons, and have since continued to be so.

The cutting of the figure of Lord Melville led to Mr Forrest being employed to model and cut a colossal figure of the great Scottish Reformer, John Knox, which is erected in the Merchant's Park, near Glasgow. This figure is 12 feet high, composed of seven blocks of stone; and John Knox is represented in a Geneva gown, with the Bible in his right hand. Of this statue it were idle to say more than refer to the subjoined certificate:—

Glasgow, Feb. 7, 1826.

The undersigned, being members of the Superintending Committee for the Erection of a Monument to John Knox, the great Reformer of Scotland, do hereby certify, that Mr Robert Forrest modelled and completely finished the colossal statue of that monument, in a manner which has given to them the highest satisfaction; that they consider it to do great honour to Mr Forrest as a statuary in that species of sculpture, and trust that it may prove the means of increasing his reputation and professional success. They have much pleasure in adding, that in all their intercourse with him in this business, he manifested the most obliging disposition, and honourable desire to fulfil to the utmost the obligations he had contracted.

(Signed by) Stevenson Macgill; Jas. Ewing; James Cleland; Wm. Rodger; Thomas Hopkirk; John Herbertson, Superintending Architect.

While Mr Forrest was engaged in these figures for public monuments, other artists in the same line appeared, whose works, being honoured by public patronage in a manner they highly merited, induced Mr Forrest to enter on a new field of speculation, and to finish for exhibition a portion of what he had commenced for other purposes. But as following exactly in the track of his new contemporaries would have evinced a want of originality in himself, Mr Forrest attempted what he was certain was decidedly new, viz. equestrian groups. Four of these, the Duke of Wellington, the Duke of Marlborough, Queen Mary and Lord Herries, Robert the Bruce and the Monk Baston, form the leading subjects of an exhibition on the Calton Hill, which has been honoured with the patronage and approbation of the chief nobility and gentry, as well as the most distinguished connoisseurs in art resident in Edinburgh.*

* The Duke of Wellington is represented leaning against the shoulder of his charger, supposed to be addressing his officers after the battle of Waterloo. His Grace is dressed in the costume of a field-marshal, and the mode in which the detail is finished is well worthy of minute examination. The charger is in the attitude of pawing.

The group in which the Duke of Marlborough is the leading figure is after the Elgin Marbles. His Grace is dressed in a Grecian costume.

The third group represents Queen Mary mounted on a Scots Galloway, and Lord Herries urging the unfortunate Queen to fly, after the defeat of her troops at the battle of Langside. When the late Sir Walter Scott visited Mr Forrest, he expressed himself not merely pleased with the *tout ensemble* of this group, but highly commended the manner in which he had succeeded in represent-

* The author of a letter in the New York Observer.

Such is a plain unvarnished outline of the history of one of Scotia's humble sons, who, by the efforts of his genius and strength of mind, has raised himself from the obscurity of his native glen to be an honour to himself and to the country which gave him birth; and one who, to those that have known him from his youth, still appears the simple, unassuming, unpretending country mason, apparently as much astonished at his own efforts as those who look on them are gratified.*

THE FIRE-FANCYING DOG.

We have all heard strange stories told of the sagacity and peculiar habits of dogs, but among these none are so remarkable as that related of an *eccentric* dog now living in London, which makes a point of being at every fire that happens in the metropolis. The following interesting account is given of this animal:—

About three years ago, a gentleman residing a few miles from the metropolis was called up to town in the middle of the night, by the intelligence that the premises adjoining his house of business were on fire. The removal of his furniture and papers, of course, immediately claimed his attention; yet, notwithstanding this, and the bustle which is ever incident to a fire, his eye every now and then rested on a dog, whom, during the hottest progress of the devouring element, he could not help noticing running about, and apparently taking a deep interest in what was going on, contriving to keep himself out of every body's way, and yet always present amidst the thickest of the stir.

When the fire was got under, and the gentleman had leisure to look about him, he again observed the dog, who, with the firemen, appeared to be resting from the fatigues of duty, and was led to make some inquiries respecting him. "Is this your dog, my friend?" said I to a fireman. "No, sir," answered he; "it does not belong to me, or to any one in particular. We call him the firemen's dog." "The firemen's dog!" I replied. "Why so? Has he no master?" "No, sir," rejoined the fireman; "he calls none of us master, though we are all of us willing enough to give him a night's lodging and a penny-worth of meat; but he won't stay long with any of us; his delight is to be at all the fires in London, and, far or near, we generally find him on the road as we are going along, and sometimes, if it is out of town, we give him a lift. I don't think there has been a fire for these two or three years past, which he has not been at."

The communication was so extraordinary, that the gentleman found it difficult to believe the story, until it was confirmed by the concurrent testimony of several other firemen. None of them, however, were able to give any account of the early habits of the dog, or to offer any explanation of the circumstances which led to this singular propensity. A minute of the facts was made at the time by the inquirer, with a view to their transmission to some of the journals or periodicals which publish anecdotes of the natural history of animals, but other things interfered, and the intention was lost sight of.

In the month of June, last year, the same gentleman was again called up in the night to a fire in the village in which he resided, Camberwell, in Surrey, and to his surprise here he again met with "the firemen's dog," still alive and well, pursuing, with the same apparent interest and satisfaction, the exhibition of that which seldom fails to bring with it disaster and misfortune, oftentimes loss of life and ruin. Still he called no man master, disdained to receive bed or board from the same hand more than a night or two at a time, nor could the firemen trace out his resting-place.

Such was the account of this interesting animal as it appeared in *The Standard*, and several other papers. A short time after, some firemen being in attendance at Union Hall police-office, were asked whether some curious circumstances relative to a dog, which was known by the name of "the firemen's dog," an account of which appeared in some of the newspapers, were founded in truth. A fireman replied, that he had not heard of nor seen the account, but the dog "Tyke" was an old acquaintance of his, and he supposed that he was the animal to which the paragraph alluded. The magistrate asked whether it was a fact that the dog was present at most of the fires that occurred in the metropolis. The fireman said, that during their acquaintance he never knew Tyke to be absent from a fire upon any occasion that he (the fire-

man) attended himself. The magistrate said the dog must have an extraordinary predilection for fires. He then asked what length of time he had been known to possess that propensity. The fireman replied, that he knew Tyke for the last nine years, and although he was getting old, yet the moment the engines were about, Tyke was to be seen as active as ever, running 'off in the direction of the fire. The magistrate inquired whether the dog lived with any particular fireman. The fireman replied, that Tyke liked one fireman as well as another; he had no particular favourites, but passed his time amongst them, sometimes going to the house of one, and then to another, and off to a third when he was tired. Day or night, it was all the same to him; if a fire broke out, there he was in the midst of the bustle, running from one engine to another, anxiously looking after the firemen, and, although pressed upon by crowds, yet, from his dexterity, he always escaped accidents, only now and then getting a ducking from the engines, which he rather fancied than otherwise. The magistrate said that Tyke was a most extraordinary animal. The fireman: "We have an annual dinner at the outskirts of the town, which takes place during the summer: if Tyke happened to be absent from the firemen of our company for a week previously, he is always sure to be at the house where we meet to go in procession to the dinner, to which he accompanies us, as he well knows he fares right well upon those occasions. He gets a regular blow-out of whatever we have ourselves, and eats so ravenously of the good things that he can scarcely wag. The magistrate asked whether a fire ever happened to break out when Tyke was indulging with them at their annual festival. The fireman did not recollect an instance of the kind, but he was convinced, knowing Tyke's love to be present at a fire, that he would leave the entertainment, and scamper off to the scene of action.

The magistrate having expressed a wish to see this dog, he was shortly after exhibited at the office, and some other peculiarities respecting him were related.

There is nothing at all particular in the appearance of the dog; he is a rough-looking small animal, of the terrier breed, and seems to be in excellent condition, no doubt from the care taken of him by the firemen belonging to the different companies. There was some difficulty experienced in bringing him to the office, as he does not much relish going any distance from where the firemen are usually to be found, except in cases of attending with them at a conflagration, and then distance is of no consequence. There was stratagem obliged to be used. A fireman commenced running: Tyke, accustomed to follow upon such occasions, set out after him; but, this person having slackened his pace on the way, the sagacious animal, knowing there was no fire, turned back, and he was obliged to be carried to the office.

THE DOUBLE MARRIAGE.—A TALE.

In the course of a late tour in the south of Europe, I remained for a short time in Florence, before proceeding to Naples. It was in autumn, the most delightful season of the year in the Tuscan capital. The beauty of its situation, its splendid edifices, and brilliant streets, are then seen to the best advantage; while the peculiarly lively animated appearance of the inhabitants awakens emotions of the most pleasant description. The country, not less than the city, is fitted in a high degree to excite interest. The whole vale presents the aspect of a continued grove and garden, enhanced in beauty by the graceful windings of the river Arno, which intersects it from east to west. Numerous white villas, situated along its banks, strike the eye through the extensive orchards; and romantic residences, equally beautiful, stud the surrounding hills, rising in every variety of form, till the prospect is bounded by the lofty Apennines.

With such inducements to perambulate, I was daily abroad. One of my favourite routes was the line of road leading to the Abbey of Vallambrosa, a place the name of which must be familiar to every reader of Milton's "Paradise Lost." In this direction I frequently met an elderly gentleman and a lady, apparently his daughter, generally riding in an open vehicle. There was something in her appearance that affected me deeply. She seemed about twenty years of age. Her features were of nature's finest mould, and her whole form was elegance and grace. I could easily perceive, however, that a settled melancholy rested on her countenance—the sure indication that grief, deep and poignant, preyed upon her heart. The rose's bloom, indeed, had not left her cheek, but consumption seemed, prematurely, to have begun its work, and I could not help exclaiming as she passed, "My dear young lady, the destroyer has already marked you as his victim, and you are destined, ere long, to enter the gates of the city of the dead."

Having met her father, shortly afterwards, at the house of a friend, I availed myself of the opportunity of inquiring after her health. This was evidently touching a tender chord. After answering my inquiry, and informing me he expected her that day to join the party at dinner, he thus proceeded:—

"I perceive, sir, that you are, like myself, comparatively a stranger in Florence. It is little more than three months since I left Scotland with my daughter, to try what a change of air, and a variety of scenery, might effect in the restoration of her health. Hitherto, our tour has been productive of no benefit to her,

and I am beginning to fear that the results may be fatal. The anticipation of such an event is to me the more dreadful, for I have myself to blame as the sole cause of her present affliction. Amelia is my only child. She had the advantage of being trained under one of the best of mothers, till she was twelve years of age, when she was sent to a boarding-school in the neighbourhood of London. She remained there for nearly four years, when the illness of her mother rendered it necessary to recall her home. This was a trying season to Amelia. She neglected all attention to her own personal comfort, watching night and day by her mother's bedside, and administering to her wants with the most endearing tenderness. Never did a daughter display greater intensity of filial affection, and never was there a parent who better deserved it. But every effort that affection or medical aid could devise, was ineffectual. Disease continued to extend its ravages, till Amelia was rendered motherless, and I was deprived of one of the most valuable of woman-kind. Among those who visited her during her illness, none was more unwearied in his attentions than Mr R——, the respected tutor at Rosehall. With her, even when in health, as well as with myself, he had always been in high esteem, and it gave us great pleasure when he occasionally spent an afternoon or evening with us at Bentley House. He was a young gentleman of unaffected piety and engaging manners. He had distinguished himself at the University by the extent and variety of his classical and literary acquirements. Unsuspicious of danger, I encouraged his visits after the death of my wife, and his interesting conversation tended much to relieve our minds of the grief consequent on such a bereavement. Amelia herself did every thing she could to comfort me, and I was thankful to Heaven that I had been blessed with such a daughter. Every month she became more endeared to me by her affectionate attentions. With rapture I viewed her rising to womanhood, acquiring those accomplishments which were fitted to adorn the situation in society which she appeared destined to occupy. At home or abroad, there was no one in my estimation superior, or even equal to Amelia; and the flattering attention every where shown her was but too much calculated to confirm a father's partiality. By the time she had reached her eighteenth year, her admirers were numerous; many of them exceedingly wealthy, and of high respectability. Her own fortune, left her by her mother, was handsome; while the addition likely to be given by me, rendered her not an unfit match for any gentleman of distinction in our neighbourhood. I early perceived, however, that external equipage and splendour presented few attractions to Amelia, unless accompanied by personal worth. With just discrimination, she admitted into her confidence only those whose correctness of principle and consistency of conduct were a sufficient guarantee for the stability of their friendship. Of those who aspired to the favour of her hand, there was one Mr Tarnley, for whom I felt some partiality. He was the son of my former partner in business; he had lately returned from the West Indies, and was sole heir to his father's fortune, which was immense. But she had discovered, on a very short acquaintance, that his morals had been corrupted during his residence abroad. Any civility she subsequently showed him was very distant, and seemed rather in deference to my feelings, than from her own choice. Mr Tarnley was much piqued at her indifference; and, in conversation with me, attributed it to an unworthy attachment she had been cherishing for the tutor at Rosehall, and with whom, it was suspected, she intended to make an early elopement. I had, indeed, observed that Amelia always treated that gentleman with the most marked respect; but this I attributed not to any attachment she could have formed for one so much her inferior in rank, but to regard for his worth, and gratitude for his attention to her mother. When I spoke with her on the subject that evening, she solemnly assured me, that if Mr R—— really entertained an affection for her, he had never avowed it, and that any communications she had ever received from him were merely translations of select passages, chiefly from German and Italian authors, whose works he had been reading—all of which papers she laid before me. On examining them, I found many pieces of exquisite beauty, while every one of them seemed designed either to refine the taste or purify the heart. From the ambiguous manner in which she expressed her own feelings on the occasion, as well as from what I witnessed shortly afterwards, not a doubt remained on my mind that this intercourse, begun in friendship, had, on her part, gradually ripened into love. Strong as was my affection for Amelia, and much as I respected Mr R——, the knowledge of this attachment gave me great pain; and I resolved at once to break up a correspondence which threatened to bring disgrace on my family and friends. Without communicating my design to Amelia, I wrote to him that very evening, forbidding further visits at Bentley House; but, in consideration of his kind services during the illness of my wife, enclosed him a small present, which I begged him to accept as a proof of my gratitude, and as a memorial of her name. Little did I then know that, by that act, I was inflicting additional pain on a heart already overcome with sorrow; and as little did I anticipate the serious consequences which should ensue from it, to the only one whom I held dearest on earth.

"Next morning Amelia, taking a walk before break-

ing ancient armour; and so minute was the worthy Baronet in his examination of the details, that the very saddle-girth did not escape his scrutinizing eye, and he was pleased to say that it was one of the best representations of the ancient girth he had ever seen. Queen Mary's steed is rampant.

Robert the Bruce, and the Monk Baston presenting him with verses after the battle of Bannockburn, are the leading figures in the fourth group. The monk came to curse, but remained to bless. The King's charger is represented as restive.

These statues are all cut from a greyish sandstone, of that kind known to masons by the name of liver rock. It is very hard and durable, and free from spots and streaks. It is found in a quarry, the property of Lord Douglas, in the parish of Lesmahagow. Each block, before being begun to be dressed, was estimated to weigh fully 20 tons; when finished, the groups weigh 4 to 7 tons each.

Mr Forrest has in preparation the statues of three eminent public characters, lately deceased, and which he expects to be able to produce to the public in the course of the spring.

* We consider it proper to state, that the Committee of Contributors to the National Monument, when it was known that Mr Forrest intended to exhibit the efforts of his chisel in Edinburgh, generously gave him the use of the enclosed area at the National Monument.

fast, had a packet put into her hand by the footman from Rosehall, which she instantly opened, without perceiving that it was addressed to me, and read as follows—

"DEAR SIR—What the circumstances are to which you refer I know not, nor is it likely I ever shall, as I leave this part of the country early to-morrow morning, never to return. I had just finished perusing the mournful and unexpected intelligence of the death of my beloved mother, when I received your card; and shortly after, one of a most reproachful kind from Miss Amelia. The contents of both astonish me; but it is almost needless to add, that, had I remained here, your commands would have been most sacredly obeyed. I am willing, however, to believe that you have been made the dupe of some designing villain; and with this impression I leave you, on parting, my cordial forgiveness. For the purity of the motives by which I have been actuated, in all my intercourse with you, I appeal to the Omniscient Searcher of hearts, before whom we must shortly appear.

"For obvious reasons, I decline accepting the very elegant gift which you have now done me the honour to enclose. I could never look on it, without associating with it the letter with which it was accompanied. In so far as it might be a token of remembrance of the late Mrs B—, I have only to say, that no such extraneous symbol is necessary to remind me of her many virtues and excellencies. They have made a deep impression on my heart, and they will ever be held by me in affectionate remembrance.

"Wishing you, and your amiable and accomplished daughter, every temporal and spiritual blessing, I bid you farewell."

"In the perusal of this letter, and the one addressed to herself, which was designed as an answer to hers of the preceding day, feelings of a most painful kind agitated the bosom of Amelia. She stood for some time struck with astonishment. She had written him no letter. The villany of Tarnley at once flashed upon her mind. The letter she had sent to him, two days before, was of the character described. With some acid he had discharged the superscription, and addressed it to Mr R—. Scarcely knowing what she did, she returned to the house, threw both letters on my table, and rushed up stairs to give vent to the bitterness of her sorrows. My heart smote me the moment I read them, and I instantly rang for Amelia. After waiting for some time with great impatience, I ran to her apartment. She had sunk into a swoon in the arms of her servant. On her recovering a little, I attempted to console her, and to justify the part I had taken, assuring her that it originated solely in a desire for her welfare, and respectable settlement in life. She was too well convinced of the sincerity of my affection to blame my motives—still the measure, designed though it was to promote her worldly interests, was evidently one which met not the approbation of her heart. I then called over at Rosehall, designing to apologize for what I had done, but found that he had gone off several hours before. It appeared that he had been greatly beloved, for the whole family were sunk in grief. The lady herself had entreated him even with tears to return as soon as he conveniently could, after the mournful occasion was over; but he continued inexorable. His feelings had been much tried in parting with the young people, to whom he was devotedly attached. On my return home, I wrote to Mr Tarnley, upbraiding him for the baseness of his conduct, in reference to Mr R—, and received a reply filled only with the most horrible imprecations. Shortly after, he left the place, but not before mournful traces of his villany had become visible. Meanwhile, Amelia remained inconsolable. Hers was not a violent paroxysm of affection, which speedily wastes itself in the violence of symptoms, and then disappears. It had taken entire possession of her heart, and it continued its power till reason had utterly departed from her throne. All was now sadness and desolation in the once happy residence of Bentley House. The sun arose, day after day, shedding down his benignant rays on the surrounding landscape. All was 'beauty to the eye and music to the ear,' but our dwelling contained one tenant that heeded them not—one, did I say?—all seemed insensible to what was passing around. During this, my agony was intense. Conscience never ceased to utter its reproaches—even the silent looks of my domestics spoke 'unutterable things;' and I viewed myself as one of the greatest monsters under heaven. In this state Amelia continued for three months, when reason again dawned; but it brought along with it no diminution of her sorrows. Her physicians, one and all, ascribed her illness to some painful circumstance pressing upon her mind, and declared, that, till this was removed, they had no hope of her recovery. I immediately wrote to Mr R—, urgently desiring him to meet me at —, but received no answer. A tour to the Continent was then recommended as the last resource, with a view to her recovery. We have proceeded thus far; but her mental suffering still continues. Nearly two years have now elapsed since she was first taken ill, and to all appearance nature cannot long sustain the struggle. Oh, sir, had I the wealth of empires, it would instantly be sacrificed to procure happiness to my daughter, and to do justice to the merits of Mr George Robinson!"

"George Robinson!" I exclaimed, with emotion, as the old gentleman had finished his narration, and

was bathed in tears. "Did he belong to — near —?" "The very same," replied Mr Bennett, looking on me with an eye of inquiring interest. "Well, then," said I, "George is my old class-fellow and intimate friend. I have not heard from him, indeed, since his mother's death, which took place at the very time when I was preparing to leave the country; but his sister's address is in my possession. The last letter I received from her was dated from her aunt's; and as she understood I was then about to proceed to the Continent, it contained a handsome memento of her gratitude, for a service once rendered to her brother." Here I took from my breast an elegant silver medal, which I showed him. It bore the following inscription:—"Presented by Harriet Robinson to Mr R—, as a memorial of her lasting gratitude for saving her brother's life, at the imminent danger of his own, May 1826."

Mr Bennett was just returning me the medal, when we observed Amelia coming into the garden, accompanied by the lady of the house. We soon joined them, when I was introduced to Amelia as an intimate friend of Mr R—'s. A ray of hope instantaneously lighted up her finely-expressive and intellectual countenance, and she received me with uncommon warmth and cordiality. At the father's request, I accompanied them home that evening. Their residence was a few miles from Florence, on the very line of road where I had so frequently met them. After this, I visited them almost daily; and though, when Mr R— was spoken of, hope and fear seemed alternately to prevail in the bosom of Amelia, yet it was very evident that her mind had been considerably relieved. In the meantime, I wrote to Miss Robinson, making inquiry after her brother, but, week after week, was disappointed of an answer. I was much puzzled to account for this, and, on my return from visiting Mr Bennett one evening, having carelessly thrown the reins on my horse's mane, was musing as to the measures I should next adopt for discovering Mr R—, when, on a sudden, from some cause which I never knew, my horse reared, and, in a few seconds, horse and rider were thrown over a dangerous precipice of considerable depth. That moment my recollection left me. On recovering, I found myself in bed, but not in my own apartment, and an elderly matron sitting near me reading. On attempting to move, I discovered that my head and left arm were bandaged. She had observed my motion, and rising up, to my surprise, addressed me in the language of my country, putting several kindly inquiries. "Thank Heaven," said she, "young gentleman, that you have escaped. My mistress had been accompanying her brother to the nearest post-town on his way to Naples, when on her return you were found lying insensible, your head streaming with blood, and your horse dead by your side. You were immediately put into the carriage, and conveyed thither. My young mistress has been in deep concern ever since you were found. O the dear angel! how anxious she is for your recovery. I hope God will reward her. She has just gone out with a lady who was paying her a visit, but will be here presently." That instant she entered the room, and appeared astonished to see me engaged in conversation. Throwing aside her veil, and approaching me, she discovered two of the finest light blue eyes I had ever seen, which, heightened in effect by contrast with her lovely yellow hair, in golden ringlets, adorning a countenance of exquisite beauty, gave her an appearance almost angelic. She expressed her sympathy for me on the unfortunate accident which had occurred, and desired me to make their house my home till I should be completely recovered. Her manner had in it so much sweetness and feeling that I could not help being struck with it; and I thanked her for her disinterested kindness to one who was a stranger in their country. "Sir," said she, "if I mistake not, neither your name nor your history is unknown to me. Are not you Mr — of —?" On my answering, with surprise, in the affirmative, she instantly asked, "Do you remember George Robinson?" "I do, Ma'am," said I, "and will to the latest hour of my life. Do you know any thing of him?" I immediately rejoined, with some impatience. "Yes, sir," said she, blushing; "George is my brother, and you are now in his house. The medal on your person led me to suspect who you were, the moment we found you. George was appointed, shortly after my mother's death, to an office of considerable emolument and literary distinction in Florence. He is at present on a visit to Naples, but will be home in two or three weeks. Oh, how overjoyed he will be to see you! he speaks frequently of you, and wonders why you have never written an answer to his letters. But I forget—longer conversation, in your present exhausted state, may expose you to a relapse; I must, therefore, leave you to repose." Before I could recover from my astonishment, she had left the room. Her sylph-like form seemed still to move before me; every look, and word, and action, was impressed upon my mind; and emotions, such as I had never before experienced, swelled my bosom. Every day she appeared to me more interesting. I was never happy unless when she was with me. I seemed to live—to breathe—only for Harriet. In a short time I was out of danger, and able to move about, when I wrote Mr Bennett, informing him of what had occurred, and of my intention of remaining in Mr R—'s till his return from Naples, after which he might expect an early visit from us. That very

evening George returned, and our joy at meeting was unbounded. Among other topics of conversation, my interviews with Mr and Miss Bennett held a chief place, and at my request he consented to visit them the following day. We were nearly ready for our departure when a carriage stopped at the door, and Mr and Miss Bennett were immediately announced. George's bosom heaved with indescribable emotion, and he stood for a little in breathless suspense. Mr Bennett then entered the room, accompanied by Amelia. In a moment the two lovers were locked in each other's arms. The father was deeply affected, and burst into tears. Harriet and I instantly left the room, and were speedily followed by Mr Bennett. The feelings of the lovers in the interval I shall not attempt to describe. They were of too pure and ethereal a kind for my feeble pen. Suffice it to say, the interview was a most endearing one. That was to George the happiest hour of his life—to Amelia it was as life to the dead. By the time of dinner, both had regained composure, when Mr Bennett, addressing himself to Mr Robinson, and cordially taking him by the hand, said, "My dear sir, I humbly crave your forgiveness for the injury I formerly did you. I have seen enough to convince me of the sincerity of the affection that exists betwixt you and my daughter, and I am now persuaded you richly deserve her. Rest assured, that henceforth I shall be no barrier in the way of your happiness." From that hour a load was removed from Amelia's spirits, and she soon regained her health and beauty. George was in transports at having an honour conferred on him which he had never hoped to realize. Harriet was overjoyed at her brother's good fortune; and my gratification was none of the least, that, while I had thus been the mean of bringing together two so well worthy of each other, I had received such an important accession to my own happiness in securing the affection of the amiable Harriet. We were waited on, shortly afterwards, by a presbyterian clergyman from Scotland, then in the neighbourhood; and the same hour that united George to Amelia, made Harriet mine.*

THE BETTER LAND.

(From Mrs Hemans' Songs of the Affections.)

"I hear thee speak of the better land,
Thou callest its children a happy band;
Mother! oh where is that radiant shore?
Shall we not seek it, and weep no more?
Is it where the flower of the orange blows,
And the fire-flies glance through the myrtle boughs?"

—"Not there, not there, my child!"

"Is it where the feathery palm-trees rise,
And the date grows ripe under sunny skies?
Or 'midst the green islands of glittering seas,
Where fragrant forests perfume the breeze;
And strange, bright birds, on their starry wings,
Bear the rich hues of all glorious things?"

—"Not there, not there, my child!"

"Is it far away, in some remote old
Where the rivers wander o'er sands of gold?—
Where the burning rays of the ruby shine,
And the diamond lights up the secret mine,
And the pearl gleams forth from the coral strand?—
Is it there, sweet mother, that better land?"

—"Not there, not there, my child!"

"Eye hath not seen it, my gentle boy!
Ear hath not heard its deep songs of joy;
Dreams cannot picture a world so fair—
Sorrow and death may not enter there;
Time doth not breathe on its fadeless bloom,
Far beyond the clouds, and beyond the tomb,
—It is there, it is there, my child!"

SPEAKING JACKDAWS.

In modern times, parrots are almost the only birds that have the gift of speech, though connoisseurs are not ignorant that starlings and jackdaws have good abilities in that way, when properly educated. The ancients could at times make them speak to some purpose: Macrobius tells us that when Augustus Cæsar was returning in triumph to Rome from his victory over Mark Antony, there appeared among the crowd which welcomed him, a bird borne on a man's hand, which flapped its wings, and cried out, "God save the Emperor, the victorious Cæsar!" Augustus, delighted to see himself saluted by this winged spokesman, gave its owner a handsome sum for the bird. The owner pocketed the money, refusing to share any of it with an associate who had aided him in training his jackdaw. This man, in order to be revenged, and to shew the loyalty which had animated his friend, brought to the Emperor another bird which they had in training, and which called out, "God save the victorious Mark Antony." Augustus, whose good nature is well known, only laughed at the joke, and ordered the confederates to divide the money. After his liberality in this instance, he had a number of speaking jackdaws and parrots brought to him. One poor fellow, a shoemaker, took great pains to teach a bird which he had got for the purpose, hoping to make his fortune by it. The bird, who had no such prospects, was but a slow scholar; and his master, in the midst of his lessons, often ejaculated in despair, "Well, I have lost my labour!" Having at last, however, and with much pains, completed his education, the daw was brought out one day to salute Augustus, and repeated his "God save the Emperor!" with great distinctness. "Tut!" said Augustus, "I have too many courtiers of your kind." "Well," cried the daw, who at that moment remembered his master's ejaculation—"well, I have lost my labour." The Emperor was so much amused with its answer, that he bought the feathered wit for double the expected sum.

THE MILLER AND THE FREEBOOTER.

In Glenquoich, in Aberdeenshire, in the early part of last century, there was a corn-mill erected for the use of the neighbourhood, and as the construction and management of such machines were ill understood in that part of Scotland at the time, a miller was brought from the low country to superintend it. In this neighbourhood there lived at that time a certain Donald Mackenzie, a hero remarkable for his haughty and imperious manner, and known by the appellation of *Donald Unasach*, or Donald the Proud. Being a native of Glenquoich, he knew as little of the English language as the miller did of Gaelic. He was an outlaw, addicted to freebooting, and of so fierce and unruly a temper, that the whole country stood in awe of him. One circumstance regarding him struck every one with superstitious awe, and created much conjecture and speculation among those around him: he was never known to be without abundance of meal, and yet he was never known to carry any corn to the mill.

But the sagacious miller of Glenquoich soon discovered, that, in order to bilk him of his proper mill-dues, the caitiff was in the habit of bringing his grain to the mill in the night, and grinding it, and carrying it off before morning. To charge him directly with this fraud, was too dangerous an attempt. But the miller ventured to ask him now and then, quietly, how he did for meal, as he never brought any corn to the mill; to which the freebooter never returned any other answer than one in Gaelic, signifying that "strong is the hand of God!"

Provoked at last, the miller determined to take his own way of curing the evil; and, having some previous notion of the next nocturnal visit of his unwelcome customer, he took care, before leaving the mill in the evening, to remove the bush, or that piece of wood which is driven into the eye of the nether millstone, for the purpose of keeping the spindle steady in passing through the upper stone. He also stopped up the spout through which the meal discharged itself; and as the mill was one of those old-fashioned machines, where the water-wheel moved horizontally, and directly under the stones, it follows, that, by this arrangement of things, the corn would fall into the stream. Having made these preparations, the miller locked his house door, and went to bed. About midnight, Donald arrived with his people, and some sacks of dry corn; and finding every thing, as he thought, in good order in the mill, he filled the hopper, and let on the water. The machinery revolved with more than ordinary rapidity; the grain sank fast in the hopper; but not a particle of it came out at the place where he was wont to receive it into his bag as meal. Donald the Proud, and his *gillies*, were all agast. Frantic with rage, he and they ran up and down; and, in their hurry to do every thing, they succeeded in doing nothing. At length Donald perceived, what even the obscurity of the night could not hide, a long white line of fair provender flowing down the middle of the stream, that left not a doubt as to where his corn was discharging itself. But he could neither guess how this strange phenomenon was produced, nor how the evil was to be cured. After much perplexity, he thought of turning off the water. But here the wily miller had also been prepared for him, having so contrived matters, that the pole, or handle connecting the sluice with the inside of the mill, had fallen off as soon as the water was let on the wheel. Baffled at all points, Donald was compelled at last to run to the miller's house. Finding the door locked, he knocked and bawled loudly at the window; and, on the miller demanding to know who was there, he did his best to explain, in broken English, the whole circumstances of the case. The miller heard him to an end; and, turning himself in his bed, he coolly replied, "strong is the hand of God!" Donald Unasach gnashed his teeth, tried the door again, returned to the window, and, humbled by the circumstances, repeated his explanation and entreaties for help. "*Te meal toun te purn to te tell! hoigh, hoigh!*" "I thought ye had been over weel practised in the business to let on sic mischanter come ower ye, Donald," replied the imperturbable lowlander, "but, you know, 'strong is the hand of God!'" The mountaineer now lost all patience. Drawing his dirk, and driving it through the window, he began to strike it so violently against the stones on the outside of the wall, that he illuminated the house with a shower of fire, and showed the terrified inmates the ferocious countenance of him who wielded the weapon. "*Te meal to te mill, te mitter to te mailer,*" sputtered out Donald, in the midst of his wrath, meaning to imply, that, if the miller would only come and help him, he should have all his dues in future. Partly moved by this promise, but still more by his well-grounded fears, the miller arose at last, put the mill to rights, and ground the rest of the corn. And tradition tells us that after this the mill-dues were regularly paid, and the greatest harmony subsisted between Donald Unasach and the miller of Glenquoich.—*From Sir T. Dick Lauder's Account of the Moray Floods.*

SWEDISH METHOD OF PRESERVING APPLES.

They are skinned and quartered, and then half baked, which produces a disagreeable shrivelled appearance; but they retain their flavour, and in that state can be kept any length of time.

THE BHATTEE ROBBER.

The country of the Bhattees is situated in the north-eastern quarter of the province of Ameer, in the East Indies. Until the progress of events brought the British arms within the limits of their country, this class of the natives of Hindostan was scarcely known even by name. The Bhattees were originally shepherds. Of late years they have abandoned that honest occupation, as servile, and unworthy of their talents, and have adopted a predatory system of life, which is considered by them more noble than tending sheep. The following is a portion of the system of education:—When the young Bhattee is about three or four years of age, his education, or training, is commenced, by being compelled to walk and run a given distance daily. As he advances in years, the exercise required of him is increased in proportion, until he may at last be said to have gone through a regular course of gymnastics, in the etymological sense of that word—for all his exercises are performed in a state of nudity. The object and natural effect of this kind of schooling is to increase the physical powers of the body in all situations, and to enable the individual to endure with comparative ease the greatest fatigue or labour. Among other essential accomplishments in which the young Bhattee is expected to perfect himself by unremitting practice, the following may be mentioned as absolutely indispensable. He must acquire the art of bleating like a sheep, barking like a dog, crowing like a cock, braying like the ass, and in like manner of imitating all kinds of animals. He must also be able to throw himself, as occasion may require, into every kind of attitude, to crawl along or lie as flat as possible on the ground, to run like a goat or a dog, to stand on his head with his legs extended widely, so as to appear in the dusk like the stump of a tree. With reference to the last-mentioned acquirement, I recollect to have heard a sentinel of the 4th Bengal cavalry tell his officer, that when he was on duty, on a certain occasion, he heard something move about the head-ropes of his horse. On looking round, he saw what he supposed to be a large dog, which ran between his legs and nearly upset him. The sentinel, however, had heard of the ability with which many of the natives could imitate different animals, and was not satisfied with this explanation of the noise that had first excited his attention. He still suspected that some rogues were on foot, and, the better to detect it, he placed himself behind what appeared to be the stump of a tree, at a short distance from the spot on which he had been previously standing. On the supposed stump he hung his helmet, and, bent on the most attentive scrutiny, he placed his head between the two limbs of the stump, so as, unperceived, to command a direct view of the quarter from which the noise had originally proceeded. This, however, was too much for the thief (for such, in reality, was this pseudo tree-stump), who, unable to restrain his laughter, and finding his situation somewhat critical, suddenly executed a somerset, upset the astonished soldier, and made clear off with his helmet.—*Englishman's Magazine.*

MOURNING.

Mourning, among the ancients, was expressed by very different signs, as by tearing their clothes, wearing sackcloth, laying aside crowns and other ensigns of honour: thus Plutarch, in his *Life of Cato*, relates, that from the time of his leaving the city with Pompey, he neither shaved his head, nor, as usual, wore the crown or garland. A public grief was sometimes testified by a general fast. Among the Romans, a year of mourning was ordained, by law, for women who had lost their husbands. In public mourning, the shops of Rome were shut up; the senators laid aside their legislative robes, the consuls sat in a lower seat than usual, and the women put aside all their ornaments. The colours of the dress, or habit, worn to signify grief, are different in different countries. In Europe, the ordinary colour for mourning is black; in China, it is white, a colour that was the mourning of the ancient Spartan and Roman ladies; in Turkey, it is blue, or violet; in Egypt, yellow; in Ethiopia, brown, and kings and cardinals mourn in purple. Every nation and country gave a reason for their wearing the particular colour of their mourning: black, which is the privation of light, is supposed to denote the privation of life; white is an emblem of purity; yellow is to represent that death is the end of all human hopes, because this is the colour of leaves when they fall and flowers when they fade; brown denotes the earth, to which the dead return; blue is an emblem of the happiness which it is hoped the deceased enjoys; and purple or violet is supposed to express a mixture of sorrow and hope. The custom of mourning for the dead in shrieks and howlings, is of great antiquity, and prevails almost universally among the followers of Mahomet.

GREAT NEWS FOR GARDENERS—HOW TO KILL SLUGS.

Take a quantity of cabbage-leaves, and either put them into a warm oven, or hold them before a fire, till they get quite soft; then rub them with unsalted butter, or any kind of fresh dripping, and lay them in the places infested with slugs. In a few hours the leaves will be found covered with snails and slugs, which may then be destroyed in any way the gardener may think fit.—[We have tried this at Bayswater, and found it attended with complete success.]—*London's Gardener's Magazine.*

THE COTTON MANUFACTURES OF FRANCE.

The French cotton manufacture has increased with great rapidity since the peace, as appears from the fact that the quantity of cotton wool imported was 25,000,000lbs. in 1810, and is between 80,000,000 and 90,000,000lbs. at present. The French, however, can never rival the English in this manufacture, and though they have nurtured up great manufacturing communities, who have rapidly gained wealth, this is at the expense of all the rest of France. The cost of fitting up a cotton mill with machinery at Rouen is at least one-third more than at Manchester; fuel is four times as dear; and the working and repairing of the machinery must therefore be far more expensive and difficult. Many of the machines are brought from England. The fact that cotton goods are now three or four times as dear in France as in England, is a decisive proof that this government has judged ill in compelling so much capital and labour to take so unprofitable a direction. It is true the French manufacturer may gain a profit on his dear goods whilst the cheap goods of England are rigorously excluded; but it is an advantage to the French nation generally to foster such a branch of industry at the expense of buying the products of that industry at three or four times the price for which similar goods might have been brought across the Channel? But the mischief is now done. Hundreds of thousands of pounds have been invested in machinery, buildings, and materials, and many thousand hands have been trained up to the manufacture here, and at St Quentin, Cambray, Lisle, Paris, and in the department of the Haut Rhin. It is obvious that the French cotton manufacturers can never supply other nations with their goods; France must have all the benefit, or rather all the cost, of supporting the system herself. This being the case, the manufacturing prosperity of Rouen rests on a precarious foundation, seeing that it can only be upheld at the expense of the agriculture, the wine trade, and the foreign commerce of France.

HAYDN AND HIS PUPIL PLEYEL.

It was a custom of Haydn, as soon as he had finished any new work, to lay it aside for some time before he again looked at it, for the purpose of retouching and correcting. It happened that, under the influence of low spirits and chagrin, this great master had written six quartets, all in a minor key. According to custom, he left the manuscript on his piano, and, as was also usual with him whenever he had finished a new work, he dismissed from his mind, and forgot entirely, the subjects and ideas on which he had been working. Some time afterwards, Haydn felt inclined to revise these quartets, of which he thought favourably; but he sought for them in vain; they had disappeared, were no where to be found, and all attempts to recover them ended only in disappointment. Pleyel, who alone had access to Haydn's house and apartment, was suspected by him of having stolen the missing quartets; and, notwithstanding all the protestations of his pupil to the contrary, he continued for a long time firm in that opinion. At length, however, the sincere and devoted attachment of his young pupil convinced Haydn that his suspicions must be unfounded: he restored him to his friendship, and thought no more of the circumstance, except occasionally to regret the disappearance of what he considered one of his best productions. The most singular part of the whole affair is, that the thief, whoever he may have been, did not attempt to derive any advantage from his robbery; these stolen quartets never saw the light.—*Memoir of Pleyel, in Harmonicon.*

HILL OF IRON.

This hill is situated in Brazil, on the left of the road from Queloz to Villa Rica, rather more than a league from the former place. It is described by Mr Luccock as "one entire mass of iron, so perfectly free from any mixture of common soil as to produce no vegetable whatever, being covered with a coating of rust, or oxide of iron. The hill is so lofty and steep, that its top was not discernible, but, from its more elevated part, nodules of corroded metal had rolled down and greatly embarrassed the road. At the foot of the mountain the soil is red clay, mixed with ponderous brown dust. As we advanced, the metal seemed to become less pure, until, after an extent of two leagues and a half, it altogether vanished, and was succeeded by common clayey land. I had often heard of this immense mass of metal, but none of the reports had presented an adequate picture of it to the imagination. The very core of the hill, as far as we could judge, appeared to consist of vast blocks of iron, in tables, and it is so singularly free from alloy as to produce, when melted, twenty-five per cent. of pure metal."

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

No. 46.

SATURDAY, DECEMBER 15, 1832. PRICE THREE HALFPENCE.

EXTRAORDINARY HISTORY OF MR THOMAS JENKINS.

THE facts we are about to relate respecting this person are of so extraordinary a nature, that, if they had happened at a place distant from our scene of publication, or at a time remote from the present, we would have despaired of procuring credence for them, and, perhaps, on that account, abandoned the idea of giving them publicity. It happens, however, that, both in respect of time and place, they are so readily liable to be denied, if found incorrect, that we can bring them forward with the greatest confidence.

Mr Thomas Jenkins was the son of an African king, and bore externally all the usual features of the negro. His father reigned over a considerable tract of country to the east of, and, we believe, including *Little Cape Mount*, a part of the wide coast of Guinea, which used to be much resorted to by British vessels for the purchase of slaves. The negro sovereign, whom the British sailors knew by the name of King Cock-eye, from a personal peculiarity, having observed what a superiority civilization and learning gave to the Europeans over the Africans in their traffic, resolved to send his eldest son to Britain, in order that he might acquire all the advantages of knowledge. He accordingly bargained with a Captain Swanstone, a native of Hawick in Scotland, who traded to the coast for ivory, gold dust, &c., that the child should be taken by him to his own country, and returned in a few years fully educated, for which he was to receive a certain consideration in the productions of Africa. The lad recollected a little of the scene which took place on his being handed over to Swanstone. His father, an old man, came with his mother, who was much younger, and a number of sable courtiers, to a place on the side of a green eminence near the coast, and there, amidst the tears of the latter parent, he was formally consigned to the care of the British trader, who pledged himself to return his tender charge, some years afterwards, endowed with as much learning as he might be found capable of receiving. The lad was, accordingly, conveyed on ship-board, where the fancy of the master conferred upon him the name of Thomas Jenkins.*

Swanstone brought his protegee to Hawick, and was about to take the proper means for fulfilling his bargain, when, unfortunately, he was cut off from this life. No provision having been made for such a contingency, Tom was thrown upon the wide world, not only without the means of obtaining a Christian education, but destitute of every thing that was necessary to supply still more pressing wants. Mr Swanstone died in a room in the Tower Inn at Hawick, where Tom very faithfully attended him, though almost starved by the cold of a Scottish winter. After his guardian had expired, he was in a state of the greatest distress from cold, till the worthy landlady, Mrs Brown, brought him down to her huge kitchen fire, where, alone, of all parts of the house, could he find a climate agreeable to his nerves. Tom was ever after very grateful to Mrs Brown for her kindness. After he had remained for some time at the inn, a farmer in Teviot-head, who was the nearest

surviving relation of his guardian, agreed to take charge of him, and, accordingly, he was removed to the house of that individual, where he soon made himself useful in rocking the cradle, looking after the pigs and poultry, and other such humble duties. When he left the inn, he understood hardly a word of English; but here he speedily acquired the common dialect of the district, with all its peculiarities of accent and intonation. He lived in Mr L—'s family for several years, in the course of which he was successively advanced to the offices of cowherd and driver of peats to Hawick for sale on his master's account, which latter duty he discharged very satisfactorily. After he had become a stout boy, Mr Laidlaw of Falnash, a gentleman of great respectability and intelligence, took a fancy for him, and readily prevailed upon his former protector to yield him into his charge. "Black Tom," as he was called, became, at Falnash, a sort of Jack-of-all-trades. He acted as cowherd at one time, and stable-boy at another: in short, he could turn his hand to any sort of job. It was his especial duty to go upon all errands to Hawick, for which a retentive memory well qualified him. He afterwards became a regular farm-servant to Mr Laidlaw, and it was while acting in this capacity that he first discovered a taste for learning. How Tom acquired his first instructions is not known. The boy probably cherished a notion of duty upon this subject, and was anxious to fulfil, as far as his unfortunate circumstances would permit, the designs of his parent. He probably picked up a few crumbs of elementary literature at the table of Mr Laidlaw's children, or interested the servant lasses to give him what knowledge they could. In the course of a brief space, Mrs Laidlaw was surprised to find that Tom began to have a strange appetency for candle-ends. Not a *doup* about the farm-house could escape him. Every scrap of wick and tallow that he fell in with was secreted and taken away to his loft above the stable, and very dismal suspicions began to be entertained respecting the use he put them to. Curiosity soon incited the people about the farm to watch his proceedings after he had retired to his den; and it was then discovered, to the astonishment of all, that the poor lad was engaged, with a book and a slate, in drawing rude imitations of the letters of the alphabet. It was found that he also kept an old fiddle beside him, which cost the poor horses below many a sleepless night. On the discovery of his literary taste, Mr Laidlaw put him to an evening school, kept by a neighbouring rustic, at which he made rapid progress—such, indeed, as to excite astonishment all over the country—for no one had ever dreamt that there was so much as a possibility of his becoming a scholar. By and by, though daily occupied with his drudgery as a farm-servant, he began to *instruct himself in Latin and Greek*. A boy friend, who in advanced life communicated to us most of the facts we are narrating, lent him several books necessary in these studies; and Mr and Mrs Laidlaw did all in their power to favour his wishes, though the distance of a classical academy was a sufficient bar, if there had been no other, to prevent their giving him the means or opportunity of regular instruction. In speaking of the kind treatment which he had received from these worthy individuals, his heart has often been observed to swell, and the tear to start into his honest dark eye. Besides acquainting himself tolerably well with Latin and Greek, he initiated himself in the study of mathematics.

A great era in Tom's life was his possessing himself of a Greek dictionary. Having learned that there was to be a sale of books at Hawick, he proceeded thither, in company with our informant. Tom pos-

sessed twelve shillings, saved out of his wages, and his companion vowed that if more should be required for the purchase of any particular book, he should not fail to back him in the competition—so far as eighteenpence would warrant, that being the amount of his own little stock. Tom at once pitched upon the lexicon as the grand necessary of his education, and accordingly he began to bid for it. All present stared with wonder when they saw a negro, clad in the grey cast-off surtout of a private soldier, and the number XCVI. still glaring in white oil-paint on his back, competing for a book which could only be useful to a student at a considerably advanced stage. A gentleman of the name of Moncrieff, who knew Tom's companion, beckoned him forward, and inquired with eager curiosity into the seeming mystery. When it was explained, and Mr Moncrieff learned that thirteen and sixpence was the utmost extent of their joint stocks, he told his young friend to bid as far beyond that sum as he chose, and he would be answerable for the deficiency. Tom had now bidden as far as he could go, and he was turning away in despair, when his young friend, in the very nick of time, threw himself into the competition. "What, what do you mean?" said the poor negro, in great agitation; "you know we cannot pay both that and the duty." His friend, however, did not regard his remonstrances, and immediately he had the satisfaction of placing the precious volume in the hands which were so eager to possess it—only a shilling or so being required from Mr Moncrieff. Tom carried off his prize in triumph, and, it is needless to say, made the best use of it.

It may now be asked—what was the personal character of this extraordinary specimen of African intellect? We answer at once—the best possible. Tom was a mild unassuming creature, free from every kind of vice, and possessing a kindness of manner which made him the favourite of all who knew him. In fact, he was one of the most popular characters in the whole district of Upper Teviotdale. His employers respected him for the faithful and zealous manner in which he discharged his humble duties, and every body was interested in his singular efforts to obtain knowledge. Having retained no trace of his native language, he resembled, in every respect except his skin, an ordinary peasant of the south of Scotland: only he was much more learned than the most of them, and spent his time somewhat more abstractedly. His mind was deeply impressed with the truths of the Christian faith, and he was a regular attender upon every kind of religious ordinances. Altogether, Tom was a person of the most worthy and respectable properties, and, even without considering his meritorious struggles for knowledge, would have been beloved and esteemed wherever he was known.

When Tom was about twenty years of age, a vacancy occurred in the school of Teviot-head, which was an appendage to the parish school, for the use of the scattered inhabitants of a very wild pastoral territory. A committee of the Presbytery of Jedburgh was appointed to sit on a particular day at Hawick, in order to examine the candidates for this humble charge, and report the result to their constituents. Among three or four competitors appeared the black farm-servant of Falnash, with a heap of books under his arm, and the everlasting soldier's greatcoat with the staring "XCVI." upon his back. The committee was surprised; but they could not refuse to read his testimonials of character, and put him through the usual forms of examination. More than this—his exhibition was so decidedly superior to the rest, that they could not avoid reporting him as the best fitted for the situation. Tom retired triumphant from the

* The mind of the reader will here at once revert to the well-known story of Lee Boo, who, about fifty years ago, was entrusted by his father, a king in the Pelew Islands, to Captain Wilson of the Antelope, for the same purpose. Lee Boo, it will be recollected, belonged to an order of uncivilized people who are not considered so hopeless as the negroes of Africa. Yet, while the dispositions of Thomas Jenkins were equally amiable with those of Lee Boo, it will be found that he more than realised all the expectations which were formed regarding the intellect of that promising boy, unfortunately cut off before his education had been well commenced.

field, enjoying the delightful reflection that now he would be placed in a situation much more agreeable to him than any other he had ever known, and where he would enjoy infinitely better opportunities of acquiring instruction.

For a time, this prospect was dashed. On the report coming before the Presbytery, a majority of the members were alarmed at the strange idea of placing a Negro and born Pagan in such a situation, and poor Tom was accordingly voted out of all the benefits of the competition. The poor fellow appeared to suffer dreadfully from this sentence, which made him feel keenly the misfortune of his skin, and the awkwardness of his situation in the world. But, fortunately, the people most interested in the matter felt as indignant at the treatment which he had received, as he could possibly feel depressed. The heritors, among whom the late Duke of Buccleuch was the chief, took up the case so warmly, that it was immediately resolved to set up Tom in opposition to the teacher appointed by the Presbytery, and to give him an exact duplicate of the salary which they already paid to that person. An old *smiddy* [blacksmith's shop] was hastily fitted up for his reception, and Tom was immediately installed in office, with the universal approbation of both parents and children. It followed as a matter of course that the other school was completely deserted, and Tom, who had come to this country to learn, soon found himself fully engaged in teaching, and in the receipt of an income more than adequate to his wants. To the gratification of all his friends, and some little confusion of face to the Presbytery, he turned out an excellent teacher. He had a way of communicating knowledge that proved in the highest degree successful, and, as he contrived to carry on the usual exercises without the use of any severities, he was as much beloved by his pupils as he was respected by those who employed him. Five days every week he spent in the school. On the Saturdays, he was accustomed to walk to Hawick (eight miles going and as much returning) in order to make an exhibition of what he had himself acquired during the week, to the master of the academy there; thus keeping up, it will be observed, his own gradual advance in knowledge. It farther shows his untiring zeal, that he always returned to Hawick next day—of course, an equal extent of travel—in order to attend the church.

After he had conducted the school for one or two years, finding himself in possession of about twenty pounds, he bethought him of spending a winter at college. The esteem in which he was held rendered it an easy matter to demit his duties to an assistant for the winter; and, this matter being settled, he waited upon his good friend Mr Moncrieff (the gentleman who had enabled him to get the lexicon, and who had since done him many other good offices), in order to consult about other matters concerning the step he was about to take. Mr Moncrieff, though accustomed to regard Tom as a wonder, was, nevertheless, truly surprised at this new project. He asked, above all things, the amount of his stock of cash. On being told that twenty pounds was all, and, furthermore, that Tom contemplated attending the Latin, Greek, and mathematical classes, he informed him that this would never do: the money would hardly pay his fees. Tom was much disconcerted at this; but his generous friend soon relieved him, by placing in his hands a *carte blanche* order upon a merchant in Edinburgh, for whatever might be further required to support him for a winter at college.

Tom now pursued his way to Edinburgh with his twenty pounds. On applying to the Professor of Humanity [Latin] for a ticket to his class, that gentleman looked at him for a moment in silent wonder, and asked if he had acquired any rudimentary knowledge of the language. Mr Jenkins, as he ought now to be called, said modestly that he had studied Latin for a considerable time, and was anxious to complete his acquaintance with it. Mr P——, finding that he only spoke the truth, presented the applicant with a ticket, for which he generously refused to take the usual fee. Of the other two Professors to whom he applied, both stared as much as the former, and only one took the fee. He was thus enabled to spend the winter in a most valuable course of instruction, without requiring to trench much upon Mr Moncrieff's generous order; and next spring he returned to Teviot-head, and resumed his professional duties.

The end of this strange history is hardly such as could have been wished. It is obvious, we think, that Jenkins should have been returned by some benevolent society to his native country, where he might have been expected to do wonders in civilizing and instructing his father's, or his own subjects. Unfortunately, about ten years ago, a gentleman of the neighbourhood, animated by the best intentions, recommended him to the Christian Knowledge Society, as a proper person to be a missionary among the colonial slaves; and he was induced to go out as a teacher to the Mauritius—a scene entirely unworthy of his exertions. There, for any thing known to the contrary by his Scottish friends, he is still living.

Feeling that this tale requires only its own facts to render it both instructive and agreeable, we are little disposed to draw inferences from it. It is true: that is enough. Most of the individuals connected with the fate of Jenkins are still alive, and, while we accord them the praise due to their disinterested services in his behalf, we earnestly hope that no one will feel aggrieved by being noticed publicly in this man-

ner, a liberty which we have been induced to take by the best of motives—an anxiety to put the facts of the story beyond a doubt.

NATURAL HISTORY.

MONKEYS, APES, AND ORANG-OUTANGS.

HAVING presented an outline of those physical and moral properties which distinguish MAN above all other animated beings, we may now appropriately point out the natural characteristics of the monkey tribes, forming the order of *Quadrumana*, that is, creatures with four hands. The animals of this interesting order have three kinds of teeth, namely, incisors or cutting teeth, canine teeth, and grinders; their four extremities are terminated by hands, with the thumb separate from the other fingers, and more or less opposable to them; they have long and flexible fingers; they have from two to four teats, situated on the breast; the clavicles or collar bones are complete; the bones of the legs and arms are distinct, and susceptible of motions of pronation and supination; they have a simple membranous stomach; and their intestines are of medium length.

In internal and external conformation, apes and monkeys approach nearest to man of any other animal. In their grimace and actions, also, they bear a striking similitude to the lords of creation; yet how far inferior are they in point of intellect to several other animals, such as the dog, the elephant, and the horse! They, however, possess the power of imitation in an eminent degree, and seldom miss an opportunity of putting it in practice. In countries where apes and monkeys abound, the natives take advantage of this propensity, and thereby entrap them. These ape-catchers wash their hands and faces in a pitcher of water in situations where apes inhabit, after which they pour out the water, and replace it by a solution of glue; then leave the spot, when the apes descend from the trees, and wash themselves as they had observed the men do; their eyelashes are, consequently, glued together, and they are rendered unable to escape from their enemies, and are thus easily taken. It was from this that the ancient generic name of the tribe was established, that of *Simia*, from the Latin word *simulare*, to imitate.

The strong impression of the human likeness which is borne by apes, has induced many to suppose that man is only an animal of the same kind, but more perfect in his form, and other qualities. It has been argued that the *os occipitis*, or the prolonged portion of the spine in man, which is analogous to the tail of animals, is strongly confirmatory of this, and that they have, like monkeys, originally had tails. We have already stated that comparative anatomists can trace all the bones corresponding to those of man, developed, in a greater or lesser degree, through the whole class of animals which naturalists term vertebrated, or those which have a backbone. This is a wonderful manifestation of the uniformity of the plan of the Framer of the universe, or what may be termed the harmony of creation; and this very harmony is deeply imprinted in the mind of man, and from which we enjoy many of our pleasurable sensations. As familiar examples of this, we may notice the harmony of colours, and the harmony of the notes of music.

Although, in the general distribution of the parts of animals, there is usually an admirable adaptation of their structure to the uses to which they are to be employed, yet in many cases we are unable to trace the reason why parts are of a particular formation, or why animals should be furnished with those parts at all, which appear to be of no use to them. This we can only attribute to the general harmony of design. We shall give as an example the *Proteus anguinus*, a reptile which inhabits the waters of certain subterranean caverns in Carniola. Some of these subterranean lakes are of vast size and depth, and perfectly secluded from all light. It is, therefore, quite evident that eyes to animals which inhabit such situations would be quite useless. The *Proteus* is totally blind, and yet it has an indication of eyeballs, but which are covered with skin.

But what distinguishes all the ape tribe from man is their horizontal position in walking, for it has been now satisfactorily ascertained, that, although they may occasionally assume the upright position in progressive movement, it is by no means natural to them. Another evident distinction is their lower extremities being in the form of hands, with long fingers fitted for grasping; from which it is quite evident that the whole tribe are essentially formed for climbing trees, and they are, consequently, principally found in the confines of forests. When they walk on the ground, their motions on all-fours are awkward, and their progress is rather by leaping than walking. The head of apes, besides, is not placed in equilibrium on the spine as in man, their pelvis is very small, and the muscles of their thighs being attached very low on the legs, prevent their assuming with ease the upright posture. Their very long arms, with hands on their lower as well as higher arms, admirably adapt them for their mode of life. They, however, can sit erect with the greatest ease, and, indeed, it is the posture natural to nearly the whole tribe.

The time of gestation in apes varies, according to the species, from five to seven months, and they seldom produce more than one or two at a birth. The females carry their young in their arms like the hu-

man species, or upon their backs. They generally are nursed in the same way as human infants.

Apes live in large communities, and generally on peaceable terms; their social instinct, however, seems limited to the tendency which all frugiferous animals have in general to live in wandering troops, for the purposes of mutual protection. They frequent large and fertile solitudes, and not unfrequently in great herds of different kinds, and without one species commingling with another. But should any intruders present themselves upon a district possessed by these troops, they all combine to assert what they think their natural rights. De Maisoupre, and six other Europeans, witnessed a combat betwixt two opposite herds, that took place within the wall which surrounds the pagoda of Cheringham. A large and powerful ape had got into the place, but was soon recognised as an interloper by the resident tribe, and upon the alarm being given, a number of males united in an attack; and although the intruder was much more powerful than his assailants, he soon perceived that he was to be overcome by their united strengths, and fled for refuge to the top of the pagoda, which was eleven stories in height; but this did not screen him, for he was closely pursued thither by his enemies. Having reached the top of the dome, which was small and narrow, he availed himself of the security of the position. In this advantageous situation, and by his superior strength, he seized four of the most forward of his pursuers, pitched them headlong to the bottom, and they were consequently killed by the fall from such a great height. This proof of his strength somewhat damped the ardour of the rest, who, after setting up a loud and threatening chattering, judged it prudent to make good their retreat. The intruder kept his situation till the evening, when he descended and escaped.

When MM. de la Condamine and Bouquer were making their observations in South America on the figure of the earth, they were greatly annoyed by domesticated apes, which are very numerous, looking through their telescopes, planting signals, running to the pendulum, taking their pens and trying to write, and, in short, imitating every action which they saw performed by these gentlemen.

In many districts of India, apes and monkeys are objects of religious veneration, and various temples have been erected in honour of them. In these countries it is considered as sinful to molest them, and they consequently become bold and troublesome. They enter cities in large troops, and venture into the domiciles of the natives. In Amadabad, the capital of Guzerat, there are three hospitals erected for monkeys, where the sick and lame are fed and relieved by medical attendants, kept there for the express purpose, at the public expense.

At the head of this extensive tribe of animals stands the Chimpanseé, who, in face, form, and internal organization, approaches most nearly to that of man. We are, however, yet unacquainted with the height to which this animal grows, as all the specimens which have hitherto reached Europe have been young. There is every reason to believe that the Chimpanseé is the wild man of the woods so frequently mentioned by travellers.

The angle of the face of the Chimpanseé is 50 degrees; he is destitute of cheek pouches or tail, nor has he any callous skin on his hinder parts; his arms are short, and the superciliary ridges are distinct; his canine teeth are a little projecting, and are close to the cutting teeth and grinders, like those of the human species; the head is rounded, and the muzzle very slightly projecting.

This animal seems entirely confined to Central Africa, and probably some of the islands in the same latitude.

We are informed by M. de Grandpré, that he saw a female Chimpanseé on board of a vessel, which manifested great intelligence. She had been instructed to heat the oven, and took care that no coals should fall out. She had a perfect knowledge of the proper temperature of the oven, and, when it was in a condition for baking, immediately apprised the baker that it was so, who placed implicit confidence in her information, and never failed to fetch him in due time. This animal performed many useful occupations; she assisted at unfurling the sails, and spliced ropes, and could pull a rope along with the sailors. The vessel in which this animal was seen, was bound for America, but which country she did not live to see, the mate on one occasion having inflicted a very cruel punishment on her, which she did not deserve, and which she bore with the utmost fortitude, only holding out her hands to break the force of the blows, and at the same time supplicating for mercy. From that time she refused all sustenance, and died on the fifth day from grief and hunger, lamented by all on board but the cruel and unfeeling mate.

Next in order is the Orang-outang, who is probably much superior in size to the Chimpanseé. The canine teeth of the Orang-outang are somewhat longer than the others; the grinders are more equal than those of man, the tubercles of which are more acute; the head is round, and he is destitute of a superciliary ridge; his facial angle is 60 degrees, and he has no cheek pouches; his ears are rounded, as in man; his thumbs are rather short, and he has no tail.

The Orang-outang inhabits Cochinchina, and several of the larger islands of the Indian Ocean. This animal is next to the Chimpanseé in perfection of form, and grows to a gigantic size, being, when full grown, from seven and a half to eight feet in height.

Until Dr Clarke Abel published an account of this animal, we had no certain information of its great size, which is now established without a shadow of doubt.

Dr Abel says, "My attention was directed to this Orang-outang, by the following notice of the animal in the Hukara newspaper, which was sent to it, as I have ascertained, from one of the persons actually concerned in his capture:—A party having landed on the south coast of Sumatra, from the Mary Anne Sophia, Captain Cornfoot, for the purpose of watering, fell in with an animal of the monkey species, of most gigantic size. It was upwards of seven feet in height, and, after receiving seven shots, was killed. After the fifth shot, it climbed a tree, and reclined against its boughs, to all appearance in great pain, and vomited a considerable quantity of blood. Some of the teeth are about three inches long. The lower jaw is immense; and the skin of its arms, although cut off from the wrists, was considerably longer than the length of a man's arm about six feet high. The back is remarkably broad, and covered with long coarse brown hair. Its gait was slovenly, and as it went, it waddled from side to side."

Captain Cornfoot dwells much upon the human-like expression of its countenance, and especially on the beautiful arrangement of its beard.

It appears that on the spot where this animal was killed were five or six trees, which occasioned great trouble to the hunters in procuring their prey; for in consequence of the extreme agility and power of the animal in springing from branch to branch, and bounding from one tree to another, his pursuers could not fix their aim, until they had cut down all the trees but one. When thus limited in his range, the Orang-outang was shot, but did not die till he had received five balls and the thrust of a spear. One of the five balls probably penetrated his lungs, as he, immediately after receiving the wound, slung himself by his feet from a branch with his head downwards, and allowed the blood to flow from his mouth. On receiving a wound, he always put his hand over the injured part, and his pursuers felt distressed at the human-like agony of his expressions. When on the ground, after being exhausted by his many wounds, he lay as if dead, with his head resting on his folded arms. It was at this moment that an officer attempted to give the *coup de grâce*, by pushing a spear through his body; but he immediately jumped on his feet, wrested the weapon from his antagonist, and shivered it to pieces. This was his last wound, and last great exertion; yet he lived some time afterwards, and drank, it is stated, great quantities of water.

CATHERINE AND LOUISA.—A TALE.

"It just wants one week to-day," said Catherine to her sister Louisa, "and then, O happiness! we make our first appearance at the county ball. We must really do as papa tell us, practise our quadrilles every evening before that time; for it would be sad, indeed, if we were to make fools of ourselves. Lady Elizabeth would never patronize us again." "O, Catherine," said her sister, "you are always talking that way; I am sure, for the last month, you have spoken of nothing else but that county ball. Now, I really feel a good deal afraid about it, and should not wonder if I were, as you say, to make a fool of myself." "Really," replied Catherine, "you astonish me; you were not afraid when it was first talked of. You know papa has promised for the last two seasons to *bring us out*, but we have been always disappointed. Now I feel quite delighted, and I am sure I shall enjoy myself exceedingly. I know you are disappointed that Mr Marston has been called away to town, and cannot go; but never mind, dear Louisa; there will be plenty of nice beaux there, I dare say; and Lady Elizabeth tells me that Colonel Danby, and all the officers of the 12th, are to be there with their charming band. Oh! how delightful it will be to dance to military music, you know how much I enjoy a band! And I am sure Colonel Danby will pay us great attention, for we are such favourites of his." Thus chatted the two beautiful daughters of Sir Robert Gordon of Belston, as they were walking in the shrubbery one day before dinner. It had been the intention of their father for the last two years to bring out his daughters, but circumstances had prevented him fulfilling this design. Either he was obliged to go to London at the time appointed, or Lady Elizabeth M., who was to patronize them, was from home. But now there was no hindrance; every thing was in preparation for that important event; their dresses had arrived from Madame Devys, and they had been permitted for the first time to see the ornaments that were to be appropriated to each from their dear departed mother's jewel-box. When Louisa was presented with hers, she wept, and could not be consoled; lamented her sad bereavement afresh, and went out alone into the garden, to hide the tears and the anguish she could not control. It was just three years since she had lost a much beloved mother, and she had a lively and tender recollection of her. When Catherine received hers, she felt sad;

still they were so beautiful, she could not help admiring them. When she looked up, she saw the tears glistening in her father's eyes. This recalled all her tenderness, and all her sorrow; she flew to his arms, and sobbed as if her heart would break. "My own Catherine," said he, "my darling Catherine, take these jewels, and wear them for the sake of your dear mother; they were presented to her by her own father on her presentation at court, which was her first appearance in public. They have been kept for you; she always said they should be yours, as you are her name-daughter; they are the most expensive trinkets she ever possessed, and I need hardly tell Catherine to be careful, and to value them." She dried her tears, promised every thing he could wish, asked a great many questions about the ball, and left the room in high spirits. Just as she was taking another look at her superb necklace, before depositing it in its red morocco case, Louisa returned: she was calm and composed, but in low spirits. She had not mourned solely for the dead; thoughts and regrets for the living intruded, and made her spiritless and sad. "If Arthur had been here," thought she, "and going with us, I should have been gay and happy as Catherine, but I need not, dare not think of it now. I know he will not return at this time." Louisa mourned, and mourned alone; for she dared not trust her volatile sister with her sorrows and her secret. She had met with a disappointment in her first love. When young Marston applied to Sir Robert for permission to address his daughter, he was refused. Two days after, he was on the road to his estate, to look after the cultivation of his farm and his trees, and to forget, as he at present thought, but rather to brood, as time afterwards showed, over his disappointment. It was understood by every one after this, that Sir Robert looked for *titles* to his daughters. At last the important day arrived, the day that Catherine thought would never come. And such a tiresome week as it had been to her! But now all was joy and bustle; the day would soon pass, and Lady Elizabeth would come in her own carriage to fetch them, and the ten miles of distance they had to go would seem nothing. The two sisters were soon dressed, for their hair, naturally beautiful, and always well kept, did not require the aid of roses or ribands to make it look well. They both wore a simple band round the head, with a small ornament clasping it at the side. It was with no small degree of pleasure and pride that Sir Robert beheld his two lovely girls, in all the bloom of youth and gaiety, dressed in the most becoming manner, and looking as he had never seen them look before. Lady Elizabeth arrived, and the *parti quarrée* set off for the county town. When the full blaze of light, beauty, and dress met the delighted eyes of Catherine, she felt fluttered and bewildered. The dazzling splendour of the officers with their dresses of scarlet and gold, ladies with feathers waving in the dance, and, above all, the delightful music, which Catherine loved to enthusiasm, all conspired to give a new feeling, a sensation perfectly different from any thing she had ever felt before. After the ceremony of introduction was over, Catherine had time to *think*. She looked to her sister, who was leaning on the arm of her father, and wondered what her feelings could be. Louisa was perfectly composed; she looked as if she had never felt, never wondered. Catherine was amazed at her stoicism. Just then, Colonel Danby came bowing up, paid his compliments to each, and begged permission of Sir Robert to introduce a young friend. He soon again appeared, and presented to Catherine a young officer, tall and handsome as she could have wished, who immediately led her to the dance. Colonel Danby himself requested Louisa to honour him with her hand. In the same quadrille, *vis-à-vis*, stood the two lovely girls. All eyes beheld them with admiration, and "who is she?" and "what are they?" resounded from every quarter. "That dark girl, how majestically she moves! and the laughing blue-eyed fair one, how light and how graceful!" Many and clamorous were the requests made to Colonel Danby by the young officers to introduce them to Sir Robert, that they might have the pleasure of talking to his charming daughters, and, perhaps, have the chance of being asked to Belston during the shooting season with the Colonel, who was a frequent guest there, and devotedly fond of dogs and game. Captain Harvie, the young officer to whom Catherine had been introduced at the commencement of the evening, was the only one who succeeded in the wish of procuring an invitation to Belston; and as he handed Catherine to the carriage, and saw her sweet smile when she heard Sir Robert request the pleasure of his company along with the Colonel to shoot, he fervently wished the dreary three weeks past, and would have given the world that it had been to-morrow. Sir Robert acted well. Captain Harvie was the eldest son of an old baronial family, and not only would he inherit, at the death of his father, a title and estate, but he had the prospect of an earldom at the death of an uncle who had no family. Moreover, Sir Robert saw that he had been captivated with Catherine, and, from the warm expressions of admiration he had used to the Colonel about her, he at once thought it advisable to ask him. September came, and with it the two gentlemen. Louisa was not able to receive them. She had been for some time a drooping flower; her father and Catherine were not aware of the great change that a few weeks had produced upon her; but those who had not seen her for some

time felt shocked and alarmed at her appearance. The roses had fled from her cheeks, and instead of the lively and good-natured girl that used to sing, and dance, and laugh, she was now the cold and distant Miss Gordon, who repelled all kindness and attention by her air of *hauteur* and *sang froid*. She had given up all her hopes of happiness to *family pride*: She had passed a vow to her father never to marry without his consent, and he had tried every means to make her believe that to be connected with Mr Marston would be a degradation to herself and family: She had hinted to her father that the only terms on which she would give up all idea of her marriage was, that the subject (of matrimony) might never be spoken of, or proposed to her again: She had, therefore, made up her mind as to her future conduct, and determined to repel all advances, and conduct herself as the high and honourable daughter of Sir Robert Gordon of Belston, one of the oldest families in Scotland. Alas! in thus making up her mind to change her very nature, she knew not that her health would sink under the trial; she thought the task easy, but found it difficult and bitter. When the gentlemen returned from their walk before dinner, and saw Louisa reclining on a sofa, pale and emaciated, they could hardly believe it possible that she was the same blooming girl that they had seen so shortly before. The old Colonel started; he had been a frequent visitor for many years, and had seen the sisters as they had gradually made an advance into womanhood, and improved in beauty; in fact, he was just as much interested about the girls as Sir Robert could possibly be, and the shock he received when he then saw her was great. She perceived his look, and knew his feelings, and the painful consciousness of her altered appearance caused the blood to rush to her face and neck, and in an anguish of agitation she burst into tears. Her father had never seen her act thus before, and he felt both sorry and angry; it showed him that she had not yet completely conquered her feelings. As soon as she had left the room with her sister, he explained to the Colonel the whole affair, and begged that, when he could find a fitting opportunity, he would talk to her on the subject, and endeavour to reconcile her to the paternal decree.

Poor Marston was little better than Louisa; his mind was in a most unsettled, unhappy condition; he could apply himself to nothing. Life, in short, was a burden, and he determined (as soon as he could arrange affairs at home) to do what most young men do in cases like his—go to the Continent for a few years, and forget, in the excitement of a tour, his disappointed hopes.

Weeks rolled on, and still Louisa drooped, and her father was relentless. In the meantime, the young and gallant Captain Harvie lost no time in gaining the consent of Sir Robert and his own friends to an alliance with Catherine. He had gained his own consent at the very first, and now nothing remained but to procure hers. That he felt quite sure of, as he had seen that Catherine was in every way disposed to favour him. What was his astonishment, then, to learn, from her own lips, that it was *not* her intention to marry, and nothing but *one* circumstance could alter her determination! She knew that her father was favourable, nay, anxious that she should accept of Captain Harvie's offer, for it must prove a very advantageous and honourable settlement for her; but her father had disappointed Louisa, and she had formed the heroic resolution of refusing the man of her choice, and her father's wishes, till he should first consent to make her sister happy. Sir Robert had mentioned to Catherine the affair of Marston with Louisa, and explained his reasons for declining him; and she knew from his firm manner of speaking that there was little or no hope of his changing his mind. She thought there was but *one* way of doing it, and that was by refusing all offers herself, till he should give his consent to Louisa's marriage; and she was firm, and determined. Not all the persuasions of her lover, who foresaw the case to be hopeless, nor the anxious entreaties and remonstrances of her father, could change her. Colonel Danby was the only cool person in the house. Louisa was wretched; Catherine was heroic; Captain Harvie was in despair; and Sir Robert was furious. The Colonel only waited till things calmed down a little to talk with Sir Robert on the subject, and try to argue him out of his resolutions.

Just at this crisis the agreeable and delightful Lady Elizabeth came to pay a visit at Belston. The girls hoped every thing from her influence with their father, and he in like manner hoped every thing from her influence with them; so, with one consent, affairs were turned over to her, and her decision was to be definite. Sir Robert felt quite secure in thus leaving matters to her, for he knew her to have *high family notions*, and was assured that she would try to instil what he called *right principles* in the breast of Louisa, and turn Catherine any way she chose. He was right so far. Lady Elizabeth said the connection with Marston was degrading, and not to be thought of. "He was, to be sure, an only son, and wealthy; but he had no rank, no title, nor the least prospect of one; and was," as a matter of course, "*nobody*." Captain Harvie was much to be wished for; but Catherine was not to be shaken in her fixed purpose of refusal: not even Lady Elizabeth could sway her. And now a year had passed over since these incidents occurred. Our sisters were living quietly at home. Captain Harvie had been in London, but was every day expected at Belston; he had not yet given up all hopes of

Catherine changing her mind. Poor Marston was most unhappy; he had not yet had enough of resolution to go abroad; he still lingered at home in hopes of hearing something that might give him some hope. His friends wished him to stand for the county; but, whether it was from want of energy to *push* the business, or that he heard that Sir Robert himself was proposing to canvass, we know not, but he declined, which was much wondered at, as he had many friends and great influence among the freeholders. Their estates lay in the same county, but thirty miles distant from each other. It was true that Sir Robert intended proposing for the county; and when one of his friends called upon Mr Marston to request his vote, he gave it cheerfully, and felt happy at being able to serve the father of Louisa. It gave a new impulse to his feelings, a sort of hope that he might yet, through some means, be enabled to overcome Sir Robert's reluctance to the match. This hope roused all his dormant energies, and he determined to use all his influence, and exert himself to the utmost in his favour. Had Sir Robert's principles been of a different nature from his own, he could not have done so; but, fortunately, they were both liberals. He succeeded in procuring three votes, and received a letter of thanks from Sir Robert. The day of election arrived, a day of much anxiety and trouble to many. Sir Robert was likely to lose, for the opposition candidate had one vote more. Just as all were collected in the Town-house, and the Sheriff about to pass the decision against Sir Robert, a carriage was heard to drive up, and Mr Marston entered, along with two freeholders who had been out of the way at the time of the canvass, and whom he had taken the trouble to collect from distant parts of the county, and bring off post haste. They arrived at the critical moment. Sir Robert was duly elected; and, in gratitude for such eminent service, he requested Marston to accompany him with his friends to dinner. This was an important day for Arthur Marston; he saw his beloved Louisa, and trembled at the change he saw in her appearance. He determined once more to solicit Sir Robert, as a sort of desperate and final effort to gain her. He did so, and Sir Robert could hardly refuse the man who had done him such distinguished service. At the earnest solicitations of Catherine and Captain Harvie, he complied; at least Mr Marston had the satisfaction of receiving an invitation that night to spend a few weeks at Belston; and it need hardly be told that he considered it as a tacit encouragement to pay his addresses to Louisa. At this moment all is bustle and preparation at Belston House. The gay and lively Catherine is happy in accepting the offered hand of the handsome Captain, and the two sisters are to be married on the same day, which is not far off.

RAILWAYS.

THE following is an abstract of the evidence on the advantage of railroads, given on the London and Birmingham railway bill, which was thrown out by the House of Lords:—Before the establishment of the Liverpool and Manchester railway, there were twenty-two regular, and about seven occasional extra coaches, between those places, which, in full, could only carry, per day, 688 persons. The railway, from its commencement, carried 700,000 persons in eighteen months, being an average of 1070 per day. It has not been stopped for a single day. There has occurred but one fatal accident on it in eighteen months. The fare by coach was 10s. inside, and 5s. outside; by railway it is 5s. inside, and 3s. 6d. outside. The time occupied in making the journey by coach was four hours; by railway it is one hour and three quarters. All the coaches but one have ceased running, and that chiefly for the conveyance of parcels. The mails all travel by the railway, at a saving to government of two-thirds of the expense. The railway coaches are more commodious than others; the travelling is cheaper, safer, and easier. A great deal of traffic which used to go by other roads comes now by railway: both time and money are saved, though the length of the journey may be often increased. The proportion of passengers carried by railway over those carried by coach has been 22 to 10 in winter, and 17 or 18 to 10 in summer. A regiment of soldiers has been carried by the railway from Manchester to Liverpool in two hours. Gentlemen's carriages are conveyed on tracks by the railway. The locomotive travel in safety after dark. The rate of carriage of goods is 10s. per ton; by canal it used to be 15s. per ton. The time occupied in the journey by railway is two hours; by canal it is twenty hours. The canals have reduced their rates 30 per cent. Goods are delivered in Manchester the same day they are received in Liverpool; by canal they were never delivered before the third day. By railway, goods, such as wines and spirits, are not subject to the pilferage which existed on the canals. The saving to manufacturers in the neighbourhood of Manchester in the carriage of cotton alone has been £20,000 per annum; some houses of business save £500 a-year in carriage. Persons now go from Manchester to Liverpool and back in the same day with the greatest ease; formerly they were generally obliged to be absent the greater part of two days. More persons now travel on their own business. The railway is assessed to the parochial rates in all the parishes through which it passes: though only thirty-one miles, it pays between £3000 and

£4000 per annum in parochial rates. Coal-pits have been sunk and manufactories established in the line, giving great employment to the poor; manufactories are also erected on the line, giving increased employment, and thus reducing the number of claimants for parochial relief. The railway pays one-fifth of the poor-rates in the parishes through which it passes. Fresh coal-mines have been sunk, owing to facilities of carriage and reduced price. It is found advantageous for the carriage of milk and garden produce: arrangements are about to be made for milk to be carried 15 miles at 1s. per 10-gallons (*i. e.*, less than one farthing per quart). A great deal of land on the line has been let for garden ground at increased rents. Residents on the line find the railway a great convenience, by enabling them to attend to their business in Manchester and Liverpool with ease, at little expense. No inconvenience is felt by residents from smoke or noise, but, on the contrary, great advantages are experienced by means of travelling, to and fro, distances of ten miles in half an hour for 1s., and without any fatigue. The engines only burn coke. The value of land on the line has been considerably enhanced by the operation of the railway: land cannot be purchased but at a large increase in price; it is much sought after for building, &c. The Railway Company, in their late purchases, have been obliged to pay frequently double the price they originally paid for their land. A great deal of land has been sold for building at three times its former value. Much waste land on the line has been taken into cultivation, and yields a good rent. Land-owners, originally opposed to the railway, are now its warm advocates: having found their fears wholly groundless, they have now been solicitous that the line should pass through their land. Mr Babbage observes, in his book on the "Economy of Manufactures," "One point of view in which rapid modes of conveyance increase the power of a country deserves attention. On the Manchester railroad, for example, above half a million of persons travel annually; and supposing each person to save only one hour in the time of transit between Manchester and Liverpool, a saving of five hundred thousand hours, or of fifty thousand working days of ten hours each, is effected. Now, this is equivalent to an addition to the actual power of the country of one hundred and sixty-seven men, without increasing the quantity of food consumed; and it should be also remarked, that the time of the class of men thus supplied is far more valuable than that of mere labourers."

The great utility of railways, and their productive-ness in a pecuniary point of view, have just been exemplified at Edinburgh, where a railroad, formed for the purpose of introducing coal to the city from pits a few miles distant, has been covered with vehicles for the conveyance of passengers to all parts of the adjacent country. A similar degree of success has attended a railway in the west of Scotland; and it may safely be presumed that no species of commercial enterprise would be so certain of prospering, and yielding so large a return for capital, as a railway betwixt Edinburgh and Glasgow, the intercourse betwixt which towns resembling that between Liverpool and Manchester, and the level nature of the country rendering the plan comparatively easy of accomplishment.

BOUNDARY BETWIXT SCOTLAND AND ENGLAND.

THE present boundary on the east, betwixt Scotland and England, is the Tweed; but this line of division is of comparatively modern date. For several ages prior to the eleventh century, the borders of England extended as far north as some part of Stirlingshire, and therefore included all that portion of country now known by the name of Lothian, as well as Berwickshire, and part of Roxburgh and Selkirk shires. This fair district of Scotland was seized from the natives by Anglo-Saxon invaders, who poured in from the north of England at the middle of the fifth century, and who, fixing themselves in the country by the erection of forts and other strongholds, the chief of which was the Castle of Edinburgh, retained possession of it for about six hundred years. During this period the Anglo-Saxons completely dispossessed the original inhabitants, and introduced their own language, laws, and customs. Their country received the title of *Loth-ling*, or *Lod-ling*, Saxon or Teutonic words, signifying a special jurisdiction on the marches of two kingdoms, and not derived, as Buchanan has mentioned, from a supposed king of the name of *Loth*. In the year 1018, Malcolm II., King of Scots, in prosecution of a quarrel with the Earl of Northumberland, and possessor of the territory of Lothian, conducted his Scottish warriors from their western and northern domain, and met his foe between Carham and Wark, on the south bank of the Tweed. This battle, so important in its results, was long contested with desperate valour, and the palm of victory was claimed by the English leader; but this prince being soon after assassinated, his earldom descended to his brother, who, dreading the arms of the Scots, was induced, for the sake of peace, to cede Lothian for ever to Malcolm. This event occurred in the year 1020, and ever since, the Tweed, in its lower part, has been the acknowledged boundary betwixt Scotland and England.

LETTER FROM AN EMIGRANT.

A LETTER from a person who lately emigrated from Bristol to the United States of America, recently appeared in a Leeds newspaper, and from which the following extract is given, in the expectation of its being useful to many of our readers.

"Though greatly reduced by my long voyage, it has been of great service to my health. I am now perfectly well, and have nothing of that cough I have been subject to. My beloved wife and dear children are all very well, and look more healthy than before we left England. This is the case, likewise, with all our friends and their children (three families from Bristol, who removed about the same time). We are all very comfortable, and often meet together, and discuss, contrast, and compare things in America with those in England; on some points we agree in our likes and dislikes, and on some points differ very widely. On all material points, however, we fully agree—that this is the best *poor man's country*; the best to bring up and launch out a family; the best for persons of small incomes (if they can accommodate themselves to circumstances, and depend upon their own resources); servants ('helps') may be had here, board and wages both considered, at an expense but little more than in England; but then the maid is as good as her mistress, the man as his master.

"Though to parents coming out here, if they have the common feelings of our nature, it must be a sacrifice of the pleasures of friendship, and at first an endurance of many inconveniences, yet their children will bless them for their self-denial; and I believe, in ninety-nine cases out of a hundred, parents will feel thankful they had sufficient nerve to come to this country. Parents have no difficulty in bringing up their children, and placing them out in business; nor need they fear their future prosperity. Here, also, there is far less temptation to vice of every kind—sobriety and good order prevail in a way unknown in England. The direct and indirect effects of temperance societies are truly astonishing. This true happiness may be found in England; but I believe the sum of happiness in America is infinitely greater than in England. The chief cause of sorrow and distress in England is *unknown here*! Here there is not the garb of poverty, nor the look of distress.

"It was a fine morning; I walked five miles before breakfast on a very good tow-path, with the canal on my right, and the Mohawk River on my left, with a pretty fertile country and varied scenery. It reminded me strongly of Hay, my native place. We met a very agreeable English gentleman on the aqueduct over the Mohawk. He had travelled extensively through the States, and was then on his return to England, with a view of bringing his family over. He was highly pleased with the country and the people, and said, 'the English will never believe America to be so happy and prosperous a country, unless they see for themselves.' This reminded me of what an English gentleman at New York said to me. He inquired if I intended to send a full account home of what I saw. 'Certainly,' was my reply. 'And do you,' he said, 'expect they will believe you?' 'Surely they will.' 'Take my word for it,' he said, 'they will not believe the one-half of what even you say.'

"We arrived at Schenectady about two o'clock; it is a pretty good town. There is a rail-road from Albany to this place, for steam-coaches, which go 14 miles an hour. Wednesday, at daylight, came in sight of Utica. This is a very handsome town, abounding with well-built churches, of the various denominations, with spires. I do not know in England so regular and good a town—not the semblance of poverty or poor-houses. I will give you present prices of provisions:—Fowls, 12½c. (a cent is a halfpenny) per couple; turkeys and geese, 25c. each; venison, very fine, 1½c. per lb.; beef, veal, and pork, 3c.; potatoes, 25c. per bushel, very good, but not so mealy as the English; butter, always good, 12½c., now considered very dear; apples, 25c. per bushel; cider, 1½ dollar per barrel of 32 gallons; flour, now high, 4½ dollars per barrel; corn, 20c. per bushel. The horses are generally good, and the oxen are fine large beasts for labour. Self supporting, or manual labour schools, are already established in many parts of the Union, and promise to be the means of diffusing more good than any other society established in modern times. These schools are promoted by the Baptists, who are a very numerous sect in America. I would just observe that young men desirous of being educated for the ministry, as well as others entering these schools, obtain a good classical and religious education. By their labouring at some trade on the premises four hours a-day, they pay for their board, and one hour more for their education. Mechanics in this State get well paid. A working jeweller in the town of Newark gets 9½ dollars per week, besides board and lodging; and common carpenters and coopers get 20 dollars a-month, besides board and lodging. When at New York, my friend Mr Jennings told me, if 500 young women were to come over, they would immediately get into situations there: were many thousands to come over, they would find sufficient employment in the States, and get well paid for their services."

BRITISH AND IRISH LINEN
MANUFACTURE.

THE superiority of British manufactures is not more manifest in any branch of trade than in that of linen. The inhabitants of the United Kingdom, whatever may be their poverty in particular circumstances, pride themselves in possessing good linen shirts, and, if possible, a proper assortment of household drapery of the same substantial stuff. The cultivation of flax, and the weaving of that produce into linen, is therefore one of the staple employments in the country. But a vast proportion of the cloth which is prepared is exported to other nations, and this yields a large return of capital to the manufacturer. Some of the chief manufacturing districts for this article are found in Scotland and Ireland. In Scotland the trade is confined almost entirely to Fife and Forfar shires, and in Ireland it is limited to the northern portion of that kingdom. The introduction of the linen manufacture into Scotland is comparatively recent, great efforts having been made, both by government and associations of individuals, about a century ago, to turn the attention of the people towards this branch of trade, which was appropriate both to the climate and the condition of the country. Linen was much earlier made in Ireland. The trade, we are informed, flourished here during the reigns of Henry VIII. and Elizabeth; but from the particular fashion of the Irish shirts, great part of the linen manufactured was used within the country. The settlement of many industrious families from Britain, in the province of Ulster, most likely led to the prosperity of the linen trade, and brought it, through various vicissitudes, to its present flourishing state. The linen which is now made in Ireland is reckoned remarkably fine for shirting, &c., but has generally the reputation of being overdone on the surface, and of being somewhat unequal in the proportion of weft to the warp. The Scottish linen has not, in most cases, so attractive an appearance as that of Ireland, but is esteemed superior in point of wearing qualities, and brings a higher price in the English market. It appears from official returns that the annual average of the linen trade of Ireland, for ten years, from 1770 to 1780, was 25,000,000 yards. In 1782, and the ten succeeding years, the average rose to 40,000,000, being an exact annual increase of 15,000,000. The exports of linen from Ireland in 1814 amounted to £2,645,912, and of linen yarn, £62,928. They have since greatly increased.

Scotland does not export linen to such an extent as Ireland, the amount of exports of this article, in the year ending 5th January 1828, being 14,945,299 yards, the official value of which was £803,267; but this, it is presumed, is exclusive of coarse linen and hempen goods. The finer fabrics of the Scottish linen manufacture are made in Fife, principally at Dundfermline and the adjacent villages; while the coarser articles, in which steam power is employed, are produced at Dundee, and other towns in Forfarshire. The trade in flax and hemp goods at present carried on in these thriving seats of population is immense, considering their recent rise. "The precise period at which the trade was established (says the writer of an article on the subject in *The Dundee Chronicle*) we have not been able to ascertain, but there are various reasons for believing that it was about the beginning of the last century. It made little progress for some time, as appears from a statement of imports and exports in the year 1745, which is to be found in Dr Small's Statistical Account of Dundee. In that year, 74 tons of flax were imported, but no hemp. The quantity of linen exported is estimated at one million of yards, but there is no mention of sailcloth or bagging. In Dr Small's book there is also a statement of imports and exports in the year 1791, which shews that a considerable increase had by that time taken place. The import of flax then amounted to 2444 tons, and of hemp to 299 tons. The quantity of linen exported that year had increased to 7,842,000 yards, besides 280,000 yards of sailcloth, and 65,000 yards of bagging. From this period the trade began gradually, but not very rapidly, to extend itself; and the foundation was laid for that extraordinary increase in it which has taken place during the last fifteen years. Before the peace of 1814, the quantity of machinery employed in spinning was not great. About this time, however, and in consequence chiefly of improvements in the machinery, the trade altogether became more safe than during the war, when the supply of raw material from the Baltic was apt to be cut off by the operations of the belligerent powers. The consequence has been, that, since the date just mentioned, the importation of flax at Dundee has increased from 3000 tons to 15,000 tons per annum, and the exportation of linen in an equal proportion. Nor is it easy to predict any probable limit to its further increase.

"The following abstract of imports and exports of the articles above referred to, for the year ending 31st May 1831, shews an increase of the trade almost wonderful. Flax imported, 15,010 tons; hemp, 3082; linen shipped off, 356,817 pieces, measuring about 50 millions of yards; sailcloth, 85,522 pieces, measuring about 3½ millions of yards; bagging, 62,199 pieces, measuring about 4 millions of yards. Total, 57½ millions of yards."—A great proportion of this large quantity is exported to the United States of America and the West Indies.

A HIGHLAND LAIRD.

THE last of the Chiefs was Glengary, Macnab was the last of the Laids—but MacNichol of Fishwig was well entitled to be considered a well-marked specimen of that species of the squire genus. Where or when he was born, is of little consequence. Most probably it was on his hereditary property in Caithness, and about seventy or seventy-five years ago. It is certain he must have been born, and also grown and prospered, for his stature exceeded six feet, and he was stout in proportion; and when you fancy an Herculean person of these dimensions, with regular features, and sandy hair, an eye that, like the eye of Highlanders in general, is easily kindled, with somewhat of a stoop, a habit of folding his arms, and walking slouchingly, and a taker of snuff, you have an idea of Fishwig in his latter days.

In his early days he must have been handsome in spite of himself, but he was probably always indifferent to it. He was bred to the profession of medicine, but it had never been bread to him. He was a laird, however, in expectancy from the beginning, and at last, in fact; and therefore, and from his ancient family, felt doubtless no difficulty in getting married; and he happened to find the circumstance of some consequence, for he required to be married three times. In his younger days he probably drank and snuffed moderately; rode to the town on market days, when his father was unable; drew the corks after dinner, when there was company, and even went to the cellar—in short, was a young laird. He was also able very probably, upon compulsion, to tell a tenant, or a tenant's wife, what was the matter with them, when they ailed, and came to the place in quest of advice; but without taking the trouble of drawing his hands from his pockets to write a prescription, or even go through the farce of feeling their pulse—except under the threat of having his head broken if he did not. In due time, the old laird died, and the son was a doctor no more; and farther history sayeth not, upon that occasion. He only emerges into notice and notoriety in his first widowhood; and then he is full grown, perhaps in his fortieth year; very frequent in his visits among his tenants, and continuing them till not only the tenants' patience, but his pantry, and even his shirts and stockings, were completely worn out. What first led him into this habit is not known; it is only certain, that for days, weeks, and months, he would remain sometimes in the poorest houses; not occupying the best apartment, or the best bed, but lying along by the fire, in his plaid; sometimes with not only the cats and dogs of the family lying down beside him, or sitting by him demure and listless as he; but, in a wet day, with even the fowls roosting on him. Some people may be apt to fancy this utter abandonment of himself, the effect of his domestic privation; and exclaim with the poet—

"Ah! what a noble mind is here o'erthrown!"

The mind is much obliged to them, but it had no claim to nobility; nor was it overthrown; it was only if any thing in particular, laid to rust like an old razor, that in time it might shave again. Others may fancy, that having now no game at home, a barn-door fowl or a pullet might be in favour, and that the laird, like a lazy malkin, was merely desirous of being near his prey; but even that is not alleged. He was not yet in want of money, for he had not yet gone to law, nor consequently thought of keeping an agent. He seemed, from causes nearly inexplicable, to have only got into a snuffing, drinking, loitering sort of state, and to have preferred indulging in those, in the company of a tenant, or a tenant's wife, to doing either in solitude, and at home.

Meantime the house, now seldom conscious of the presence of the master, would become more and more unfit for it. When the laird returned, a blowsy, or perhaps grim and scraggy cow-milker, would remove the milk dishes from the dining-room table, if there was one unbroken; scrub and flap off with her apron the uppermost of the dust from the chairs. She would sweep in, with all haste, the ashes that had lain in the fire-place since the last fire, and perhaps contrive to create as much smoke in the cold chimney as to make the apartment thoroughly disagreeable or uninhabitable. Perhaps the can would be off the chimney top, the tongs straying, and the poker bent, not from age, but ill usage, till it disdained to be any longer assisting in stirring the coals for any one. There would be no meat in the house, of course; there was nobody to eat it; no bread for the same reason; no sugar, no tea; not even warm water. There would only be some cakes, some cheese, and perhaps some whisky, if the laird had left any, but that seems unlikely. There would not even be a bed, for the sheets and blankets, like the ship-boy's cheese, would be at washing. The laird would naturally and necessarily look dismay; he would swear—for who could endure this? He would turn his steps from his own house, as a matter of absolute necessity; and woe to the tenant that received him, under the full impression of all these impediments to his return.

History states, that after due time there was a necessity for his being again married; and though we are aware that in proper circumstances little courtship is necessary on the part of a laird, the forms must be gone through; society requires it. Before a man can go to court, he must dress himself; and here the annals of the period have done posterity some justice: The dress of the Laird of Fishwig, upon this occasion,

is minutely described. According to the most authentic accounts, he wore his usual old hat, a little turned up behind; not, like a parson's beaver, from the propriety and dignity of the thing, but from use; he wore a coat, whether black, blue, or grey, is not said; he found a pair of buckskin breeches wandering about the house, and apprehended them as proper to ride in; white silk stockings would be proper, as he was going among ladies; and so perceiving something of that description hanging over a drawer, he took them; there was only one hole too many in each, and that had been made by his own heel, but it was only a few inches above the shoe, and so was of little consequence. That shoe was strong, and well ironed for the country, and as clean as was necessary to go riding through dirty roads. He had a spur for one side of the horse, and a stick was soon cut for the other. He had only to catch a plough-horse, and have the old saddle cast on him, which to be sure had wanted a stirrup since the mistress's death, but a rope one soon supplied it; and, with a cart bridle, as the riding one was not to be found, MacNichol of Fishwig was mounted, and went upon his way. No old shoe was thrown at him; they had been all used; and, besides, there was nobody cared whether he was married or not. The woman servant was glad that he had done railing at her, because she had taken no care to have a clean shirt for him; the man, for that the cart-horse was as furry as if there was not a wisp of straw to curry him with in the kingdom; and they went away, each admiring the unreasonableness of masters, to assist one another in conjecturing the probable result of this outfit.

It is of no use to describe a laird's courtship; we know the end of it before it is begun. Before Fishwig alighted, the roads had coated his legs so completely over, especially behind, that the holes in his silk stockings, though ample, were undistinguishable. He was received by the young lady's father (if, as we suppose, ladies are always called young till they are married) with his hands in his breeches pockets, at the stable door. Seeing our friend's feet and ankles rather muddy, he observed, that he had been taking samples of the roads, and recommended that, in order to make decent, he should walk through the water of Strathy, a rivulet that run hard by. Our friend declined this, being of opinion, perhaps, that when things are better hid than shown, they ought not to be shown. His host could only insist, therefore, that his river was useful notwithstanding; for, said he, now that I am not able to go out to get my feet wet in the moors, as I used to do, I every morning, as soon as I am dressed, walk through that water, and then I am comfortable for the day.

The lady was one of those stayed respectable-looking persons that may often be seen in the parlours of old families, too proud to marry beneath themselves, and formerly supposed pretty, and too poor to secure a husband whenever they may choose to give in. She was what is called not far from forty, although she had for some time been going farther from it every day. As soon as she had received, and coldly shook hands with, our friend, she sat down, and crossed her arms. The old laird was merry, because he thought his daughter was going to get married; not that he had any wish to part with her, and particularly with the cattle and money which he foresaw must change owners at the same time, but because she had not allowed her mother, or indeed any of the family, to remain ignorant that she wished it—as many a broken plate could testify, were it considered of consequence to preserve such witnesses. It is certain she had wished to be married—not for any thing that she need be ashamed of, but because it is discreditable, and an evidence of the most abominable luck in the world, to be unmarried, or at least without an offer; and this lady declared, and was joined in it by more than one old woman in the parish who understood these matters, that her mother must have omitted to have her wrapped in a man's linen when she was born, or it was impossible she could have remained without an offer so long.

The supposition was now about to be proved false. As soon as the ladies had retired after dinner, the laird and the old gentleman talked freely of the business in hand. They both of them agreed that marriage was often a great bore, and every snuff and tumbler gave strength to their assertions. They talked of fifty people who had been made miserable in fifty ways, in, by, and through their wives. "There is one good thing," said Fishwig; "they may be unchangeable, but they are not immortal." "You, at least, have been fortunate," said the other; "but I have been married these fifty years, and, for any thing I see, may be so many more." "If my luck should be the same," said the laird, "I defy me to be much unhappier than I am;" and he set down his tumbler as on a conclusive argument. "Then, 'take me!'" said the other, "if you can put up with the woman, if I would not give the cattle and the money to you, sooner than to any other man I know!" Our friend thanked him, and acknowledged his obligations; and in evidence of all together they shook hands, and replenished their tumblers in the most affectionate manner.

With tea the ladies returned, and the subject was introduced in full conclave with our friend's consent. We believe no woman makes such a contract without some emotions, both of affection and gratitude, and we are sure we have no wish to insist upon the con-

trary. This lady, though dark, and not comely, looked moved. It is even said—

"Some natural tears she shed!"

Fishwig saw it, and was not insensible. On the contrary, being now warm with excellent brandy, or, as he himself would have expressed it in his latter years, "well stricken in drink," he started up, and, to the discomfort of his friend, striking the laird's shin with his heel, and tearing his intended bride's gown with his toe, he not only squeezed her hand in his shoulder of mutton fist, but absolutely inflicted a kiss! and, smiting her again on the hand between his two, declared it a bargain! a done thing! a bargain that he would not renounce for twice the money; "unless," said he mentally, "it were to be paid down, and I had a better prospect!" and, having made this honest acknowledgment to himself, he resumed his seat without much farther damage, and the exercise of his tumbler without the least delay. The maiden of WETANSTOUR retired a trembling bride, our friend accompanying her to the door, and assuring her the thing was not worth being moved about; and as soon as by the dispatch of a bowl of cold punch, in which the laird and he, by special contract, went equal partners; we say, as soon as by the dispatch of this he could regain his single vision, and saw, by repeated observations carefully taken, that the different articles on the table appeared tolerably steady, he again got carefully upon his horse—collecting his legs into the stirrups, for fear that a vagrant dyke, or some such matter abroad in that dark season, might effect a separation between horse and foot, and reached home, as far as we have learned, not much more the worse of liquor than he expected to be.

For several days after, there was a vigorous ejection, from the house of Fishwig, of old shoes and all the other stationery of a neglected bachelor's residence. Certain habiliments of various ages and denominations were obliged to vacate their seats on the chairs. In ten or fifteen days, by a great expenditure of swearing and whisky, the house was painted by an old man, one of the first painters in the neighbourhood; the bell-wires were all repaired, as far as the blacksmith could judge; the furniture was all reviewed by a cartwright of the first eminence; and wherever a leg was wanting to a mahogany table, or an arm to a chair, a substitute of the finest birch, stained to match, was introduced; and the article thereby, as every one that saw it declared, made stronger than ever. Floors were planed, roofs pointed, windows patched, and courts cleaned, so that, with the help of a wet dish-clout judiciously applied, the house looked more glorious than ever; and the laird, having taken a *curiosity* view of the subject (that is to say, sworn at every one thing that had been done, that he was badly done as possible, and even beyond what he had ever conceived possible), gave orders for renewing the crockery, which, it is asserted, proved absent without leave, even to the cat's dish, and left not a single article bearing the name of stone, except a few Delft dishes for milk; and, finally, let on the whisky, and prepared for the great occasion.

We will not attempt to describe a Highland wedding. It is not in our line. We only know this, that the bridegroom, having sent suitable presents, and the bride presented the gentleman with a shirt, as use is, intended, we suppose, to provide, that if a lady takes her husband in his shirt, it shall be a good one, she herself came home, amid the clamour of pipes, the shooting off of guns, the snorting of horses, and the hallooing of men and boys; that a cake was broken on her head; that there was a long table in the barn, with plenty of beef, bread, and beer, and sitters to match; that in the house the same order of battle was observed; that there was a cask of sugar on the stair-head, with a spade in it, and brandy and whisky not far distant; and that next morning when they sought for them, "behold they were not." Fancy the couple married then; fancy the honey-week over; fancy Fishwig not so unhappy as he thought he would be, nay, "comparatively happy"—for he now was no longer out either at elbows or heels, had part of a clean shirt to his back, and a shoulder of mutton on his table; fancy the lady matronising in style, and Fishwig himself less snuffy and shaved, happy when, with an old companion, to see a cheerful fire, a clean house, and to have broad-cloth without and whisky within. He was what Scrub calls, "clean another sort of man." The lady kept the key, both of the cellar and cash-box, but neither in extremes; he had always a glass for a friend, and some shillings to rattle in his pockets. He dressed, he shaved, talked wisely, and went to church. But man is not born to be happy; and how could our friend hope to be allowed to continue so? He was not allowed. He became in the last degree unhappy, and acquainted with sorrow. And how? Hear it, ye hardened bachelors, and, like some others that we could mention, "believe, and tremble." He lost his wife! We are sorry to be accessory to her death, even after the fact; but the course of our history requires it. She died, and was buried. Instead of falling into his former habits, of deserting home, or seeking unsuitable company, or going to the devil in any of the many hundred ways,

"For which the door is open night and day,"

He did what in the estimation of many is equal to, and synonymous with, them all—he went to law.

How our hero got into debt and repented, and how he again married and became a gentleman, we shall embrace another opportunity of recording.

POPULAR INFORMATION ON HISTORY.

ATHENS AND SPARTA.

THE two principal states of ancient Greece were Athens and Sparta; they were both republics, but there were several curious peculiarities in their form of government which may be interesting to our readers.

The government of Athens has been said to be democratic; but it was so in a much more limited sense than is frequently supposed. Only a small part of the inhabitants had privileges, which entitled them to vote either in the election of candidates to public offices, or in the management of the business of the state. This right belonged only to a class who claimed to be descended from the original citizens of Athens, and who, in a population of perhaps 120,000, did not, with their families, amount to more than 21,000; the males who at any time actually exercised the right of citizens of Athens (or freemen of the town, as it would be called in our times) did not, therefore, much exceed six thousand. The exclusive privileges of this small body were guarded by them and their descendants with the utmost jealousy; and no one, except by special permission of the whole assembly, was allowed to be added to their number. The hereditary nature of this right, and the small number of those who held it, led to the worst consequences; no citizen, however poor, lost his privileges, and no mere resident, however wealthy, could acquire them: hence the right of voting in the public meetings, and of electing candidates to offices, fell gradually into the hands of a set of people, who, as a body, were far from wealthy; and who were, therefore, accessible to bribes, and to all those other temptations with which intriguing statesmen seek to influence the poor. The fact that the citizens, properly so called, depended for a great part of their subsistence on the entertainments made at public sacrifices, or on the pittance allowed to them for attending the courts and assemblies, sufficiently shows both their small number and their poverty. Hence they were continually the tool of every man of rank or influence who chose to flatter or to feed them. One rich person held the ascendancy in Athens a long time, by throwing open his gardens, and making public feasts for them; another, who had not the same wealth, got a decree passed that all citizens should have freedom to attend the theatre gratis; and as the same dependent class were employed as a kind of jurors both on civil and criminal trials, some public men flattered them by increasing the pay they received in that capacity, from three half-pence a-day, its original amount, to five-pence, which was the highest sum ever given. Statesmen who had the art of managing them, made every effort to get their influence increased; and as this could be done by their own act, the power of the popular assemblies gradually encroached on all the powers of the government. The habits of the people who possessed these privileges, and abused them in this manner, could not be otherwise than vicious; and we accordingly find them the object of contempt in most of the ancient writers who venture to describe them truly: the comedian Aristophanes treats the five-penny judges (*triboi*) with unsparing ridicule. And the absurd situations into which they threw the republic, at the suggestion of some of their favourites of the moment, justifies all that can be said of them as an ignorant, unsteady, and mercenary rabble. At one time they gave their patron Alcibiades the command of the most important and expensive armament ever fitted out in Athens; and almost as soon as he was gone, and had it no longer in his power to bribe and flatter them, they listened to some of his enemies, and ordered their commander home on trial for his life—a step which ruined their army and fleet, and led to the downfall of their power soon after. One day a decree was obtained from them for executing thirty generals, who, after a victory at sea, had neglected, on account of a storm, to bury the dead; and in a few weeks, the man who had brought about this consummation, was himself sentenced to be poisoned. Some enemies of Socrates got the miserable citizens to pass sentence of death against him; and, shortly after, his friends, by a little management, made them issue a decree for erecting a temple to his memory. The men who managed public affairs through the instrumentality of this body, being under the necessity of attending to their wishes, often levied large sums from the conquered cities, in order to provide public entertainments, where they might be amused or feasted. And, singular as it may appear, we find, at the time the Athenian power was at the highest, grave calculations of the amount which would be required from each of the tributary towns, to support all the citizens in idleness and comfort.

It is obvious that the caprices, corruption, and meanness of this body of people, arose from the smallness of their number, and the hereditary nature of their privileges, which kept political influence in the hands of men who were not above being influenced by considerations of petty gains, and even daily subsistence. The rest of the inhabitants, who consisted of residents (*non-freemen*), servants, and slaves, formed a very large population. The numbers are uncertain, for ancient writers are woefully deficient in statistical information; but, from the great commerce of Athens after the subjection of Egina, they could not amount to less than 100,000. The slaves, who were treated much in the same way as our servants, formed what would now be called the populace of the town. There were generally four slaves to every freeman in the

Greek cities, and these not marked out as bondsmen by their speech or complexion, but of the same blood as their masters, and sometimes attaining their freedom, though seldom, if ever, the right of citizenship. There were some foreign slaves in Athens, but these at all times must have been an inconsiderable number; the vast majority were only Greeks of inferior condition.

The character and circumstances of the persons who thus formed the basis of political power in Athens, gave a tinge to the whole proceedings of the government, making it unsteady and fluctuating, according as one or other of the favourites of the people had the ascendancy. This evil became greater as the power of the citizens increased, and, from the time of Pericles, who was the first that endeavoured to render himself popular in this way, there was little consistency or system in the proceedings of Athens. That statesman established his own influence over his tools, by giving them privileges which rendered them too vain of their power to submit long to any of his successors; and, accordingly, the weak citizens vacillated between the bribes of one demagogue and the promises of another, till the power of Athens sunk into contempt. It was in the latter part of its history that the influence of oratory became conspicuous; and it is to the idleness and caprice of the citizens of Athens (a very different class from the Athenian people) that we owe the cultivation of eloquence, an art peculiarly necessary for amusing public assemblies.

We do not mean to say that the government of Athens, as thus constituted, was entirely without useful qualities. The most upright statesmen are not without ambition, and some of these descended to seek influence among the citizens by the usual means, which they afterwards employed for admirable purposes. Sometimes the sense of imminent danger, or great public advantage, led the people to act right, in spite of their flatterers; and the public assemblies often formed a drag on the bad purposes of the worst demagogues, who sometimes found it easier, even here, to do right than to defend the wrong, which they would have preferred. But with all this, the limited and hereditary tenure of the right of citizenship (or franchise) was the cause of ultimate ruin to this celebrated government. Had the privilege of citizenship not been hereditary, but given to those who had acquired property in the city, the system of Athenian government would have been very different, and its prosperity would have been chequered by fewer of those reverses which at last destroyed its power as a free state.

Sparta presents a still more singular spectacle than Athens. In this state the ruling class was a body still smaller than in the latter, but they had no deliberative powers; there was little electing of candidates, no canvassing of public measures: the whole class were soldiers, forming a body of military nobility not unlike that of Poland in more modern times. They had different ranks among themselves, each of which was excessively jealous of its own precedence. There were, in the first place, the Spartans properly so called, who, like the "Hebrew of the Hebrews," could boast of pure Spartan descent, untainted by any other alliance; of these, in the authentic periods of Grecian history, there were not more than a hundred families, chiefly of senatorial rank. The next class was the Lacedemonians, who were more numerous, consisting of the freemen or rather gentry of mixed descent, in the capital, and other districts; though those of the latter were held to be inferior in degree. It is with regard to these three classes that the strange romance passes current, of their conforming to certain laws established by Lycurgus in the poetical times of Greek history. It is said that he enjoined an exact equality of property; the use of iron money, to prevent trade; common tables where the rich and poor ate together without distinction; and a number of other laws equally absurd and impracticable—and which, moreover, we know never were practised; for the distinctions of rank were maintained with more invidious severity in this state than in any other of Greece, and there were rich men and poor in every authentic period of its history, the state of equality here, as in other nations, having existed in the golden and poetical ages only. The secret of their having little money or iron money was not because their laws prevented it, but because, like other half savage nations, priding themselves on being great warriors, they were ignorant of any art of trade which could induce strangers to bring money among them. What appears certain is, that the education of the young freemen (or *gentry*, shall we still call them?) of Sparta, was exclusively military, and that they lived, perhaps, in a kind of barracks, along with the grown-up persons who had them in training. This is all that is credible of their system of equality, because every other part of it is contradicted whenever we are brought into actual contact with any part of Spartan history. The training of these young men as soldiers was very severe and complete; they formed always a steady and trustworthy force, both in action and for enduring fatigue. But they acquired no other accomplishment except their military exercises, and no search after knowledge was encouraged among them. Lycurgus—or whoever framed their laws—by branding all handicrafts with disgrace, by banishing trade, and excluding strangers, took the most effectual means to form a nation of ignorant soldiers; and the gloomy military virtues of the Spartans accordingly

remind a reader in the present day of nothing so much as the fame of the Troquois or Cherokees. Their regulations concerning lending wives, and the destruction of weakly infants—if ever such regulations were put in practice—were more absurdly savage than any thing among the wildest tribes of North America. It is impossible to read the commendations of *Spartan virtue*, which has passed into a proverb among ancient and modern writers, without a smile; for there never was a people of more grossness of manners, or a set of laws more fitted to perpetuate barbarism, than those of Sparta. Among none of the Greeks do we find more duplicity, or less disinterestedness, than in the transactions of the Spartan generals and statesmen.

The classes already mentioned formed, as we have said, a distinct and superior order in Sparta; the great bulk of the population was reckoned as their slaves, and was held by them in the most rigorous and degrading subjection. These slaves were called *helots*, and they were the only working people in the community. They farmed the land as small tenants, and paid a certain rent in kind to the public funds of the superior class; they were employed as artisans in all the coarse manufactures which the rudeness of Spartan manners admitted; and they were also the domestic servants and slaves of their masters. In the wars they formed by far the greater part of the armies, but were always slightly armed, and never employed in any situation of trust; for the Spartans (that is, the ruling class) made it a maxim that almost every one of themselves should have some command, however inconsiderable. It appears, therefore, that the *helots* were by far the most useful and industrious class in the state; yet, by their masters, they were treated with every mark of scorn and cruelty. They were allowed only to appear in a dress betokening slavery; a bonnet of dog-skin (worn in the rudest times of Greece), and sheep-skin vests, were the only apparel they dared to use: they were prohibited from teaching their children any accomplishments which might make them like their lords: and a Spartan might flog them once every day, merely to remind them that they were slaves. It is hardly to be supposed that such laws, any more than those of Lycurgus, were actually in practice; for we find that, in spite of them, many of the *helots* rose to a certain degree of wealth, and that they sometimes fought for their masters with zeal; but we know also that as soon as any of them gained by these means a little consideration, the spirit of jealousy was awakened among their barbarous superiors, who, in order to get rid of those who were likely to become leaders among them, had recourse to assassination. The murder of a *serf* (or *helot*) was not punishable by law; nay, it was even allowable, if we can believe this horrible part of the story, for the young Spartans to lie in wait, as a kind of sport, for any good-looking or saucy-looking slave, and stab him to the heart in the highway. It is certain that at one time, when the *helots* had stood their masters in good stead in battle, they were desired, by way of reward, to choose out 2000 of their best men, that they might receive their freedom, and be enrolled as Spartans, and that these 2000 men were all silently murdered soon after. At another time, when danger was apprehended from the growing numbers and petty wealth of the boors, the senate enacted the farce of declaring war against them, and coolly murdered many thousands, in order to thin their numbers and break their spirit. Had there been any redeeming trait in the Spartan character to compensate for such barbarity, one would have wondered less at the respect which is sometimes paid them; but their military fame only adds another instance to the many already on record, that the most ignorant and savage tribes make the most dogged soldiers.

Such were the Spartans and Athenians, the most celebrated of the Greek states, and whose transactions have made the greatest figure in history.

COAL.

A FEW minutes' reflection upon the subject will convince every one, that to this inflammable mineral Britain is indebted for the rank which she holds amongst the nations of Europe. Coal is the most valuable substance that ever was dug from the bowels of the earth, and hence the most inestimable terrestrial gift of the Great Creator. Suppose that our island had, instead of her coal-mines, those of the precious metals, such as gold and silver, would she have been a profitter by the exchange? Far otherwise. There might, indeed, have been as many human beings directly engaged in extracting the treasure from the earth, and fabricating it in various ways, and also in exporting it to other countries. But we do not consider coal as principally valuable because a number of individuals are employed in raising it from its subterranean bed, no, nor even in its usefulness for domestic purposes. Its great value consists in its application in the arts. We look to it in its relation to the steam-engine, that stupendous power which may be said to have changed the history of the world. What would we be as a nation without our manufactures? what would our ma-

nufactures be without the steam-engine? and what, again, would it be without coal? It may be replied that we might have had recourse to wood. But this combustible is a great deal more expensive, and does not answer the purpose half so well. Besides, had wood been used, long ere this time there would not have been left a standing tree on the whole island, and a foreign supply could scarcely be relied upon. It was liable to be cut off by the casualties of war, or the caprice of governments.

Coal to manufactures and commerce is just what food is to the human body. The combustible mineral is not a steam-engine, or the gold of the mint, it is true, but it is the vital life of the one, and the creator of the other. Food is not the blood, or the bones, muscles, sinews, &c.; but is it not them all in embryo? If our coal-mines were to become exhausted, the nation would sink like a foundered ship, and several centuries of civilization would go down with the wreck. It hence becomes matter of deep interest to every one in whose bosom there is a kindling of patriotism, to know how our country stands with respect to this invaluable treasure. But we shall first say a few words on the nature and history of coal.

Mineralogists have divided coal into three great families, namely, black, unflammable, and brown, each of these being again subdivided into a vast number of different species. Into the metropolis of England no less than seventy different kinds of coal are imported, and forty-five of these come from Newcastle alone. All the common coals, such as cannel coal, slate coal, foliated coal, &c., belong to the black family. Unflammable coals are those known in Scotland by the names of *blind* or *deaf* coals, and in England by those of Welsh, culm, or stone coals. The Kilkenny coals of Ireland belong also to this species. At Bovey, near Exeter, the brown coal is principally found. It is more commonly known by the name of the place where it is found.

The Scotch coals are familiarly called *open burning* coals, from their not running into a cake during combustion, like those of Newcastle. The best fires for household purposes are made by a mixture of Scotch and Newcastle coals.

Coal and wood, although very different in their appearance, are in their composition very nearly alike. Carbon, hydrogen, and oxygen, are the chief constituents of both. It is well known that the gas employed for lighting the streets is obtained by heating coal in close vessels. The hydrogen gas, or inflammable air combined with the coal, is driven off by the heat, and collected in vessels for the purpose. The substance which remains is called *coke*; and when wood is treated in the same manner, the residuum is called *charcoal*. They are both nearly pure carbon.

The fact is, that much of our coal is transformed wood, a great number of the mines being evidently the remains of forests; for the species of plants and trees which formed the coal-beds can still be distinguished; they are also often found mixed up with the remnants of animals. The peat-mosses now existing on the surface of the earth consist principally of vegetable remains in an early stage of transformation into the state of coal.

Beds or strata of coal occur amongst those of gravel, sand, clay, &c., of which the present surface of the earth is composed, and their accumulation must be ascribed to the agency of water. These strata, by long contact and pressure, became solidified into a rocky crust; and this crust, by repeated convulsions of the earth, of which there are abundant evidences, has been broken, and heaved up above the level of the sea, so as to form the dry land, diversified into mountain and plain. Coal, as well as other precious minerals, was first discovered by man at the fractures of the strata, which may often be seen lying one above another like piled books. It was at last discovered that the mineral strata occur among themselves in regular succession, so that the discovery of one stratum is a sure indication that the other is lying near; and thus the operations of the miner have been rendered of much surer result than if no such order were observed in nature. Indeed, expensive boring through superior strata can now be undertaken with a certainty of finding the desired treasure, provided the proper indications are given at the commencement.

HISTORY OF COAL.

Coal appears to have been known to the ancient Britons, although history, as far as we can recollect, is silent upon the subject. Indeed, it seems scarcely possible that they could have remained ignorant of its properties. Certain it is that they knew of its existence, for its present appellation is a British, and not a Saxon word, and still subsists among the Cornish in their *kolan* to this day. But, for many centuries after its discovery, wood was the prevailing fuel of the nation. In the year 852, we find the abbey of Peterborough granting some lands under the reservation of certain payments to the monastery, and amongst these there are mentioned sixty cart-loads of wood, and twelve of pit coal. Thus at this period the consumption of coal, in comparison with wood, was as one to five. The fact is, that as long as the immense forests remained, it was matter of policy to clear the soil of them.

The first public notice of coal occurs in the reign of Henry III., who granted a charter to Newcastle, conferring on the inhabitants the privilege of digging for coals. The first statute regarding this article was the ninth of Henry V. c. 10, ordaining all keels in the port of Newcastle to be measured by commissioners before carriage of coals, under the penalty of forfeiture. It was not, however, until the reign of Charles I. that they came into anything like common use; they were sold at that time for about 17s. per chaldron. At the Restoration, the quantity imported was supposed to amount to about 200,000 chaldrons. At the Revolution they amounted to about 300,000 chaldrons, and the importation has, of course, gone on to increase with the growing magnitude of the city: it at present amounts to 1,600,000 chaldrons. A London chaldron is 26½ cwt.

For a long period, and until very lately, the most grievous taxes were laid upon the importation of coals into London. The government duty of six shillings per chaldron has been recently abolished, but several burdens, in no ordinary degree oppressive, still remain. Perhaps the heaviest is the price paid for conveying the coal from a little below London Bridge to the consumers in the city. It amounts to more than the entire cost of the coal in the north, which is about 14s., and the sum paid by the consumer in London is £2. 4s. 7½d., above 14s. of which goes to defray the expense of the carriage above noticed. The principal cause of the exorbitant charge for conveying coal is to be traced to the monopoly enjoyed by those who are employed in the operation, they being paid in almost every instance four or five times more than they should be.

Another abomination existed until lately, that of selling coal by measure, instead of weight. A cubic yard of coal is nearly equal to five bolls; if broken into pieces of moderate size, it measures seven and a half bolls; and if broken small, nine bolls. Here the dealer had an opportunity of defrauding his customers, by pulverizing his coals. Indeed, the profit of many of the retailers arose from the increase of measure by the breakage of the article. Parliament, however, has recently enacted that it must be sold by weight. But we must hasten to the most important branch of the subject, namely,

THE PROBABLE QUANTITY OF COAL WHICH OUR ISLAND CONTAINS.

The investigations hitherto made as to the magnitude of the coal-mines, and the extent to which they can be wrought, are vague and unsatisfactory, and hence a near approximation to the truth cannot be looked for. But there has been one consoling fact elicited by the inquiries of those who have studied the subject: all are agreed that many centuries must elapse before any difficulties can be felt from a diminished supply of coal. Mr Taylor, an experienced coal-owner, has given it as his opinion that the coal-fields of Durham and Newcastle alone will furnish the present annual supply for 1700 years. Dr Buckland, the celebrated geologist, thinks this estimate greatly exaggerated; but in his examination before the House of Commons, he approves of a passage in Bakewell's Geology, which states that the coal-beds in South Wales are themselves sufficient to meet the present demand for a period of 2000 years. The passage is as follows:—"Fortunately we have in South Wales, adjoining the Bristol Channel, an almost exhaustless supply of coal and ironstone, which are yet nearly unwrought. It has been stated that this coal-field extends over about 1200 square miles, and that there are 23 beds of workable coal, the total average thickness of which is 95 feet; and the quantity contained in each acre is 100,000 tons, or 64,000,000 tons per square mile. If from this we deduct one half for waste, and for the minor extent of the upper beds, we shall have a clear supply of coal equal to 32,000,000 tons per square mile. Now, if we admit that 5,000,000 tons from the Northumberland and Durham mines is equal to nearly one-third of the total consumption of coal in England, each square mile of the Welsh coal-field would yield coal for 100 years' consumption; and as there are from 1000 to 1200 square miles in this coal-field, it would supply England with fuel for 2000 years after all our English coal-mines are worked out!"

After reading the above statement, we do not think there can be any exaggeration in saying that the coal-mines of Britain are inexhaustible; for if we add to the Welsh mines those of England and Scotland, they will be found collectively to contain fuel for more than 4000 years. Indeed, this we think a very low estimate. Again, coal is continually forming in the bowels of the earth, and it is very probable that long ere 2000 years have run the circle of the world, vast mines of the mineral will have reached a state of perfection. How absurd then is it to restrict the exportation of the article by heavy duties! We are aware that recently these have been reduced, but not so much as they might be without any danger of exhausting the mines, and with a certain prospect of benefiting the country. But this is not the place for political argumentation.

Many other nations of Europe possess considerable coal-mines, as France, Germany, Sweden, &c. It also abounds in several parts of America. But in all other countries the article is much inferior to our own.

• This is evidently a mistake; it should be 600 years. But we give the passage as it has appeared in various works, in order thus to point out the error to the notice of those concerned.

JAMAICA.

It is a curious fact, that Jamaica, at this time, produces a greater revenue to the mother country than the whole amount of the national revenue in the Protector's time. Jamaica was no doubt generally considered, at the period of its conquest, and for several years after, as far inferior in importance to either Cuba or Hispaniola; as in truth it would be at the present day, were those islands equally improved by cultivation. It was reserved for the enterprising industry and commercial spirit of the British to render Jamaica what it now is, the most highly cultivated and most productive colony in the American archipelago.

The following particulars will show the progressive improvement of the cultivation, population, and commerce of Jamaica, for the last century and a half:—

In 1673, there were in the island 7768 whites, and 9504 slaves. The chief products were cocoa, indigo, and hides. Sugar had just then been begun to be cultivated.

In 1722, the island produced 11,000 hogsheads of sugar.

In 1734, there were 7644 whites, 86,546 slaves, and 76,011 head of cattle in the island.

In 1744, there were 9640 whites, 112,428 slaves, and 88,036 head of cattle; and the island produced 35,000 hogsheads of sugar, and 10,000 puncheons of rum.

In 1768, there were 17,000 whites, 166,914 slaves, and 135,773 head of cattle; and 55,761 hogsheads of sugar, and 15,551 puncheons of rum were produced.

In 1774, the island produced only 654,700 lbs. of coffee; and in 1790, 1,783,740 lbs.

At present there are in Jamaica about 350,000 slaves, 300,000 head of stock; and the annual average produce may be about 130,000 hogsheads of sugar, 60,000 puncheons of rum, and 13,000,000 lbs. of coffee, &c.

In return for its commodities, Jamaica receives from Great Britain an annual supply of almost all her manufactures. The exclusive right which she claims of supplying this and the other islands with her products is one important source of her commercial and manufacturing prosperity. The annual amount of British manufactures imported into this island alone is upwards of two millions. The imports from other parts (of lumber, provisions, cattle, &c.) amount to nearly a million currency.

The annual exports to Great Britain and Ireland may amount, one year with another, to about five millions; and those to other parts to about £4,400,000.

PECULIAR METHOD OF TURNING WOOL INTO FUR.

The wool-growers of Podolia and the Ukraine, and particularly in the Asiatic province of Astrachan, have a peculiar method of turning wool into fur. The lamb, after a fortnight's growth, is taken from the ewe, nourished with milk and the best herbage, and wrapped up as tight as possible in a linen covering, which is daily moistened with warm water, and is occasionally enlarged as the animal increases in size. In this manner the wool becomes soft and curly, and is by degrees changed into shining beautiful locks. This is the kind of fur which passes under the name of Astrachan, and is considered on the Continent as the most genteel lining for winter cloaks. Similar trials with German sheep have been attended with the same success. The Saxon breed of sheep have, within the last ten years, superseded the merinos, and their wool is of superior quality.

GRATITUDE AMONG THIEVES

That the thieves of Paris are not without sentiments of probity and gratitude, the following fact may serve to prove:—M. Jacquemin, physician to the prison of La Force, had his pocket picked of his opera-glass, a few evenings since, on his return from the theatre of the Palais Royal. Next morning, on visiting the prison, he complained bitterly of the ingratitude of the thieves, who had thus so badly requited the care which he had bestowed upon them. "Yes, it is too bad," cried a skilful practitioner among the light-fingered tribe. "He must have been a novice, an ignorant fellow, who could so far forget himself as to exercise his vocation upon you. I am sorry I cannot get out, or in two hours I would give you some account of your glass. But stop—let me see—yesterday evening—at the Palais Royal. Give me a description of the glass; if it is still in the hands of the *fourgangs* (purchasers of stolen goods), we shall have it." Our honest thief contrives to transmit a hint upon the subject to his *collaborateurs* outside, and next day the glass is forwarded to the Director of La Force, in order to be restored to the doctor. A similar adventure happened some time ago to M. Lebon, the barrister, whose chief practice is at the assizes. His wife had been robbed at the theatre of a Cashmere shawl, of which he complained at the prison. "The shawl was taken at the theatre—it is abominable," said one of M. Lebon's clients, who was confined within the walls; "but I know who was on duty at the theatre that evening;" and, like the opera-glass of M. Jacquemin, the shawl was restored next day.—*Gazette des Tribunaux*.

THE BEST LEATHER FOR SHOES

Matthew Lansberg used to say, "if you wish to have a shoe made of durable materials, you should make the upper leather of the mouth of a hard drinker, for that never lets in water."

TOADS.

The common toad, which is generally esteemed the most loathsome of British reptiles, and which boys too often heedlessly pelt with stones, as if it were a creature injurious to mankind, is an animal of considerable use in the economy of nature, being evidently created for the purpose of destroying and clearing away worms and other small vermin which would injure vegetation. The character of this inoffensive creature has recently been well described by Mr Fothergill, a naturalist. "The common food of the toad (says he) is small worms, and insects of every description; but its favourite food consists of bees and wasps. When a toad strikes any of these insects, however, deglutition does not immediately take place, as in other cases, but the mandibles remain closely compressed for a few seconds, in which time the bee or wasp is killed, and all danger of being stung avoided. The mandibles are provided with two protuberances, which appear to be destined for this office. Although capable of sustaining long abstinence, the toad is a voracious feeder when opportunity offers. To a middle-sized one the writer has given nine wasps, one immediately after another; the tenth it refused, but in the afternoon of the same day it took eight more. To see the toad display its full energy of character, it is necessary to discover it in its place of retirement for the day, and, if possible, unperceived, to drop an insect within its sight: it immediately arouses from its apparent torpor, its beautiful eyes sparkle, it moves with alacrity to its prey, and assumes a degree of animation incompatible with its general sluggish appearance. When arrived at a proper distance, it makes a full stop, and, in the attitude of a pointer, motionless eyes its destined victim for a few seconds, when it darts out its tongue upon it, and lodges it in its throat with a velocity which the eye can scarcely follow. It sometimes happens to make an effectual stroke, and stuns the insect without gorging it, but never makes a second stroke until the insect resumes motion. It uniformly refuses to feed on dead insects, however recent. For several years a toad took up its abode, during the summer season, under an inverted garden-pot, which had a part of its rim broken out, in the writer's garden, making its first appearance in the latter end of May, and retreating about the middle of September. This toad, there is reason to believe, distinguished the persons of the family, who daily fed it, from strangers, as it would permit them to pat and stroke it. To try the indiscriminating appetite of these animals, the writer has dropped before a full-grown toad, a young one of its own species, about three-fourths of an inch long, and the instant it began to move off, it was eagerly struck at and swallowed; but the writer, in repeating this experiment, found that more will refuse than devour the young of their own species. When living minnows were dropped before a toad, they were struck at and swallowed in the same manner. These experiments were made on toads at full liberty, and met with accidentally. Toads generally return to their winter quarters about the time that swallows disappear. The writer, on such occasions, has seen them burrowing in the ground backwards, by the alternate motion of their hind legs."

UMBRELLAS.

Umbrellas, in my youth, were not ordinary things; few but the macaronis of the day, as the dandies were then called, would venture to display them. For a long while it was not usual for men to carry them without incurring the brand of effeminacy, and they were vulgarly considered as the characteristics of a person whom the mob highly disliked, namely, a mincing Frenchman! At first, a single umbrella seems to have been kept at a coffeehouse for some extraordinary occasion—lent as a coach or chair in a heavy shower, but not commonly carried by the walkers. The Female Tatler advertises, "the young gentleman belonging to the customhouse, who in fear of rain borrowed the umbrella from Wilks's coffeehouse, shall the next time be welcome to the maid's pattens." An umbrella carried by a man was obviously then considered as extreme effeminacy. As late as in 1778, one John Macdonald, a footman, who has written his own life, informs us that when he used "a fine silk umbrella, which he had brought from Spain, he could not with any comfort to himself use it, the people calling out, 'Frenchman! why don't you get a coach?'" The fact was, that the hackney coachmen and the chairmen, joining with the *true esprit de corps*, were clamorous against this portentous rival. The footman, in 1778, gives us further information. "At this time there were no umbrellas worn in London, except in noblemen's and gentlemen's houses, where there was a large one hung in the hall to hold over a lady or a gentleman, if it rained between the door and their carriages." His sister was compelled to quit his arm one day from the abuse he drew down on himself and his umbrella. But he adds, that "he persisted for three months, till they took no farther notice of this novelty. Foreigners began to use theirs, and then the English. Now it is become a great trade in London." This footman, if he does not arrogate too much to his own confidence, was the first man distinguished by carrying and using a silken umbrella. He is the founder of a most populous school. The state of our population might now in some degree be ascertained by the number of umbrellas.—*New Monthly Magazine*.

THE SMOKING DOCTOR.

In a pleasant little work, just published, under the title of "*Nicotiana*," is the following anecdote of Dr Aldrich:—The doctor's excessive love of smoking was well known to his associates; but a young student of his college, finding some difficulty to bring a fellow-collegian to the belief of it, laid him a wager that the dean, Aldrich, was smoking at that time (about ten o'clock in the morning). Away went the latter to the deanery. After being admitted to the dean in his study, he related the occasion of his visit. The dean, instead of being disconcerted, replied in perfect good humour, "you see your friend has lost his wager, for I am not smoking, but only filling my pipe." The story, however, is not quite correctly told: the wager was, that the dean was either smoking, stopping, or filling his pipe. The parties called on him, and he who made the bet immediately exclaimed, "I have lost my wager, I perceive;" for the doctor was not smoking, but had his hand in his waistcoat pocket. "You have won it," said the dean, to whom the matter had been explained; "for," said he, withdrawing his hand from its place of concealment, "I am filling my pipe at this very moment," his pocket being his tobacco-box.—*Harmonicon*.

THE BRITISH OAK.

Among the traditions of this wonderful tree, the following will, we have no doubt, prove interesting to our readers. The large Golenos oak, which was felled in the year 1810 for the use of his Majesty's navy, grew about four miles from the town of Newport, in Monmouthshire; the main trunk, at ten feet long, produced 450 cubic feet; one limb, 355; one ditto, 472; one ditto, 235; one ditto, 156; one ditto, 106; one ditto, 113; and six other limbs of inferior size averaged 93 feet each; making the whole number 2426 cubic feet of sound and convertible timber. The bark was estimated at six tons; but as some of the heavy body bark was stolen out of the barge at Newport, the exact weight is not known. Five men were twenty days stripping and cutting down this tree; and a pair of sawyers were five months converting it, without losing a day (Sunday excepted). The money paid for converting only, independent of the expense of carriage, was £32; and the whole produce of the tree, when brought to market, was within a trifle of £600. It was bought standing for £405. The main trunk was nine feet and a half in diameter, and in sawing it through a stone was discovered six feet from the ground above a yard in the body of the tree through which the saw cut; the stone was about six inches in diameter, and completely shut in, but round which there was not the least symptom of decay. The rings in its butt were carefully reckoned, and amounted to above four hundred in number, a convincing proof that this tree was in an improving state for upwards of 400 years; and as the ends of some of its branches were decayed, and had dropped off, it is presumed it had stood many years after it had attained maturity.

RATS IN JAMAICA.

In no country is there a creature so destructive of property as the rat is in Jamaica; their ravages are inconceivable. One year with another, it is supposed that they destroy at least about a twentieth part of the sugar-canes throughout the island, amounting to little short of £200,000 currency per annum. The sugar-cane is their favourite food; but they also prey upon the Indian corn, on all the fruits that are accessible to them, and on many of the roots. Some idea will be formed of the immense swarms of those destructive animals that infest this island, from the fact, that on a single plantation thirty thousand were destroyed in one year. Traps of various kinds are set to catch them, poison is resorted to, and terriers, and sometimes ferrets, are employed to explore their haunts, and root them out; still, however, their numbers remain undiminished, as far at least as can be judged by the ravages they commit. They are of a much larger size than the European rat, especially that kind of them called by the negroes *racoons*. On the experiment being tried of putting one of these and a cat together, the latter declined attacking it.

BURNING MUMMIES.

The Arabs who inhabit the neighbourhood of the great cemeteries of Upper Egypt have a strange way of cooking their victuals. Whenever fuel is wanting, they descend into their tombs, and, dislodging a mummy, and throwing it on their shoulders, return to their tent. Then taking a hatchet, and seizing the mummy by one leg, they hew the body into two at a blow, and afterwards cutting it into smaller pieces, make use of a leg or an arm, or part of the trunk, as it may happen, to boil their kettle. As the ancient Egyptians always enclosed their dead in resinous substances, the mummies are easily combustible, and make excellent fuel.—*London Weekly Review*.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office, and printed by BALLANTYNE and COMPANY, Paul's Walk.

No. 47.

SATURDAY, DECEMBER 22, 1832. PRICE THREE HALFPENCE.

SETTING UP.

THE taking of a shop, whether to set up a new business or translate an old one, is always a matter of deep and anxious concernment. On such an occasion, one generally gets into a state of fidgettiness and perplexity, which is felt to be far from disagreeable. A sentiment of unwonted enterprise rises in his mind. He is going, he thinks, to do a great thing—at least something beyond the usual range of commercial existence. In the first place, he pays a few sly and solitary visits to the place—not that he goes in to look about him—no, no; he is not for some time up to that point. He tries first how the premises look when simply walked past as if by an unconcerned passenger. As he passes, he casts an affectedly careless glance at the door and windows, taking care, however, to receive as deep an impression as possible of the whole bearing and deportment of the place. After walking to a sufficient distance, he turns and walks back, and sees how it looks when approached from a different point of the compass. Then he takes a turn along the other side of the street, or perhaps, if afraid to excite observation (and if the place be in Edinburgh), goes up a common stair, and takes a deliberate and secure observation from a window. His feeling is almost exactly the same as that of a lover making observations of a mistress, whose figure he wishes to ascertain before getting too deeply in love with her to put correct judgment out of the question. As, in the one case, stature is perhaps considered, complexion and outline of face duly weighed, and possibly some very modest inquiries instituted as to what Master Slender calls "possibilities," so, in the other, does the shop-inspector consider all the particulars of the aspect and likelihood of the contemplated premises. Shops, it must be understood, have characters, exactly like human beings. Some have an open, generous, promising countenance, while others have a contracted, sinister, lowering expression of phiz, according to the quantity of mason-work there may be in front. Some are of a far more accessible character than others, with a kind of *facilis descensus* in the entry that is in the highest degree favourable to custom. People can hardly avoid falling into such shops as they pass along the streets, for positively they gape like so many Scyllas for your reception, and goodwives, who, like Roderigo, have put money in their purses, are caught like so many rats without thinking of it. There are others, I grieve to say, with such a difficulty of entrance, either from a narrow door, a shut door, an elevation off the pavement, or a certain distance from the thoroughfare, that it requires an absolute determination to purchase such and such articles in such and such shops—a full *animus emendi*, as lawyers would say—to overcome the obstacle. Perhaps it does not matter for some businesses, which are not much overrun with competition, that they should be carried on in shops of this kind. If there be only one music-seller in the town, he might have his boutique in a twelfth story, and yet he would be sure to get all the natural custom of the place; but in the case of one out of some five hundred haberdashers, or some two thousand grocers, it is absolutely imperative that he should be established in some place with a fatal facility of access. In all cases, there is a combination of qualities in shops as well as in men and women. There is something indescribable about it; but an experienced eye, pretty well acquainted with the characters of the streets [this is another subject] and parts of streets, could almost in a moment decide upon the probabilities of any given shop in a large city. He would combine in an instant in his own mind the various qualities, and, counting them

into each other after the manner of Lieutenant Drummond, but by a figureless kind of arithmetic, assign at once the exact value of the shop to any class of traders. And shops have characters, too, in another sense of the word—that is, they have reputations. Let a shop have all the apparent advantages in the world, yet, if it be a shop in which several persons have committed *faux pas* in business, it is naught. We often see an excellent shop thus lose caste, as it were, and become of hardly any value to its proprietor. Suppose some one has failed in it between terms, and deserted it: then do all the bill-stickers come in the first place, and paste it over with huge placards from top to bottom, exactly as a man drowned in the sea, however fine a fellow he may have been, gets encased in a few days in barnacles and shell-fish, the chonchological part of the world taking that opportunity to show their contempt for the human. Though the character of the shop is not yet, perhaps, at its worst, yet, as it happens to remain unleased over the next term, the despairing landlord, some time in September or October, begins to let it "by the month or week" to all kinds of nameless people, who die and make no *sign*, such as men that show orreries, or auctioneers selling off bankrupt stocks, till at last it is as hopeless to think of getting a good tenant into it, as for a man with a bad character to expect a good place in the Excise. The shop is marked for ever, and unless, like the man in the Vicar of Wakefield, it can get a thoroughly new face and form, it has no chance whatsoever of resuming its place in the first rank of shops.

After having completely made up his mind to take a particular shop, he goes and asks advice. His confessor* readily consents to take a walk with him in that direction, and give his candid opinion upon the subject. The two walk arm in arm past the premises, the confessor alone looking, lest, in endeavouring to observe, they should themselves be observed. "I'll tell you what," says the confessor, "I like that shop very much. If the rent be at all suitable, I think you might do very well in it." It is then proposed that the confessor should step in to inquire the rent; for though there be equal reasons why each should not expose himself as being on the outlook for a shop, the person not actually concerned has always least reluctance to submit to that disadvantage, being borne up, it would appear, by a conscious absence of design, while the guilt of the other would be betrayed by his first question. If the confessor reports favourably, then the individual who wants the premises ventures in himself, inspects the accommodations, and makes further inquiries. The two afterwards retire together, and have a deep and serious consultation upon the subject.

In the deliberations of a person about to enter life in this way, there is always much that is extravagant, and much that is vague. I never yet knew it fail, that, if there was success at all, it arose from different sources from those which had been most securely calculated upon as likely to produce it. Suppose it is a business for the supply of some ordinary necessary of life: the novice reckons up almost all the people he knows in different parts of the town as sure to become his customers: he expects, indeed, hardly any other kind of support. It is found, however, when he commences, that one friend is engaged in one way, and another in another, so that, with the exception, perhaps, of some benevolent old lady, who

sends occasionally to buy a few trifles from him upon principle, all is waste and barren where he expected to reap a plentiful harvest. He finds, however, on the other hand, that he gets customers where he did not expect them. People seem to rise out of the earth, like the men of Cadmus, to buy from him. The truth is, he is resorted to by those who are disengaged at the time, and to whom his shop is convenient; and all the good will of all the friends in the world will not get over, for his sake, the difficulty of some engagement elsewhere, or the inconvenience of distance.

It is also a very remarkable thing of people about to enter upon such an enterprise as we are now describing, that they often overlook the most important considerations of all, and pay a very minute attention to trifles and things by the bye. They perhaps fail to observe that there is not nearly enough of population around them to justify their setting up a particular business; but they fully appreciate and lay great stress upon the circumstance of having a water-pipe in the back room, by which they may be enabled to wash their hands at any time of the day. They may neither have capital nor range of intellect for the business; but they are top-sure that the woman who sells small wares in the area will supply them with a light for the fire every morning. The shop may be unsuitable in many important respects; but nothing could be better in its way than the place for a sign above the door. Even where every matter of real consequence is well weighed and found answerable, there is generally a fussy and festering anxiety about details, accompanied, in the sensations of the principal party, by a peculiar dryness of mouth and excoaration of thought-chewed lip. Matters may be such that a confessor, with all the evil-foreboding qualities of a stormy petrel, could not see a single flaw in the prospect; yet it is amusing in such cases to hear the intending trader laying as much stress upon the peculiar situation of a fire-place in the back room, or the willingness of the landlord to supply a padlock to the door, as if in these things, and in nothing else, lay all his hopes of profit and eventual respectability in life.

Suppose, however, that, after all kinds of fond and dreamy calculations, the shop has been taken and opened: I think there can hardly, for some time, be a more interesting sight to a benevolent onlooker, than the young and anxious trader. The shop almost throws itself out at the windows to attract the observation of the passer by. The youth himself stands prompt and alert behind his counter, never idling for a moment, nor permitting his shop-boy to idle, but both busy, cutting, and brushing, and bustling about, whether there be any thing to do or not. If but an old lady be seen looking up at the window, or glancing in through the avenue of cheap prints that forms the doorway, what an angler-like eagerness in the mind of the trader that she would but *walk in!*—nothing more required—were she once within the shop, no fear but she is well done for. And when any body does go in to buy any thing, what a readiness to fly upon the article wanted—with what serviceable rapidity of finger is the parcel unbound—how polite and *impressé* the manner in which the object is presented and laid out for inspection—what intense gratitude for the money wherewith it is paid! With what a solicitous air is a card finally put into your hand as a memorandum of the place!—a proceeding only the more eloquent when not accompanied by an actual request for your further custom.

In a large city, advertising is necessarily resorted

* Bosom friend.—See a particular account of the fraternity in the Journal, No. 15.

to as one of the modes, if not almost the only mode, of forming a business. Here it is obvious that a mere modest statement of the case will not do. Something must be said, to make the setting up of the new shop appear in the character of an *event*. The public attention must be arrested to the circumstance, as if it were a matter of public concernment. It must appear, as if the interest of the community, and the interest of the shopman, were identified. No good bargains, no certainty of good articles, no safety of any kind, any where else. Such is the strain of his advertisements, which, though they make the judicious grieve, make a vast number of other people, and even some of the judicious, buy. The secret is this: A warm and highly coloured style is necessary with a new shopkeeper, to meet and counteract the indifference of the public towards his concerns. If he put forth a cool schedule of his goods and chattels, it does nothing for him, because it does not single him out from the great herd. But if he uses a striking and emphatic phraseology, and even mixes a little extravagance in the composition, it is apt to fix attention to him and his shop; and the people, being so warmly solicited, go to try. Again (and here, perhaps, lies the better part of the thing), the frequency and fervour of his advertisements at least convey the impression that he is anxious for business, and ready and willing to execute it, and, as people like to deal with such persons, he is apt to be resorted to on that account, if upon no other. Frequent advertising is, upon the whole, a mark rather of a want of business, than of that kind of respectability which consists in the enjoyment of a concern already in full operation and productiveness; but with beginners, it is quite indispensable.

The difficulty of establishing a new business is fortunately got over in a small degree by a certain benevolent principle in human nature—a disposition to encourage the efforts of the young. Some people act so much under this sentiment, or have such an appetite for the sincere thanks of the needy, that they go to hardly any shops but those of new beginners. The sight of a haberdasher's shop, in its first and many-coloured dawn, with prints, and ribbons, and shop-bills, flying in all directions—or of a provision shop, where hams project their noses into the very teeth, almost, of the passer by, and cheeses lie gaping with a quarter cut out, as if ready to eat rather than to be eaten—or of a bookseller's shop, where every fresh and trig volume upon the counter seems as if it would take the slightest hint of your will, and starting up, pack itself off, without any human intervention whatsoever, to your lodgings—is irresistible to these people. They must go in, whether they want any thing or not, and, after buying some trifle as an earnest of future custom, get themselves delighted with a full recital of all the young trader's feelings, and prospects, and capabilities, which he is ready to disclose to any one that will lay out sixpence, and appear to take an interest in his undertaking. If the customer be an old lady, she is interested in his youth, and inquires whether he be married or not. If not, then she wants him to get on well, so that he may soon be able to have a wife: if he be, and have children, then she sympathises but the more keenly; she thinks how much human happiness depends upon the success or failure of his undertaking—how one fond soul will watch with intense anxiety the daily progress of the business, taking an interest in almost every penny that comes in, and how many little mouths ungenerously depend upon what is done *here*, for the fare which childhood so much requires and so truly enjoys. She goes away, resolved to speak of the shop to all she knows, and perhaps in two or three days she is able to bring in a flock of young ladies who want various articles, and who, recommending the new beginner to others, aid materially in making up the steady business, which, with economy, perseverance, and suitable personal qualities, he at length acquires.

LITERARY HISTORY OF THE BIBLE.

FIRST ARTICLE.*

THE Bible of the Christians is, without exception, the most remarkable work now in existence. In the libraries of the learned, there are frequently seen books of an extraordinary antiquity, and curious and interesting from the nature of their contents; but none approach the Bible, taken in its complete sense, in point of age, while certainly no production whatever has any pretension to rival it in the dignity of composition, or the important nature of the subjects treated of in its pages. The word *Bible* is of Greek origin, and, in signifying simply *The Book*, is expressive of its superiority over all other literary productions. The origin and nature of this every way singular work, how it was preserved during the most remote ages, and how it became known to the modern world in its present shape, form a highly interesting chapter of literary history.

* No work has been so thoroughly investigated as the Bible, and none is so much the subject of disquisition among all classes of Christians; but it is humbly conceived that the people generally, as yet, know exceedingly little regarding its literary history, such a species of information apparently not being considered of any use by the clergy, or being confined to very expensive publications. The Editors of the Journal being of opinion that the more that is known regarding this invaluable work the better will it be for the community at large, now bring forward the first of a series of short articles on this interesting subject, written, they would fain hope, in a style which cannot possibly offend any sect in religion, and suitable to the edification of the young, and families in the humbler classes of society.

The Bible comprehends the entire foundation of the religious belief of the Jews and Christians, and is divided into two distinct portions, entitled the Old and New Testament, the former being that which is esteemed by the Jewish nation, but both being essential in forming the faith of the Christian. The Old Testament is the largest department of the work, and appears a collection of detached histories, moral essays, and pious poetical effusions, all placed together in the order of time, or, as they may serve, for the purpose of mutual illustration. On taking a glance at the contents, the principal subject of narration seems the history of the Jews, commencing with an account of the creation of the world, and tracing their history, genealogically, through a series of striking vicissitudes and changes of situation. But when we examine the narratives minutely, it is found that there is another meaning than that of mere historical elucidation. It is perceived that the whole train of events recorded, the whole of those lofty impassioned strains of poetry which distinguish the volume, are precursory and prophetic of a great change which, at a future period, was to be wrought on the moral properties and fate of mankind, by the coming to the earth of a Messiah.

The authorship of the Old Testament has been universally ascribed by both Jews and Christians to God himself, though not by direct composition, but by spiritually influencing the minds of certain sages to accomplish the work, or, in ordinary phraseology, by *inspiring* or endowing them with a perfect knowledge of the transactions to be recorded and predicted, in a way suitable to the great end in view. The Bible is hence usually termed the *Sacred Scriptures*. The periods when the act of writing all or most part of the Scriptures took place, as well as most of the names of those who were instrumental in forming the work, have been ascertained with surprising accuracy, both from written evidence in the narratives themselves, and from the well preserved traditions of the Jews. At whatever time the different books were written, they were not collected and put into a connected form till long after their immediate authors were deceased; and their present arrangement, as we shall afterwards fully explain, is of comparatively modern date.

According to the order in which the books of the Old Testament now stand, those of a historical nature are appropriately placed at the beginning. The first five books, having a chain of connection throughout, are Genesis, Exodus, Leviticus, Numbers, and Deuteronomy. These are styled the *Pentateuch*, such being the Greek compound for *five books*. They are likewise entitled the Books of Moses, from the belief that that enlightened Jewish leader composed them.

The Jews, or Hebrews, take the name of the sacred books from the first word with which each begins; but the Greeks, whom our translators generally follow, take the names from the subject-matter of them. Thus, the first book is called by the Hebrews *Bereshith*, which signifies *In the beginning*, these being the first words; but the Greeks call it *Genesis*, which signifies *Production*, because the creation of the world is the first thing of which it gives an account. It likewise contains an account of the increase of mankind; of their corruption of manners, and its cause; of their punishment by the deluge (an event which, by scientific investigation and historical research, is placed beyond a doubt); of the origin of the Jewish people from Abraham; of the manner in which God was pleased to have them governed; and, particularly, of the nature of the special superintendence vouchsafed to the Jewish nation by the Creator. This comprehensive narrative reaches from the creation of the world till the death of Joseph, or a period of 2369 years. In another part of the Scriptures, reference is made to the *Book of Jasher*, and it is believed that Genesis is there meant; for *Jasher* signifies the *Just*, and, according to St Jerome, a learned Christian writer, the name of the Book of the Just, or the Authentic Book, was applied to it, from its containing the history of Abraham, Isaac, and Jacob.

Exodus, the title of the second book of Moses, signifies, in Greek, *The going out*, and was applied from the account which it gives of the Israelites going out of Egypt. In it are related the cruel Egyptian slavery under which the Jews groaned; their delivery by flight and a passage through the Red Sea; the history of the establishment of their very peculiar law, and many remarkable transactions; concluding with the building of the Tabernacle, or place appropriated to the service of the Divinity. This book comprises the history of 145 years, from the death of Joseph till the building of the Tabernacle. The Hebrews call it *Veelle Shemoth*, that is, in English, *These are the names*, which are the words with which it begins.

The third book of Moses is called *Leviticus*, because it contains the laws which God commanded should be observed by those of the tribe of *Levi*, who ministered at the altar. It treats at large of all the functions of the Levites; of the ceremonial of religion; of the different sorts of sacrifices; of the distinction of clean and unclean beasts; of the different festivals; and of the year of Jubilee, or continued holiday. It likewise presents us with an account of what happened to the Jews during the space of one month and a half; that is, from the time the Tabernacle was erected, which was the first day of the first month of the second year after the Israelites came out of Egypt, till the second month of the same year, when God commanded the people to

be numbered. The Hebrews call this book *Vayicre*, that is, *And he called*, these being the first words; they call it also *The Law of the Priests*.

In the fourth book, which we call *Numbers*, Moses numbers the Israelites, and that, too, in the beginning of the book, which shows whence it had its name. The Hebrews call it *Vayedaber*, that is, *And he spake*. This book contains the history of all that passed from the second month of the second year after the Israelites came out of Egypt, till the beginning of the eleventh month of the fortieth year; that is, it contains the history of thirty-nine years, or thereabouts. In it we have also the history of the prophet Balaam, whom the King of the Midianites brought to curse the people of God, and who, on the contrary, heaped blessings upon the Israelites, and foretold the coming of the Messiah. It particularly mentions, also, the two-and-fourty encampments of the Israelites in the wilderness.

The fifth book is called *Deuteronomy*, a Greek term, which signifies *The second law*, or rather, *The repetition of the law*, because it does not contain a law different from that which was given on Mount Sinai; but it repeats the same law, for the sake of the children of those who had received it there, and were since dead in the wilderness. The Hebrews call it *Elle-haddebarim*, that is, *These are the words*. Deuteronomy begins with a short account of what had passed in the wilderness, and then Moses repeats what he had before commanded, in Exodus, Leviticus, and Numbers, and admonishes the people to be faithful in keeping the commandments of God. After this, he relates what had happened from the beginning of the eleventh month, to the seventh day of the twelfth month of the same year, which was the fortieth after their leaving Egypt. The discourse which is at the beginning of this book was made to the people by Moses, on the first day of the eleventh month. According to Josephus, he died on the first day of the twelfth; and the Israelites, as the Scripture says, mourned for him in the plains of Moab thirty days, and, consequently, during the whole of the twelfth month.

The Jews call the Pentateuch *The Law*, without doubt because the law of God, which Moses received on Mount Sinai, is the principal part of it; and it is as little to be doubted whether that great man was the writer of the Pentateuch. This is expressly declared both in Exodus and Deuteronomy. But as an account of the death of Moses is given in the last eight verses of this book, it is therefore thought that these verses were added either by Joshua or Ezra. The opinion of Josephus concerning them is very singular; he pretends that Moses, finding his death approaching, and being willing to prevent an error into which the veneration the people had for him might cause the Jews to fall, wrote this account himself; without which the Jews would probably have supposed that God had taken him away, like Enoch.

After the death of Moses, Joshua, by the order of the Divine Being, took upon himself the conducting of the Hebrew people, and succeeded Moses, to whom he had been a faithful servant, and by whom he had been instructed in what he ought to do. It is uncertain whether the book which contains the history of this successor of Moses be called *Joshua*, from the subject of it, or from his having been the writer of it. But it is certain that it contains an account of what passed from the death of Moses to that of Joshua. Nevertheless, there are several things in it which did not come to pass till after the death of this great man, and which, consequently, could not have been written by him. The common opinion as to the length of time it contains is, that Joshua discharged his office only for seventeen years, and that, therefore, this book contains no more than the history of that number of years.

After the death of Joshua, the Israelites were governed by magistrates, who ruled under the general designation of *Judges*; and the book which contains the history of these rulers is called *The Book of Judges*. This history begins with the death of Joshua, and reaches to that of Samson. We here see the people of God often enslaved in punishment of their crimes, and often wonderfully delivered from slavery. Towards the end of it, we have some instances of this people's inclination to idolatry, and of the corruption of their manners, even before they had been brought into slavery. Such are the histories of Micah, and of the Benjaminites who abused the Levite's wife. This book contains the history of three hundred and seventy years.

During the time of the government of Judges, there was a great famine in the land of Israel, which forced Elimelech, a native of Bethlehem, to retire into the land of Moab, with his wife Naomi and two children. Elimelech died there, as also his two sons, who had married two Moabitish women, one of whom was named Ruth. Naomi, after the death of her husband and her children, returned to Bethlehem, accompanied by Ruth, her daughter-in-law, who was there married to Boaz, Elimelech's near relation, and the heir to his estate. The book which contains this history is called *The Book of Ruth*. The beginning of it shows that it happened in the time of the *Judges*, but under which of them is not certainly known; some place it in the time of Shamgar, or of Deborah. As to the writer of this book, some think that the books of Judges and Ruth were both written by Samuel; others attribute them to Hezekiah, and others to Ezra. The Jews place the book of Ruth among the five books, which they usually read on all the festivals in the year.

These five books are, *The Song of Songs*, *Ruth*, *The Lamentations of Jeremiah*, *Ecclesiastes*, and the book of *Esther*. In the Hebrew bibles they are printed or written apart by themselves, and are bound up together.

The four books following *Ruth* are called by the Greeks, and also in some Latin bibles, *The History of the Reigns*. Others call them all *The Books of Kings*, because they give an account of the establishment of the monarchy, and of the succession of the Kings, who reigned over the whole kingdom at first, and over the kingdoms of Judah and Israel after its division. At the beginning of these books is given the history of the prophet Samuel, which gives light to that of *The Kings*. The Jews call the two first of these books, *The Books of Samuel*: perhaps because they contain the history of the two Kings, who were both anointed by Samuel; and because what is said of Saul in the first, and of David in the second, proves the truth of Samuel's prophecies. They give the name of *The Books of Kings* only to the other two, which, in the Latin and French bibles, are called the *Third* and *Fourth Books of Kings*.

The *First Book of Kings*, or the *First of Samuel*, contains the history of the high-priest Eli, of Samuel, and of Saul. As the first year of Eli's high-priesthood falls on the year of the world 2848, and the death of Saul in 2949; the history of this book must comprehend the space of one hundred and one years.

The *Second* contains the reign of David, which is the history of about forty years. It is commonly believed that Samuel, Nathan, and Gad, were the writers of these two books; and, indeed, they are called, in the end of the first book of *Chronicles*, *David's Historians*.

MISADVENTURES OF A LOVER.

[This story is extracted from a volume which has just made its appearance under the title of the *ELGIN ANNUAL* for 1833. The most of our readers will probably be surprised to learn that the small, though respectable town of Elgin, in the north of Scotland, should have produced such a work. Their surprise would be heightened by ourselves, if we did not know that the mystery is solved by a single fact, the accidental location (to use an American phrase) of an ingenious and enterprising individual in that burgh—namely, Mr James Grant, editor of the *Elgin Courier*. Literature is everywhere honourable; but it seems to us honourable and praiseworthy in a particular degree, when prosecuted with some share of success in a remote and provincial situation. This Mr Grant has now done for some years, and in such a manner as to attract the regard of some very considerable persons in the republic of letters. In the present case, he appears in the complex capacity of author, draughtsman, printer, and publisher; and, though the volume is not so fine as those issued in London, nor the writing in all cases so polished as might be wished, both are certainly such as might do honour to a more accustomed scene of publication than the ancient cathedral city of Moray. The following extract forms the third of a series of stories under the title which we have affixed to it, and it is only necessary to premise further, that Mr Grant appears to be the hero of his own tale.]

I WAS very fortunate as regarded pecuniary matters, on my arrival in Carlisle. One of my old and most intimate schoolfellows had been settled there in a respectable way for several years. He at once procured a situation for me. I lived a little distance out of town, and, in returning in the evening from the day's duties, had to pass by some beautiful gardens. Sooth to say, I used very much to delight in dressing gardens with my own hand, and, if the reports of friends may be credited, displayed much more than the average taste that way. One of the gardens I had to pass by in returning home of an evening, seemed to me the very *beau idéal* of good taste in the science of "laying out." I generally stood eight or ten minutes in the evening looking over its wall—which, fortunately, was of no inconvenient altitude—admiring its beautiful contents. One evening, as I popped my head over the garden wall, I saw a new flower—an exquisitely beautiful young lady; one of whom Milton would have written—"herself the fairest flower." A deep blush tinged her supremely beautiful cheeks while her lustrous eyes met mine. I felt a momentary enrapturement—I was glued to the spot on which I stood; but a recollection of Louisa, and the adventures connected with her, flashing across my mind, I succeeded, after a desperate struggle between prudence and love, in getting my legs to perform their duty in removing me home.

As will be readily credited, this charming damsel (name at this time unknown) had a liberal share of my thoughts that night. I weighed in my own mind whether, in the event of ascertaining, that, in addition to her personal attractions, she united respectability of character and station in society, I ought not after all to make an attempt on her heart, as she had already, without any seeming effort, conquered mine. The hearing of arguments *pro* and *con* robbed me of two or three hours' sleep. The opinion of Sir John Falstaff, that there is divinity in odd numbers, occurred to me, and, I believe, would have made me decide on seeking an interview, had not the awkward issue of Jack's third visit to Mrs Ford shot athwart my mind, followed by a painful remembrance of what had happened to myself in my two previous adventures. All this, it is right to add, was succeeded by a recurrence of the afore-mentioned conviction that Fate had ordained I was never to be married. The interlocutor of my judgment therefore was, that I would suffer unknown to, and unpitied by, the world, a universe of ardent unrevealed love, rather than run the hazard of making myself anew a laughing-stock to the public, and the butt of my acquaintances.

This, then, was a settled point. And so strictly had I resolved to act up to the letter of my resolution,

that, rather than be in temptation's way, I would submit to the ineffably great sacrifice of passing by the beautiful garden, without casting a glance at it, lest that glance should encounter the exquisitely handsome form of the living flower I had before seen in it. For three days, evenings rather, I religiously adhered to my determination: she might, each time I passed, have been again eclipsing, by her presence, all the other beauties in the garden; but I saw her not. On the third day after, returning home, I learned by the merest accident the young lady's name, who were her connections, and what her character and station in society was. On the fourth, while I was as usual passing by the garden on my way home, I observed her—Lavinia was her name—walking slowly, not in the garden, but on the road outside, as if coming directly up to me. She seemed contemplative: there was a touching pensiveness in her look: there was a book in her hand. We met, and were in the act of passing each other, when Lavinia, as if suddenly seized with sickness, quivered a little, and was in the act of falling. I caught hold of her before she swooned altogether: the book she held in her hand fell fall.

"Pray, madam, are you indisposed?" inquired I, with much tenderness and concern.

"A little, Sir," she softly answered, at the same time glancing a look at me which it is impossible to characterise, but which I must have been steel-hearted, indeed, not to have felt.

I lifted the book from the ground: I looked at it: it was a novel. The passage she had evidently been reading was indicated by the leaf being folded down. That passage told—told eloquently, though briefly, of the loves of a young lady and gentleman; how they eloped together, got married at Gretna Green, and lived a long life of the utmost possible happiness. I could not—who could?—be blockhead enough to misunderstand this. I could not in any circumstances, far less in the circumstances of that moment, resist it.

"My dearest girl," said I, "will you meet me to-morrow morning at ten o'clock, at the S—?"

"I will, with all my heart," was the brief answer she returned; and that answer was accompanied by a look more expressive a thousand-fold than a whole world of books could have been, had such been written, to describe the young lady's feelings.

We parted that evening; we met next morning at the appointed time and place. We set off in a coach and four for Gretna Green. Jehu was well paid; he did his duty admirably. We halted no longer than was necessary to change horses, until we reached a small town within ten miles of the destined place. On our way Lavinia disclosed to me how she had been struck by my appearance the very first time she had seen me looking over her father's garden wall; but a sense of the delicacy and reservedness becoming her sex prevented her from revealing her affection for me, until the evening I met her on the road, when she found that keeping it any longer concealed in her breast was likely to endanger her life.

On reaching the small town just mentioned, Lavinia complained—and no wonder—of exhaustion, in consequence of the fatigues of that day, as well as of a sleepless previous night spent in concerting measures for making the elopement successful. She begged a little time might be allowed her to recruit her strength. I ordered a snatch of supper. We both ate heartily, having been well appetised by the length of the journey.

We had been in the inn about half an hour, when Lavinia—addressing me of course—said, "My dear, I think we may go now." These words were delivered in a tone, they were accompanied by a look of affection, which I valued at the time as infinitely above all the riches of either India.

"Well, then, my darling, we shall set out instantly," was my reply.

I rang the bell violently. In about twenty seconds, in rushed a stout well-made man. "Waiter!" said I, in a tone which indicated that I thought myself a personage of some consequence; "waiter! I say, bring me the bill. Order the horses and carriage to be got ready this moment; and be sure, too, you don't—"

A shriek from Lavinia interrupted me. She swooned away in the easy chair on which she sat at the time. I of course forgot the waiter and every earthly thing else in the plenitude of my concern for Lavinia.

"Lavinia! Lavinia! my dear! my angel! what can be the matter?"

While in the act of addressing her in these terms of affectionate concern, and simultaneously taking her by her snow-white hand, I felt some powerful fist take hold of, and drag me back by the neck of my coat.

"What insolence, Sir!" exclaimed I, thinking it was the waiter who thus intruded on us. So saying, I turned about my face towards the vulgar ill-bred lackey of the public, when, to my utter astonishment, I beheld three fellows beside me.

"Come," said the intruder who first entered the room, and whom I took to be Jehu, "come, let us carry her out!"

"The man who presumes to lay a hand on her will be as dead as a herring that instant," said I, indignantly.

"Never mind the empty threats of the blockhead," said the fellow who had spoken already.

He had no sooner uttered the words than the vile paws of the villanous trio seized hold of Lavinia. I

felt a kind of madness coming over my soul. I know I resisted with all my might; but what else occurred I cannot tell.

Next morning I awoke as from a dream. I looked around in utter amazement. I fancied myself in a new world. While thus bewildered, while like a person out of his senses, Boots entered my bed-room. I inquired where I was, and was answered, "the Duke of York hotel, in the town of D—."

"The same," I ejaculated with myself; "the same as that in which Lavinia and I supped last night."

"And where," I asked with an emphasis of which print can give no idea, "where is Lavinia?"

"Lavinia!" exclaimed Boots, evidently ignorant of who I meant.

"The young lady I brought here with me last night," said I, hurriedly.

"Adz, Sur, she was carried off by the three gentlemen who coomed in such haste in a carriage," said Boots, with an archness of look which denoted that nature had intended the young rascal for the stage.

"The three gentlemen!" A recollection of the triumvirate of scoundrels who so abruptly and unceremoniously thrust their hated presence on us the previous night, darted across my mind. But what they were, whither they had come, where they were gone, what they had done with Lavinia, whether they had "Burked" her, or compelled her to marry one of their ruffian selves, were all matters as to which I was in a state of as total ignorance as the child unborn; nor could any person in the inn furnish me with the important and so anxiously desired information.

Boots withdrew. I rose, huddled on part of my clothes, and prepared for shaving. Has the reader a superior imagination? If he have, let him conceive, as he best can, of my horror, mingled with astonishment, when, on looking in the glass, I saw my frontispiece so shockingly mangled and furrowed with deep scratches, that there was scarcely a square inch of whole skin on it.

"In the name of wonder, what can be the meaning of this? How have I come by such a face?" were questions I asked myself. They were unanswerable by me; the matter was involved in as much mystery as the identity of the trio of scamps who wrested Lavinia from my arms.

What was to be done concerning my innamorato? what with my face? were two queries which now occupied my thoughts. A little sober reflection advised me that time alone could remedy the latter evil. As for my dulcinea, I had at intervals a faint hope that she might possibly make her escape from the ragamuffins who had abstracted her; in which case I had no doubt of her return. But this delusion, indifferently pleasing as it only was at best, was of short continuance. The horrible hypothesis would every now and then suggest itself, that of one of the three—most probably the first who entered the room—was some unknown rival; in which case there was no room for even the slightest hope.

However, as the state of my phiz disqualified me from being seen in public, I thought it the most advisable course to stay that day in the inn, to see what would turn up in the chapter of accidents.

The day passed; but not a syllable about Lavinia. Dante speaks of the ineffable miseries of those who have entered a certain place, on whose portals are written the words, "All hope abandon ye who enter here." Their misery! It must be happiness compared with my then situation. I went to bed as night approached. How I spent the night I will not say—for this good reason, I cannot. Morning came. I arose. While pacing to and fro in my apartment, half apparelled, and wholly unshaved, resembling more, in my conduct, a bedlamite than a rational person, Boots, who seemed to be an animal newly imported from some uncultivated district of the country, entered. "Sur," said he, "would on like a read of our paper, just printed?" at the same time holding towards me a damp unopened broad-sheet.

"Lay it down there," said I unconcernedly; "lay it down there; I'll possibly look at it."

I took up and opened the broad-sheet. I found it was the county paper, newly issued from the press. I carelessly glanced over the inside surface. The head, "Elopement Extraordinary," being in large caps, was the first thing that attracted my attention. I read as follows:—

"On Wednesday"—the paper was dated Friday—"On Wednesday, an elopement extraordinary took place from Carlisle. The young lady had only returned the other day from a fashionable boarding-school, where she had been Frenched, danced, taught music, the use of the globes, and, in fine, every thing that is deemed necessary to make a perfectly educated female. Of late she had been wondrously given to the reading of novels. The gay Lothario was one of the most sheepish looking bipeds under the sun. The folks in the neighbourhood very emphatically characterised him as the 'chap as used to be seen popping a long nose over the garden wall, at the good people's daunter.' The fugitives took the high road to Gretna, of which place they were within one short stage when the young lady's brother, accompanied by two police officers, overtook the matrimony-aspiring couple at the head inn. When the brother and assistants entered, they found the loving Miss and her clumsy-looking swain sitting quite comfortably at a table, on

which, in beautiful confusion, were displayed the fragments of an excellent supper. When the young lady recognised her brother, she enunciated a very unique sort of shriek, and swooned away with wonderful good grace, in the easy chair she occupied at the time. Her clownish Lothario, who evidently mistook Miss's brother, when he entered, for the waiter, gallantly flew to the assistance of his dulcinea; and on the intruding parties taking the fainted beauty by her taper waist, as if to carry her lovely person away, he swore that the first man who dared to touch her—they had touched her already, though—should, in a moment, be stretched at full length on the floor. As if determined to suit the action to the word, the love-sick swain, in the phrenzy of the moment, seizing hold of a huge tom-cat that was lying purring on an easy chair, and evidently unconscious of the nature of his weapon, brandished the animal about his own head, previous to inflicting a supposed mortal blow on that of his adversary. At this moment his innamorato's brother presented a pistol to the booby-lover's breast, exclaiming, 'Villain! presume to offer further resistance, and I'll blow your brains out!' The poor unfortunate wight stood stupefied, resembling a man whose wits had all of a sudden taken to themselves wings and flown away. The cat, smarting from the harsh gripe of the noodle, turned about by a sudden jerk of his body, and inserted his talons in sundry parts of the lover's frontispiece. The claret flowed profusely from divers fountains; and the poor fellow, like his heart's best treasure, also swooned away. He was afterwards carried to bed in an insensible state. Miss was taken away, put into a carriage, and carried back to pa' and ma', who, it is hoped, will cure the young lady of her foolish passion."

Here, in this vile print, was too clear a solution of the several enigmas touching the three intruders—the absence and destiny of Lavinia—and the horribly disfigured state of my face. My eyes turned in their sockets before I got to the end of the odious paragraph. My whole frame trembled. All things reeled about me. The house appeared to be falling: I felt as if the world had come to an end.

It was long before my consciousness returned. When it did, my first intention was to cover my disgrace from myself, and to end my earthly woes, by putting a period to my existence. What were the best means of accomplishing my purpose, was the first query which demanded an answer. A razor? I had lost too much blood already, my face was too much mangled by feline talons, to think of mangling my throat with a razor. To speak a truth, after what I had seen of gore in the case of my face, I had no wish to see more of that claret-looking commodity, whether drawn by a razor or any other instrument. Drown myself? That could not be accomplished without an ample supply of water; and where this was to be had, I knew not, being a complete stranger in the place. "I might have inquired," the reader will say. Had the reader seen my face at that time, he would neither say nor think any such thing. It made it impossible for me to think of going out of doors in open day, on any errand. Besides, had I asked any body the way to a river, my face would infallibly have generated instant suspicion of what my intentions were, and consequently prevented their being carried into effect. Hang myself? The only objection—but it was an insuperable one—which I had to that mode of making my exit, was, that all the offscourings of society, every lackey and chimney-sweep who get tired of life, end it by means of a rope, a handkerchief, or some other suspender. At any rate, it is indubitably certain that no gentleman swings by his own hand. Pistols? Well, I concluded, blowing out one's brains is certainly the preferable mode of doing the business, of any yet mentioned. But the evil of it was, I had no pistol: that had already proved my misfortune. It was the most grievous error I ever committed, that I omitted to take a pair of pistols with me when Lavinia and I quitted Carlisle for Gretna. Had I taken these implements with me, she and I had been, by this time, man and wife. I should in that case have instantaneously scattered, in a thousand directions, the brains of a couple of the trio of insolent intruders, when they presumed to lay hands on Lavinia, and the third would, coward-like, have taken to his heels. But regrets were unavailing now; the question was, how to procure a pair of pistols for my present purpose? I could not, for the reason already mentioned, venture out myself in day light to any shop to purchase the articles; and to have sent any other person would have awakened suspicions, and consequently defeated my purpose. I thought, in all the circumstances, the best way would be to wait until dark, when I might go out myself and procure the implements I wanted, taking care, while in the ironmonger's shop, to keep my face shrouded, by means of my pocket handkerchief, from the unhalloved gaze of the shopmen. Evening came. I had left money to pay my bill, and was in the act of going down stairs to procure the instruments wherewith to execute my rash purpose, when I heard the sound of a coach horn. "Holla! holla! here's the London coach!" vociferated Boots to some hostler-looking figure at the door. The London coach! thought I. It is dark; no one will see or know me in the coach: I will go to London, where I am all but utterly unknown: perhaps I may, after all, by observing a prudent conduct for the future, be a happy man. I ran up stairs for the money I had left, inquired how far on the way

to London the coach would be by day light; was answered; took my seat for that place, and set off. By confining myself in a room in one of the inns of the respective towns all day, and travelling all night, I reached the metropolis after four days' stoppages by the way.

SHIPWRECKED SAILORS.

ABSTINENCE.

WE remember having once read a dreadful story of the shipwreck of a large East India vessel off the coast of Africa. The greater part of the crew were happily saved from the raging ocean, but it was only to encounter unheard-of privations, toils, and dangers in making the best of their way across the deserts towards a civilized settlement. Having saved some provisions and arms from the wreck, they set out in tolerably good spirits, expecting to reach Mogadore in a certain space of time before their store of food was exhausted. They were, however, as the event proved, completely mistaken in their calculations. Besides the miseries arising from toiling across sandy plains, so hot that their feet could not touch the ground without pain, they were continually harassed by parties of hostile savages, who hung like a cloud sometimes on their rear, and sometimes on their advance, and at nights they laid themselves down in a narrow circle, not to enjoy repose, but to keep watch lest they should be destroyed one and all by wild beasts. Their stock of provisions was also approaching a close. Flesh and blood could not endure such bodily fatigue and mental horrors. The party gradually decreased in numbers. Every day, one or more of the little band dropped off, and their survivors were called on by a sense of humanity to put their corpses beneath the withering sands, although well aware that they would next night, in all likelihood, be torn up to be devoured by beasts of prey. At last, all the party died but two; and these, sympathising deeply in each other's fate, became doubly attached as friends. With hardly a rag to cover them, not a shoe upon their lacerated feet, and depending chiefly on the herbs which they could pick up for their subsistence, did these two miserable beings, for some weeks, pursue their weary way. At night they had still to protect themselves from the tigers and lions, and in executing this necessary duty, they were obliged to light a fire of dried leaves or grass, beside which one lay down to sleep while the other watched. At length, one declined so much in strength that he could proceed no further. He endeavoured to walk, but his power was utterly gone, and he laid himself down to die, with all the resignation and manliness of feeling which characterizes our British seamen. The case of the hapless survivor was perhaps not more enviable than that of his exhausted companion. To remain beside his apparently dying friend, would have served no good purpose, and to pursue his way alone was a task of imminent danger. He waited beside the person of his prostrate shipmate for some hours, endeavouring to soothe his fate by any little attention he could bestow, conversing with him till his power of utterance had ceased; and it was only when he was beckoned by the feeble waving of the hand to leave him to his certain fate, that he slowly departed from the spot, and pursued his path through the wilderness. This day's march of the last remnant of the wreck was one of peculiar sorrow, but the intrepid tar pushed on with what activity he could muster, in the hope of reaching the settlements of the Europeans, which he believed could not now be far distant. As the sun slowly descended in the west, and admonished by his slanting beams the solitary wayfarer to seek out a place where he might securely pass the approaching night, a terrific thought darted through his mind. Had he the flint and steel necessary to produce a light to kindle his midnight fire? No. He recollected with anguish that these implements were carried in the pocket of his companion, and that he had altogether forgot to bring them with him. Without a moment's delay, he turned back on his route, fully resolving, if possible, to reach the body of his deceased friend before he stopped. The exertions put forth on this occasion, it seems, were more than could have been expected from a human being; but what will the instinctive love of life not overcome? The deep shades of evening had fallen over the scene before this determined man found himself beside the recumbent body of his late fellow traveller. The story becomes now painfully interesting. The precious flint and steel were secured; but in searching for them, the limbs moved slightly, still showing that animation had not left the frame. A light was struck, and a fire was kindled, which yielded a protection to the weary mariner till he procured a few hours' slumber. When the morn again dawned, the wayworn traveller once more bade adieu to the body of his friend, which now lay stiff on the soil, and, as he supposed, dead, and for the second time directed his steps towards the settlements. To bring this distressing recital to a conclusion: the surviving sailor, in a few days after, reached Mogadore, where he was kindly received by a European consul, who relieved his distresses, and interested himself in his case. On hearing the story of the shipwreck, and the travels of the party through the desert, it occurred to him, that, after all, the man might not be yet dead, who had been left, as we have just stated, by his companion; and impressed with this notion, he dispatched a small band to examine the body, with directions, if

it were still alive, to bring it along with them. It was about the eighth day after the body had been given up as dead, that it was reached by the consul's party; yet, incredible as it may appear, it was discovered, on careful investigation, that the principle of life was still in the unfortunate man. His person, nevertheless, exhibited a shocking spectacle. He lay with his face immersed in the sand, while his almost naked back was exposed to the scorching rays of the sun, which had literally roasted his flesh. Every thing was done which humanity could point out under the circumstances to preserve the life of the luckless individual. He was carefully borne on a litter to the house of the friendly consul, who, by due attention, restored him to health and to his companion; and in a short time an opportunity occurring, both were sent in a vessel to England.

This remarkable instance of the possibility of life being preserved under the most severe difficulties, and an abstinence from food of many days' duration, is not more interesting than another, which appeared in the newspapers for August 1822, and was entitled the SKELETON OF THE WRECK.

While Sir Michael Seymour was in the command of the Amethyst frigate, and was cruising in the Bay of Biscay, the wreck of a merchant ship drove past. Her deck was just above water, her lower-mast alone standing. Not a soul could be seen on board, but there was a cub-house on deck, which had the appearance of having been recently patched with old canvass and tarpauling, as if to afford shelter to some forlorn remnant of the crew. It blew at this time a strong gale, but Sir Michael, listening only to the dictates of humanity, ordered the ship to be put about, and sent off a boat with instructions to board the wreck, and ascertain whether there was any being still surviving, whom the help of his fellow men might save from the grasp of death. The boat rowed towards the drifting mast, and, while struggling with the difficulty of getting through a high running sea close alongside, the crew shouting all the time as loud as they could, an object resembling in appearance a bundle of clothes was observed to roll out of the cub-house against the lee-shrouds of the mast. With the end of a boathook they managed to get hold of it, and had hauled it into the boat, when it proved to be the trunk of a man, bent head and knees together, and so wasted away, as scarce to be felt within the ample clothes which had once fitted it in a state of life and strength. The boat's crew hastened back to the Amethyst with this remnant of mortality; and so small was it in bulk, that a lad of 14 years of age was able with his own hands to lift it into the ship. When placed on deck, it showed for the first time, to the astonishment of all, signs of remaining life; he tried to move, and next moment muttered in a hollow sepulchral tone, "there is another man." The instant these words were heard, Sir Michael ordered the boat to shove off again for the wreck. The sea having now become smoother, they succeeded this time in boarding the wreck; and, on looking into the cub-house, they found two other human bodies, wasted, like the one they had saved, to the very bones, but without the least spark of life remaining. They were sitting in a shrunk-up posture, a hand of one resting on a tin-pot, in which there was about a gill of water, and a hand of the other reaching to the deck, as if to regain a bit of salt beef of the size of a walnut, which had dropped from his nerveless grasp. Unfortunate men! They had lived on their scanty store till they had not strength remaining to lift the last morsel to their mouths! The boat's crew having completed their melancholy survey, returned on board, where they found the attention of the ship's company engrossed by the efforts made to preserve the generous skeleton, who seemed just to have life enough to breathe the remembrance, that there was still "another man," his companion in suffering, to be saved. Capt. Seymour committed him to the special charge of the surgeon, who spared no means which humanity or skill could suggest to achieve the noble object of creating anew, as it were, a fellow creature, whom famine had stript of almost every energy. For three weeks he scarcely ever left his patient, giving him nourishment with his own hand every five or ten minutes, and at the end of three weeks more, the "skeleton of the wreck" was seen walking on the deck of the Amethyst; and, to the surprise of all who recollected that he had been lifted into the ship by a cabin-boy, presented the stately figure of a man nearly six feet high.

It seems that death from hunger occurs soonest in the young and robust, their vital organs being accustomed to greater action than those of persons past the adult age. In the foregoing cases, the lives of the sufferers may be said to have been in a dormant state, the natural functions being in a great measure suspended, and the exhausted condition of the frame, as in a state of disease, not permitting the action of the stomachic juices. When death from hunger occurs in persons of good health of body, the pangs they endure are truly dreadful. Hunger and intense thirst are felt at an early period; the nervous system becomes disordered; the conservative power of the constitution, distressed by the want of nourishment, urges the absorbents to prey upon the intestine; and delirium and madness often conclude the scene.

In the Lectures of Charles Turner Thackrah, on Diet, &c., we are presented with some interesting cases of persons dying from extreme abstinence, one of which was that of a German merchant, which has

been well authenticated. This unfortunate individual, at the age of thirty-two years, being depressed by severe reverses of fortune, and the consequent slights of his relations, formed the unhallowed resolution of destroying himself by abstinence. With this view he repaired, on the 15th of September 1818, to an unfrequented wood, where he constructed a hut of boughs, and remained, without food, till the 3d of October following. At this period he was found by the landlord of a neighbouring pot-house, still alive, but very feeble, speechless, and insensible. Broth, with the yolk of an egg, was given him. He swallowed it with difficulty, and died immediately. In the pocket of this miserable man was found a journal, written in pencil, singular in its kind, and remarkable as a narrative of his feelings and sentiments. It begins thus:

"The generous philanthropist, who shall one day find me here after my death, is requested to inter me, and, in consideration of this service, to keep my clothes, purse, knife, and letter-case. I moreover observe, that I am no suicide, but have died of hunger, because, through wicked men, I have lost the whole of my very considerable property, and am unwilling to become a burthen to my friends." The ensuing remark is dated September 17, the second day of abstinence: "I yet live; but how have I been soaked during the night, and how cold has it been! O God! when will my sufferings terminate!! No human being has for three days been seen here; only some birds." The next extract continues: "And again, three days, and I have been so soaked during the night, that my clothes to-day are not yet dry. How hard is this, no one knows; and my last hour must soon arrive. Doubtless, during the heavy rain, a little water has got into my throat; but the thirst is not to be slaked with water; moreover, I have had none even of this for six days, since I am no longer able to move from the place. Yesterday, for the first time during the eternity, which, alas! I have already passed here, a man approached me within the distance of eight or ten paces. He was certainly a shepherd. I saluted him in silence, and he returned it in the same manner. Probably he will find me after my death!"

"Finally, I here protest, before the all-wise God, that, notwithstanding all the misfortunes which I have suffered from my youth, I yet die very unwillingly, although necessity has imperiously driven me to it. Nevertheless I pray for it. Father, forgive him, for he knows not what he does! More can I not write; for faintness and spasms; and this will be the last.—Dated near Forest, by the side of the Goat public-house, Sept. 29, 1818.—J. F. N."

"It is hence evident (says Mr Thackrah) that consciousness and the power of writing remained till the fourteenth day of abstinence. The operation of famine was aggravated by mental distress, and still more by exposure to the weather. This indeed seems to have produced his most urgent sufferings. Subsequent to the common cravings and debility of hunger, his first physical distress seems to have been the sensation of cold; then cold and thirst; lastly, faintness and spasms. In this case we find no symptoms of inflammation. A want of nervous energy, arising from the reduction in the quantity or quality of the blood, appears to have been the principal disease. The effort of swallowing, and the oppression of food on the exhausted stomach, completed the catastrophe. Perhaps the unhappy man might have recovered, had he been more judiciously treated—had some nutritious fluid been injected into the intestines, a gentle heat applied to the body, ammonia cautiously administered, and, lastly, on the rise of the pulse, and not till then, soup or broth given by the mouth; but these several means employed with the least possible annoyance to the exhausted sufferer."

THE COALERIES OF CULROSS.

THESE were at one period the most extensive coal-mines in Scotland, and, what is remarkable, they extended a considerable way beneath the Firth of Forth. It is recorded by tradition, that when James the Sixth revisited Scotland after his accession to the throne of England, he made an excursion into Fife, for the purpose of enjoying the diversion of hunting in the neighbourhood of Dunfermline. After recreating himself with the sport, he invited the company in attendance to dine along with him at "a collier's house;" meaning the Abbey of Culross, then belonging to Sir George Bruce, one of the most ingenious and enterprising coal-masters in Scotland. Being conducted at his own desire to see the works below ground, of which he had heard a good deal, he was led by a passage to the mouth of a pit, opening within sea-mark, and only protected from inundation by a wall or moat. Having ascended to the brink of the opening, he was astonished and dismayed to find himself, without previous intimation, surrounded by water; on which he was seized with an immediate apprehension of some plot against his liberty or life, and called out "Treason! treason!" But Sir George assured him there was none, and that he had nothing to fear. Pointing to an elegant pinnace that was made fast to the moat, he desired to know whether his Majesty would feel it most agreeable to be carried ashore in it, or to return by the subterraneous route. The king preferred the shortest way back, and was consequently borne ashore in the vessel, all the time expressing his admiration of what he had seen. After

this, the royal guest was sumptuously entertained at the abbey. Some of the glasses are still preserved in the family of his host, and the room in which he was feasted still receives the name of the *King's Room*. It is recorded that this curious pit was totally destroyed in March 1625, on the night of James's death, by a violent storm, which, washing away the raised part around the moat, deluged the workings with water so irreparably, that till this day they are choked. The stones of the rampart not carried away were afterwards sold for the purpose of repairing the old stone pier of Leith.

SCOTTISH SCENERY.

WE feel much pleasure in attracting the notice of those who take an interest in picturesque scenery, to a work publishing in numbers, in a quarto form, at Perth, entitled "Scenery of the Highlands and Islands of Scotland, with descriptive letter-press." The drawings in this interesting publication are admirably executed in outline, by Lieut.-Colonel W. Murray, younger of Ochertyre, and are lithographed by Mr Leith, of Banff, in a way highly creditable to the fine arts in the north. The views selected for the purposes of the work are those most favourable for pictorial delineation, and convey an excellent idea of the sublimity and grandeur of the works of nature in the Highlands, and along some parts of the sea-coast of Scotland. In the second number we are presented with a faithful view of those stupendous cliffs on the coast of Angus, or Forfarshire, facing the German Ocean, too well known to mariners by the dangers of their precipitous shore, and named the Red Head. As a specimen of the descriptive part of the publication, we present our readers with the account annexed to this striking scene.

"Although the mountains of Scotland subside as their ranges approach the east coast, and the greater part of that shore presents only the broken edge of an undulating plain, yet, in several places, the swell of the land is so considerable as to produce scenes of a highly picturesque description. Among the promontories on the east coast which the sailor has many reasons, in an easterly gale, to avoid, there are none which possess more attractions for the landsman than the Red Head. The friable nature of the red sandstone of which the rocks are composed, which stretch north-east for about six miles between Arbroath and the Red Head, gradually increasing in altitude as they approach the headland, renders them pervious to the action of the water, which has scooped out many little bays and caves, and worn the rocks at the intervening promontories into forms so often similar—a likeness increased by their regular horizontal stratification—that it is difficult for an inexperienced eye to distinguish between these recesses. At the ebbing of the tide, they are all left dry, each with its pure silvery beach, rendered yet more beautiful by its contrast with the dark rocks and sombre caves, where the ripple of the receding waters or the gurgle of the hidden pool is gently echoed through their dim recesses. At the return of the tide, the communication between these bays along the beach is speedily cut off; the swelling waters rush in rapidly, and those grottoes, which the hour before had been the pictures of solitude and peace, now become the prison-houses of the raging element, which boils and roars through every chasm, and, when aggravated by the lashing of the storm from without, present a succession of scenes of the wildest and most magnificent character.

The number of caverns along this part of the coast, and the noises which the winds and waves occasion amongst them, has naturally given rise to many popular superstitions and legends. Some of these stories, if not fabricated, have, it is supposed, been given additional circulation to by smugglers, for the purpose of carrying on their illicit trade with greater security. One of the most easterly of these cavities, of difficult access, excepting by sea, has long been known by the name of the 'Forbidden Cave,' and, in early ages, was supposed to be frequented by all the evil spirits of the country, and in more modern times known to be the receptacle of the best spirits from abroad. No mortal could venture within its precincts with impunity: endless captivity was the least punishment which awaited the individual who would have the hardihood to encounter the beings of another mould in their own proper habitation. An unfortunate piper, in the olden time, thought to frighten its unearthly inmates with the sound of his bagpipe, but they had been too long accustomed to noises of all descriptions to be alarmed at this addition to the concert, and poor 'Tam Tyrie' never returned to tell the secrets of his prison-house. He is still held in thrall by the Wierd Sisters, who seem to be fond of his music, for he is occasionally heard under the hearthstone of a farm-house three miles inland, 'skirlin' a favourite pibroch, the chorus of which seems to be ever and anon—

'I doubt, I doubt, I'll never win out!'

One fact has certainly been elicited by the piper's hardihood, and that is, that some of these caverns extend inland as far as the farm of Dickmontlaw, which is three miles from the coast.

Near the entrance of the Forbidden Cave, and about thirty feet above the tide mark, is a small apartment, beautifully hollowed by nature out of the solid rock, which some of the neighbouring proprietors

were suspected of using occasionally as a 'Rosamond's Bower.' A dismal story is told of a young woman who perished from hunger there, during the continuance of a storm which ravaged the coast for many days, and interrupted the visits of her lover. The eeriness of the spot is increased by two cairns or heaps of stones on the beach, to which every passenger is expected to add his contribution, in order to avert ill luck, and to appease the manes of two poor old women who were there stoned to death, after being duly convicted of witchcraft.

There is an opening called the 'Gyler Pot,' about three miles from Arbroath. It is a ravine communicating with the sea, but only accessible from the north or land end, by groping down a steep path to a depth of 250 feet. The effect produced in this grim cavern by the light struggling to find access from above, or faintly glimmering through the sea-ward opening, as through the narrow window of a huge cloister, is awfully sublime; and, during any convulsion of the waters, when they are driven furiously through the opening, and bellow amongst the shapeless rocks, partakes, in no small degree, of the terrific.

We must not leave this spot without warning the reader that between the Red Head and Red Castle he will discern a little fishing station, 'Torrence's Haen,' which is pointed out as the locality of 'Muckle-backet's' cottage; and not far distant from it stands the farm-house of Newbarns, where Sir Walter Scott, not many years past, visited in person the grandson of Mr Jonathan Oldbuck. So our friends the antiquaries of Arbroath say, and they add, that any admirer of Monkbarns will find a hospitable reception at the house of his descendant, and a 'routh o' auld nick-nackets' which will warm the heart of any genuine professor of his antiquated but wholesome doctrines."

ANECDOTES OF SIR WALTER SCOTT.

[Furnished by a friend.]

BEING in London at the time when Sir Walter Scott made researches among the papers of some of the government offices concerning some points in his life of Bonaparte, I happened to be at the Colonial Office one day waiting in an anteroom, when Sir Walter came in, and sat down close by the door; another gentleman entered shortly after, and, giving a slight, and, as it appeared to me, somewhat supercilious glance at the persons already in the apartment, took up his station by the chimney-piece, and occupied himself in examining something that hung upon the wall, as if he did not think his companions worthy of any further attention. I sat in a window looking down Downing Street, immediately opposite Sir Walter, and having been previously slightly known to him, it was not long till he recognised and addressed me. He asked how I liked to live in London, to which I made some reply professing my contentment with it; on this, Sir Walter said, "Oh, I dare say you would like to see the hills and waters of the North again, and to get a breath of pure mountain air." The words were simple in themselves, but they marked his own attachment to home, and they were pronounced in such a tone of kindness as made a deep impression on me, for Sir Walter spoke to every man as if he had been his blood relation. I have sometimes amused myself with conjecturing what the gentleman who had turned his back upon us thought of the conversation. Perhaps he despised us as two "fause Scots," who pretended to retain some traces of affection for our beggarly country, and some wish to return to it. If such were his thoughts, they must have been dispersed in an unexpected manner. An attendant opened the door, and pronounced the magic name, "Sir Walter Scott," by way of intimation that Mr Hay, I believe, would be happy to see the Baronet up stairs; upon which, as if he had received a shot, the stranger wheeled suddenly round; but, perhaps, the only opportunity he ever had of seeing that great man, who had made himself known to so many ears, and friends in so many hearts, was lost. Sir Walter sat very near the door, and was concealed by it without our companion obtaining a view of him. He gazed for a moment, then turning round about, honoured me with a stare more particular than he had deigned to bestow at his entrance, and perceiving that I was nothing but a poor Scotch clerk, resumed consideration of the table of official regulations which he had previously made the object of study, deeming me entirely beneath his notice.

So eager at all times was Sir Walter to return to the retirement of his beloved Abbotsford, that on the days when the Court of Session closed, having made all necessary preparations previously, his coach was usually in readiness at the doors of the Parliament House, and he drove off direct to the country, without waiting to take a new day for the journey.

Whilst the incognito about the authorship of the Waverley novels was still preserved, Miss Scott, now Mrs Lockhart, was particularly solicitous to persuade herself that the honour belonged to her father; and she took great pains to collect and enumerate to Mr Laidlaw every circumstance which came to her knowledge that helped to fortify her in that belief. Among these was the fact, that although her mother seemed to be as well acquainted as other people with the novels after they were published, and joined in conversation about them, yet the copy which was placed

on the table of her chamber was left uncut. From this she argued that Lady Scott must have previously perused them on the proof-sheets, and, consequently, that none but her father could be the author.

Near the beginning of the *Bride of Lammermuir*, the sign of the Wallace Head is described as "the majestic head of Sir William Wallace, grim as when severed from the trunk by the orders of the felon Edward." A person once took the liberty of inquiring of the author whether he meant here felon in the common acceptation of the English word, or if it was a mis-spelling of the printer for the old Scotch word *felloun*, which means *fierce, ruthless*. Sir Walter replied, "I leave the orthography entirely to you, only begging you will spell the felon as feloniously as possible." This circumstance, though trivial in itself, marks the strong and decided feeling of indignation with which Sir Walter regarded the conduct of Edward towards the preserver of Scottish independence.

BIOGRAPHIC SKETCHES.

J. J. AUDUBON.

SKETCHES of American scenery and manners have from time to time been selected by us from the Ornithological Biography of J. J. Audubon, and presented to our readers in the hope of exciting an interest in their minds relative to the labours of this ingenious and most meritorious artist, whose published drawings of American birds form, without exception, one of the most extraordinary productions of the age. The world generally has no conception of the enthusiasm which has animated Mr Audubon in the pursuits to which he has successfully attached himself, or what he has accomplished; and as he is still, we believe, engaged in traversing the extensive woods of his native country, in the search of new objects in natural history, the scientific world has perhaps reason to anticipate a still greater increase to its stores from his hands. The memoir with which he has prefaced his ornithological work, besides being a pleasantly written piece of autobiography, gives an idea of the nature of his professional avocations, and will be perused with no small degree of interest. To our young readers it will point out the necessity for never relaxing in their exertions, or giving way to despondency, whatever may be the nature of the difficulties they have to encounter in their progress through life.

"I received life and light (says he) in the New World. When I had hardly yet learned to walk, and to articulate those first words always so endearing to parents, the productions of Nature that lay spread all around were constantly pointed out to me. They soon became my playmates; and before my ideas were sufficiently formed to enable me to estimate the difference between the azure tints of the sky, and the emerald hue of the bright foliage, I felt that an intimacy with them, not consisting of friendship merely, but bordering on phrenzy, must accompany my steps through life; and now, more than ever, am I persuaded of the power of those early impressions. They laid such hold upon me, that, when removed from the woods, the prairies, and the brooks, or shut up from the view of the wide Atlantic, I experienced none of those pleasures most congenial to my mind. None but aerial companions suited my fancy. No roof seemed so secure to me as that formed of the dense foliage under which the feathered tribes were seen to resort, or the caves and fissures of the massy rocks to which the dark-winged cormorant and the curlew retired to rest, or to protect themselves from the fury of the tempest. My father generally accompanied my steps, procured birds and flowers for me with great eagerness, pointed out the elegant movements of the former, the beauty and softness of their plumage, the manifestations of their pleasure or sense of danger, and the always perfect forms and splendid attire of the latter. My valued preceptor would then speak of the departure and return of birds with the seasons, would describe their haunts, and, more wonderful than all, their change of livery; thus exciting me to study them, and to raise my mind toward their great Creator.

A vivid pleasure shone upon those days of my early youth, attended with a calmness of feeling, that seldom failed to rivet my attention for hours, whilst I gazed in ecstasy upon the pearly and shining eggs, as they lay imbedded in the softest down, or among dried leaves and twigs, or were exposed upon the burning sand or weather-beaten rock of our Atlantic shores. I was taught to look upon them as flowers yet in the bud. I watched their opening, to see how Nature had provided each different species with eyes, either open at birth, or closed for some time after; to trace the slow progress of the young birds toward perfection, or admire the celerity with which some of them, while yet unfledged, removed themselves from danger to security.

I grew up, and my wishes grew with my form. These wishes, kind reader, were for the entire possession of all that I saw. I was fervently desirous of becoming acquainted with nature. For many years, however, I was sadly disappointed, and for ever, doubtless, must I have desires that cannot be gratified. The moment a bird was dead, however beautiful it had been when in life, the pleasure arising from the possession of it became blunted; and although the greatest cares were bestowed on endeavours to preserve the appearance of nature, I looked upon its vesture as more than sullied, as requiring constant attention, and

repeated mendings, while, after all, it could no longer be said to be fresh from the hands of its Maker. I wished to possess all the productions of nature, but I wished life with them. This was impossible. Then what was to be done? I turned to my father, and made known to him my disappointment and anxiety. He produced a book of *Illustrations*. A new life ran in my veins. I turned over the leaves with avidity; and although what I saw was not what I longed for, it gave me a desire to copy nature. To Nature I went, and tried to imitate her, as in the days of my childhood I had tried to raise myself from the ground and stand erect, before nature had imparted the vigour necessary for the success of such an undertaking.

How sorely disappointed did I feel for many years, when I saw that my productions were worse than those which I ventured (perhaps in silence) to regard as bad, in the book given me by my father! My pencil gave birth to a family of cripples. So maimed were most of them, that they resembled the mangled corpses on a field of battle, compared with the integrity of living men. These difficulties and disappointments irritated me, but never for a moment destroyed the desire of obtaining perfect representations of nature. The worse my drawings were, the more beautiful did I see the originals. To have been torn from the study would have been as death to me. My time was entirely occupied with it. I produced hundreds of these rude sketches annually; and for a long time, at my request, they made bonfires on the anniversaries of my birth-day.

Patiently, and with industry, did I apply myself to study, for, although I felt the impossibility of giving life to my productions, I did not abandon the idea of representing nature. Many plans were successively adopted, many masters guided my hand. At the age of seventeen, when I returned from France, whither I had gone to receive the rudiments of my education, my drawings had assumed a form. David had guided my hand in tracing objects of large size. Eyes and noses belonging to giants, and heads of horses represented in ancient sculpture, were my models. These, although fit subjects for men intent on pursuing the higher branches of the art, were immediately laid aside by me. I returned to the woods of the New World with fresh ardour, and commenced a collection of drawings, which I henceforth continued, and which is now publishing, under the title of "THE BIRDS OF AMERICA."

In Pennsylvania, a beautiful state, almost central on the line of our Atlantic shores, my father, in his desire of proving my friend through life, gave me what Americans call a beautiful 'plantation,' refreshed during the summer heats by the waters of the Schuylkill River, and traversed by a creek named Perkioming. Its fine woodlands, its extensive fields, its hills crowned with evergreens, offered many subjects to my pencil. It was there that I commenced my simple and agreeable studies, with as little concern about the future as if the world had been made for me. My rambles invariably commenced at break of day; and to return wet with dew, and bearing a feathered prize, was, and ever will be, the highest enjoyment for which I have been fitted.

Yet think not, reader, that the enthusiasm which I felt for my favourite pursuits was a barrier opposed to the admission of gentler sentiments. Nature, which had turned my young mind toward the bird and the flower, soon proved her influence upon my heart. Be it enough to say, that the object of my passion has long since blessed me with the name of husband. And now let us return, for who cares to listen to the love-tale of a naturalist, whose feelings may be supposed to be as light as the feathers which he delineates!

For a period of nearly twenty years, my life was a succession of vicissitudes. I tried various branches of commerce, but they all proved unprofitable, doubtless because my whole mind was ever filled with my passion for rambling, and admiring those objects of nature from which alone I received the purest gratification. I had to struggle against the will of all who at that period called themselves my friends. I must here, however, except my wife and children. The remarks of my other friends irritated me beyond endurance, and, breaking through all bonds, I gave myself entirely up to my pursuits. Any one unacquainted with the extraordinary desire which I then felt of seeing and judging for myself, would doubtless have pronounced me callous to every sense of duty, and regardless of every interest. I undertook long and tedious journeys, ransacked the woods, the lakes, the prairies, and the shores of the Atlantic. Years were spent away from my family. Yet, reader, will you believe it, I had no other object in view than simply to enjoy the sight of nature. Never for a moment did I conceive the hope of becoming in any degree useful to my kind, until I accidentally formed acquaintance with the Prince of Musignano at Philadelphia, to which place I went, with the view of proceeding eastward along the coast.

I reached Philadelphia on the 5th April 1824, just as the sun was sinking beneath the horizon. Excepting the good Dr Mease, who had visited me in my younger days, I had scarcely a friend in the city. I called on him, and showed him some of my drawings. He presented me to the celebrated Charles Lucian Bonaparte, who in his turn introduced me to the Natural History Society of Philadelphia. But the patron-

age which I so much needed, I soon found myself compelled to seek elsewhere. I left Philadelphia, and visited New York, where I was received with a kindness well suited to elevate my depressed spirits; and afterwards, ascending that noble stream the Hudson, gliding over our broad lakes, to seek the wildest solitudes of the pathless and gloomy forests.

It was in these forests that, for the first time, I communed with myself as to the possible event of my visiting Europe again; and I began to fancy my work under the multiplying efforts of the graver. Happy days, and nights of pleasing dreams! I read over the catalogue of my collection, and thought how it might be possible for an unconnected and unaided individual like myself to accomplish the grand scheme. Chance, and chance alone, had divided my drawings into three different classes, depending upon the magnitude of the objects which they represented; and although I did not at that time possess all the specimens necessary, I arranged them as well as I could into parcels of five plates, each of which now forms a Number of my *Illustrations*. I improved the whole as much as was in my power, and as I daily retired farther from the haunts of man, determined to leave nothing undone, which my labour, my time, or my purse, could accomplish.

Eighteen months elapsed. I returned to my family, then in Louisiana, explored every portion of the vast woods around, and at last sailed towards the Old World. But before we visit the shores of hospitable England, I have the wish, good-natured reader, to give you some idea of my mode of executing the original drawings, from which the *Illustrations* have been taken; and I sincerely hope that the perusal of these lines may excite in you a desire minutely to examine them.

Merely to say that each object of my *Illustrations* is of the size of nature, were too vague—for to many it might only convey the idea that they are so, more or less, according as the eye of the delineator may have been more or less correct in measurement simply obtained through that medium; and of avoiding error in this respect, I am particularly desirous. Not only is every object, as a whole, of the natural size, but also every portion of each object. The compass aided me in its delineation, regulated and corrected each part, even to the very fore-shortening which now and then may be seen in the figures. The bill, the feet, the legs, the claws, the very feathers as they project one beyond another, have been accurately measured. The birds, almost all of them, were killed by myself, after I had examined their motions and habits, as much as the case admitted, and were regularly drawn on or near the spot where I procured them.

An accident which happened to two hundred of my original drawings, nearly put a stop to my researches in ornithology. I shall relate it, merely to show you how far enthusiasm—for by no other name can I call the persevering zeal with which I laboured—may enable the observer of nature to surmount the most disheartening obstacles. I left the village of Henderson, in Kentucky, situated on the bank of the Ohio, where I resided for several years, to proceed to Philadelphia on business. I looked to all my drawings before my departure, placed them carefully in a wooden box, and gave them in charge to a relative, with injunctions to see that no injury should happen to them. My absence was of several months; and when I returned, after having enjoyed the pleasures of home for a few days, I inquired after my box, and what I was pleased to call my treasure. The box was produced, and opened; but, reader, feel for me; a pair of Norway rats had taken possession of the whole, and had reared a young family amongst the gnawed bits of paper, which, but a few months before, represented nearly a thousand inhabitants of the air! The burning heat which instantly rushed through my brain was too great to be endured, without affecting the whole of my nervous system. I slept not for several nights, and the days passed like days of oblivion, until the animal powers being recalled into action, through the strength of my constitution, I took up my gun, my note-book, and my pencils, and went forth to the woods as gaily as if nothing had happened. I felt pleased that I might now make much better drawings than before, and, ere a period not exceeding three years had elapsed, I had my portfolio filled again.

America being my country, and the principal pleasures of my life having been obtained there, I prepared to leave it with deep sorrow, after in vain trying to publish my *Illustrations* in the United States. In Philadelphia, Wilson's principal engraver, amongst others, gave it as his opinion to my friends, that my drawings could never be engraved. In New York, other difficulties presented themselves, which determined me to carry my collections to Europe.

As I approached the coast of England, and for the first time beheld her fertile shores, the despondency of my spirits became very great. I knew not an individual in the country; and although I was the bearer of letters from American friends, and statements of great eminence, my situation appeared precarious in the extreme. I imagined that every individual whom I was about to meet, might be possessed of talents superior to those of any on our side of the Atlantic! Indeed, as I for the first time walked on the streets of Liverpool, my heart nearly failed me, for not a glance of sympathy did I meet in my wander-

ings, for two days. To the woods I could not betake myself, for there were none near.

But how soon did all around me assume a different aspect! How fresh is the recollection of the change! The very first letter which I tendered procured me a world of friends. My drawings were publicly exhibited, and publicly praised. Joy swelled my heart. The first difficulty was surmounted. Honours, which, on application being made through my friends, Philadelphia had refused, Liverpool freely accorded.

I left that emporium of commerce, with many a passport, bent upon visiting fair Edina, for I longed to see the men and the scenes immortalized by the fervid strains of Burns, and the glowing eloquence of Scott and Wilson.

My journey to Scotland was performed along the north-western shores of England. I passed in view of Lancaster Castle, and through Carlisle. I had by this time much altered my ideas of this island and its inhabitants. I found her churches all hung with her glories, and her people all alive to the kindest hospitality. I saw Edinburgh, and was struck with the natural pictorial elegance of her site; and I soon found that her inhabitants were as urbane as those whom I had left behind me. The principal scientific and literary characters of the ancient metropolis of Scotland received me as a brother. It is impossible for me to mention all the individuals from whom I received the kindest attention.

In this capital commenced the publication of my Illustrations, and there it might have been accomplished, had not unexpected difficulties come in the way. My engraver, Mr W. H. Lizars, advised me to seek an artist in London. There, after many fruitless inquiries, I became acquainted with Mr Robert Havell, junior, who has ever since continued to be employed by me, and who, I am happy in saying, has given general satisfaction to my patrons.

Four years have passed. One volume of my Illustrations, containing one hundred plates, is before the public. You may easily see, good-natured reader, that to Britain I owe nearly all my success. She has furnished the artists through whom my labours were to be presented to the world; she has granted me the highest patronage and honours; in a word, she has thus far supported the prosecution of my Illustrations. To Britain, therefore, I shall ever be grateful."

THE UNKNOWN POETS OF SCOTLAND.

THE first number of a work under this title has just appeared. It is the production of Mr Alexander Campbell, of Leith—himself an unknown poet, and also a prose writer of considerable nerve and fancy.* The object of the work is to collect and preserve the best stray productions of men who have not regularly appeared as authors, living and dead, and who, but for this peculiar plan of publication, would have never, in all probability, been heard of beyond a small local circle.

As it is impossible for any man of ordinary feeling to be indifferent respecting the productions of obscure genius; as, on the contrary, all hearts feel a natural and sincere pleasure in seeing talent rescued from the pressure of unfavourable circumstances, and brought fully into that publicity which it merits; we should think that the idea of Mr Campbell's book must meet with general acceptance. All that remains to be considered is—Is the selection judicious? Are the pieces brought forward really such as to make it desirable that the writers should be introduced to the public? And, finally, are they presented in company with such biographical facts and critical observations as may aid in giving the necessary interest to the book?

We think that Mr Campbell has partly failed and partly succeeded in these objects. Of the specimens which he brings forward, some are truly admirable, some so-so, and a few, in our humble opinion, might have been as well spared. We would also suggest, that, though the editor's feelings are always of the right kind, and, in some cases, eloquently expressed, there is often an unnecessary obtrusiveness and plenitude of remark, and, what is much worse, there is a prevailing propensity to sarcasm and acerbity, that have an effect far from pleasant. Passing, however, over these objections, which bear but a small proportion to the merits of the design, and the better parts of its execution, we think Mr Campbell will probably add a very curious and valuable volume to our national literature.

In the present number, only three poets are introduced. The first is James Forrest, who spent the whole of his tuneful life in the capacity of a weaver, and died at Carlisle in 1818, aged forty-three. Forrest's poetry is generally of a melancholy cast, with a strain of delicate natural feeling running throughout. He has apparently lit his torch at the more pensive poems of Burns; and when the perusal of his verses is coupled with the recital of a life of humble and hopeless poverty, the effect is altogether truly touch-

ing. We think the following poem to a Redbreast a perfect gem in its way:—

ON A REDBREAST COMING INTO MY COTTAGE, DECEMBER, 1810.

Thou'rt welcome, Robin, to my dwelling,
Sae dinna keek behind the hallan,
Step briskly ben, my canty callan,
Thout fear or dread,
The noisy weans, sae loudly bawlin',
Ye needna heed.

Troth, lad, the day is e'en right gurl,
The snaw blaws thick wi' choakin' swurl,
The shapeless wreaths, high-tow'ring, curl,
While through the cluds
Bleak boreas, gowlin', starves the warl'
Wi' spitefu' thuds.

Right sair I mourn thy mates now roamin',
Wi' hungry wames, o'er nature's common,
Wha maun cou in some hole at gloamin'
Beneath the drift,
While loud the ruthless tempest's moanin'
The lang dark night.

I'm sorry, Bob, that reasonin' man
Should mar kind nature's social plan,
Wha boasts his powers her works to scan
And wondrous laws,
From the long chain's remotest span
To the First Cause.

Then dinna doubt me, tune fu' brither,
The feckless aye are fond o'ither;
Sae dinna hap, an' hitch, an' swither,
An' glow about,
Ye'll here be safe til better weather
Shall shine without.

Amongst the other poems by Forrest, several of which are very tame, there is one beginning, "That altered form thou shalt not see," which has hitherto been attributed to Mrs Brunton, because found among her papers, but which Mr Campbell asserts as more probably by the Carlops weaver, though he has only the same reason to adduce, namely, that it was found in a MS. volume left by that person. When read beside the other productions of Forrest, it is quite incredible that this poem is by him, and we cannot help expressing our wonder at the ingenious editor having imposed it upon himself as one of his productions.

Mr Campbell's second hero is James Home, an existing builder of dykes—i. e., dry-stone inclosures. He is the Anacreon of the fraternity, and really writes amatory poetry of much fervour.

But by far the most remarkable individual of the three is a young person named James Ballantyne (a painter residing in Hanover Street, Edinburgh), of whose genius we could hardly speak in high enough terms. The vein of this young poet is one of peculiar humour—resembling, if it resembles any thing, some of the droll effusions ascribed to James the Fifth of Scotland—but at the same time mixed and threaded up with a strain of feeling that elevates it far above any thing that the royal poet has to boast of. Of this most original and most promising genius, we shall give one specimen, that strikes us as containing a picture of extraordinary distinctness, in a style of singularly happy language:—

THE WEE RAGGIT LADDIE.

Wee stuffy, stumpy, dumpy laddie,
Thou urchin elfin, bare an' duddy,
Thy plumpit kite an' cheek sae ruddy
Are fairly baggit,
Although the breakums on thy fuddy
Are e'en right raggit.

Thy wee roun' pate, sae black an' curly,
Thy twa bare feet, sae stourie an' burly,
The biting frost, though snell an' surly
An' sair to bide,
Is scouted by thee, thou hardy wurly,
Wi' sturdy pride.

Come frost, come snaw, come win', come weat,
Ower frozen dubs, through slush an' sleat,
Thou patters wi' thy wee red feet
Right bauld an' sieker,
An' ne'er wast kenned to whinge or greet,
But for thy bieker.

Our gentry's wee peel-garlie gets
Feed on bear meal, an' sma' ale swats,
Wi' thin beef tea, an' scours o' sauts,
To keep them pale;
But airmel parritch straughts thy guts,
An' thick Scotch kail.

Thy grannie's palks, the maister's whippin',
Can never mend thy gait o' kippin';
I've seen the hail schule bairnies trippin'
A' after thee,
An' thou art, like a young colt, skippin'
Far ower the lea.

'Mang Hallowfair's wild, noisy brattle,
Thou'rt foughten mony a weary battle;
Stridin' ower horse, an' yerkin' cattle
Wi' noisy glea,
Nae jockey's whup nor drover's wattle
Can frighten thee.

Ilk kiltit Celt, ilk raggit Paddy,
Ilk sooty sweep, ilk creeshy caddie,
Ilk tree-legged man, ilk club-taed laddie
Ilk oily leary,

Ilk midden mavis, wee black jaudy,
A' dread an' fear ye.

Ilk struttin' swad, ilk reelin' sailor,
Ilk rosin' snab, ilk barkin' naler,
Ilk funky bauld, ilk comy collier,
Ilk dusty batchy,
Ilk muckle grab, ilk little tailor,
A' strive to catch ye.

Ilk thimlin', theevin', gambin' diddler,
Ilk bellows-mendin' tinkler diddler,
Ilk haltin', hirplin', blindin' fiddler,
Ilk wee speech-crier,
Ilk lazy, ballant-singin' idler,
Chase thee like fire.

Ilk waly-draglin', dribblin' wight,
Wha sleeps a' day, an' drinks a' night,
An' staggers hame in braid daylight,
Bleerit, blin', and scaur,
Thou coverest him up, a' movin' fright,
Wi' dunts o' glaur.

Ilk auld wife stoyterin' wi' her drappie
In teapot, bottle, stoup, or cappie,
Fu' snugly fauldin' in her lappie,
Wi' couthy care,
Thou gar'st the hidden treasure jaupie
A' in the air.

At e'en, when weary warkmen house,
Their sair forfoughten spunks to rouse,
An' owre the inspirin' whisky bouse
Croon mony a ditty,
Thou sits among them bauld and crouse,
Whiffin' thy cutty.

Thine education's maistly perfect,
An' though thou now art wee an' barefoot,
Thou't be a swankin', spunky spark yet,
Or I'm mista'en,
Unless misfortune's gurl bark yet
Should change thy vein.

O, why sould age, wi' cankered e'e,
Condemn thy pranks o' rattlin' glee,
We a' were callants ance, like thee,
An' happier then
Than, after clarnbin' up life's tree,
We think us men.

Feeling the warmest interest in the object of this book (a feeling which has induced us, busy as we are, to take some pains in circulating it over the country), we shall probably return to it when it has advanced a little farther.

THE SON OF COLKITTOCH.*

ALEXANDER MACDONELL, commonly known in the Highlands and in Ireland by the patronymic of Allister MacCollie, or the Son of Coll, was the eldest son of Colkittoch, a gentleman of whom we have already given an account. He was born in the island of Colonsay, and his close connexion with the family of Antrim induced him to engage in the troubles which occurred in Ireland in the reign of Charles the First. The Earl of Antrim appointed him to command the auxiliary force which he sent to assist the king's friends in Scotland. These troops consisted chiefly of his own tenants and followers.

Alexander first landed with his soldiers near the castle of Mingary, at the western extremity of the Sound of Mull, and then in possession of the Parliamentary party. A fellow who travelled to exhibit the enormity of his appetite, paid his respects to Macdonell, and treated him with a specimen of his powers, by devouring the whole dinner which had been prepared for the crew of his vessel. Having acquitted himself thus handsomely, he appealed to the commander for his reward; upon which Alexander ordered his men to hang him to the mast, as being a nuisance to the world.

Alexander had no artillery, but he ordered a vast quantity of combustible materials to be collected in the dry ditch at the foot of the castle wall, and to be set on fire, expecting to compel the garrison to surrender, from the violent heat. The fire was kept burning for several days, and the wall still bears the mark; but the attempt failed. Want of provisions, however, induced the besieged to surrender in the course of time, and they were made prisoners of war.

The Irish troops being much in want of shoes, Campbell, of Bragleen, who had commanded the castle, said that he knew where some Irish leather might be found, and offered to procure it if he obtained a party of soldiers. This was agreed to, and Campbell led them to the rocky bed of a river in the vicinity, where he selected a place well adapted to his purpose. He first descended by a narrow winding path, and ordered the men to follow him singly into a cavern below, where he said the leather was concealed. This was done, and Campbell stabbed every man as he entered the cavern, until he killed the whole party, and then made his escape. The situation of the place justifies the belief of the bloody deed. Campbell was afterwards taken prisoner, and he defended his conduct by asserting that he had performed his promise, by having so many Irish hides, meaning the skins of those whom he killed. Alexander was remarkable for his great strength of body and daring intrepidity. He appears to have understood the character of his troops well, for his popularity among them was very great. He was much distinguished for his conduct in all the actions which Montrose fought against the Covenanters, and was promoted to the rank of major-general, or general-major, as it was then termed. He also received the honour of knighthood.

After the unfortunate defeat of Montrose at Philiphaugh, Sir Alexander retired into Argyleshire. Passing by the side of Loch Ballimore, in the centre of which one Mackorquodale, the head of a neighbouring sept, had fortified a small islet, where he considered himself in perfect security, having the only boat on the lake in his possession. When he saw that Sir Alexander, with his troops, was marching past without taking any notice of him, he went to the top of his castle, and vauntingly fired off a musket, as a mark of defiance. Macdonell upon this turned round, levelled his rifle, and saying, "Oh, poor trifling Mackorquodale, I beg pardon for passing without taking notice of you!" he shot him dead as he stood on the roof of his castle. The very spot on which he stood when he fired the shot is still marked by a cairn, and the distance certainly appears to justify the little Baron's confidence in his own safety.

* We give this as a second extract from those "Legends of the Western Highlands" which appeared some years ago in the *London Literary Gazette*. Some further information of an authentic character, and also a few legendary anecdotes, respecting the son of Colkittoch, are given by one of the Editors of the present Journal, in his History of Montrose's Wars, Constable's Miscellany, volumes XXXI, XXXII.

* He is the author of a historical novel upon the subject of Perkin Warbeck, published about two years ago.

Sir Alexander remained for some days after this in the district of Argyll properly so called; and having observed a mill at some distance, he accidentally inquired the name of the place where it stood, and was informed it was called the Mill of Goghkum-Go. He started when he heard the name, struck his hand on his forehead, and retired into his tent. Next day he continued his retreat into Kintyre.

It seems that before he left Ireland, Sir Alexander had, according to the custom of that age and country, consulted a witch as to the fate of his expedition, and she foretold that he would be fortunate in all his undertakings until he should reach Goghkum-Go. He laughed at the oddness of the name, and thought no more of it. But when he found himself at a place of that name, his situation being at the time unfavourable, the circumstance made a strong impression on his mind.

He had with him twelve hundred foot, and certainly might have defended the very strong passes which command the entrance into the peninsula of Kintyre very effectually. But he neglected to do so. He was followed by Sir David Leslie. Sir Alexander chose to place a garrison of three hundred men in the castle of Dunaverty, near the Mull of Kintyre. This had been one of the ancient residences of the lords of the isles; and it was there that the valiant Bruce was so kindly entertained by that potent chief when he was on his way to the island of Rathlin, on the coast of Ireland, after he had been defeated by Macdougall, Lord of Lorne, at Dalry. Leslie laid siege to Dunaverty, and the unfortunate garrison was soon forced to surrender for want of water. They gave themselves up "on the mercy of the kingdom;" but, alas! they found no mercy. Three days after, they were put to death in cold blood by the execrable Leslie, to which there is evidence that he was strongly incited by the Rev. John Nave, commissioner from the Kirk, who acted as the general's chaplain, and who incessantly prompted him to this bloody act, threatening him with the curses that befel Saul for sparing the Amalekites, should he not put these men to death. They consisted chiefly of the clan Macdougall, and their young chief alone was saved, on condition that he should banish himself to France. The Marquis of Argyll was present on this occasion; and though he had no higher rank than colonel, the nation in general imputed much of the fault to him. Sir Alexander himself did not remain at Dunaverty, but after putting a few troops into Dunivaig, in Islay, embarked for Ireland with the rest of his men. These consisted entirely of Irish; and with them he found the royal party in that country, where he was soon after killed in battle against the republicans under Lord Taffe, afterwards Earl of Carlingford. Sir Alexander was taken prisoner by two private soldiers, who, having discovered his rank and importance, disputed the honour of capturing him, and to prevent either having a preference, they put him to death. This happened in the year 1647, at a place named Glenlussart.

Some strange fatality certainly appears to have seized Sir Alexander in the last part of his career; and it is by no means improbable that his mind became impressed with the inevitable destruction to which he was doomed, after the partial fulfilment of the oracle he had unhappily relied on. Sir Alexander and his father are confounded by all the historians of that period we have seen. They are often confounded under the names of Colkittoch, or Macdonald of Colkittoch.

POMPEII AND HERCULANEUM.

MANUSCRIPTS.

Of all the relics of antiquity which have been brought to light during the excavation of Pompeii and Herculaneum, the papyrus of the latter subterranean city must be allowed to stand pre-eminent in value and importance. It is, however, to be regretted that so little success has followed the labours of those who have attempted to unroll them. They seem to have been first enveloped by a paste, which consolidated around them, and then allowed them to become slowly carbonized. The vegetable substance is now a thin friable black matter, in appearance somewhat like the tinder which remains when strong paper has been burnt, in which the letters may still be sometimes traced. The leaves of the papyrus are so closely cemented together, that the roll appears as one mass, and the difficulty of separation has been found scarcely surmountable, without doing injury to the writing. Some portions, however, have been unrolled, and the titles of about four hundred of the least injured have been read. They are works of no importance, but all entirely new, and chiefly relating to music, rhetoric, and cookery. The obliterations and corrections are numerous, so that there is a probability of their having been original manuscripts. There are two volumes of Epicurus "On Nature," and the rest are for the most part productions of the same school of writers. Only a very few are written in Latin, almost the whole being in Greek. All were found in the library of one private individual, and in a quarter of the town where there was the least probability of manuscripts being found. From this circumstance, we may be allowed to indulge the hope that future excavations will discover some literary treasures of real value. But the enterprise of private individuals will not be able to accomplish this. The governments

of Europe ought to come forward with their support. The supineness manifested at the present moment by all of them—our own, of course, included—reflects something very like disgrace upon them.

SKELETONS, PAINTINGS, &c.

A very small number of skeletons, as was formerly observed, have been found in either city; hence it is clear that the greater mass of the inhabitants had found time to escape. Besides those already noticed, there were found in the vaults of a house in the suburbs of Pompeii, the skeletons of seventeen individuals, who appear to have sought refuge there from the tempest of ashes which poured from the sky. There was also preserved in the same place, a perfect cast of a woman, supposed to have been the mistress of the house, with an infant locked in her arms. Her form was imprinted upon the rock which formed her sepulchre, but only the bones remained. To these a chain of gold was suspended, and rings with jewels were upon the fingers of the skeleton. The remains of a soldier were found in a niche, where, in all probability, he was performing the office of sentinel. His hand still grasped a lance, and the usual military accoutrements of the time were also found there.

The walls in the interior of buildings are generally adorned with fresco paintings, the colours of which are in a state of perfect preservation, and have all the freshness of recent finishing. The shells also, which decorate some of the public fountains, have sustained no injury from the lapse of ages, or the volcanic products in which they were buried, but appear as entire as if they had been preserved in a museum.

Fishing nets, some of them quite entire, have been found, in great numbers, in both cities. Linen, also, with the texture well defined, was amongst the excavated products. In the shop of a baker, a loaf was found still retaining its form, with the baker's name stamped upon it, and which, to satisfy the curiosity of modern professors of the art, we shall give: it was "Eleris Q. Crani Riser." On the counter of an apothecary's shop, was a box of pills, and by the side of it a small cylindrical roll, evidently ready for cutting up: this method of administering to a body diseased is therefore of very ancient date.

It would be easy to extend our notice of the various relics of antiquity which have been found; but the details already given will probably satisfy the reader, as they are the most interesting and important which we have been able to collect, after examining a number of works upon the subject.

SMOKING IN GERMANY.

We have more than once pointed out the dangerous effects of smoking, now one of the most vulgar accomplishments among young men. The following observations in a Hamburg journal shew the extent to which this vicious and mean indulgence is carried in Germany:—"The propensity of smoking is declared by the physicians to be actually one of the most efficient causes of the German tendency to diseases of the lungs. In point of expense, its waste is enormous. In Hamburg alone, 50,000 boxes of cigars have been consumed in a year, each box costing about L.3 sterling: L.150,000 puffed into the air! And it is to be remembered, that even this is but a part of the expense; the cigar adorning the lip only of the better order, and even among those, only of the young; the mature generally abjuring this small vanity, and blowing away with the mighty meerschaum of their ancestors. This plague, like the Egyptian plague of frogs, is felt every where and in every thing. It poisons the streets, the clubs, and the coffee-houses; furniture, clothes, equipage, person, are redolent of the abomination. It makes even the dullness of the newspaper doubly narcotic; the napkin on the table tells instantly that native hands have been over it; every eatable and drinkable, all that can be seen, felt, heard, or understood, is saturated with tobacco; the very air we breathe is but a conveyance for this poison into the lungs; and every man, woman, and child, rapidly acquires the complexion of a boiled chicken. From the hour of their waking, if nine-tenths of the population can ever be said to awake at all, to the hour of their lying down, which in innumerable instances the peasantry do in their clothes, the pipe is never out of their mouths; one mighty fumigation reigns, and human nature is smoke-dried by tens of thousands of square miles. But if it be a crime to shorten life, or extinguish faculties, the authority of the chief German physiologists charges this custom with effecting both in a very remarkable degree. They compute, that of twenty deaths of men between eighteen and thirty-five, ten originate in the waste of the constitution by smoking. The universal weakness of the eyes, which makes the Germans *par excellence* a spectacled nation, is probably attributed to the same cause of general nervous debility. Tobacco burns out their blood, their teeth, their eyes, and their brains; turns their flesh into mummy, and their mind into metaphysics."

SAYING OF MARGAROT.

When Maurice Margarot was tried at Edinburgh for sedition, Lord Justice Clerk Braxfield, who always talked broad Scotch upon the bench, said, "Hae ye ony counsel, man?" "No." "Do you want to hae ony appoint?" "No." "I only want an interpreter to make me understand what your Lordship says."

A SOUND HORSE.

Sergeant Bond related the following anecdote of himself with great good humour:—"I once bought a horse from a horse-dealer, warranted sound in all his points. I thought I had got a treasure, but still wished to find out if he had any fault. I, therefore, when I paid for him, said to the seller, 'Now, my friend, you have got your money and I the horse, so that the bargain is closed; but do, like an honest fellow, tell me fairly of any fault that he has.' 'Why, Sir,' says he, 'you have dealt with me like a gentleman, and as you ask me to be frank with you, I must tell you that the horse has one fault.' I pricked up my ears. 'What is it, my friend?' 'Why, Sir,' says he, 'it is, that he will not go into the yard of the Crown Inn at Uxbridge.' 'Pooh!' said I; 'if that's all, I am not likely to put him to the trial, as I have nothing to do with or to lead me to Uxbridge.' It, however, so happened that I had occasion to go to Uxbridge, and I determined to try if my horse retained his dislike to the yard of the Crown Inn. I accordingly rode up the street, until I came opposite to the inn-yard of the Crown. I faced about," said the Sergeant, "seated myself firmly in my stirrups (at the same time exhibiting the attitude in which the feat was to be performed), expecting a plunge from my horse; I stuck my spurs into his sides, and pushed him forward into the yard; but what was my surprise to find him enter the yard as quietly as a cow that had just gone in before him! But I was not long left in doubt of what appeared to be the cause of this change in his antipathies, by the landlord's coming up to him, and, tapping him on the shoulder, 'Ha, Jack!' says he, 'I'm glad to see you again; I thought I had lost you.' 'What do you mean, Mr Landlord?' 'Sir,' says he, 'this horse was stolen from me about six months ago, and I have never seen him since.' I did not much relish this piece of information," said the Sergeant, "but I could not help laughing at the conceit of the horse-dealer to prevent me from going to a place where his theft would be discovered. I wished I had attended to his caution, as the sale was not regular, and I was left to make the best terms I could with the landlord." What they were he kept to himself.—*Fraser's Magazine.*

CHANGE OF COLOUR IN ANIMALS.

As the cold season advances, the coats of many animals change colour. This curious phenomenon is rarely observable in our temperate climate, except in the case of the Alpine hare, which inhabits Scotland, and which, from a brown colour, becomes, in winter, of a snowy white. It is in the arctic regions that this interesting change is most strongly manifested. Warmth is the object of the singular provision, and the principles upon which it is secured are simply these:—All persons have felt that black clothes heat the body in summer-time much sooner than white ones, and hence the prevalence of light-coloured garments in the hot season; but the contrary is the case during the winter; black clothes are the most comfortable garments we can wear. Black substances, when they are placed in a temperature superior to their own, absorb heat more readily than a white substance, but if, after heating a black and white body to an equal degree, they are removed to a temperature lower than their own, the black body will part with its heat and be cool much sooner than the white. White skins are, therefore, better fitted for preserving the body of an animal from cold than those of any other colour; they shut in the heat, while a darker skin would have let it out. Accordingly, we find this law brought to contribute to the comfort of the fowls and beasts of the arctic circle, at a time when, without them, they would perish.—*Guide to Knowledge.*

The Messrs Chambers have to announce, that in consequence of the continued demand for early numbers of the *Journal*, they have resolved, although at a great expense, to reprint the work from No. 1 to 36 in the new size, and that these numbers will be speedily republished both in Edinburgh and London. To suit a certain class of readers in the country, the *Journal* is now made up in Monthly Parts, with a neat printed cover, including the *Historical Newspaper*, a monthly publication resembling the *Journal* in size and appearance, at the same low price, and containing, besides Original Papers, a complete Digest of the Foreign and British News of the month. This newspaper is also published separately on the first or second day of every month, and may be obtained from all booksellers and dealers who supply the present publication.

It is again respectfully notified, that no communications in verse or prose are wanted. All unpaid anonymous letters whatsoever are returned to the Post Office.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

EDINBURGH CHAMBERS' JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS, AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 48.

SATURDAY, DECEMBER 29, 1832.

PRICE THREE HALFPENCE.

DANGLERS.

"By the bye, do you know who that genteel-looking young man is, that I see constantly hanging about the Wilsons? Go where I will, I am sure to see him along with one or other of the young ladies. Last Wednesday night, having occasion to call on Mrs Wilson about the character of a servant, whom did I see stuck up in a corner of the sofa but this same young gentleman, discussing with Miss Jessy, if I understood it rightly, the merits of a patent thread paper; I next night saw him with them in the pit of the Theatre, the third seat from the orchestra; and I am positive that he is ten times oftener in their seat at church than in his own, wherever that may be." Such is the sort of question that some well-meaning, but curious female controller-general of society puts on observing a dangler in high practice. The dangles are a class of young men belonging to some idle profession, who are never happy unless they be on terms of intimate acquaintance in families having one or two daughters come to a marriageable time of life. Having effected an introduction, it is impossible to tell how—most likely at a soiree, where he made quite a sensation by dancing the *Lancers* in a first-rate style, or through means of another dangler or friend of the family, or, what is more likely still, through an acquaintanceship with a brother of the young ladies, picked up at a fencing-school—the dangler falls into a habit of dropping in at all seasons, and, in a short time, from being a good-looking young man, and of tolerable address, becomes a privileged person in the household. If there be any dinner, tea, or supper party, Mr Brown is sure to be put down first on the list, or is there of his own accord; and, from his frequent appearances on such occasions, a certain kind of *understanding* as to his motives prevails among all descriptions of regular visitors. The dangler thus makes himself a species of necessary evil in the family. He brings all the floating small-talk of the town to the young ladies; speaks to them about concerts, play-actors, and charity sermons; helps the tea-kettle, and has a habit of saying "allow me," and making a movement as if to rise, when any thing is to be lifted; converses on the prevailing colour in the new winter dresses, and leads the laugh when any thing droll is mentioned. When Miss Jessy and Miss Sally go out for a walk, or on any necessary piece of duty, the dangler has a knack of hitting the exact time they are to leave the house, and, with an inclination, offers his arm, but always has a tendency to be on the side next Miss Jessy. At "kirk or at market," the dangler acts the obliging young man, being equally ready to carry a parasol, or look out the place in the Bible or Psalm-book. The dangler, in short, is ubiquitous in his services, and so, as a matter of course, all the world put him down as a favoured suitor of one or other of the young ladies. "Take my word for it," says Mrs Gavine, to her friend Mrs Brotherstone, "it is a set thing that young Tom Brown is after Jessy Wilson, and there's no doubt he'll get her too. I'm sure they've been long enough in making it up at any rate; for, to my certain knowledge, he used to call when they lived in George Street, and that is more than three years since." "Indeed," replies the party addressed, "I'm not so sure about it as all that. I have always had my own opinion that he is one of those flirting fellows that never know their own mind for three minutes at a time, and, whatever they do, take always good care never to come to the point. However, I dare say he gets enough of encouragement, and they may take their own way of it, for me. Had the father not been a poor silly man, he would have settled the matter long

ere this." There are strong grounds for belief that Mrs Brotherstone is not far from the truth in her opinion of our hero Mr Brown. Under the indistinct idea that he is in love with a young lady, when he is no such thing, the dangling genteel young man haunts her wherever she goes, gets recognised by her father or mother as a suitable enough match for their daughter, flirts about her for a year or two, without, be it remarked, ever having spoken a word to her of personal esteem or attachment, yet insinuated himself so far into her good graces by his actions and looks—his everlasting dangle—that he knows he could get her at any time for the asking; then, behold, when he sees he can secure another with a better fortune, or, in his eyes, some other great recommendation, he leaves the long assiduously-courted young lady to pine over her solitary fate. How often is this the case in the middle ranks of life! How many hundreds and thousands of amiable young women have had cause to rue that they ever gave any permanent encouragement to a dangler. Such a character acts like a blight on the fate of a young lady; for he not only consumes her valuable time, and distracts her feelings, but prevents real and modest admirers from making advances; wherefore, in the end, she has perhaps to marry a person of inferior respectability, or remain on the list of old maids. Such a result forms the worst feature in the case of the dangler. Heedless of the havoc he is committing in the fate of the young lady; not reflecting that what has been simple killing of time or amusement to him has been protracted-torture to a sensitive female, who, probably, all the while pardons him, from the impression that he is only waiting till he can conveniently make a declaration, he either starts off after a new object, or grows cool in his attentions, after the bloom of her youth is fled. Yet, we have known dangles deservedly caught in their own cunning devices. The eldest daughter of the family, to whom he has long been in his own opinion attached, is carried off, as it were, out of his very grasp, when he thought himself most secure; and he probably enters into a campaign of dangle with the younger; but she is also married before he has time to make up his resolution, and he is left in a queerish, desolate condition. In such cases, we have known the dangle of half-a-dozen years pretend to feel hurt, and actually "wonder" how Miss Wilson or Miss Any-body-else "was in such a hurry to get off, for it was well known to her that nobody felt so much attached to her as himself." Such is the drivel of a disconcerted dangle. He breaks his acquaintance with the family "which has used him so very ill," and looks about him for means of revenge in marrying some "extraordinary great match." He procures an acquaintance with the accomplished and elegant Miss Blackitt, who lives with her aunt in the Crescent, and who, it is currently reported, has three thousand pounds at her own disposal, besides expectations from her uncle the lieutenant-colonel in India. The aunt, who is a knowing hand in the science of dangle, encourages his addresses, but takes care not to be long in fixing him, by asking him with an air (some day about twenty minutes past twelve o'clock, when he had called in a pair of washed gloves to escort the young lady to the Exhibition) "what his intentions are regarding her niece." Of course, Mr Brown protests—rather in a flutter, however—that his "intentions" are beyond all measure "honourable." The marriage in such a case soon ensues, and the dangle is beautifully noosed with a girl who, according to the report of the controllers-general of the neighbourhood, "can-

not put on her own clothes," "who has all kinds of bad habits," not a penny of fortune, no expectations from her uncle in India—he being a married man with five mulatto daughters—and, consequently, to sum up the story, makes the dangle miserable for all the rest of his life.

ISBEL LUCAS,

A HEROINE OF HUMBLE LIFE.

ABOUT fifteen years ago, a woman of the name of Isbel Lucas kept a small lodging-house in the southern suburbs of Edinburgh. She was the daughter of a respectable teacher in the city, who, at his death, had bequeathed to her, as his sole surviving relation, about three hundred pounds, together with the furniture of a house. The latter part of the legacy suggested to her the propriety of endeavouring to support herself by keeping lodgings, while the part which consisted in money promised to stand effectually between her and all the mischances that could be expected to befall her in such a walk of life. She accordingly, for several years, let one or two rooms to students and other persons, and thus contrived to live very decently, without trenching upon her little capital, till at length she attained the discreet age of two-and-forty.

Isbel had at no period of life been a beauty. She had an iron-gray complexion, and a cast of features bespeaking rather strength of character than feminine grace. She was now less a beauty than ever, and for years had tacitly acknowledged her sense of the fact, by abandoning all those modes and materials of dress which women wear, so long as they have any thoughts of matrimony. Where, however, is the woman at that, or any more juvenile period of life, in whose bosom the spark of love lies dead beyond recall? If any such there be, Isbel's was not of the number.

Among her lodgers was an individual of the name of Fordyne, who kept a grocer's shop of an inferior order in the neighbourhood. This person gave himself out for a native of the Isle of Man, and stated that he had made a little money as mess-man to a militia regiment, by which he had been enabled to set up in business. He was a large, dark, coarse man, of about five-and-thirty, with a somewhat unpromising cast of face, and a slight twist in his left eye. Fordyne seemed to be a man of great industry and application, and used to speak of his circumstances as agreeable in every respect, except that he wanted a wife. This, he said, was a great want. There were many things about his shop which no one but a female could properly attend to. Without such a helpmate, things were continually going wrong; but with her, all would go right. One point, however, he must be clear about: she who should be his wife would require to bring something with her, to add to his stock, and buy the necessary house-furniture. He cared little about good looks, if there was good sense; and indeed a woman of some experience in the world would answer his purpose best.

Honest Isbel began in a little while to turn all these matters in her mind. She one day took a steady look at Fordyne, and discovered that he had a good upright carriage of body, and that, though his mouth was of the largest, yet his teeth were among the best she had ever seen. Next time she visited his shop, she took a glance at the room behind, and found that it had a nice out-look upon Salisbury Crags. Fordyne, observing that she glanced into his back-shop, invited her to come in and see what a fine house he had, for such in reality it was, though unfurnished. Isbel very quickly saw that

there was one capital bed-room, a parlour, a kitchen, and a vast variety of closets, where things could be "put off one's hand." One press, Mr Fordyne showed, was already furnished, being tenanted by a huge dram-bottle, and a server full of short-bread, which, he said, had been lately required to treat his customers, on account of the New Year. Of this he made Isbel a partaker, drinking in his turn to her good health, and a good man to her before the next recurrence of the season. This exchange of compliments did not take place without some effect. Isbel ascended the stair in a kind of reverie, and found herself entering the next door above, instead of her own, before she was aware. In a month thereafter, the two were married.

Three days after the nuptials, Mrs Fordyne was sitting in her little parlour, waiting supper for her husband, and reflecting on the step she was about to take next day, namely, the transference of her household furniture to the apartments behind Fordyne's shop, and the surrender of her little fortune into his hands. Her eye happened, in the course of her cogitations, to wander to a portrait of her father, which hung opposite; and as she gazed on it, she could hardly help thinking that its naturally stern and even sour features assumed an expression still sterner and sorer. No doubt this was the mere effect of some inward pleading of conscience, for she could not but acknowledge secretly to herself that the step she had taken was not of that kind which her parent would have approved. She withdrew her eyes with a disturbed mind, and again looked musingly towards the fire, when she thought she heard the outer door open, and a person come in. At first, she supposed that this must be her husband, and she began, therefore, to transfer the supper from the fire to the table. On listening, however, she heard that the footsteps were accompanied by the sound of a walking-cane, which assured her that it could not be Fordyne. She stood for a minute motionless and silent, and distinctly heard the sound as of an old man walking along the passage with a stick—sounds which at once brought to her recollection her departed father. She sunk into her chair, the sounds died away in the distance, and almost at that minute her husband came in to cheer her, calling to the servant as he passed, in his loud and boisterous way, that she had stupidly left the outer door open.

Though Isbel Lucas had committed a very imprudent action in marrying a man who was a perfect stranger to her, nevertheless the predominating feature of her mind was prudence. The impressions just made upon her senses were of a very agitating nature, yet, knowing that it was too late to act upon them, she concealed her emotions. There could be no doubt that she had received what in her native country is called a warning; yet, conceiving that her best course was to go on and betray no suspicion, she never faltered in any of her promises to her husband. She was next day installed in Mr Fordyne's own house, to whom, in return, she committed a sum rather above four hundred pounds; for to that extent had she increased her stock in the course of her late employment.

For some time matters proceeded very well. Her husband professed to lay out part of her money upon those goods which he had formerly represented himself as unable to buy. His habits of application were rather increased than diminished, and a few customers of a more respectable kind than any he had hitherto had, began to frequent the shop, being drawn thither in consideration of his wife. Among the new articles he dealt in was whisky, which he bought in large quantities from the distillers, and sold wholesale to a number of the neighbouring dealers. By and bye, this branch of his trade seemed to outgrow all the rest, and he found himself occasionally obliged to pay visits to the places where the liquor was manufactured, in order to purchase it at the highest advantage. His wife in a little while became accustomed to his absence for a day or two at a time, and, having every reason to believe that his affairs were in a very prosperous state, began to forget all her former misgivings.

On one occasion, he left her on what he described as a circuit of the Highland distilleries, intending, he said, to be absent for at least a week, and carrying with him money to the amount of nearly a thousand pounds, which he said he would probably spend upon whisky before he came back. Nothing that could awaken the least suspicion occurred at their parting; but next day, while his wife superintended matters in the shop, she was surprised when a large bill was presented, for which he had made no provision. On inspecting it, she was still further surprised to find that it referred to a transaction which she understood at the time to be a ready-money one. Having dismissed the presenter of the bill, she lost no time in repairing to the counting-house of a large commission house in Leith, with which she knew her husband to have had large transactions. There, on making some indirect inquiries, she found that his purchases, instead of being entirely for ready money, as he had represented to her, were mostly paid by bills, some of which were on the point of becoming due. It was now but too apparent that the unprincipled man had taken his final leave of her and his creditors, bearing with him all the spoil that his ingenuity could collect.

Isbel Lucas was not a person to sit down in idle despair on such an event. She was a steady Scotch-

woman, with a stout heart for a difficulty; and her resolution was soon taken. She instantly proceeded to the Glasgow coach-offices, and ascertained, as she expected, that a man answering to the description of her husband had taken a place for that city the day before. The small quantity of money that had been collected in the shop since his departure, she put into her pocket; the shop she committed to the porter and her old servant Jenny; and, having made up a small bundle of extra clothes, she set off by the coach to Glasgow. On alighting in the Tron-gate, the first person she saw was a female friend from Edinburgh, who asked, with surprise, how she and her husband happened to be travelling at the same time? "Why do you ask that question?" asked Isbel. "Because," replied the other, "I shook hands with Mr Fordyne yesterday, as he was going on board the Isle of Man steam-boat at the Broomielaw." This was enough for Isbel. She immediately ascertained the time when the Isle of Man steam-boat would next sail, and, to her great joy, found that she would not be two days later than her husband in reaching the island. On landing in proper time at Douglas, in Man, she found her purse almost empty; but her desperate circumstances made her resolve to prosecute the search, though she should have to beg her way back.

It was morning when she landed at Douglas. The whole forenoon she spent in wandering about the streets, in the hope of encountering her faithless husband, and in inquiring after him at the inns. At length, she satisfied herself that he must have left the town that very day for a remote part of the island, and on foot. She immediately set out upon the same road, and with the same means of conveyance, determined to sink with fatigue, or subject herself to any kind of danger, rather than return without her object. At first the road passed over a moorish part of the country; but after proceeding several miles, it began to border on the sea, in some places edging the precipices which overhung the shore, and at others winding into deep recesses of the country. At length, on coming to the opening of a long reach of the road, she saw a figure, which she took for that of her husband, just disappearing at the opposite extremity. Immediately gathering fresh strength, she pushed briskly on, and, after an hour's toilsome march, had the satisfaction, on turning a projection, to find her husband sitting right before her on a stone.

Fordyne was certainly very much surprised at her appearance, which was totally unexpected; but he soon recovered his composure. He met her with more than even usual kindness, as if concerned at her having thought proper to perform so toilsome a journey. He hastened to explain that some information he had received at Glasgow, respecting the dangerous state of his mother, had induced him to make a start out of his way to see her, after which he would immediately return. It was then his turn to ask explanations from her; but this subject he pressed very lightly, and, for her part, she hardly dared, in this lonely place, to avow the suspicions which had induced her to undertake the journey. "It is all very well," said Fordyne, with affected complaisance; "you'll just go forward with me to my mother's house, and she will be the better pleased to see me since I bring you with me." Isbel, smothering her real feelings, agreed to do this, though it may well be supposed that, after what he had already done, and considering the wild place in which she was, she must have entertained no comfortable prospect of her night's adventures. On, then, they walked in the dusk of fast approaching night, through a country which seemed to be destitute alike of houses and inhabitants, and where the universal stillness was hardly ever broken by the sound of any animal, wild or tame. The road, as formerly, was partly on the edge of a sea-worn precipice, over which a victim might be dashed in a moment, with hardly the least chance of ever being more seen or heard of, and partly in the recesses of a rugged country, in whose pathless wildernesses the work of murder might be almost as securely effected. Isbel Lucas, knowing how much reason her husband had to wish her out of this world, opened her mind fully to the dangers of her path, and at every place that seemed more convenient than another for such a work, regarded him, even in the midst of a civil conversation, with the watchful eye of one who dreads the spring of the tiger from every brake. She contrived to keep upon the side of the road most remote from the precipices, and carried in her pocket an unclashed pen-knife, though almost hopeless that her womanly nerves would support her in any effort to use it. Thus did they walk on for several miles, till at length, all of a sudden, Fordyne started off the road, and was instantly lost in a wild, tortuous ravine. This event was so different from any which she had feared, that for a moment Isbel stood motionless with surprise. Another moment, however, sufficed to make up her mind as to her future course, and she immediately plunged into the defile, following as nearly as possible in the direction which the fugitive appeared to have taken. On, on she toiled, through thick entangling bushes, and over much soft and mossy ground, her limbs every moment threatening to sink beneath her with fatigue; which they would certainly have done very speedily, if the desperate anxieties which filled her mind had not rendered her in a great measure insensible to the languor of her body. It at length became a more pressing object with her to find some

place where she could be sheltered for the night, than to follow in so hopeless a pursuit; and she therefore experienced great joy on perceiving a light at a little distance. As she approached the place whence this seemed to proceed, she discovered a cottage, whence she could hear the sounds of singing and dancing. With great caution she drew near to the window through which the light was glancing, and there, peeping into the apartment, she saw her husband capering in furious mirth amidst a set of coarse peasant-like individuals, mingled with a few who bore all the appearance of sea-smugglers. An old woman, of most unamiable aspect, sat by the fireside, occasionally giving orders for the preparation of food, and now and then addressing a complimentary expression to Fordyne, whom Isbel therefore guessed to be her son. After the party seemed to have become quite tired of dancing, they sat down to a rude but plentiful repast; and after that was concluded, the whole party addressed themselves to repose. Some retired into an apartment at the opposite end of the house; but most stretched themselves on straw, which lay in various corners of the room in which they had been feasting. The single bed which stood in this apartment was appropriated to Fordyne, apparently on account of his being the most important individual of the party; and he therefore continued under the unsuspected observation of his wife till he had consigned himself to repose. Previous to doing so, she observed him place something with great caution beneath his pillow.

For another hour, Isbel lay at the window, inspecting the interior of the house, which was now lighted very imperfectly by the expiring fire. At length, when every recumbent figure seemed to have become bound securely in sleep, she first uttered one brief, but fervent and emphatic prayer, and then undid the loose fastening of the door, and glided into the apartment. Carefully avoiding the straw pallets which lay stretched around, she approached the bed whereon lay the treacherous Fordyne, and slowly and softly withdrew his large pocket-book from beneath the pillow. To her inexpressible joy, she succeeded in executing this manœuvre without giving him the least disturbance. Grasping the book fast in one hand, she piloted her way back with the other, and in a few seconds had regained the exterior of the cottage.

As she had expected, she found the large sum which Fordyne had taken away nearly entire. Transferring the precious parcel to her own bosom, she set forward instantly upon a pathway which led from the cottage, apparently in the direction of Douglas. This she pursued a little way, till she regained the road she had formerly left, along which she immediately proceeded with all possible haste. Fortunately, she had not advanced far when a peasant came up behind her in an empty cart, and readily consented to give her a lift for a few miles. By means of this help, she reached Douglas at an early hour in the morning, where, finding a steam-boat just ready to sail, she immediately embarked, and was soon beyond all danger from her husband.

The intrepid Isbel Lucas returned, in a few days, to Edinburgh, with a sufficient sum to satisfy all her husband's creditors, and enough over to set her up once more in her former way of life. She was never again troubled with the wretch Fordyne, who, a few years afterwards, she had the satisfaction of hearing, had died a natural death of an epidemic fever in the bedchamber of Tralee, in Ireland.

The moral of this story (and it is a real one) is, that unmarried ladies should be particularly cautious about their hearts when they reach the peculiarly tender and susceptible age of *forty-two*.

POPULAR INFORMATION ON HISTORY.

THE TURKS.

THE country at present called Turkey, comprises, with some small exceptions, that tract of continent, sea, and island, which lies between the River Tigris to the eastward, and the Gulf of Venice on the west. Several of the districts towards the boundaries of this region pay but a nominal subjection to the Turkish sovereign; but he claims to rule over the whole, and, indeed, considers also all the states of Northern Africa, from Egypt to the Straits of Gibraltar, as his vassals or feudatories; these, however, hardly acknowledge him even by the payment of a nominal tribute, and in no respect adhere to his authority. The only countries which can be actually considered as his territories, are, in Europe, the districts between the Danube and Greece, with the Grecian islands; and, in Asia, those of Anatolia, or Asia Minor; and these regions are perhaps the most fertile, and best adapted for commerce, of any in the world, were they cultivated as they ought.

It must not be supposed, however, that even this region is wholly occupied by the people called Turks: it is subject to their government, but they do not constitute more than a fourth part of its inhabitants. The rest are the original occupiers of the soil, who possessed it before the Turks conquered them, and who yet continue as the subjects or tributaries of that people. The Turks themselves live chiefly in the garrisoned towns, in villages near these, or in some scattered districts where they have been induced more particularly to settle; but hardly ever in these last are they equal in numbers to their subjects, the ori-

ginal inhabitants who are intermingled with them. Their dominion over the races whom they keep in subjection is maintained with great severity and haughtiness; and, from feeling themselves always superior to them in power, they come to look on them with the greatest disdain. The Turks are all of the religion of Mahomet, and the races who are subject to them are Christians; hence the name of Christian is with these people an expression of scorn, and in their towns any one of that religion who should refuse to step off the foot-path to make way for a Turk, would be subjected to a severe beating; they would no more allow any of their females to marry a Christian, than a West India planter would permit his daughter to give her hand to a negro. It is death for a Christian even to marry or attach himself to a Turkish woman. This extreme contempt appears to arise solely from the Turks having long had the dominion in the country, and having been accustomed to treat its inhabitants on all occasions as a disarmed and conquered people.

The original Turks were a tribe of Tartar origin. It must not be imagined, however, that all the people who now claim that name are the descendants of the original Tartaric warriors: these invaders adopted into their body all the choice of the conquered nations who consented to assume their religion, and enter their armies; this, of course, was no small number, and the conquerors increased it, by forcing from their parents as many Christian children as they wished, in order to train them up in their national manners and discipline. The present Turks, therefore, are a people of mixed origin, and have little relation either in blood or character with the high-capped Tartars of the Desert, to whom they trace their lineage. The Turkish language affords the best evidence of this mixture of people; for though it has a thread of the original Tartaric here and there in its composition, it is chequered at every point with fragments of other tongues.

The original Turkish invaders were, as we have said, a tribe or tribes belonging to Central Tartary, that part of the Asiatic continent which lies between Europe and China, and is little known to either; it contains populous nations and large cities, of which we have scarcely heard the names. The old annals of Persia (which country lies on the south of the Tartaric regions) are filled with accounts of wars with that people, while they do not even allude to those contests with Greece which we are accustomed to consider as the leading points of Persian history in those ages (500 years before Christ). It is evident that the Tartars consisted of many populous and warlike tribes in periods beyond the date of our records. Their first appearance in the histories with which we are familiar, is about six hundred years after Christ, when they made several fierce and successful irruptions into Persia, and continued afterwards to spread forwards over all the civilized countries in their neighbourhood. In those days (from 650 to 1240 of the Christian era) little science was necessary for carrying on war; and mere animal courage, with the capability of bearing fatigue, being sufficient to ensure superiority, the unwearied and innumerable succession of Tartar soldiers which issued from their recesses, shook or overturned the principal monarchies of the time, from Constantinople to China and India. They were ignorant, barbarous, and cruel: the kings, conquerors, and heroes who governed their tribes, could neither read nor write, and considered success at the head of their armies as the only object worthy of their ambition: a chief was thought effeminate who sought other palace than his sheep-skin tent, or other throne than his saddle. No means, however cruel, were thought evil, if they insured victory; when Jenghis Khan (one of their greatest conquerors, 1210) invaded China, he took prisoner a great multitude of old men and women, and placed them in front of his troops, when he wished to avert an attack, because he had heard that the Chinese venerated age so highly, that they would not hurt it, even to defend themselves. The delicacy of their manners at home corresponded with their ferocity abroad. Tamerlane, another Tartar hero, in returning from his expeditions, used to assemble all the young females of the nation, and order a general marriage; in 1389, he gave a sumptuous feast in the plains near Samarcand, on the marriage of his nobles, his inferior officers, and soldiers, at which all the guests were arranged in their respective ranks, according to battle array; the bridegrooms on one side of the benches, and the brides on the other. Such is a picture of Tartaric life in war and peace; their conquests over more civilized nations were effected by means of vast bands of disciplined savages, who could bear endless fatigue, and whose lives could be thrown away in myriads. Their history at the present time, therefore, excites little interest; it is sufficient here to say, that we find certain of their tribes, about the twelfth century, in military possession of Asia Minor, of which the principal towns, and all the open parts of the country, were in their hands. There were several districts, indeed, which defied their power—and in which they have not even yet settled—but these were only the highlands of the country, which, in all conquered regions, remain independent, without being able to act in concert against the invaders.

It was to these conquerors of Asia Minor that the name of Turks was latterly restricted. When they

first established themselves there, they had for nearly 200 years a chief, who was sultan of Iconium; but the several leaders were always at war either with the conquered people, with one another, or with their sultan; hence they were never strong enough to extend the Turkish conquests into Europe, or to give much alarm to the Greek emperors of Constantinople, whose territories adjoined theirs. After a course of events, one of the leaders, named OTHMAN (1318), whose territory lay near the Hellespont, became distinguished by his talents and his ambition. He assumed the style and honours of royalty; defeated every one who dared to question his pretensions; and finally established a sovereignty which, though of small extent, was rendered strong by the confidence which his subjects had in his abilities and love of justice, as well as by the terror with which he inspired his enemies. This prince laid the foundations of the present empire of Turkey, and it is from him that it has the name of the Othman or Ottoman empire. He was succeeded by his son Orchan (1340), who maintained the respect which their power had acquired, and placed the military force with which his Emirs, or great lords, were obliged to furnish him, on a basis of discipline and regularity which enabled him to seize every opportunity of extending his territories. The empire of Constantinople, which had long considered itself as inheriting all the glories of classical history, because it had succeeded to the dominions of Rome, and the language of Greece, lay closely adjoining to the territories of Orchan; but being proud of its imperial dignity and old fame, it affected to despise its neighbour as the mere chief of a Tartar horde. Its own power was, however, fast verging to decay: the emperors were pressed by enemies on every side, and their revenues were consumed in supporting an appearance of splendour which was out of proportion both to their means and power. The resources of the son of Othman, on the other hand, were all employed to increase his military strength, and make additions to his territories. Hence the Emperor Andronicus was soon glad to apply to him for aid against the enemies who were scattering to pieces his enfeebled empire. Orchan, who was, like the modern conqueror Bonaparte, ambitious of allying his self-constituted royalty with the glories of an ancient line of sovereigns, asked the hand of the emperor's daughter as the price of his assistance. His request was granted, and the young and graceful Theodora was given away by her father as one of the wives of the Turk. She seemed the emblem of the ancient glory of empire, finally resigned by Greece. The aid obtained by her father only added to his embarrassment; for the Turks, who came as friends, kept possession as enemies; and the Ottoman sovereignty extended itself, wherever it gained footing, whether as an assistant or a conqueror.

The third sovereign (1362) was Amurath, a prince whose reign was chiefly rendered remarkable by his forming a new kind of military force, consisting of the children of Christian parents, or of young captives taken in war, who were trained up in the Ottoman religion and discipline, and, when enrolled in the army, were distinguished by the name of *yengi-cheri* (young soldiers), which we have changed into janissary. This body of troops was recruited for two centuries in the same manner as it had begun, and formed, during all that time, the flower and strength of the Turkish armies. Amurath extended his conquests beyond Constantinople, and into Hungary, though he did not venture to attack the imperial city itself; and he was at last killed, while walking among the bodies of the dead after a day of victory—a Slavonian soldier, who lay dying, having started up as he passed, and stabbed him to death. He was succeeded by his son Bajazet, who deserved the name of *Ilderim*, or Lightning, from the terrible rapidity of his movements in war. This prince extended his father's conquests along the Danube, and pushed the Turkish dominion southward into Macedonia and Thessaly. The chiefs of his own nation, whom his ancestors had kept in subjection in Asia Minor, rebelled while he was thus employed, and called into their assistance Timor Beg, or Tamerlane, a celebrated conqueror of the Mogul tribe of Tartars. Bajazet, with his usual rapidity, rushed to meet this fearful intermeddler; but his army was dashed to pieces by the shock. He was himself taken prisoner, and Timor shut him up in a cage of iron to die there; having heard that Bajazet had threatened him with the like treatment, should he be taken.

The Turkish sovereignty remained in confusion for some time after the death of this prince. His son Mahomet did little to re-establish it; but Amurath the Second effectually revived the fame of his ancestors. In Europe, however, he was bearded by the Albanian patriot Scanderbeg, who, for a quarter of a century, set the whole Turkish power at defiance; and Amurath, whom he had frequently foiled, was so eager for revenge, that on his death-bed he addressed his son Mahomet as follows:—"I now leave you, my son, this crown, but, above all things, I leave you this enemy." Mahomet, however, was baffled as well as his father. After Scanderbeg died, his strongholds were taken, and the Turkish soldiers, whose highest ideas of glory were concentrated in military success, dug up his bones, and had pieces of them set in gold and silver, hoping that they would confer on

the wearers the valour and good fortune of their living owner.

The next reign was that of Mahomet the Second. This prince, in 1453, captured the city of Constantinople, whose whole territory, except a few fragments, had long been in the hands of the Ottomans, and which had preserved the name of an empire after it could hardly command the highways leading to its own gates. After seizing the imperial city, Mahomet subdued also those portions of Southern Greece which had hitherto remained faithful to their ancient capital and emperors; established the Turkish power in the whole region lying betwixt the Danube, the Save, and the Mediterranean; drove the Genoese out of Crim Tartary; and invaded Italy, where he captured the city of Otranto. His success, and the growing power of the Turkish empire, alarmed the jealousy of the Mamelukes, who at that time ruled over Egypt and Syria, and whose boundaries touched those of the Turks at Mount Taurus, the same point to which the present ruler of Egypt has extended his conquests. His son Bajazet gave these soldiers a mortal injury by conquering Circassia, from which country they obtained the young recruits, whom they adopted as their children, and trained to perpetuate their power. The next prince, Selim the Second, defeated them both in Syria and Egypt, adding these two countries to the Turkish dominions, and gaining also the title of *Caliph*, or successor of Mahomet, and chief of his religion. The Ottoman sultan had now, therefore, taken the place both of the first Christian and first Mahometan sovereigns, and stood an increasing and threatening power, whose attitude struck terror into Europe and Asia. Selim wrested from Persia the rich country lying between the Tigris and Euphrates, and, by his various conquests, almost doubled the extent of his empire. His character, however, gives no brilliancy to the fame of great conquerors. He was called *Selim the Cruel*, from his indifference to the life or death of those around him; and it is said, that, when one of his officers one day asked him when the army would reach a certain village, he replied, "when God pleases; but for thee, it is my pleasure that thou remain here," and ordered his head to be struck off for presuming to ask the question.

The next sovereign, "Soliman the Magnificent," is better known in European history than any of the other Turkish princes. The empire had then no enemy towards the east; and as the Ottomans never thought of remaining at peace while they had a pretext for war and a prospect of conquest, he devoted the whole of his resources to successive attacks upon Germany, Hungary, and the Venetians. From the last he took Rhodes and the Greek islands, and Hungary he entirely subdued, by much treachery and an enormous expense of blood. He next collected a vast army to besiege Vienna; and the fate of Christendom was apprehended to be in the hands of the proud Ottoman. The measures of the Emperor Charles the Fifth, however, deterred him from the meditated attack, and he hurried off to Persia, to harass the sovereign of that country, who baffled him with the same watchful caution which had foiled his immense German preparations.

Soliman is called among his countrymen the law-giver, from his forming a body of regulations for the conduct of the public officers of his empire; but though his reign was one of much wisdom, and of unparalleled warlike achievement, yet certain regulations introduced by him were the first cause of the decline of the Ottoman empire. The government of Turkey being a pure despotism, the whole character and success of its measures depend upon the personal qualities of the sovereign. Now, before the time of Soliman, all the princes of the royal family were employed, as they grew up, in the service of the state, and acquired experience of which the most able frequently availed himself in order to seize the sceptre. This sultan, however, made a regulation, by which the young men of the royal family were ordered to be kept secluded from all business, and immured in the palace, till one of them should be called to the throne. This extraordinary edict has been ever since complied with to the letter; and the consequence has been, that from the days of Soliman, a line of princes have held the Ottoman sceptre who knew neither how to make themselves respected by their enemies, nor by their own army. "Snatched from a prison to preside at court," they were incapable either of heading their forces, or of selecting able statesmen for their ministers; and the fierce janissaries, who had been accustomed to be led to victory by their princes, began to murmur when they suffered defeats under inferior guidance. The sultans, also, who went no longer with them to war, regarded them with less favour, and abridged privileges which the soldiers rather thought of extending: hence there was a ceaseless contest between the army and the sovereign; on every opportunity there was a massacre of rebellious janissaries, who in their turn avenged themselves by assassinating their sultan, and raising another of his imprisoned relations to the throne. The persons who thus succeeded to empire were of course totally unacquainted with the improvements now daily introduced in neighbouring armies, and even if they had known them, had no personal influence to procure their adoption by their own forces. In order to weaken the rebellious janissaries, they were even obliged to corrupt

their military spirit by granting them the privilege of engaging in trades; and this, though it partly weaned them from their turbulent habits, lessened their efficiency in the field. Hence the Ottoman power, which, from the perfect organization of its military strength, had, under Soliman and his ancestors, overawed all Europe, began gradually to decline, as improvement advanced in other states.

These results, though they became more apparent on the accession of every new prisoner from the seraglio to the throne, did not arrive all at once. The military genius of the Ottomans long survived in their armies, and the officers trained in them; so that Europe at intervals still felt their power. Under Selim the Second (1570), they took Cyprus from the Venetians, and, with a barbarity which shows the true genius of war, had its defender skinned alive, and his hide stuffed with straw, to be hung up at the yard-arm of one of their galleys. This insult the Christian powers avenged, by destroying the whole Turkish fleet in the Gulf of Lepanto. On another occasion (1676), an Ottoman army, availing itself of a rebellion in Hungary, invaded Germany, and formed the siege of Vienna: it was defeated by the Poles under their gallant sovereign Sobieski, a service which Europe has repaid with little gratitude.

Within the last hundred years, the empire of the Turks has been gradually waning to extinction. The genius of the people being opposed to all improvement whatsoever, they have been circumvented on every hand by their more civilized neighbours. Their wild and ill-regulated warfare has been effectually checked by the cool intrepidity and discipline of European armies. Their indolence has always induced them to rely for support on the states they conquered, more than their own industry; indeed, the revenue they thus drew from their provinces was almost the only means of support to their government; their recent loss of Greece, Algiers, and, we may now say, Egypt and Syria, has therefore brought speedy ruin upon their commonwealth, and destroyed their trade. The present Turkish sovereign is much more civilized than his predecessors, and he has been engaged in remodelling the army, and introducing European costume and tactics; but it is believed that these creditable attempts are too late in being resorted to, and that the empire of the Ottomans must very soon sink into utter obscurity. As if conscious of their want of permanent security, it is said that the Turks on the European side of the Hellespont have a tradition that they are at some time to be driven across to their ancient Asiatic territories. This prediction would certainly long since have been fulfilled, but for the jealousies of the chief European powers, who countenance the Turkish government, and preserve it as a check upon the extension of the Russian dominions. It, nevertheless, seems probable that the present generation will have the satisfaction of seeing the barbarous sway of the Turks extirpated in Europe.

THE SUTORS OF SELKIRK.

TRADITION and history concur in celebrating the devoted bravery of the citizens of Selkirk at the fatal battle of Flodden, in 1514; and it is related, that of one hundred who followed James the Fourth to the field, only a few survived. A standard taken from the English on the occasion, by a member of the incorporation of weavers, is still in the possession of his descendant, an inhabitant of the town. The English were so exasperated at the bravery of that band of citizens, that they laid Selkirk in ashes. James the Fifth, however, in reward of their eminent services, granted them a thousand acres of Selkirk Forest, which are now worth about £1500 a-year. In the annual survey of this tract of land, or riding of the marches, the English standard is still carried before the incorporation of weavers. It is recorded by tradition, that, on the return of the few survivors from Flodden, they found, by the side of Lady-Wood-Edge, the corpse of a female, wife to one of their fellow-comrades, with a child sucking at her breast. In memory of this latter event, continues the tradition, the present arms of the burgh bear a female holding a child in her arms, and seated on a sarcophagus, decorated with the Scottish Lion; in the back ground a wood. In connexion with the story of the bravery of the men of Selkirk at Flodden, tradition has handed down the following rhyme, which has been the subject of much literary contest:—

Up wi' the sutors of Selkirk,
And down wi' the Earl of Hume;
And up wi' the bra' lads
That saw the single-soled shoon.

Whether this rhyme be as old as the battle of Flodden, whether it refer to the conduct of Lord Hume on that occasion in comparison with the bravery of the burgesses of Selkirk, or whether it applies to a more modern incident, a match at foot-ball betwixt the men of the Merse, or Earl of Hume's country, and those of Selkirk, it seems now difficult to decide. Although the words of the song, of which the above is the first verse, be not very ancient, and although there was no Earl of Home till the year 1604, antiquaries have generally found reason to believe that they allude to the conflict at Flodden. It is related that the principal trade carried on at the time of the battle, and for centuries afterwards, was that of manufacturing thin or single-soled shoes. Hence the glory of the above enterprise is wholly appropriated by what are

called "the Sutors of Selkirk," though the great trophy of the day was won by a person of a very different profession. It seems evident that the shoemakers have only become conspicuous in the story by their numbers, and by the predominance of the craft over all others, in remote as well as in recent times. This has proceeded to such a length, that to be made a sutor of Selkirk is the ordinary phrase for being created a burgess; and the ceremony gone through on such occasions seems to set the matter at rest. The candidate for burgal honours, at the festivity which always attends these ceremonies, is compelled to lick or pass through his mouth a small bunch of bristles, such as are used by shoemakers, which has previously been licked or mouthed by all the members of the Town-Council who may be present. This is called *licking the birse*, and is said to imply allegiance or respect to the craft who rule the roost in Selkirk. The late distinguished Sheriff-depute of the county, Sir Walter Scott, Bart., who supplied part of this information, on being made a sutor, used the precaution of washing the beslabbered birse in his wine, but was compelled, *noletis volens*, to atone for that act of disrespect by drinking off the polluted liquor. Nor was the custom ever dispensed with in any case on record, except that of Prince Leopold of Saxe Cobourg, who visited Selkirk in 1819.

The game of foot-ball, above alluded to, was anciently a very favourite sport throughout Scotland, but especially upon the Borders. Sir John Carmichael of Carmichael, warden of the middle marches, was killed in 1600 by a band of Armstrongs returning from a foot-ball match. Sir Robert Carey, in his *Memoirs of Border Transactions*, mentions a great meeting appointed by the Scottish riders to be held at Kelso, for the purpose of playing at foot-ball, but which terminated in an incursion upon England. At present, the foot-ball is often played by the inhabitants of adjacent parishes, or of the opposite banks of a stream. The victory is contested with the utmost fury, and very serious accidents have sometimes taken place in the struggles.

RELIQUES OF WALTER SCOTT.

FOLLOWING up the plan we have commenced, of giving such anecdotes of Sir Walter Scott as come to our hands, in the successive numbers of the Journal, we have this day the agreeable task of introducing to the notice of our readers three distinct productions of his pen, of which the two first were never before printed, while the third, though published at the time of its composition in a newspaper, was not then ascertained to be his, and has never since been before the public.

LETTER TO BISHOP PERCY.

The first of the three articles in point of date is a letter to the celebrated Bishop of Dromore, apparently in answer to one in which his Lordship had expressed satisfaction with the scheme of the Border Minstrelsy, and offering to contribute to the additional volume, then projected, of the *Reliques of Ancient English Poetry*. The way in which he alludes to his first perusal of that work is a vivid trait of character. It seems tolerably clear, from various circumstances, that he first perused Bishop Percy's collection in 1784, at Rosebank, near Kelso, the seat of his uncle Captain Robert Scott; and in one of his published works he thus alludes to it: "The tree is still in my recollection, beneath which I lay and first entered upon the enchanting perusal of Percy's *Reliques of Ancient English Poetry*, although it has long perished in the general blight which affected the whole race of oriental platanus to which it belonged." From the two passages united, we may almost make out the scene of this remarkable era of his life, and it may be added, of modern literature; for it will never be disputed that the great mind which has given such a bias to the intellectual system of the present age, received its own first direction in a great measure from the national poetry published by Percy. It must have been upon a verdant seat or bank, beneath an eastern plane (probably brought from India by his uncle), that the bard of Marmion first glowed over the kindred strains of the southern minstrels.

The last paragraph of the letter will also have its interest:—the immortal claiming present respectability from the mortal—the noble of mind from the noble of matter! It will be recollected that the Marquis of Downshire was guardian to Lady Scott.

"MY LORD—I shall not trouble your Lordship with an attempt to express the pleasure I felt at the receipt of the letter with which you honoured me, because the task would be equally difficult to me, and disagreeable to your Lordship.

"Were I to compare it to any thing, it would be to the sensation I felt when the *Reliques of Ancient Poetry* were first put into my hands, an era in my poetical taste which I shall never forget.

"The very grass sod seat to which (when a boy of

twelve years old) I retreated from my playfellows, to devour the works of the ancient minstrels, is still fresh and dear to my memory. That you are pleased to approve of my intended work, will prove to me an additional stimulus in the execution. An early partiality to the tales of my country, and an intimate acquaintance with its wildest recesses, acquired partly in the course of country sports, and partly in pursuit of antiquarian knowledge, will, I hope, enable me at least to preserve some of the most valuable traditions of the south of Scotland, both historical and romantic.

"My want of knowledge and experience in these pursuits will, I hope, be in some measure supplied by the enthusiasm with which I have pursued my object, and the obscure path through which I have traced it.

"I am very much obliged to your Lordship for the urbanity with which you have offered me a copy of the Earl of Westmoreland's escape; but, under the circumstances you mention, I can have no wish to give your Lordship's amanuensis the trouble of transcribing it upon my account. On the contrary (did I not think that Mr Percy's own researches must be far more accurate than mine), I would with pride contribute to the 4th vol. of the *Reliques* such particulars regarding the 'Rising in the North Country' as I had arranged, with a view to some notices in my own publication; and if this would be acceptable, your Lordship has only to give me a hint to that purpose.

"I have published (that is, printed) in the *Minstrelsy of the Scottish Border*, the Scottish account of the Battle of Otterbourne; a ballad evidently much more modern than that published in the *Reliques* on the same subject.

"In the notes upon the poem, I have been led to express doubt with regard to the account given in the *Reliques* of one of the heroes of the tale—I mean John of Agurstone—whom your Lordship, certainly not without probability, has conjectured to be one of the family of Hagerstone, in Northumberland. At the same time, considering that the English, at the period of the battle of Otterbourne, possessed Roxburgh and Berwick, together with the intermediate fortresses on the south of the Tweed—Wark, Norham, Ford, Cornhill, Twisel, &c.—I think it unlikely that the Hagerstones could at that time acknowledge the Scottish sovereignty, and am rather induced to think (*salva auctoritate tanti viri*) that the warrior was one of the Rutherfords of Edgerstone, anciently spelled Adgurstone, an ancient family, followers of the house of Douglas, and long established on the Scottish Borders, five or six miles above Jedburgh.

"I am sure your Lordship's goodness and liberality will easily excuse my requesting your farther opinion on this hypothesis, although in making this request I am conscious I intrude upon time dedicated to much more valuable and important avocations.

"Your Lordship may probably know my excellent and kind friend, the Marquis of Downshire, whose name I take the liberty of using as some security for my personal character; and I flatter myself he will bear testimony, that in honouring me with an occasional continuance of your correspondence, your Lordship will not entirely misplace your favour. If there is any thing to be done here which can further the 4th vol. of the *Reliques*, your Lordship will honour me by commanding my best services.—I am, my Lord, your Lordship's obliged and very humble servant,

WALTER SCOTT.

"Edinburgh, 11th January 1801."

THE BATTLE OF KILLIECRANKIE.

THE second of our *religues* is a ballad poem, and one not unworthy to rank with the best efforts of its author in verse. It is a translation of the well-known modern Latin poem, beginning,

"Gramius notabilis collegat montanos,"

which was in its turn a free imitation of the original ballad of "Killiecrankie," and capable of being sung to the same spirited tune. For the benefit of the English reader, it may be mentioned, that the subject of the poem is the battle fought on the 26th of July 1689, near the Pass of Killiecrankie, between the celebrated Viscount Dundee (formerly Graham of Claverhouse), in behalf of the expatriated James the Second, and General M'Kay, who appeared at the head of a superior army of Dutch and British troops, for the defence of the revolution settlement. Dundee fell in the arms of victory, and his loss was never recovered by the Jacobite party. The occasion of the poem being written, and the date of its composition, are explained by the following note from the hand-writing of the late Alexander S. Hunter, Esq. of Blackness, a partner in the firm of Archibald Constable and Company.

"This translation was made by Walter Scott, Esq., and was presented by him to me, being intended to accompany an engraved portrait of Lord Dundee, from the original picture in the possession of the Duke of Montrose, which I had been the means of obtaining from the Miss Youngs of Aulbar, in Angus (for his Grace), in whose family it had remained upwards of a century. This spirited effusion has never yet been published, nor do I believe Mr Scott has any

other copy of it.—November 1811. P.S. I got it from Mr Scott about six years ago; i.e. in 1805."

The glorious GRAHAM, of deathless fame,
Brought down his mountain band;
The Southron race, in rout they chase,
Claymore and targe in hand.
The lowland prig, and canting whig,
In headlong flight were roll'd;

O wondrous GRAHAM! Herculean frame,
And faith sustained by fear!
Thou well couldst fire, to deeds of ire,
The agile mountaineer.
Though twice thy force opposed thy course,
In deep and dark array,
Yet swept thy sword the foreign lord,
And stranger race away.

Of noble birth, and nobler worth,
A Peer of old renown,
His blade sae true, DUNFERMLINE drew,
And hew'd the traitors down.
With heart of faith, and hand of death,
Old Scotland's Nestor gray,
O'er helms of steel, through ranks that reel,
PITCOUR led on the way.

For James's right, GLENGARY's might
The field with slaughter strew'd;
Not he through fire, who bore his sire,
Such zealous duty shew'd.
The men of Skye, of metal high,
They shared their chieftain's toils;
Both sire and son, to fight rushed on,
Macdonalds of the Isles.

MACLEAN the bold fought as of old,
Amid his martial clan;
From foemen such, the tardy Dutch,
With speed unwonted ran.
The stout LOCHIEL, with dirk of steel,
And many a Cameron there,
The Southron fell, dispatched to hell
And bore their spoils to Blair.

BARA, GLENCOE, KEPCOCK also,
And BALLOCH and his brother,
They fenced the claims of good King James
And would not brook another.
And APPINE, too, his faulchion drew,
With Stuarts brought from far;
And CANNON sage, did guide their rage,
And marshall'd all the war.

There, too, was he from Hungary,
Who for his Prince did come,
And turned his dirk from faithless Turk,
Gainst falser whigs at home.
The TUTOR sage, to battle's rage,
Clanronald's broadsword brought,
And with his clan, in act a man,
Their stripling Captain fought.

GLENMORRISTON from wood and glen,
A huntsman warrior came;
His carbine true, to earth he threw,
And drew his sword of flame.
He left the doe, and bounding roe,
He left the stag at bay,
The whiggish race, like deer to chase,
And course the false Mackay.

While Tummel's wave, by rock and cave,
From Blair to Tay shall run,
Claymore and targe, in Highland charge,
Shall rout the pike and gun.
And you, ye true, your blades who drew,
For Scotland's laws and King,
In storied lays, your deathless praise,
Immortal bards shall sing.

HYMN FOR THE CZAR.

Our third relique is a hymn to the Czar Alexander, which Sir Walter composed at the request of a magistrate of Edinburgh, and an old school-fellow of his own, for the purpose of being sung to Haydn's "God Save the Emperor Francis," at the dinner given by Lord Provost Arbuthnot, December 19, 1816, to the Arch Duke Nicolas, now Emperor of Russia, on his visiting and becoming a freeman of the city of Edinburgh. The verses were applied for in the afternoon of the day before the Arch Duke's arrival, and the poet, having been furnished with a copy of the air, finished them, and sent them to their proper destination that night. At the feast, which took place some days afterwards, many distinguished persons were present, including Mr Scott; and the hymn was sung by the band with great effect, the company receiving copies at the same time on a printed slip. The last verse, which must be considered as detached from the hymn, was received with great applause:—

God protect brave Alexander!
Heaven defend the noble Czar!
Mighty Russia's high commander,
First in Europe's banded bar.
For the realms he did deliver
From the tyrant overthrown,
Thou, of every good the Giver,
Grant him long to bless his own.

Bless him 'mid his land's disaster,
For her rights who battled brave;
Of the land of foemen master,
Bless him who their wrongs forgave,
O'er his just resentment victor,
Victor over Europe's foes:
Late and long, Supreme Director,
Grant in peace his reign may close.
Hail, then, hail! illustrious stranger!
Welcome to our mountain strand;
Mutual interests, hopes, and danger,
Link us with thy native land,
Foemen's force, or false beguiling
Shall that union ne'er divide
Hand in hand, while peace is smiling,
And in battle side by side.

THE SOUTH OF FRANCE.

[The following is the first of a series of original articles descriptive of remarkable places in foreign countries, which we mean to continue in the Journal, if we shall find that they give satisfaction to any considerable portion of our readers. It appears to us, that such a series of articles, if written, as the other articles of this work are written, with an express view to what is capable of interesting, or being intelligible to, the mass of mankind, may instruct the minds and expand the views of many persons who have not read even the most familiar books respecting the Continent. The South of France will be described in three articles—the next in order being devoted to Toulouse.]

BOURDEAUX.

On the 18th of September 1830, we sailed out of the Bay of Dublin, which the rays of the morning sun and a fine fresh breeze had rendered a glittering mass of green and gold, the Wicklow mountains stretching calmly up in the distance, and descending to the shore in bold rocky lines. The rapid pace of the steam-boat, as it carried us along the coast, gave it much the appearance of a peristrophe panorama, object succeeding object in quick succession; but before nightfall, we had entirely lost sight of it, as we kept inclining to the left across St George's Channel. It is not my intention to amuse you with an account of the very heavy gale we encountered the three following days—which, as sailors say, made our mizen-mast go by the board—and of our great joy when we found ourselves safely anchored in smooth water at the mouth of the Garonne, under the custom-house of Polignac. It was late in the evening before we came to anchor, so that, though I felt much anxiety to catch a glimpse of the shore, to which we were so close that I could distinguish the lights of the cottage fires, and hear faint sounds of human voices, I had to content myself with walking to the wheel, and examining with curious eyes the uncouth figure of the French pilot, which had hailed and boarded us some hours previously in the Bay of Biscay. There was nothing very distinctive about this man, except his great red night-cap with a yellow tassel, and the ponderous magnitude of his sea-boots; but then he was not one of us—his language, religion, food, all different: and yet in his character of pilot he grasped the wheel with an air of importance, giving directions to our sailors in unintelligible English, which they received with their tongues in their cheeks, and a sly wink to the captain. It appeared to me that the feeling of superiority and contempt which our sailors so fearlessly evinced for the French in the last war had not terminated with it.

I was on deck at an early hour in the morning, and cannot say but I was much disappointed with the character of the scenery. The banks of the Garonne, as far as Bordeaux, are low and swampy, reminding me strongly of the Mersey at Liverpool; and the vines, which you see on all sides, as far as the eye can reach, growing close to the ground, have much the appearance of bean-fields. We were soon boarded by the custom-house officers, who set about with diligence, yet politeness, to examine our baggage. Their uniform was a sort of medium between a civilian and soldier, being light blue with a little embroidery, and foraging caps. They were especially precise in replacing every thing as they found it, and the only articles seized were some culinary instruments belonging to missionaries on their way to Persia, which, I believe, were afterwards reclaimed with success. The passport system is by no means so strict at present in France as it was under Charles the Tenth—an Irish gentleman finding no difficulty in making good his landing without having any thing to show in proof of his not being *un mauvais sujet*; i.e. a Carlist.

Bordeaux is to this country in wine what Meux's brewery is to London in porter, and, were it not for the heavy duty on its importation, claret might be drunk almost as cheap as beer. This, however, is not much to be regretted, as I question whether the climate and dispositions of Britons are at all in unison with cold acid potations. Surface acquirements, and their usual adjuncts, carelessness and gaiety, are all in unison with light meats, light wines, and cloudless skies; but deep-rooted feelings and strong perceptions seem to require stronger diet and deeper excitement. An Englishman, and, still more, a Scotsman, is contemplative and observing, his body being often exhausted through the medium of his mind. A Frenchman, on the other hand, is a creature of circumstance—a shuttlecock, who, from the whole train of his education and thought, believes his country to be the greatest in the world, and his lot an enviable one, because he is a part of it. His highest stretch of philosophy is to make the most of the present minute, and his only religious formula, "Sufficient for the

day is the evil thereof." The town is built in the form of a bow, of which the river may be aptly termed the string; and as its magnificence and wealth, which now entitles it to rank the third town in France, is of recent date, most of the public buildings are new, and the streets spacious and clean. The quays are several miles in length, the depth of water admitting the approach of the largest vessels, the breadth of the Garonne being considerably greater than the Thames at London Bridge. A great deal of bustle and activity seems to prevail, and I noticed both the British and American flags flying from many vessels. On landing, I breakfasted at a *restaurant's*, or coffee-house, where every thing was elegance and glitter, and sufficiently foreign. Suppose a saloon something like the Writer to the Signet's library in Edinburgh, but much gayer, with marble columns and pavements, and gilded ceiling, filled with company refreshing themselves in the recesses of the windows with wine, and fruits, and coffee, on marble tables, with waiters flying about with French nimbleness, and a very pretty grisette seated in great state on a sort of throne at the extremity, like the presiding genius of the place, superintending the accounts, and you have some little idea of the place. The constant sound of billiards, proceeding from a neighbouring room, will also add to the picture, as it gives some little idea of a Frenchman's mode of passing the day. In spite of all this show, however, which in our country would all have appeared in the bill, I made a good breakfast, on coffee, eggs, and rolls, for one franc, or ten pence British money. It being Sunday, I set out for the cathedral, which, with the help of a guide-book, I was able to do without the assistance of a *cicerone* or town-crier, of whom there are vast numbers, who fasten themselves like burs upon *unwary travellers*, and who destroy by their descriptions all the pleasure of sight-seeing. On my way, I passed through the market, which was thronged with peasants and townspeople. Amongst the former, I did not observe many handsome faces, the women having the hardy sun-burnt look which out-of-door labour in the fields produces, and the men in general a lumpy look, from the great wooden shoes and gaudily coloured night-caps they wear. The colours of the women's dresses strike one as very intense—red, blue, and yellow coming sometimes in strong contrast, which, being mixed up with fruits and flowers, have a very rich effect. Their head-dress, too, is striking, being in general white caps of great height, stiffened with pasteboard, which stand erect, and from the top of which two small pinates or streamers of white muslin depend. Their ears are almost invariably loaded with massy ear-rings of solid gold, which, I understand, are part of their doweries, and to purchase which all their earnings are hoarded. The gloomy interior of the Cathedral of St André presented no small contrast to the activity and bustle of such a scene. It is a fine Gothic mass, in the form of a cross, with side chapels running round the east end. The south front has two spires, each 150 feet high, and a pediment; the north front, two unfinished towers; the greatest length is 413 feet, and that of the transept, or cross part, 150. A peculiar feature in this church is the want of aisles, so that the nave has the appearance of an immense hall. When I entered, it wanted some half hour of mass-time, and one or two people only were scattered about in solitary places, engaged in devotional exercises. Many of the attitudes assumed by these poor people were both devout and picturesque, and as the tinted light fell upon them through the richly stained windows, it discovered countenances of hope and resignation. In a short time, several priests began to flutter about in white robes, and light a dozen or two of huge wax candles. The bustle increased, more people entered, and the sound of martial music mingled with the hubbub. It gradually approached, and I was lost in wonder when in marched a regiment of soldiers, with drums beating and colours flying. The men ranged themselves down each side of the nave; the word was given to ground their arms, and there they stood whispering and laughing to one another, as if they had been at a review. Two more regiments entered in the same way, and took their places rank and file. As these were the first French troops I had seen, I could not help making a comparison between them and our own. They were in general much punier men, with an air and swagger, something like our sailors; however, in spite of the bravado of their mustachios, and want of soldierly precision in their dress, they certainly appear a brave, desperate set of fellows, not mere engines in the hands of their officers, but feeling and acting under impulses of their own. Their uniform is a blue coat, trimmed with yellow, and red trousers. The officers now entered, and, passing down the centre, the clashing of arms, as the soldiers gave them the salute, sounded harsh, and out of harmony with the quiet peacefulness which ought to characterize a Christian temple. The bands of music belonging to the regiments now approached the altar, and performed some gay operatic airs, whilst the priest performed the usual religious ceremonial, which was not of long duration; the priest stopped, the men fell into line, and marched out as they had entered, with the music of their little brass drums pealing about the vaulted ceiling.

As I happened to be provided with a letter of introduction to Mr Le H—, one of the leading wine-merchants of the city, I proceeded to call upon him, and he was polite enough to accompany me in visiting

the other leading features of the town. The church of greatest attraction, after the cathedral, is St Michael, the bell tower of which stands apart from the body of the church, and in which are shown some human remains, said to have been preserved for 400 years, from the embalming nature of the soil. On the summit is a telegraph, by means of which news is conveyed to Paris in five or six hours. There are, I believe, ten or twelve other churches of less notoriety. Next to religious, the French love theatrical exhibitions. The great theatre, Place de la Comedie, is one of the handsomest in France, capable of holding 4000 persons. In front, twelve Corinthian columns, 40 feet in height, support the nine Muses and three Graces. The architectural object of most attraction, however, is the bridge over the Garonne, built by Napoleon, after designs by Deschamps. It consists of seventeen arches, the seven central ones being each eighty-seven feet span; the whole length is 1600 feet, and breadth between parapets 50 feet. The interior consists of a series of open vaulting, in three divisions, the haunches not being filled in, so that one may walk under cover from one end to the other. Models of various portions of the constructive parts are kept here, beautifully executed in wood and plaster. As we passed along, Mr Le H— pointed out to me the Chateau Royale, the Public Library, the Exchange, Public Baths, &c., all of which appeared spacious, appropriate, and magnificent. One of the great characteristics of French towns, I believe to be the beautiful shady walks which intersect the streets, and nothing is more harmonious than the mixture of trees and architecture. In Bourdeaux, the Royal Gardens is a magnificent example of this; some of the alleys are five deep, giving a very umbrageous look, something like the nave and double aisles of a magnificent cathedral. On fete days, and Sundays, those walks are crowded with gay company, and bands of music. At one extremity is a Roman ruin (for this was an ancient city), called Gallien's Palace, but more probably Amphitheatre. Little remains to admire except the admirable consistency of the mortar, which time seems to have found a harder morsel than either stone or brick. As we had thus found our way into the country, Mr Le H— took me to see one of his neighbouring vineyards. We found the people busily engaged: some gathering the grapes, which they did with a pair of large shears, cutting the strings of the clusters without handling them, and allowing them to drop into a basket; others, at dinner under a large chestnut—their wages, comprehending a dinner of soup, bread, and meat, being only 3d. per day. The grapes were chiefly of a deep purple colour, though they varied in tone from that to a faint creamy tint. As we passed by a little hut, I looked in at two or three huge brawny-legged peasants stamping away in a tub, like our washerwomen, amongst a mash of grapes; this being the process of pressing. I cannot say I much enjoyed the sight; the stains upon the legs and arms of a deep port wine colour, gave them rather a strange appearance. When we returned, Mr Le H—, insisting upon my dining with him, gave me an opportunity of seeing a true French dinner. It consisted of soup, and melons—boiled beef, oysters—stewed meat, oysters again—roast mutton—dessert, coffee and liqueurs. From what Mr Le H— said, I should fancy the finest sorts of claret are only to be found in our country, as there is no market for them anywhere else; the poorer sorts the French themselves consume.

CHARACTERISTIC SKETCHES.

BENTHAM.

JEREMY BENTHAM, recently deceased, has been described as one of the most remarkable literary characters in Great Britain. Till the period of his decease, he existed in some measure as a connecting link between the philosophic theorists of the past and present age, yet extremely little is known of his character or pursuits; for though lauded in unmeasured terms by some of his contemporaries, and made a pet subject among magazine writers and reviewers, the people, by whom it will be allowed all popularity and true greatness become fixed, hardly know that there was ever such a person, and very few of them indeed could tell what were his peculiar doctrines. There is a large class of individuals in this country who continue to write and publish books, and make up papers for periodical publications, and whose names are frequently enough met with in our ephemeral literature, yet who are quite unknown and uncared for by the general community, and whose productions have no visible effect whatever either on the conduct or style of thinking of the people. To this class in a great measure belonged Jeremy Bentham. He was a great and voluminous writer on metaphysical and political subjects, as well as on jurisprudence; he strove for many years for what he considered the good of the people; and he almost died for the people, for he bequeathed his body to the dissectors, in order to benefit the science of anatomy; yet, strangely enough, the people generally seem to know little or nothing of him; and it might be safely affirmed that there could not be found a dozen complete copies of his works in ordinary use from the one end of our island to the other. Nevertheless, according to some of the newspapers and magazines, and those who give praise on trust, Bentham was "one of the greatest philosophers of his time"—an assertion there is no possibility of disproving. From what can be guessed

as to the sum of Bentham's principles, it appears he was one of those men who *think* themselves into a belief, that, as things go, mankind are all in the wrong; that they do nothing rightly; that the whole of the machinery of society should be stopped, the wheels cleaned and altered, and then set a-going on a new plan. Yet, with this whimsicality of character, Bentham was in reality a sincere friend to mankind in the widest possible sense; and it is only a pity that he did not take pains to bring his views lucidly and pointedly before the community, so that they might have been studied, and, if necessary, acted upon. His plans for simplifying our forms of law were, we believe, of a valuable kind, and had he brought them forward on a practical scale, great benefit might have ensued. As it is, they might almost as well have never been digested. The character of Bentham—in whom there was much to admire, and something to condemn—has perhaps never been so well delineated as by Hazlitt, and, with the translation from the present to the past tense, may here be introduced.

"Mr Bentham was one of those persons who verified the old adage, that 'a prophet has no honour, except out of his own country.' His reputation lay at the circumference; and the lights of his understanding were reflected, with increasing lustre, on the other side of the globe. His name was little known in England, better in Europe, and best of all in the plains of Chili, and the mines of Mexico. He offered constitutions for the New World, and legislated for future times. The people of Westminster, where he lived, hardly knew such a person. We believe that the Empress Catherine corresponded with him; and we know that the Emperor Alexander called upon him, and presented him with his miniature in a gold snuff-box, which the philosopher, to his eternal honour, returned. Mr Hobhouse is [or was] a greater man at the hustings; but Mr Bentham would have carried it hollow, on the score of popularity, at Paris or Pegu. The reason is, that our author's influence was purely intellectual, having devoted his life to the pursuit of abstract and general truths, and to those studies

'That waft a thought from Indus to the Pole,'

and never mixed himself up with personal intrigues or politics. Mr Bentham was very much among philosophers what La Fontaine was among poets—in general habits, in all but his professional pursuits, he was a mere child. He lived for the last forty years in a house in Westminster, overlooking the Park, like an anchorite in his cell, reducing law to a system, and the mind of man to a machine. He scarcely ever went out, and saw very little company. The favoured few who had the privilege of the *entrée* were always admitted one by one. He did not like to have witnesses of his conversation. He talked a great deal, and listened to nothing but facts. When any one called upon him, he invited them to take a turn round his garden with him (Mr Bentham was an economist of his time, and set apart this portion of it to air and exercise), and there you might have seen the lively old man, his mind still buoyant with thought, and with the prospect of futurity, in eager conversation with some Opposition member, some expatriated patriot, or trans-Atlantic adventurer, urging the extinction of close boroughs, or planning a code of laws for some 'lone island in the watery waste,' his walk almost amounting to a run, his tongue keeping pace with it in shrill, clattering accents, negligent of his person, his dress, and his manner, intent only on his grand theme of UTILITY. He heard and saw only what suited his purpose, or some 'foregone conclusion'; and looked out for facts and passing occurrences in order to put them into his logical machinery, and grind them into the dust and powder of some subtle theory. Add to this physiognomical sketch the minor points of costume, the open shirt-collar, the single-breasted coat, the old-fashioned half-boots, and ribbed stockings, and you would have found in Mr Bentham's general appearance a singular mixture of boyish simplicity and the venerableness of age.

Mr Bentham, perhaps, overrated the importance of his own theories. He has been heard to say (without any appearance of pride or affectation) that 'he should like to live the remaining years of his life, a year at a time, at the end of the next six or eight centuries, to see the effect which his writings would, by that time, have had upon the world.' But we do not think, in point of fact, that Mr Bentham has given any new or decided impulse to the human mind. He cannot be looked upon in the light of a discoverer in legislation or morals. He has not struck out any great leading principle or parent truth, from which a number of others might be deduced, nor has he enriched the established stock of intelligence. Mr Bentham's *forte* was arrangement. He has methodised, collated, and condensed all the materials prepared to his hand, on the subjects of which he treats, in a masterly and scientific manner. His writings are, therefore, chiefly valuable as books of reference, as bringing down the account of intellectual inquiry to the present period. Mr Bentham's leading doctrine was the necessity for studying UTILITY in every rule of society; but he was not the first writer who assumed that principle as the foundation of just laws, and of all moral and political reasoning. Perhaps the weak side of his conclusions is, that he has not made sufficient allowance for the varieties of human nature, and the caprices and irregularities of the human will. [This, by the way, has been a very

common error among the philosophers and theorists of ancient and modern times.] Every pleasure, says Bentham, is equally a good, and is to be taken into the account as such in a moral estimate, whether it be the pleasure of sense or of conscience, whether it arise from the exercise of virtue or the perpetration of crime. We are afraid the human mind does not readily come into this doctrine. Our moral sentiments are made up of sympathies and antipathies, of sense and imagination, of understanding and prejudice. Mr Bentham, in adjusting the provisions of a penal code, lays too little stress on the co-operation of the natural prejudices of mankind, and the habitual feelings of that class of persons for whom they are more particularly designed. Legislators (we mean writers on legislation) are philosophers, and governed by their reason; criminals, for whose control laws are made, are a set of desperadoes, governed only by their passions. What wonder so little progress has been made towards a mutual understanding between the two parties! If sanguine and tender-hearted philanthropists have set on foot an inquiry into the barbarity and the defects of the penal laws, the practical improvements have been mostly suggested by reformed cut-throats, turn-keys, and thief-takers. The laws of the country are ineffectual and abortive, because they are made by the rich for the poor, by the wise for the ignorant, by the respectable and exalted in station for the scum and refuse of the community. If Newgate would resolve itself into a committee of the whole press-yard, with Jack Ketch at its head, aided by confidential persons from the county prisons or the hulks, and would make a clear breast, some data might be found out to proceed upon; but as it is, the *criminal mind* of the country is a book sealed. Mr Bentham, in his attempts to revise and amend our criminal jurisprudence, proceeded entirely on his favourite principle of utility. Convince highwaymen and housebreakers that it will be their interest to reform, and they will reform, and lead honest lives, according to Mr Bentham. He says, 'All men act from calculation, even madmen reason.' And, in our opinion, he might as well have carried this maxim to Bedlam or St. Luke's. Criminals are *not* influenced by reason; for it is of the very essence of crime to disregard consequences both to themselves and others. You may as well preach philosophy to a drunken man, or to the dead, as to those who are under the instigation of any mischievous passion. The style of Mr Bentham is unpopular, not to say unintelligible. He wrote a language of his own, that darkens knowledge. His works have been translated into French—they ought to be translated into English. People wonder that he was not prosecuted for the boldness and severity of some of his invectives; but he might have warped up high treason in one of his inextricable periods, and it would never have found its way into Westminster Hall. He was a kind of manuscript author—he wrote a cypher hand, which the vulgar have no key to. It is a barbarous philosophical jargon, with all the repetitions, formalities, uncouth nomenclature and verbiage of law Latin; and what makes it worse, it is not mere verbiage, but has a great deal of acuteness and meaning in it, which you would be glad to pick out, if you could. Mr Bentham, in private life, was an exemplary character. He was a little romantic, or so; and dissipated part of a handsome fortune in practical speculations. His house was warmed and lighted by steam; and he was one of those who prefer the artificial to the natural in most things, and think the mind of man omnipotent. It was the great fault of this able and extraordinary man, that he concentrated his faculties and feelings too entirely on one subject and pursuit, and did not 'look enough abroad into universality.'

AN IRISH DANCE.

If any of our readers be fond of stories illustrative of Irish manners and passions, and descriptive of *Paddy* as he is to be found in his native purity, in "dear old Ireland," let them peruse a work which has recently made its appearance, entitled "Traits and Stories of the Irish Peasantry." In one of these interesting tales, called the "Midnight Mass," the author develops a good deal of drollery in the following account of an Irish dance:—

"The Irish dance (he remarks), like every other assembly composed of Irishmen and Irishwomen, presents the spectator with those traits which enter into our conception of rollicking fun and broad humour. The very arrangements are laughable; and when joined to the eccentric strains of some blind fiddler like Barny Dhal, to the grotesque and caricaturish faces of the men, and the modest, but evidently arch and laughter-loving countenances of the females, they cannot fail to impress an observing mind with the obvious truth, that a nation of people so thoughtless and easily directed from the serious and useful pursuits of life to such scenes, can seldom be industrious and wealthy, nor, despite their mirth and humour, a happy people.

The barn in which they danced on this occasion was a large one. Around the walls were placed as many seats as could be spared from the neighbours' houses; these were eked out by sacks of corn laid lengthwise, logs of round timber, old creels, iron pots, with their bottoms turned up, and some of them in their usual position. On these were the youngsters seated. Up in a corner sat Barny, surrounded by the seniors of the village, saving the fiddle with indefatigable

vigour, and leading the conversation with equal spirit. Indeed, his laugh was the loudest, and his joke the best, whilst, ever and anon, his music became perfectly furious—that is to say, when he rasped the fiddle with a desperate effort 'to overtake the dancers.' from whom, in the heat of the conversation, he had unwittingly lagged behind.

Dancing in Ireland, like every thing else connected with the amusement of the people, is frequently productive of bloodshed. It is not unusual for crack-dancers from opposite parishes, or from distant parts of the same parish, to meet and dance against each other for victory. But as the judges in those cases consist of the respective friends or factions of the champions, their mode of decision may readily be conjectured. Many a battle is fought in consequence of such challenges, the result usually being that not he who has the lightest heel, but the hardest head, generally comes off the conqueror.

While the usual variety of Irish dances—the reel, jig, fling, three-part-reel, four-part-reel, rowly-powly, country-dance, cotillion, or cut-along (as the peasantry call it) and minuet, vulgarly minion and minionet—were going forward in due rotation, our readers may be assured that those who were seated around the walls did not permit the time to pass without improving it, many an attachment being formed at such amusements.

At the dance we are describing, luckily there was no dissension; every heart appeared to be not only elated with mirth, but also free from resentment and jealousy. The din produced by the thumping of vigorous feet upon the floor, the noise of the fiddle, the chat between Barny and the little sober knot about him, together with the brisk murmur of the general conversation, and the expression of delight which sat on every countenance, had something in them elevating to the spirits.

Barny, who knew the voices, and even the mode of dancing peculiar to almost every one in the barn, had some joke for each. When a young man brings out his sweetheart—which he frequently does in a manner irresistibly ludicrous, sometimes giving a spring from the earth, his *carbeen* set with a knowing air on one side of his head, advancing at a trot on tip-toe, catching her by the ear, leading her out to her position, which is 'to face the fiddler,' then ending by a snap of the fingers, and another spring, in which he brings his heel backwards in contact with his ham; we say, when a young man brings out his sweetheart, and places her facing the fiddler, he asks her what she will dance; to which, if she has no favourite tune, she uniformly replies—'Your will is my pleasure.' This usually made Barny groan aloud.

'What ails you, Barny?'
'Oh, thin, murder alive, how little thruth's in this world! Your will's my pleasure! *Baithershin!* but, sowl, if things goes an, it won't be long so!'
'Why, Barny,' the young man would exclaim, 'is the ravin' fit comin' over you?'
'No, in thruth, Jim; but *it's thinkin' of home I am*. Howandiver, do you go an; but, *naboklish!* What'll you have?'
'"Jig Polthouge," Barny: but oil your wrist, a bouchal, or Katty will lave us both out o' sight in no time. Who! success! clear the coorse. Well done, Barny! That's the go.'

When the youngsters had danced for some time, the fathers and mothers of the village were called upon 'to step out.' This was generally the most amusing scene in the dance. No excuse is ever taken on such occasions, for when they refuse, about a dozen young fellows place them, will they nil they, upright upon the floor, from whence neither themselves nor their wives are permitted to move until they dance. No sooner do they commence, than they are mischievously pitted against each other by two sham parties, one encouraging the wife, the other cheering on the good man; whilst the fiddler, falling in with the frolic, plays in his most furious style. The simplicity of character, and, perhaps, the lurking vanity of those who are the butts of the mirth on this occasion, frequently heighten the jest.

'Why thin, Paddy, is it strivin' to outdo me you are? Faiks, avourneen, you never seen that day, any way; the old woman would exclaim, exerting all her vigour.—'Didn't I? Sowl, I'll sober you before I lave the flure, for all that,' her husband would reply.

'An' do you forget,' she would rejoin, 'that the M'Carthy drop is in me? ay, an' it's to the good still.'

And the old dame would accompany the boast with a fresh attempt at agility, to which Paddy would respond by 'cutting the buckle,' and snapping his fingers, whilst fifty voices, amidst roars of laughter, were loud in encouraging each.

'Handle your feet, Katty, darlin'—the mettles lavin' him!'

'Off wid the brogues, Paddy, or she'll do you. That's it; kick off the other, an' don't spare the flure.' A thousand guineas an Katty! M'Carthy agin Gallagher for ever!—whirrro!

'Blur alive the flure's not benefitin' by you, Paddy. Lay an it, man!—That's it!—Bravo!—Whish!—Our side agin Europe!'

'Success, Paddy! Why, you could dance the Dusty Miller upon a flure paved wid drawn razures, you're so soople.' Katty for ever! The blood's in you, Katty; you'll win the day. More power to you!'

'I'll hould a quart on Paddy. Heel an' toe, Paddy you sinner!'

'Right an' left, Katty; hould an, his breath's goin'.'
'Right an' wrong, Paddy, you spalpeen. The whiskey's an you, man alive: do it dacently, an' don't let me lose the wager.'

In this manner would they incite some old man, and, perhaps, his older wife, to prolonged exertion, and keep them bobbing and jiggling about amidst roars of laughter, until the worthy couple could dance no longer.

During stated periods of the night, those who took the most prominent part in the dance got a plate and hat, with which they went round the youngsters, to make collections for the fiddler. Barny reserved his best and most sarcastic jokes for these occasions; for so correct was his ear, that he felt little difficulty in detecting those whose contributions to him were such as he did not relish.

The aptitude of the Irish for enjoying humorous images was well displayed by one or two circumstances which occurred on this night. A few of both sexes, who had come rather late, could get no other seats than the iron pots to which we have alluded. The young women were dressed in white, and their companions, who were also their admirers, exhibited in proud display, each a bran new suit, consisting of broad-cloth coat, yellow-buff vests, and corduroy small-clothes, with a bunch of broad silk ribbons standing out at each knee. They were the sons and daughters of respectable farmers, but as all distinctions here entirely ceased, they were fain to rest contented with such seats as they could get, which on this occasion consisted of the pots aforesaid. No sooner, however, had they risen to dance, than the house was convulsed with laughter, heightened by the sturdy vigour with which, unconscious of their appearance, they continued to dance. That part of the white female dresses which had come in contact with the pots, exhibited a circle like the full moon, and was black as pitch. Nor were their partners more lucky: those who sat on the mouths of the pots had the back part of their dresses streaked with dark circles, equally ludicrous. The mad mirth with which they danced, in spite of their grotesque appearance, was irresistible. This, and other incidents quite as pleasant—such as the case of a wag who purposely sank himself into one of the pots, until it stuck to him through half the dance—increased the laughter, and disposed them to peace and cordiality."

UNIVERSALITY OF VEGETABLE AND ANIMAL LIFE.

"These, as they change, Almighty Father! these
Are but the varied God.—
Soft roll your incense, herbs, and fruits, and flowers
In mingled cloud to Him, whose sun exalts,
Whose breath perfumes you, and whose pencil paints."

CASUAL observers of the works of Nature have frequently had cause for astonishment in reflecting on the universality of the principle of life, both in the animal and vegetable kingdoms. This principle, they perceive, is found in never-dying action over the whole habitable globe, from the lowest depths of the ocean to the tops of the highest mountains. They find it operating, by vegetation, on the surface of newly-formed islands, thousands of miles from the nearest continent; and they discover that the most lonely mountain tarn is peopled with fish, which could not by any possibility have proceeded thither themselves, and which, it is certain, were never transported by human beings. These are amongst the wonders of creation; but scientific investigation has gone far to unravel what at first sight appears a mystery. In the "Sacred History of the World," by Sharon Turner, already recommended in these pages, the intelligent author offers some useful observations on the universality of vegetable and animal life.

"You may fairly ask (says he) how, then, is vegetation found on places that are known to have originally had none, and that are not likely to have been visited by what would bring them? How, for instance, could the frozen soil of New Shetland, amid the ice-rocks of the Antarctic, obtain the lichens, the only vegetable found, or perhaps growable upon it? How have the Coral Islands of the Pacific, formed in the bosom of the waves by the petty animalculæ that construct them, derived their fine cocoa-nut trees, and beautiful forests? How can the new Volcanic Island that has just emerged from the shallow bottom of the Sicilian Sea, ever acquire, as it will do, a productive vegetation? These questions are reasonable, and we can find some facts that will satisfactorily answer them.

The clouds ever floating above us, not only bring us occasionally meteoric stones, hail, and epidemics, but also vegetable seeds, and the very lichens that would commence the new reign of vegetation on the bleak rocks of the South Polar isles. A phenomenon which occurred in Persia would have had this result. Dust and sands, heavier than many seeds are borne by the winds and clouds for several hundred miles across the atmosphere, falling on the earth and seas as they pass along. The Cryptogamia and many of the grassy seeds are not more weighty than matter of this sort, which the aerial movement thus transports. The sea, and its tides and currents, convey larger bodies for even thousands of miles.* The winds carry over the seeds of large trees, and disperse new vegetations with an extraordinary rapidity, and

to an extent which, anterior to the experience, we should not have expected. Birds also largely diffuse them. Many of these tenants of the trees and air live on fruit and berries. They digest the pulp, but pass the seeds unimpaired; and thus heavy organizations of future trees are planted in the most distant and unexpected situations. The parasitical misseetoe, converted by the stern Druids of our British predecessors into an instrument of their governing superstition, and which they gathered, from the tree on which it fed, with such imposing solemnity, thus attains its lofty, and, in the days of ignorance, mysterious situation. The digestive action of the feathered race upon them improves, in some cases, instead of injuring their growing energy. Waves, winds, and birds, fully explain the vegetations of every coral and volcanic island. The amazing muscular power and vital energy of birds to sustain their flights in their migrations, for distances that astonish us, will account for the plantations of the most distant isles and continents. Even insects people inland ponds and streams with fish,* and are often themselves carried by the winds to great distances. Thus showers of their larva have often fallen from the clouds. From all these facts, no individual of right judgment can have any difficulty of perceiving how the most remote and unvisited regions have derived their varied vegetation. We need not have recourse to the unsupported hypothesis of spontaneous production, which no circumstance that has been fully understood has at any time occurred to prove. When once a vegetable has become rooted in a soil, it is capable, if unchecked, of spreading to an indefinite extent. One tree has, in some regions, propagated into a large forest. But the possible produce which may issue from a single individual of this department of nature, like other facts that we have noticed, extends into calculations which exceed our comprehending faculty. The just conclusion, from the experience of all ages and countries, is, that spontaneous production is no part of the system for the perpetuation of the vegetable races.

THE REPRODUCTIVE faculty in plants exhibits a clear and close analogy to that of the animal kingdom. The artificial, but convenient Linnæan system, is founded upon it. One set of organs within the flower, the stamens, prepare the productive pollen, or fine dust-like substance which passes in the proper time from them to the stigma, and adhering to that, becomes the germ of the future plants. Without this pollen, there is no reproduction by seed or fruit. The natural pollen is the most effective, and no other naturally occurs to the stigma, although pollen from other flowers may be inserted on it. We have in this operation of the motion of the pollen to its germinating receptacle, another instance of the exactitude with which the effective means have been carefully provided and adapted to their appointed ends. Although it has to pass with a precise force over the particular distance, varying in every species, that is, between the stamen and the stigma, and therefore to be suited exactly to this space, and to take correctly the direction of each stigma, and this in many millions of instances at every recurring season, and to light exactly upon its minutest point; and to do this in the ever-moving air, and whatever winds may agitate it; yet this peculiar movement always takes place at the proper time in every species of plant, by a species of explosion, but with such skilful aim and measured movement, as it were, that in every plant it is performed with exact and invariable effect; so that, from their creation to the present hour, every species has regularly and abundantly produced its due seed and fruit. Wonderful has been the contrivance by which this indispensable action has been made to take place so universally and so effectually! Nothing would seem more to require an unerring eye and guiding hand, than the transfer of this little fructifying projectile from one part of the flower to that exact spot near it on which it must settle, in order to germinate into the fruit; and often from one flower to another; and not unfrequently from one plant to another. The utmost precision of the direction and degree of the protruding impulse, and the most exact timing of the discharge to the receiving state of the recipient, are in every instance indispensably necessary. The smallest error or deviation would frustrate the effect. Who is the secret calculator, measurer, impeller, regulator, and director? Who is the floral engineer, that, in each returning spring, guides and rules this botanical artillery with unflinching skill and success in the quadrillions of quadrillions of flowers that annually adorn our globe? and even, in some cases, accomplishing the prolific object at great distances. Where the organs are on separated plants, and the end cannot be obtained by instantaneous projectility, there, bees and insects are made the conveying agents, and the honey in the nectarium of flowers is the attraction that invites them to become such, though unconscious of the important purpose which they are fulfilling, while intent only on their own enjoyment. So diversified are the means employed by the Great Inventor and Preserver of our complicated fabric, to produce His appointed ends! Thus the main producing system of nature is every where maintained."

* The great river-beetle, which lives habitually on eggs of fish, climbs sometimes in the evening on the reeds high enough for its flight, and then takes wing. One was caught in its flight, and being put into water, it emitted the eggs with which it was gorged; some in part digested, and some not at all. These eggs produced fish of various sorts.—*Bull. Univ. 1829*, p. 145, from *Gill's Tech. Rep. 1828*, p. 333.

* Dr Walker declared to Lord Kames—"I have found seeds, drop accidentally into the sea in the West Indies, cast ashore on the Hebrides. The sea and rivers waft more seeds than sails."

THE POLISH JEW BOY.

POLAND is the chief modern seat of the scattered Jewish race, for while those interesting people were persecuted throughout every part of Europe, the noble sympathising Pole gave them refuge, and treated them as men and brethren. Under this kind protection, the Jews in time multiplied, and their hamlets soon rose to the condition of populous villages and towns, presenting to the modern world the spectacle of a second Judea. These Polish Jews were permitted to govern themselves by their own laws, which they did in its fullest extent, adopting all the Mosaic and Rabbinical ceremonies, and even dispensing with surnames, according to ancient usage. They also adhered to their own peculiar costume, and continue to do so. Their bodies are covered with a tightly fitted black silk robe, fastened with a band and tassel round the waist; on their head they wear a skull-cap, both in and out of the house, a rigid Jew never having his head uncovered, as, like other eastern people, he requires to say prayers and graces on many occasions, and is obliged, when addressing the Almighty, to wear his hat upon his head; a long flowing beard, and a staff, complete the outline of their appearance. Napoleon made many innovations on the Jewish customs, though with little advantage to himself. He enrolled the young men into cavalry and infantry troops, making them take surnames, and insisting that they should never wear the costume of their race. This mixing with the natives of other territories contributed to enlighten the Jews, but war gave them an insight into the riches of the neighbouring countries, and made them anxious to participate in that wealth, which they endeavour to do by the only means left within their power. Being prevented by the illiberal and odiously selfish laws of most Christian powers from devoting their attention to ordinary professional pursuits, or trying to gain distinction and opulence by any of the common modes in practice, they have in this, as in every other instance, devoted their abilities to various mercantile avocations, generally dealing in articles of great value. The way in which the industrious young Jews set out upon their wanderings is in no small degree affecting. After procuring the blessing of their parents, which, in general, is all that they have to bestow, they leave their native homes at the tender age of thirteen, and, in Scripture phrase, girding up their loins, they address themselves to their travels into far countries, in search of what fortune may be pleased to reward them with. A certain portion of mankind are still disposed to hoot and persecute the Jews, and to allow them no good property whatever; but we defy any civilized nation to produce such striking instances of intrepidity, honest industry, and humility, as are here exemplified. The circumstance of boys of thirteen years of age voluntarily abandoning the houses of their parents, to depend for their support on their own unassisted, unadvised efforts, among total strangers, is quite unparalleled in the history of the most chivalric people which the earth ever produced. We, no doubt, find Italian and Swiss boys wandering over most parts of Europe, but, it will be remarked, it is chiefly in the character of mendicants, or something nearly allied to it; while the Jew boy sets forth with the determination to pursue some branch of lucrative industry, requiring no small degree of ingenuity and wisdom. It may be mentioned, that the Jews become of age on the Sabbath after they attain the age of thirteen. On this solemn occasion, they read a portion of the Scriptures aloud in the synagogue, and dedicate themselves to their Maker, by swearing to keep the commandments. After the ceremony, the morning is celebrated with a breakfast party. At thirteen, the young Jews are required to wear phylacteries every morning while at their devotions. These consist of two long stripes of leather, one being made to fit the head, the other for the left arm, with large knots, emblematic of Almighty God. Inclosed in this knot are the ten commandments, and the prayer, "Hear, O Israel; the Lord our God is one God," &c.

These observations on the condition and manners of the Polish Jews, are preliminary to the following account, which we lately received, of the history of one of them, named Joshua Mendelsohn, who emigrated in the manner we have mentioned, and speedily raised himself from indigence to affluence, simply by perseverance and successful speculations in valuable articles of commerce. We give the account nearly in his own words, as he related it to a friend.

"Well, den, when I did come first to be a man at fourteen years of age, den I did have all de grand desire to go away to seek my fortune; so I did go to my fader and moder for der blessings, and they did give me dem, and I did ask my fader for his assistance, and he did say unto me, Mine dear son, all dat I can give you is a clean shirt, and may the God of Israel bless you: den I did leave mine own country widout one farding, and my goods did consist of mine clothes on my back, and my prayer-book, and my phylacteries. I did not know vere I should go; but my feet did take me to Frankfort; and behold der was de grand fair, and I did look me about, and I was astonished to see such quantities of fine merchandise; so I did stand for long while admiring de goods. Now, when I did stand looking, a shentleman did ask me if I was a Jew. I say, yes. He den ask me if I be honest, and I say, yes, also. He den took me for to

assist him in selling his merchandise, and was much satisfied, and he did give me about two pounds in dis country money. Oh, dis was a grand beginning of my fortune. So I did consider me what to buy, and, as luck would have it, I did buy all cornelian stones, but could not sell dem again; so I did take me to Italia; den I did shew dem to an honest Catholic jeweller, and he did give me twenty pounds. I was den very glad of dis great sum of monies, and did lay out the whole on cameos. I next went again to Frankfort, and was so fortunate as to sell dem for one hundred pounds. I now did buy all mine monies in stones, and took them again to Italia; but dish time I had a large box, which cause der custom-house officers stop me, and took away all mine riches, and put me to jail. When I was brought to der judge, they did search me, and found only my phylacteries; and de judge ask me what I did wid dese tings. And I told him they were for me to use when I pray to mine God. And he, being a good Catholic, say to me, you be a good Jew man; and he did give me all pack my goods, which I sold for dis time two hundred pounds. After dis, I went to Turkey, and dat was very good luck; for a Turk did show me a bag full of green and pink stones, and he ask me to pay dem. I did not know the value of dem; but for a grand speculation, I did say, if I make my fortune, I do; if I lose, I no worse den when I set out. So I did make a prayer, and he did sell me dem for mine own price, two hundred pounds. He ask me three hundred; but I say, I have no more riches. So the Turk gave me the whole for my price. I now took my bag of green and pink stones to a person dat was a judge, and he say, they be all emeralds and rubies, and worth a great sum. So I did sort dem, and went to Genoa, where I did never go before, and showed dem to a Jew broker, and he ask me mine price. I say, he must show dem to the diamond-merchants, and they must put der highest price, for I did not let him know dat I did not know the value of dem. The Jew broker came next day, and tell me he can get L.2000 for one parcel, and, if sent to-morrow, he will pay dem. As soon as I left de Jew broker, I jump for joy at mine good luck, and did tank mine God for his goodness to de poor Jew boy. When next day did come, I did take all the monies, L.2000, for a part of mine precious stones; and out of gratitude I did take for mine wife the broker's pretty daughter Rachel. So dis all over, I pay me a visit to all der grand cities, and did sell more and more of mine emeralds and rubies for very much monies."

To bring this autobiographical sketch to a conclusion, it has to be added, that after these various speculations, Joshua ventured on dealing in diamonds, in which he was still more successful. He has thus pursued a lucrative traffic in precious stones for many years, and is now one of the richest men in Europe. His home is at Genoa, where his wife and family live in the first style, with carriages and other luxuries of the most expensive description. Yet he still pursues his unvarying avocations, almost in his original humble condition. He travels through every continental country, and visits all the principal cities in his professional capacity. He also, in general, carries about his person property to the amount of L.100,000 and upwards, in precious stones, all of which are stowed in about fifty different pockets in various parts of his dress.

NAMES OF LONDON STREETS.

D'ISRAELI, in one of the volumes of his "Curiosities of Literature," has a paper on the changes which are frequently found to have taken place in the names of streets, by the corruptions of succeeding generations, and produces the following instances in the case of the streets of London, which may perhaps interest our readers:—

"*Mincing-lane* was *Mincheon-lane*; from tenements pertaining to the Mincheons, or nuns of St Helen's, in Bishopsgate-street.

Gutter-lane, corrupted from *Guthurun's-lane*; from its first owner, a citizen of great trade.

Blackwall-hall was *Bakewell's-hall*, from one Thomas Bakewell; and originally called *Basing's-haugh*, from a considerable family of that name, whose arms were once seen on the ancient building, and whose name is still perpetuated in *Basing's-lane*.

Finch-lane was *Finke's-lane*, from a whole family of this name.

Thread-needle-street was originally *Thrid-needle-street*, as Samuel Clarke dates it from his study there.

Bilkiter-lane is a corruption of *Belzetter's-lane*; from the first builder or owner.

Crutched-friars was *Crowched* or *Crossed-friars*.

Lothbury was so named from the noise of foundries at their work; and, as Howel pretends, this place was called *Lothbury* "disdainedly."

Garlick-hill was *Garlick-hithe*, or *hive*, where garlick was sold.

Fetter-lane has been erroneously supposed to have some connexion with the *fettlers* of criminals. It was in Charles the First's time written *Fewtor-lane*, and is so in Howel's *Londinopolis*, who explains it as *Fewtors* (or idle people) lying there as in a way leading to gardens. It was the haunt of these *Fewtors*, or "mighty beggars." *The Faintour*, that is, a defaytor, or defaulter, became *Fewtor*, and in the rapid pronun-

ciation, or conception, of names, *Fewtor* has ended in *Fetter-lane*.

Gracechurch-street, sometimes called *Gracious-street*, was originally *Grass-street*, from an herb-market there.

Fenchurch-street, from a fenney or moorish ground by a river-side.

Galley-key has preserved its name, but its origin may have been lost. Howel, in his "Londinopolis," says, "here dwelt strangers called *Galley-men*, who brought wine, &c. in *Galleys*."

Greek-street, says Pennant, "I am sorry to degrade into *Grig-street*;" whether it alludes to the little vivacious eel, or to the merry character of its tenants, he does not resolve.

Bridewell was *St Bridget's-well*, from one dedicated to Saint Bride or Bridget.

Marybone was *St Mary-on-the-Bourne*, corrupted to *Mary-bone*; as *Holborn* was *Old Bourne*, or the Old River; *Bourne* being the ancient English for river; hence the Scottish *Burn*.

Newington was *New-town*.

Maiden-lane was so called from an image of the Virgin, which, in Catholic days, had stood there, as Bagford writes to Hearne; and he says, that the frequent sign of the *Maiden-head* was derived from "our Lady's-head."

Lad-lane was originally *Lady's-lane*, from the same personage.

Rood-lane was so denominated from a Rood, or Jesus on the cross, there placed, which was held in great regard.

Piccadilly was named after a hall called *Piccadilla-hall*, a place of sale for *piccadillies* or *turnovers*; a part of the fashionable dress which appeared about 1614.

Strype notices that in the liberties of Saint Catharine is a place called *Hangman's-gains*; the traders of *Hammes* and *Guyenes*, in France, anciently resorted there; thence the strange corruption.

Smithfield is a corruption of *Smoothfield*; *smith* signifies *smooth*, from a Saxon word. An antiquarian friend had seen it described in a deed as *campus planus*, which confirms the original meaning. It is remarkable that *Smithfield* should have continued as a market for cattle for more than six centuries, with only the loss of its vowels.

This is sufficient to show how the names of our streets require either to be corrected or explained by their historian. The French, among the numerous projects for the moral improvement of civilized man, had one, which, had it not been polluted by a horrid faction, might have been directed to a noble end. It was to name streets after eminent men. This would at least preserve them from the corruption of the people, and exhibit a perpetual monument of moral feeling and of glory, to the rising genius of every age. With what excitement and delight may the young contemplatist, who first studies at Gray's Inn, be reminded of *Verulam-buildings*!"

MANGEL WURZEL.

THIS herb has not been long cultivated in this country, and, as in the case of turnips and potatoes when first introduced, little is yet known regarding it, though it promises to be one of the most useful vegetable products. Some time ago, we tasted a kind of whisky distilled from it, and, at the same time, were shown a specimen of very strong brown paper, fit for packing, which was manufactured simply from the draf or refuse. It seems also that a good kind of ale may be made from the roots. According to the *Gardener's Magazine* for December, the way to make this beverage is to "take one-third of malt, two-thirds of mangel wurzel liquor, and about a fifth part of treacle, adding hops at the rate of six ounces to nine gallons. Barrel and work with yeast in the usual manner. The mangel wurzel liquor is thus obtained: Clean the roots, pare off the outer rind, slice and boil till they are quite soft, and then squeeze off the liquor." If mangel wurzel can thus produce whisky, ale, and brown paper, and, as we are informed, at an expense ten times lower than what is now laid out on grain and old hempen materials, it will prove one of our most valuable vegetables. The paper made from the refuse, we can avouch, was far superior to that in ordinary use.

The Messrs Chambers are gratified in mentioning, that, while the sale of the Journal continues steadily to increase, their *Historical Newspaper*, or Monthly Supplement, has been well received in all parts of the United Kingdom, and that, reckoning the Edinburgh and London editions, the impression already reaches 28,000 copies, 18,000 of which are circulated in Scotland. The third number of this *Historical Newspaper* will appear on Thursday next, the 3d of January, and will continue to be issued on the 1st, 2d, or 3d day of every succeeding month, at the same low price as the present work.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their address at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ARNOLD, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM CHAMBERS, AUTHOR OF "THE BOOK OF SCOTLAND," "GAZETTEER OF SCOTLAND," &c. AND BY ROBERT CHAMBERS. AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 49.

SATURDAY, JANUARY 5, 1833.

PRICE THREE HALFPENCE.

THE DOMESTIC MAN.

NOTHING can be more obvious to remark, than that some people bear less of the characteristics of their own than of the opposite sex. We meet every day in life with clever, masculine, roughish characters in female attire, who perhaps do no grace whatever to their own sex, but yet, as every body conspires to say of them, "would make most excellent men." On the other hand, we as often find a quiet tame kind of man, who has all the features of the old wife about him, even in his one-and-twentieth year, and who, vacillating as it were between the two sexes, is despised by his fellow men, and hardly received with favour by the women, with whom he is so constantly seeking to consort, and whose manners he seems so anxious to imitate.

An individual of the latter kind is distinguished in his earliest petticoats—even before he has well left the nursery. He is then a poor, peepy wretch, with bleary eyes, and one everlasting dingy night-cap, constantly sitting by the fire, to the great annoyance of the nurse, who frequently declares him to be more of an infant than even his younger brother the baby. As he grows up, instead of falling into the ranks of other boys, and coming home occasionally with his garments rent from top to bottom, or two of his fore-teeth borne by his side on the boards of his book, or any other jolly mischance, such as boys are so perpetually falling into, he still clings to the fire-side, where he does a thousand little good offices for the culinary deities, by whom, nevertheless, he is far less kindly treated than the rudest of his brethren. He is even perhaps caught some day playing at the pall-all with the girls, or perhaps snug in one of the remotest corners of their channel-stone houses, and trying with all his pains to make up a flower-plot for them with the heads of decapitated crowslips. He is then, if a Scottish boy, fairly in for the nickname of "the lassie," than which nothing could well be more intolerable to most boys, though in his case it is submitted to with a helpless and dawdling resignation. As years advance, he becomes a careful coper of all kinds of useful family receipts from old books and newspapers. In a common-place book which he keeps, the first entry is, "a way to make good ink," then "another way to make ink," and then a way "to make red ink"—though, be it remarked, he has no earthly prospect of ever acting upon these receipts. He has also a box, secured by a small padlock, wherein he has gathered thousands of little odd articles, which he barter with less adroit, though perhaps more robust companions, for things of greater value; sometimes adding to his stock by exchanging three rides of his father's horse to the water for a pen-knife, or giving a trifling toy for some solidly useful article, to which its possessor had become indifferent, but always taking care that the thing got shall be a degree better than the thing given.

When individuals of this kind reach their twenty-second or twenty-third year, it is clearly perceived that they are to become Domestic Men. Some prophesy that their wives will have an easy time of it with them, so attentive are they, and so thoroughly versed in all the most approved rules of conducting an establishment; others maintain that their spouses will be rendered miserable, for, let them be ever so careful, there will be no possibility of satisfying the expectations of persons so finical. But on one thing all are agreed, namely, that there is no chance of their continuing long bachelors.

Well, married they certainly are, sooner than most other young fellows; for their accurate and sedulous habits fit them to be good men of business, and they speedily obtain a settlement in life. Now it is that

their darling occupations may be properly said to commence, and their qualifications to be most strikingly and usefully developed. Their pleasure lies in home, and they set in good earnest about making it delightful. They draw around them, with incredible pains, comforts and conveniences of every kind, and their ingenuity is exerted in a thousand ways to accomplish objects which to most people would appear trifling in the extreme, but which are to them of the highest importance. Abroad, our heroes are a good deal laughed at for what are called their fiddle-faddling propensities. They employ as much pains to demonstrate to you the propriety and possibility of saving twopence in some matter of household expense once a-year, as another would do to elucidate and enforce a scheme of retrenchment which was to lessen the burdens of the nation by as many millions. They grudge no part of the price of an article except the halfpenny which goes to complete the sum; but they grudge it grievously; and what other people pay a shilling for, it is the study and business of their lives to procure equally good for elevenpence halfpenny. Infinite is the labour they bestow to carry their point; and as they are indefatigable, so they are in the end generally successful. This habit of being solicitous about trifles lowers them, as has been said, not a little in the estimation of many. But it is surprising what an impression is produced upon one who has made them the subject of ridicule, if he pay a visit to the house of a Domestic Man, and become a witness of the effects of a judicious economy. He is compelled to acknowledge the superior tact of his friend, when he observes the regularity of his household arrangements: there is nothing wanting, and nothing where it should not be; every thing is good of its kind, and adjusted with the nicest skill. Every article around him has its history. Not one of them but was procured by the intervention of a number of trusty agents, and by a series of skilful negotiations. He is not one of those witless persons, who, when a thing can no longer be wanted, have no other resource but to go straight into the market and buy it; he sees a long way before him, by which means he has time not only to look about and make a choice, but to be cautious in closing a bargain, and to obtain the best terms by appearing not to care whether he get the goods or not. Then he has numerous friends, through whose interest with tradesmen he procures things both better and cheaper than customary. Thus his cellar is stocked, not by a general order to a spirit merchant: but he knows a person who has a near relation connected with a brewery, and through this medium he is supplied with superior porter and ales; he has a fifth, sixth, or seventh cousin, who, in a voyage to the Low Countries, contracted a friendship with a Dutch captain—so he is secure of the best Hollands; he possesses channels of communication even with the Highland smugglers, and would scorn to offer a guest any thing but the genuine peat-reek. Every thing comes to him from authentic sources in the same manner, and the secret history of all his various transactions furnishes him with never-failing subjects of conversation. It is in this sphere that the owner feels the triumph of his genius, and he sets himself down in the midst of the comforts he has accumulated—a happy man.

We shall only specify one particular in which the talents of the Domestic Man shine pre-eminent. Reader, were you ever in Edinburgh after a fall of snow which had continued for three days without intermission? Bands of labourers issue forth, armed with shovels, to clear the pavements, in doing which they throw up an entrenchment of snow on each side of the street, so

high, that the few passengers cannot discern more than the hats of those on the opposite footpath. The voice of the fishwives is silent, and not a cart attempts a passage through the streets. A physician's carriage may be observed here and there dragged slowly along by four horses, and a hackney coach making its way still more slowly, the additional horses yoked with traces manifestly got up for the occasion, being formed of ropes, not of the freshest kind. All intercourse and business seems to be at a stand for the time, and the only thing people can do is to remain at home, and read in the newspapers accounts of roads blocked up in every direction, and of valorous mail-coach guards, who, when their vehicles could be taken no farther, abandoned them, and, through paths knee-deep with snow, and with the drift coming absolutely in shovelfuls into their faces, carried the bags in safety to the next post-town. In this period of desolation, *the price of coals mounts rapidly*. This is a matter which comes home to the toes and fingers of every man, and the panic is consequently great and universal. As is usual in times of alarm, exaggeration flies abroad, and represents the case in its worst colours. Reports are propagated that there is not a ton in store, either at the canal or railway dépôt. On every side are echoed expressions of dismay and of astonishment that the dealers should have been so exceedingly improvident; and then, again, people check themselves by the reflection, that even although plenty of coals could be bought at the accustomed stations, there is no possibility of getting them conveyed home. Many an anxious and unwonted countenance is intruded, by way of committee of inquiry, into the gloomy regions of the coal-hole; and the cave of Trophonius had no such effect in lengthening the features of those who visited it, as is produced by the investigation of these empty, and, therefore, dismal recesses. Numbers of gentlemen, corpulent and otherwise, return with the appalling intelligence to their families, and abandon themselves to despair by the side of their expiring parlour fires: the wintry wind whistling a dreary chorus to their lamentations. In the midst of this universal consternation, the Domestic Man remains undismayed. Harassed by no anticipations of uncooked victuals, and of fingers blue with cold, he lifts his poker, smashes a large piece of coal in the grate, and plants himself for business or relaxation in front of a fire that bids frost and the fear of it avault. His winter stock of fuel was laid in long before, of the best kind, and at a reasonable rate; and he has now the satisfaction of lending a small quantity to boil the pot of Mr Temporary, who, when he saw the carts unloading their culmy stores at the door of his provident neighbour, thought he had made a hit in twitting him, that "surely he meant to roast an election dinner in his house."

TALE OF A VICTIM.

"THERE is no such thing as standing still in human life: the wheel of fortune is continually revolving; and we must either rise with it or fall."

"Very true," said my friend, as he emptied his glass, and turned a little more round to me; "I will give you a case in point, of which I happened to know myself."

"Some years ago—say fifteen or eighteen—as I was returning from London by the mail-coach, I made halt for a night at one of the York inns. The room into which I was ushered was full of bagmen and travellers of various cuts and kinds, and from the confused babel of sound I could occasionally hear a detached sentence on politics—on the theatres—on agriculture—on the late rainy weather—the price of stocks—soft goods—

and the petitions of the Roman Catholics. A knot in one corner were discussing supper; others, lounging beside the hearth, toasted their toes; while a third, and more numerous party, half concealed amid puffing exhalations, washed down the flavour of their Havannahs with steaming savoury rum-punch. Being somewhat fatigued, and the assemblage not exactly quite to my taste, I tossed off a sneaker, and rang for Boots; that indispensable actor of all drudgery work at your public establishments for board and lodging.

"In bustled a tall, thin, squalid, miserable-looking creature, his curly black hair, seemingly long unkempt, hanging about his ears 'in most admired disorder.' His dress corresponded with his looks; his jacket and waistcoat were of dark fustian, and his trousers, shabby and shrivelled, bore some traces of having been originally nankeen. Around his neck was twisted a blue cotton handkerchief, and the little of his linen seen, was not only ragged, but dirty. In one hand he carried a boot-jack, and in the other a pair of slippers, while from under his arm depended a dingy towel, perhaps as a badge of office. I could not help thinking, as he crossed the room at my summons, 'here is a most lugubrious specimen of mortality; one of those night-hawks of society, whom it would scarcely be comfortable to meet with, unarmed, on a solitary road, towards the twilight.'

"With down-looking face, the fellow made a hurried approach to me, as if he had the feeling of his task being a disagreeable one, and the sooner got over the better. As he laid the slippers on the carpet, placed the boot-jack at my foot, and was stooping his shoulder as a fulcrum for assistance in my operations, I caught a distinct glimpse of his faded features. I could not be mistaken. 'Good Heavens!' said I to myself, half aloud, 'can it possibly be Harry Melville!'

"After the poor creature had shuffled out of the room in an agitation which did not wholly escape the remark, and provoke the idle laugh of some of the loungers, I hastily rang the bell, and was shown to my sleeping-room by the waiter, whom I requested to bid the person come up who had brought me my slippers.

"I was allowed to pace about for some time in a perplexed and downcast mood, haunted by many a recollection of departed pleasures—by many delightful associations of other years, which contrasted themselves with present dejection, when at length I heard a step timidly approaching the door, and a slight tap was given. I opened it eagerly, and there stood before me the same doleful apparition. I took hold of the poor fellow's hand, and led him to a chair; but no sooner was he seated, and the door shut upon us, than he put his hands over his face, and burst into a flood of tears. When he had become a little more tranquil, I soothed him in the best way I could, and ventured to open my mind to him.

"'Oh! let me alone—let me alone,' he said, sobbing bitterly. 'I have deserved my fate. My own imprudence, more than misfortune, has reduced me to the state you see. Be not sorry for me; I am beneath your regard. I have deserved it all.'

"Having consoled him in the best manner I could, he voluntarily gave me the particulars of his history, which, as far as memory serves me, were nearly to the following effect:—

"Shortly after having been taken into the counting-house of his father—at that time a considerable West India merchant—he had married, contrary to the will of his friends, in the hope that the affections of a parent could not long remain estranged to an only son, even though conscious that that son had injured him. Perhaps in this his calculations were not altogether wrong; but at this point foreknowledge failed, and unforeseen circumstances blasted his prospects. The affairs of old Mr Melville were shortly after thrown into disorder by unsuccessful speculations; and matters at length grew so bad as to involve bankruptcy and ruin. The old man was received into the country residence of a relation; but, brought up in habits of activity and business, his mind could not withstand the dread reverse; and, after a few listless months, one shock of palsy following another, hurried him off to a not unwelcome grave.

"The penniless and imprudent Henry soon found that he had wedded not only himself, but another, to misery, as the dark night of ruin closed around them. They were both young, and capable of exertion, but, living on the faith of future prospects, and a speedy reconciliation, they had contracted debts, from which they saw no possible way of extricating themselves. Matters grew worse and worse, and at length the poor fellow was afraid to leave his home from fear of bailiffs.

"At length he fell into their hands, and was dragged to jail; and, on the news being incautiously carried to his young wife, she was seized with convulsions, and perished in giving birth to a child, not unfortunately dead. The heart of the miserable man was rent asunder on learning his domestic calamities. Scorned and despised, friendless and unpitied, he beheld from the iron-bound windows of his prison the coffin that contained the remains of his wife and child, carried through the streets by strangers to the place of interment, while, yearning with the feelings of the husband and father, he was denied the mournful solace of shedding a tear into their grave.

"Condemned to the social contamination of the base and vile, he endured the wretchedness and the disgrace of confinement for two months, when he was

set at liberty by the benefit of the act which so provides, on making oath of surrendering up every thing. Into the world, therefore, was he cast forth, branded and stigmatized, destitute, and beggared in every thing but the generous pride which withheld him from soliciting charity. Bred to no profession, he knew not whereunto to turn his hand; and misery pressed so hardly upon him, that unhallowed thoughts of suicide began to suggest themselves to his troubled mind. From town to town he wandered, soliciting the situation of clerk in any counting-house; but, alas! he had no references to make as to character, no certificates of former engagements faithfully fulfilled. For days and days together, he had not even a morsel of bread to satisfy the pangs of hunger. To add to his wretchedness, his clothes had become so shabby, from exposure to wind, and rain, and sunshine, that he was ashamed to be seen in public, or during daylight—so lay about the fields and wastes till sunset, when he ventured nearer to human dwellings.

"To have offered himself for any situation in such a squalid condition, would have been certain exposure to contumely, refusal, and suspicion; and at length the lingering rays of pride, which had hitherto sustained him, sank amid the darkness of his destiny.

"Necessity is a stern teacher. Even the face of man, which he had sought to shun in his misfortunes, became to him at length a sufferance necessary to be borne; so, as he was at first thrust from, so was he at length drawn back to the dominion of society. From the moorland wastes, where he could pick up a few wild berries, and from the sea-shore, which afforded some shellfish, he came, by degrees imperceptible but sure, to be a spectator at the corner of streets, and a hanger-on about stable-yards, where he casually earned a few pence by assisting the grooms to carry water, or lead gentlemen's horses. Low is the lowest situation which admits not of promotion, and through course of time, my old schoolfellow came to be promoted to the office in which I found him."

"Poor fellow! did you ever hear what became of him afterwards?"

"Yes I did, and a miserable end he had, though redeemed by the spirit of humanity which prompted it. He was killed in rescuing a child which had fallen before the wheels of a stage-coach, and the grateful parents not only gave him a decent funeral, but erected a simple tablet over him, recording his fate, and their gratitude.

"It is dreadful to think on the abyss into which a single erring step from the paths of prudence may precipitate us," said I.

"Yes," answered my friend; "and there are a thousand ways of going astray; while I defy you to go right, save by one."*

LITERARY HISTORY OF THE BIBLE.

SECOND ARTICLE.

To continue our literary account of the books of the Old Testament, we proceed to notice that the *Third*, or, according to the Hebrews, the *First Book of Kings*, begins with a relation of the manner in which Solomon came to the throne, and contains the whole of his reign. After that, an account follows of the division of the kingdom, and the history of four kings of Judah and eight kings of Israel. All these reigns, including that of Solomon, which occupies the first forty years, comprise the space of 126 years.

The *Fourth* of these books contains the history of sixteen kings of Judah, and twelve kings of Israel. It likewise gives account of the prophets who lived during this time. It is quite uncertain who were the writers of the two last-mentioned books. They are by some attributed to Jeremiah or Ezra, but no very convincing proofs have been adduced in support of this opinion. It is evident, indeed, that these books form a varied collection of several particular histories.

The name of *Paralipomena*, which, in Greek, signifies the *history of things omitted*, is given to the two books which follow those of *The Kings*. These form, in fact, a supplement, containing what had been omitted in the *Pentateuch*, and the books of *Joshua*, *Judges*, and *Kings*, or rather they contain a fuller description of some things which had been therein only briefly related. Some give them the name of *Chronicles*, because they are very exact in mentioning the time when every transaction happened. We divide them into two books, as do also the Jews, who call them *Dibere Hayamim*, that is, an *Historical Journal*, the matters of which they treat having been taken from the journals of the kings. In the original language, however, the word *days* often signifies the *year*, and, in this sense, we may understand the term to signify properly *Annals*. The generally received opinion is, that Ezra was the writer of these. In the *First* book, he begins with a succinct historical abridgement, from the creation of Adam to the return of the Jews from their captivity; and then he resumes the history of David, and carries it on to the consecration of Solomon, that is, down to the year before Christ 1015. The history contained in the *Second Book* reaches down to the year before Christ 536, when, upon the expiration of the seventy years of the captivity, Cyrus gave the Jews leave to return to their own country.

Ezra wrote the history of the return of the Jews from the captivity of Babylon into Judea. It is the history of about 82 years, from the year of the world

3468, when Cyrus became master of the eastern empire, by the death of his father Cambyses in Persia, and his father-in-law Cyaxares in Media, to the year 3550, which was the twentieth year of the reign of Artaxerxes, surnamed Longimanus. This book bears the name of Ezra, who was the writer of it.

The next book is a continuation of that of Ezra, and, therefore, it is by some called *The Second Book of Ezra*. It was Nehemiah, however, whose name it also bears, who wrote it, as is said, by the advice of Ezra. It contains the account of the re-establishment of Jerusalem, and of the Temple, and the worship of God. It is the history of about 31 years; that is to say, from the twentieth year of the reign of Artaxerxes Longimanus, to the reign of Darius Nothus, his son, which began in the year of the world 3581.

After this general history of the Jews, follow two histories of particular persons, viz. *Esther* and *Job*. The first contains the account of a miraculous deliverance of the Jews, which was accomplished by means of the heroine named Esther. The Scripture says it happened under the reign of Ahasuerus, King of Persia; but as there have been several Persian kings of that name, it is not exactly known in which reign it is to be dated. Dr Lightfoot thinks it was that Artaxerxes who hindered the building of the Temple, and who, in the Book of Ezra, is called also Ahasuerus, after his great-grandfather the King of the Medes.

The history of Job, which is next in order, is not only a narration of his actions, but contains also the entire discourses which this pious man had with his wife and his friends, and is, indeed, one of the most eloquent books in the Holy Scriptures. It is generally conjectured that Moses was the writer or compiler of this book; but this is very uncertain.

Next to the *Historical* books of Scripture, follow those of a moral nature. The first of these is the Book of Psalms, which are likewise, in some measure, historical; for they recite the miracles which God had wrought, and contain, as it were, an abridgement of all that had been done for the Israelites, and that had happened to them. The Hebrews call them "*The Book of Praises*," by which they mean, of the praises of God. The word *Psalm* is Greek, and properly signifies the sound of a stringed instrument of music. The Hebrews sung the Psalms with different instruments. We make but one book of them all, but the Hebrews divide them into five parts, which all end with the words *Amen, Amen*. Though the Psalms bear the name of David, yet they were not all composed by him; some of them are more ancient, and others are of a later date than his time; some of them being ascribed to Moses, Samuel, and Ezra. Speaking of the dedication of the Second Temple, Prideaux says, "In this dedication, the 146th, the 147th, and the 148th Psalms, seem to have been sung: for, in the Septuagint versions, they are styled *The Psalms of Haggai and Zechariah*, as if they had been composed by them for this occasion; and this, no doubt, was from some ancient tradition: but, in the original Hebrew, these Psalms have no such title prefixed to them, neither have they any other to contradict it." It is not probable, however, that all those whose names they bear were the true authors of them; it is more likely that these are only the names of those to whom they were first given to sing.

After the Psalms are *The Proverbs*, which are a collection of moral sentences, of which Solomon was the writer. This name is given them by the Greeks, but the Hebrews call them *Misle*, that is, *Parables*, or *Comparisons*; and the word may also signify *Sentences*, or *Maxims*. It is a collection of divine precepts, proper for every age, and every condition of life.

The book which follows is also a *Moral* one, and was likewise composed by Solomon. The Greeks call it *Ecclesiastes*, which answers to the name of *Kohleth*, which it bears in the Hebrew. Both these words signify, in our language, a *Preacher*, or *one who speaks in an assembly*. In this book is given an admirable picture of the vanity of the world.

Among the *Moral* books is also reckoned *The Song of Songs*; that is to say, according to the Hebrew manner of speaking, a *most excellent song*. This book has nothing of morality in it, and, therefore, it is thought the only reason of its being placed here is, because it was a third work of Solomon; for there is not one moral or religious maxim in it, and the name of God is not so much as mentioned in it, except once in the original Hebrew, where it is used adjectively. It is an *Epithalamium*, or nuptial song, wherein, by the expressions of love between a bridegroom and his bride, are set forth, and illustrated, the mutual affections that pass between God and a distinguished remnant of mankind. It is a sort of dramatic poem, or pastoral; the bride and bridegroom, for the more lively representation of humility and innocence, are brought in as a shepherd and shepherdess. We learn from St Jerome, that the Jews were not permitted to read this song, or the chapters at the beginning of the Book of Genesis, till they were thirty years old.

In regard to the Prophets, it may be observed, that all the Old Testament is considered to be in substance one continued prophecy of the coming of Jesus Christ; so that all the books of which it consists are understood to be in some sense *Prophetical*. But this name is more especially given to those books which were written by persons who had a clearer knowledge of futurity, who forewarned both kings and people of

* Contributed by "Delta," to the Edinburgh Literary Journal.

what would happen to them, and who, at the same time, pointed out what the Messiah was to do, whom they who are acknowledged to have been Prophets had always in view; and this is what ought most especially to be taken notice of in their writings.

The Prophecies bear the names of those to whom they belong. Some learned men are of opinion that the Prophets made abridgements of the discourses which they had written, and fixed them up at the gates of the Temple, that all the people might read them; and that after this the ministers of the Temple might take them away, and place them among the archives, which is the reason why we have not the Prophecies in the order in which they were written. But the interpreters of Scripture have long since laboured to restore that order, according to the course of their history.

The works of the Prophets are divided into two parts, the first of which contains *The Greater*, and the second, *The Lesser Prophets*. This distinction, of course, does not apply to all to the persons of the Prophets, but only to the bulk of their works. *The Greater Prophets* are Isaiah, Ezekiel, Daniel, and Jeremiah. *The Lamentations* of Jeremiah make a separate book by themselves, containing that prophet's descriptions of the destruction of the city of Jerusalem, and of the captivity of the people. *The Lesser Prophets* are Hosea, Joel, Amos, Obadiah, Jonah, Micah, Nahum, Habakkuk, Zephaniah, Haggai, Zechariah, and Malachi. They were formerly contained in one single volume, which the Hebrews call *Theresser*, which means *Twelve*, or *The Book of the Twelve*.

The dates of many of the prophecies are uncertain, but the earliest of them was in the days of Uzziah, King of Judah, and Jeroboam the Second, his contemporary, King of Israel, about 200 years before the captivity, and not long after Joash had slain Zechariah, the son of Jehoiada, in the court of the Temple. Hosea was the first of the writing Prophets, and Joel, Amos, and Obadiah, published their prophecies about the same time.

Isaiah began his remarkable prophecies a short time afterwards, but his book is placed first, because it is the largest of them all, and is more explicit relative to the advent of Christ than any of the others. The language of this eminent writer is exceedingly sublime and affecting; so much so, that it has never been equalled by any profane poet either in ancient or modern times. It is impossible to read some of the chapters without being struck by the force of the prophetic allusions to the character and sufferings of the Messiah; and in consequence of these prevailing characteristics, the author is ordinarily styled the *Evangelical Prophet*, and, by some of the ancients, a *Fifth Evangelist*. The Jews say that the spirit of prophecy continued forty years during the second Temple; and Malachi they call the Seal of Prophecy, because in him the succession or series of prophets broke off, and came to a period. The book of Malachi, therefore, appropriately closes the sacred record of the Old Testament.

ELEMENTS OF HEALTH.

TEMPERATURE.

If we refer to the bills of mortality, we shall find a very startling, and, at the same time, a very striking fact, respecting the number of unfortunate individuals who annually fall victims to consumption of the lungs; in consequence of which, it has been denominated, by many of the continental authors, as the *English malady*. The late Dr Young stated, that it destroyed no less than a fourth part of the inhabitants of Europe, and Dr Mason Good was of opinion that this calculation was not overcharged; and, to complete this enumeration, Dr Woolcombe asserted that no less than 55,000 persons prematurely fall a sacrifice annually to the ravages of this disease in Great Britain alone. It might appear, at first sight, that we intended a long dissertation on this frightful disease; this, however, is not the case, our object being to point out, that, in numerous instances, the origin of diseased lungs is from an ordinary cold, which affection frequently arises from a neglect in that due attention to clothing, which either the vicissitudes of climate, constitution, habit of body, and other circumstances, demand. The present essay will be devoted to a few observations on this important subject, particularly as connected with the due preservation of health in all classes of society. There is nothing more necessary to the proper performance of the different functions, so as to conduce to a comfortable state of existence, than the uniform temperature of the body. Now, the Almighty has, in his infinite wisdom, blessed us with the powers of the senses, by whose means we are enabled to enjoy those objects of gratification, which our daily intercourse with the world constantly presents to our notice, and of pain, for our protection; this has induced a state in the constitution, by which we find our feelings extremely sensible to either the excess or a deficiency of heat; so that we almost instinctively endeavour to procure shelter from the excess of heat or freezing cold. In the warmer seasons, we bathe our bodies, and enjoy the luxury of immersion in the limpid stream, in order to promote an agreeable coolness to the surface of our system; or, on the other hand, when the frigidities of frost and snow makes its appearance on the earth around us, then it is that we wrap our bodies in the warmest fleece, so as to promote heat to the exterior of our frame.

Our efforts in endeavouring to mitigate the dan-

gerous consequences of heat and cold, would be but of little utility to us, had not the Deity furnished us with respiratory organs, in common with all the higher classes of animals; the surface of our wondrous machine is endowed with the sensation of feeling. By these powers, the heat of the body is capable of being preserved under almost every variety of temperature to which the changeable atmosphere is liable; by which we mean, the skin, from its tendency to have the perspirable fluid increased from existing circumstances, carries off the excess of heat; and the lungs, from their being able to decompose the atmospheric air, supply the loss that is occasioned by the former; by this means the vital organs, and those of digestion and nutrition, are constantly preserved at a temperature of about 98 degrees, under all circumstances. Besides the important share which the function of perspiration has in regulating the heat of the body, it has another very important office to perform, in serving as a means of outlet to the human frame. The due functions of the skin we have thus briefly described, are of such importance to health, that we must at all times, as a matter of course, direct our attention to the proper means of seeing them properly performed; for it is consonant to the rules of common sense, that, if the fluids that ought to be thrown from the body, through the medium of the pores of the skin, are retained, they are liable to produce injurious effects. By the excrementitious secretion of the skin, we wish the reader to bear in mind, that it is not the moisture or exhalation that is poured out in hot weather, or when the system is heated by exercise, but a matter which is too subtle for the sense of vision to take cognisance of, and which has been denominated by physiologists *insensible perspiration*; this is continually passing off the body, and, consequently, is the only true excretion of the skin. As a proof of the importance of the correct performance of this function, we find it to be totally suppressed in many fevers, of which it is almost the prevailing symptom, and, likewise, is frequently their sole cause; and in many chronic cases, we can trace no other origin. The functions of the skin are prodigiously increased during hot weather and in tropical climates; therefore, any occurrence that may tend towards their interruption or suppression is proportionably dangerous to the individual. There is another office which the skin has to perform; and this is, the absorption, or taking up, and conveying into the system, any substance which it may come in contact with, or be capable of absorbing. Besides, the skin is that portion of the body on which the nerves are distributed, and thus constitutes it the organ of feeling or touch. It is likewise abundantly supplied with a series of glands, which secrete an oily matter, and thereby render it impervious to water: thus is secured the evaporation of what is termed the *sensible perspiration*. If this unctuous or oily substance is deficient, the skin would become reddened (if we may use the expression), and assume that unpleasant appearance which the hands of washerwomen, and others employed in similar operations, exhibit, in consequence of the solvent powers of the soap and alkali they use. The hair serves as so many capillary tubes, which conduct the perspirable fluid from the skin. The three powers or functions of the skin, viz. perspiration, absorption, and sensation or feeling, are so intimately blended and dependent upon each other, that the derangement of the one must more or less influence the others. Now, if, for example, a man be placed in or exposed to the bleakness of a frosty atmosphere, in a state of inactivity, or without sufficient exercise to excite a brisk circulation of the blood, and, at the same time, is destitute of the necessary clothing, his limbs will become stiff, and his skin completely insensible; the vessels which created the perspirable fluid, together with the absorbent vessels, partake of that torpor which has attacked the brain and nervous system (and particularly the nerves of feeling), in conjunction with that of the heart and arteries; and, what is more, they will not regain their proper functions and activity until their sensibility be completely restored. This is a well-known fact to those who have been in Davis' Straits, the Greenland Seas, and the higher latitudes. The great danger which arises from suddenly attempting to restore sensibility to frozen parts, most persons are well acquainted with; therefore, if the warmth which is employed is not very gradually applied, the life or vitality of the parts is destroyed. These remarks on the offices of the skin will point out at once the importance of a particular and constant attention to the important subject of clothing, more especially when we consider the fickleness and changeability of our climate. Common and almost daily experience must have convinced the generality of mankind of the capricious state of the weather in Great Britain, and the importance of guarding against the ill effects arising from it. This end is principally to be attained by the adoption of that species of dress which will afford a protection from the cold. And we must here endeavour to impress upon the minds of parents, and those connected with the management of children, that a degree of cold which creates the sensation of shivering cannot be endured, even for the shortest period, without endangering the health of the individual; neither can the most robust constitution afford a resistance to the benumbing influence of a constant cold season, notwithstanding it may be so moderate as not to be productive of any immediate cause of complaint, or to compel the sufferer to seek

protection from it. The foundation of numberless chronic diseases is oftentimes laid, in consequence of this degree of cold, and the most prominent are those of scrofula and consumption of the lungs. If we examine the various classes of the community, we shall find that persons engaged in sedentary employments are constantly more or less exposed to the baneful effects arising from this species of cold, particularly if the apartment in which they are employed is heated to a degree that subjects them, on their leaving it, to all the dangerous consequences of a sudden transition from heat to cold; thus, as it were, passing immediately from the heat of summer to the frigid temperature of winter. In consequence of the inactivity of body to which these persons are unfortunately more or less condemned, the system becomes weakened, and is rendered incapable of maintaining the necessary degree of comfort and warmth, without additional fire, clothing, or artificial heat. Under painful circumstances like these, there should be a sufficient quantity of clothing of a proper quality; and an apartment, at the same time, moderately warmed and well ventilated, should be preferred, for the purpose of keeping up the requisite degree of warmth. In order to warm the atmosphere of an apartment much above the ordinary temperature of the external air, the latter must be excluded; and either by the circulation of hot water (which is the best and most uniform method), the circulation of steam, or by heated air from a furnace beneath the room, the atmosphere of the apartment thus becomes dry, and, by the two latter methods of warming, highly rarified, and particularly the last, by which the vital parts of the air become destroyed; and if it is thus heated to any extent, dangerous consequences may ensue. All these circumstances, if well considered, will at once prove the great danger there is in passing from a heated place of this nature, to the cold, external, raw atmosphere. But if the person leaving a moderately warm room be properly clothed, then the change is not felt, or at least not so severely, and any exercise that may be taken may be enjoyed and received with advantage to the fullest extent. Now, common experience at once points out that the most proper dress for this occasion is that of cloth, flannel, or some woollen substance. Very little benefit will be derived from wearing woollen garments, unless a certain quantity be worn, and that so constructed as shall effectually keep out the cold, and prevent any tendency to shivering. Those persons who would wish to enjoy the advantages arising from being clad in woollen, and which they are capable of deriving, should constantly wear it next the skin, for it is only on the surface of the body that its health-preserving power can be felt. In illustration of this, we shall mention some of the advantages which are derivable from the employment of woollen clothes:—The extreme readiness with which the escape of the perspirable fluid is allowed through its texture; its great influence in the preservation of the sensation of warmth to the skin, under every possible variety of circumstances; there is great difficulty in making it thoroughly wet; as a conductor of heat, it is extremely tardy, whilst its pliancy, softness, and lightness, render it extremely agreeable. With respect to the use of cloth made from cotton, although it differs but little from linen, yet it approaches nearer to the woollen texture, and, consequently, from that circumstance, must be esteemed, and be employed as the next best material of which articles of dress can be constructed. The next in point of excellence is silk, but which is very inferior to the preceding in every respect. If we examine the texture of linen, we shall find it to possess almost the contrary of every one of the properties which we have justly ascribed to that of woollen. The perspirable matter is easily retained in its substance, and becomes speedily imbued in it, thereby creating an unpleasant degree of cold to the surface of the body; it is very readily saturated with moisture, and has another very great disadvantage, which is, that it conducts heat in too rapid a manner. In fact, we think we may justly condemn it as the worst of all the substances employed in dress; for this simple reason, that it is the least qualified to answer the purposes generally intended by clothing. There are many prevailing errors existing, that might be easily remedied with great advantage to the general health; and this arises from the improper adaptation of clothes to the figure of the body, particularly in infants, children, and young females. The first great mistake generally arises from the absurd prejudices of nurses, who overload and bind their unfortunate charges with flannels, stays, swathing-bands, &c., thereby rendering the infant so chilly and tender, that it suffers from, and cannot bear the external air; for common sense informs us that the clothes of children should, in all cases, be proportioned to the climate, and temperature of the atmosphere. If by accident the child is exposed to a refreshing breeze, the consequence oftentimes is, serious inflammatory affection of the eyes, lungs, or bowels; or if the child survive the month, then the opposite extreme is generally resorted to, and thus disease is early engendered in their tender constitutions. Now, it must be born in mind, that a new-born infant, being *naturally warmer* than an adult, requires proportionably less clothing, which should be neatly, but so loosely put on, that the bowels may have room, and the limbs liberty, to act and exert themselves, that the circulation of the blood, through the *superficial* vessels, may not be impeded, nor malformation or unnatural swellings be attributed

to partial compression. The latter we consider as the principal cause of many deformities and distortions, more particularly among females, who suffer more in this respect than males.

When boys escape the nurse's hand, they are in general left to that of nature; but girls are, unfortunately, doomed to be victims of fashion and prejudice, for, as they approach womanhood, they are again put into trammels, in the form of stays. The injurious consequences of this pressure are not directly obvious, but it is to be remembered that they are not the less certain on that account. The unfortunate girl twists and writhes her body almost into contortions, to avoid the pinching which, as a matter of course, must necessarily attend the commencement of wearing stays tightly laced. The posture in which she finds ease is contrary to that ordained by nature, and one which she constantly maintains. Until, at last, she cannot procure comfort in any other, even when the pressure is removed that primarily compelled her to assume it. It is in this way that those deformities arise which young and delicate females are mostly subjected to; but, unfortunately, its effects are not noticed, or they have not become sufficient to attract attention, until it is too late to admit the employment of a remedy: and many of our readers will bear in mind several cases of sudden death in young and beautiful females, in consequence of tight lacing, which the newspapers have recently recorded; this, therefore, is a frightful effect produced by the employment of an injudicious article of dress; and those who eventually become mothers suffer more considerably from this cause than many persons may imagine.

WILLIAM AND NANCY.

"Bleak was the morn when William left his Nancy,
The fleecy snow frown'd on the whitened shore;
Cold as the fears that chill'd her dreary fancy,
While she her sailor from her bosom tore."

"I've lost one eye, and I've got a timber toe," sung old Joe Jennings, as he swivelled round on his wooden pin, whilst bustling through the comical Jack-in-the-box gate, at the east end of the naval asylum going into Greenwich Park—

"I've lost one eye, and I've got a timber toe,"

"And where did you leave your eye, Joe?" "In the Gut of Giberalter." "Well, Joe, you'll never see double again. Come, let's freshen the nip, my old boy, and spin us a tough yarn. Tell the gemman about Nancy and her husband; my scuppers run over whenever I think of it." "Why, ay, he shall have it, and do you lend me a lift if I should break down, though I don't much fear it. Why, d'y see, sir, Bill Neville was our messmate, and he used to tell us a little of his history. And so, sir, he was brought up in a country village, and loved his wife when only a little girl; and he went to sea, thinking to make his fortune for her sake. Well, he got to be master of a merchantman, and then they were married. Who can describe the pleasures of that moment when their hands were spiced at the altar, and he hailed her as his own! But he was obliged to sail again. 'Oh!' said Nancy, 'should you never return, what shall I do? where shall I pass—where end my wretched days?' His heart was too full to speak; one hand clasped in hers, the other pointed to the broad expanse where the noon-day sun was shining in meridian splendour. It had a double meaning—Nancy felt it. Well, sir, eighteen months roll'd away, during which, in due time, Nancy brought into the world a dear pledge of affection—a lovely boy. But oh, the agony of the mother, as every day dragged on without intelligence from William! When she looked at the sweet babe—was it indeed fatherless, and she a widow? You'll excuse my stopping, sir, but indeed I can't help it; I've shed tears over it many a time.

"Well, sir, eighteen months was turned, when one morning Nancy arose to pour out her heart before her Maker, and weep over her sleeping child. The sun had just risen above the hills, when a noise in the little garden which fronted the cottage alarmed her. She opened the casement, and, putting aside the woodbine, beheld—delightful yet agonizing sight—her dear, her long-mourned William, handcuffed between two soldiers, while others, with their side-arms drawn, seemed fearful of losing their prey! His face pale, and his emaciated body worn down with fatigue and sickness, his spirit seemed ready to quit its frail mansion, and was only kept to earth by union with his wife. Nancy forgot all, and clasped him in her arms; but the rattling of the irons pierced her soul. I do not mean to condemn the policy, sir; but 'tis a cruel practice, that of pressing. Ah! I well remember it—though I always served my king, God bless him! Yet I've witnessed many an aching heart, and heard many a groan of agony. But to proceed: William was pressed; Nancy hastened into the cottage, and, wrapping the sleeping babe in its blanket, she prepared to accompany them. Cannot you picture to yourself the first glance which the wretched parent cast upon his child? Oh it was a sad sweet joy, that wrung the soul! I shall pass by their meeting, their dear delight, their bitter anguish. If you can feel, it is already engraven on your heart. Suffice it to say, William had been shipwrecked on the African coast, and though he had lost the whole of his property, yet heaven had spared his life, and his the only one. Sickness came on him, and but for the humanity of a poor untutored

negro, he might have breathed his last. She was black, she was a negro, but God searches the heart. He had procured, with much difficulty, a passage home. The ship arrived; he set out, and walked many a weary mile, led on by love and cheered by hope, till the roof of his cottage appeared in view; with hasty step he reached the wicket, when— But I dare not repeat the story. I've told you already he was pressed. Well, he was drafted on board of us, and his dear Nancy permitted to be with him. The evening before the action, she was sitting on the carriage of the bow gun, with her baby cradled in her arms, and William by her side; they were viewing, with admiration and delight, the beauteous scenery displayed by the sinking clouds in a thousand fantastic shapes, tinged with liquid gold streaming from the setting sun, and caressing the little innocent, while all the parent kindled in their hearts. But hark! a hoarse voice is heard from the mast-head—all is hushed. 'Halloo!' said the captain. 'A sail on the larboard bow, sir.' 'What does she look like?' 'I can but just see her, sir, but she looms large.' 'Mr Banks,' said the captain, 'take your glass aloft, and see if you can make out what she is. Call the boatswain, turn the hands up, make sail.' In a moment all was bustle; the topmen were in their station, and every man employed; and in a few minutes every stitch of canvass was stretched upon the yards and booms. The officer that was sent aloft reported it a ship of the line, which looked like a foreigner. Every heart was now elate but Nancy's—it might be an enemy! Oh, that thought was dreadful! And as William conducted her below, the tears chased each other down her pale face, and the heavy sigh burst from her gentle bosom. William mildly reproved her, and, again pointing to heaven, flew to his post. The stranger had hauled to the wind, fired a gun, and hoisted French colours. Up went ours with three cheers; and there's seldom a moment of greater pride to a British tar than when he displays the ensign of his country in presence of the enemy. Three cheers resounded through the ship, and broadside upon broadside shook her groaning timbers. Where was Nancy? William was first in every danger. Three times we boarded the foe, but were repulsed. Dreadful grew the scene of blood and horror through the darkening shades of coming night. No one bore tidings of the fight to Nancy, none, save the poor sailor whose shattered limb came to suffer amputation, or the wounded wretch to be dressed, at which she assisted with fortitude. Two hours had passed in this awful suspense and heart-rending anxiety, when a deep groan and piercing shriek from the lower deck convulsed her frame. She knew the voice, and, snatching the infant in her arms, rushed to the spot. Soon she found the object of her search: his manly form mangled and shattered; that face, once ruddy with the glow of health, now pale and convulsed; the blood streaming from his side and breast! He saw her too. 'Nancy!' said he, and raising his feeble hand pointing to heaven—it fell—and William was no more! Sinking on the lifeless body of her husband, Nancy fainted with the dear babe still in her arms; when, oh mysterious Providence! at that very moment—while senseless and inanimate—at that very moment a ball entered through the vessel's side—it pierced her bosom! Need I tell the rest? They were pleasant and lovely in their lives, and in their death they were not divided."

[This pathetic story is founded on facts which actually occurred; and there is every reason to believe that the orphan is still alive.]

THE COALSTOUN PEAR.

ONE of the most remarkable curiosities connected with ancient superstitious belief, now to be found in Scotland, is what is commonly known by the name of the *Coalstoun Pear*—an object whose history has attracted no small degree of interest, though little is popularly known regarding it. One of the editors of the present publication thus notices it in the topographical work, entitled "The Picture of Scotland."—"Within sight of the House of Lethington (in Haddingtonshire) stands the mansion-house of Coalstoun, the seat of the ancient family of Brown of Coalstoun, which is now represented by Sir James Brown, Bart., while the estate has come by a series of heirs of line into the possession of the present Countess of Dalhousie. This place is chiefly worthy of attention here, on account of a strange heir-loom, with which the welfare of the family was formerly supposed to be connected. One of the Barons of Coalstoun, about three hundred years ago, married Jean Hay, daughter of John, third Lord Yester, with whom he obtained a dowry, not consisting of such base materials as houses or land, but neither more nor less than a pear. 'Sure such a pear was never seen,' however, as this of Coalstoun, which a remote ancestor of the young lady, famed for his necromantic power, was supposed to have invested with some enchantment that rendered it perfectly invaluable. Lord Yester, in giving away his daughter along with the pear, informed his son-in-law, that, good as the lass might be, her dowry was much better, because, while she could only have value in her own generation, the pear, so long as it was con-

tinued in his family, would be attended with unfailing prosperity, and thus might cause the family to flourish to the end of time. Accordingly, the pear was preserved as a sacred palladium, both by the laird who first obtained it, and by all his descendants; till one of their ladies, taking a longing for the forbidden fruit while pregnant, inflicted upon it a deadly bite; in consequence of which, it is said, several of the best farms on the estate very speedily came to the market. The pear is said to have become stone-hard immediately after the lady bit it; and in this condition, continues the popular story, it remains till this day, with the marks of Lady Brown's teeth indelibly imprinted on it. Whether it be really thus fortified against all further attacks of the kind or not, it is certain that it is now disposed in some secure part of the house [or, as we have been lately informed, in a chest, the key of which is kept secure by the Earl of Dalhousie], so as to be out of all danger whatsoever. The *Coalstoun Pear*, without regard to the superstition attached to it, must be considered a very great curiosity in its way, having, in all probability, existed five hundred years—a greater age than, perhaps, has ever been reached by any other such production of nature."

THE HAVANNAH SHARK.

[This article has been contributed to the Journal by the highly respectable military officer who bore a principal share in the adventure. It will be found, besides its interest in that character, to contain some facts worthy the attention of the naturalist.]

SUBSEQUENT to the disastrous attack on the American lines before New Orleans, on the 8th of January 1815, the army proceeded to Isle Dauphine, in the Gulf of Mexico, where the troops remained until peace was concluded between Great Britain and the United States. As the men had been for several months exposed to severe hardships and many privations, the fleet was ordered, on its way home, to put into different ports, for the purpose of procuring fresh meat and vegetables. The ship I was on board of, with the regiment which I then commanded, belonged to that part of the fleet which touched at the Havannah. The circumstance I am about to relate is the capture of an enormous shark, which created considerable interest at the time. On arriving at the Havannah, I obtained leave from the general officer commanding, to live on shore, for the purpose of seeing something of the island. I generally went on board every morning about 10 o'clock, to give the necessary orders for the regiment. Several of our men had died during the passage to Havannah, and were consigned to the deep in the harbour of that place. One morning when I was writing in the cabin, I heard a sudden running of the men upon deck towards the after part of the vessel, and a sergeant called to me from above to come on deck immediately. Not being exactly aware of what was going on, I drew my sabre, and ran on deck without my cap. I was received with a good laugh by the officers present, and very soon was made aware of the object of the men's curiosity. It was a sight I never can forget. One of our poor fellows had been thrown overboard in the morning, sewed up in his blanket, with a shot inside to sink him. By some accident, the sewing must have been loosened, and, consequently, the body floated; and, just as I came on deck, two enormous sharks made a dash at the body, divided it in two, and disappeared with their spoil. A feeling of horror ran through every spectator. At that instant, a third shark showed himself close to our vessel. I called to the men to keep him alongside, by throwing him pieces of biscuit, at the same time desiring one of them to bring me a musket; on getting which, I fired at the animal, and the men shouted out that the ball had gone clean through him. He gave a flap with his tail, and went down, leaving the water slightly tinged with blood. At this moment, the black who beat the large drum came aft, and said to me, "Major, if you give me leave, I kill him and eat him in five minutes." I told him he should have five dollars for his pains if he kept his word. He immediately produced a shark-hook, baited it with a piece of pork, and, having fastened it to a strong line, threw it high into the air, and let it fall with a splash into the water. The effect was magical. Quick as lightning, two of the sharks were seen making towards the bait, and, in an instant, one of them swallowed it. "Now is the time, grenadier," cried blackie; "clap on the rope-line, and give him plenty o' play." Away went the monster like a whale, but *our Othello's* "occupation was not gone," and he commanded the grenadier, like an experienced general, until his enemy was lying spent and powerless on the surface of the water. A boat was now lowered, and the animal having been hauled alongside, a noose was made on a very thick rope, and he was swung into the air amidst the cheers of the whole fleet, every yard having been manned to witness our proceeding. The tail having been cut, the shark was laid on the deck, and blackie having selected a delicate piece from the shoulder, immediately proceeded to fulfil the latter part of his bargain, by broiling and eating it. The shark measured eleven feet in length, and seven feet across. The liver weighed seventy-three pounds. In the upper jaw were five rows of teeth, and in the under, six rows. I had the satisfaction to see that my aim had been good, as the mark of the ball was about two inches below the dorsal fin, and had gone "clean through," as the men said. Notwithstanding this wound, the voracious creature had returned to the

* From "Greenwich Hospital, a Series of Naval Sketches, descriptive of the Life of a Man-of-War's Man," published by J. Robins & Co., London, and which may be recommended as among the best of this species of works. The illustrations by Cruikshank are excellent.

charge within five minutes. The shark was a female, and had nineteen young ones in her belly when opened. They measured about eighteen inches each. During the time she was alongside, I (as well as two hundred others) had an opportunity of observing the young ones passing in and out of the mother's mouth; they seemed to take refuge there on the least appearance of danger. This fact, I believe, has been doubted by some naturalists. The jaw of this animal is now at Abbotsford, having been sent to the late lamented Sir Walter Scott, by the writer of this account. On the afternoon of the same day, after I had left the ship, the men caught another of the gang, rather longer than the first, and a bullock's hide and horns were found in the stomach. The horns were preserved by the surgeon of the regiment, and appeared, when taken out of the shark, to be quite soft and pulpy.

To account for this rather singular part of the story, I ought to mention that the captain of the vessel had hung several bullock hides on the rigging of the ship, which, producing a bad smell, I ordered them to be thrown overboard on the morning of the day on which the two sharks were killed.

But the most amusing part of the transaction was, that a complaint was made against me by the authorities of the place, for having destroyed two of the "guardians of their harbour." By this, I suppose, they meant, that these large sharks, playing about the mouth of the harbour, prevented a great fry of smaller ones from entering. They certainly were entitled to be considered in something like the light of "Tritons among the minnows."

OLD AND NEW PICTURES.

"Yes, my good fellow, there are tricks in all trades; and in none, perhaps, more than that to which I myself belong." Such was the sententious remark of a London artist, in descending one afternoon on the state of the fine arts in the metropolis. "I make no doubt of the correctness of your observation," I replied; "but, as you know I am quite ignorant of these matters, you will probably favour me with an insight into the legerdemain of your profession." "Oh, nothing more easy," said he; "listen but for a few minutes, and I will tell you what once came under my own observation."

A few years since, a young artist came to London for improvement, and as he had exhibited what were denominated proofs of genius, great hopes were entertained of his acquiring wealth and fame. There came with him a countryman, whose name was George Cranely, and who, having all to hope for, and nothing to lose, was glad of the opportunity to travel under the artist's protection; and, being known to each other from childhood, George was on such terms of respectful intimacy as to appear neither the servant nor the companion of the artist. In one particular alone, there was something like equality: like Roderick Random and his humble companion Strap, they had each their fortunes to make; and Cranely readily agreed to be useful to the artist in every way possible, while looking out for himself.

On the first floor of the house in which they lodged, there resided a Mr Coppenjay, who was said to possess several fine pictures, which the artist naturally desired to see; but, receiving no invitation, the pleasure was delayed. George, not possessing the modesty that withheld the artist, without any invitation inspected all Coppenjay's pictures, and frequently overhauled an illustrated copy of Pilkington's Dictionary of Painters, during the proprietor's absence. George had also witnessed the taking off of old varnish, and the application of fresh, to some of the "Old Masters," and as he was on the look-out, he was very attentive to these works of art.

Shortly afterwards, the artist received a note, stating that Mr Coppenjay would be happy to submit for inspection a picture he had recently purchased, and that he would attend the artist's leisure. This was very agreeable to the artist, and the possessor of the pictures was requested to come when it suited himself. Accordingly, he came immediately, bringing his picture. He seated himself, and, casting a look round the room, explained the motive of the visit, spoke slightly of the productions of modern painters, and enthusiastically of the "Old Masters." The artist was surprised at the volubility with which his visitor ran over the names, the characteristics, and the styles of the Italian schools; he was also as well acquainted with the Flemish and Spanish masters. There did not appear any difference while expatiating on the sublime and terrible of Michael Angelo, the simple grandeur of Raphael, the taste of Guido, the grace of Parmegiano, the chaste colouring of Titian, the florid of Rubens, the truth of Vandyck, the nature of Murillo; indeed, Mr Coppenjay appeared to have a perfect knowledge of drawing, colour, and effect, with all the peculiarities of mannerism; he was overpowering. The artist sat in silent astonishment and comparative ignorance. What application! thought he! what investigation! what taste! and what judgment! How can these be acquired? A thousand ideas rushed on the artist's mind: he feared to express one, lest he should commit himself. The desire to glean from this learned man's harvest of information, in all humility, presented itself; while collections and galleries were referred to with astonishing accuracy. At length, the eulogist's powers being exhausted, he produced the picture, which, during the oration, he had kept with the back towards the artist.

"There, sir," said its owner; "look at that." The artist's eye, embracing the effect, the colouring, and the drawing, settled on two or three particulars in succession, that gave him uneasiness, because he could discover no evidence of talent; he hesitated. "Take time, sir; I admire the minuteness of your examination; hasty decisions frequently require to be revised."

The artist continued to gaze in a kind of stupor; he thought nothing was so easy as to find fault, and he could see nothing to excite approbation. What to do he knew

not; he wiped his face, and looked again. The subject was the Adoration of the Shepherds, extremely dark in the shades, from age; the principal light on the Infant, and the white drapery on which it lay; the faces of the nearer shepherds in reflected light; the heads of Joseph and an angel or two rather spatty—otherwise, in effect, tolerably good, and suited to the design. Thus far the artist ventured. Coppenjay smiled benignantly. "Look into the picture, sir," said he; "beauties that develop themselves slowly are the delicate and estimable."

The young and inexperienced artist thought only of extricating himself from his unpleasant situation, till he was urged to give his opinion. "Well, sir," said he, "I have examined the picture, but cannot find what I am led to think you have: perhaps it arises from my incompetency to judge of a picture so injured by time."

The exhibitor again smiled. "The character and the expression are obvious," said he. "A painting should have something of the ideal, depending on a happy selection of parts, originating in beautiful nature, and judiciously uniting with high art for the general effect. When thus choice and execution are successfully displayed, the result is excellence."

The artist heard, and reflected. He knew that he who prefers quiet should not struggle to render himself conspicuous, and felt an inclination to decline saying more on the subject, since it is a degree of virtue to suspect our own judgments; but, on being urged, he ventured to say, he thought the expression rather extravagant, the light too scattered, and the effect deficient, in the placid solemnity suited to adoration.

"Ha! ha! I see," said Coppenjay; you are not well acquainted with the works of the *Old Masters*."

The artist bowed. "Well, sir," continued he, "I have studied them; the knowledge and judgment I possess direct me to declare that picture one of the happiest efforts of genius that ever quitted an easel. You do not think with me; but when you shall have travelled far, sought after, and have discovered what is great in art, your opinions respecting the *Old Masters* will undergo a revolution: for the present, I take my leave." Then, as if recollecting himself, the picture-dealer said, "I think we might be useful to each other. I have several pictures that have sustained injuries of various kinds. Lining, cleaning, and varnishing, I do in my own peculiar mode; but I frequently require the assistance of some one, to scumble down certain parts into keeping, assist the lights, and to harmonize with judgment."

"I," replied the artist, "do not understand the mode of restoring the lost tints of a good picture, and I should not like to employ myself on a bad one."

"Poh! sir," interrupted his companion; "if a small part of original tint remain, could you not match it? and, if not, could you not adapt one to suit the general tone of the picture? Could you not catch the peculiarity of touch, or imitate the mannerism of any master with a little application? It might pay you well."

"I could not do this," said the artist, "without much study, and I would rather follow nature, because there I should improve. By following the manner of any artist, I should ever be behind."

"Good morning," said Mr Coppenjay, as he retired with his picture.

The example of knavery thus displayed was not lost on young Cranely. Next day his friend the artist found him scouring away on a small old picture on panel, and, by his side, a little trunk, in which were requisites for his new profession. There was spirits of wine to take off the old varnish; pumice-stone and powder, to scrub off the oil where it had changed the surface; gold-size, to give a grain to crude masses; ultramarine, to scumble over skies and distances; yellow lake and burnt sienna, to scumble over foregrounds; liquorice-water and gall, to give the stain of antiquity, called a harmonizer; and others, the uses of which George had been clever enough to pick up. "Why, George," said the artist, "you are starting into perfection as a restorer!" "Ay, Sir, you may laugh, but I shall do the trick. I shall keep moving, and time will show," replied George.

A few years passed; they had lost sight of each other, but, meeting by accident, George prevailed on the artist to accompany him home, that a proof of his correctness of view might be exhibited. The artist was astonished. He very clearly saw that George, by studying "the *Old Masters*" in a particular way, had realized more pounds than he himself, by great application, had obtained shillings. "Now, my dear Cranely," said the artist, "if I may be thus familiar with you, while I am gratified in seeing you successful in life, you must forgive my feeling contempt for the means." "I know your opinions," replied his more polished friend; "they may be correct, and I respect them; my pursuits are to me valuable, and therefore I adopt them." "They are, my good fellow," said the artist, "a series of deceptions; fallacies which are listened to by the uninformed, who are duped; and believed by the credulous, who are plundered." George nodded, and the artist continued. "That pictures of great merit have occasionally passed through the hands of dealers, is true; for such, there could be no necessity to puff, nor difficulty in obtaining a purchaser. But the studios of Italy and of Holland furnish a constant supply of newly-made *Old Masters*, and oldly-made *New Masters*, all mischievous in proportion to their means of obliterating a knowledge of the great masters whose names they assume; and they are injurious to the extent they occupy; for their places might be filled by productions of the rising, or more elevated talent of our native country. And who has contributed to a result so opposed to the dictates of common sense? Certainly not those possessed of taste or judgment; but, since it has occurred amongst those said to be the most thinking people, the error will not be of long continuance." George smiled; the artist proceeded. "A sadly damaged and miserably restored old canvass, sanctioned by the praises of a dealer, has often found a place in a noble collection, as a production of some great master who conferred an honour on the age in which he lived, but who would feel disgraced by the thing as it appears in the present day. To

repaint the perished parts of an old picture, is not restoring it, if restoration mean the producing of its original excellence. West is said to have repaired some celebrated old pictures, but this was the employ of kindred talent in cases where injury had occurred by accident, and every way justifiable. Were Raphael to revisit his painting-room, he could not restore one of his own pictures. If such reproductions could be accomplished, the magnificent works of the Grecian artists would not have been lost in the common decay of perishable matter. The Roman artists would gladly have preserved the pictures of Apelles, had it been practicable. It remained for the age in which picture-dealers should attain commanding influence, that such impossibility could be undertaken, and presumed to be accomplished." George affected to smile; the artist continued. "The French have struggled hard in the work of preservation; they have cleaned, lined, transferred from one basis to another, varnished, scumbled over masses on some pictures, and repainted on the lights of others. It would be edifying to hear what the *Old Masters* would say, could they inspect these mangled remains." Cranely laughed outright. "Yet," continued the artist, "the endeavour to preserve from destruction any work of art is praiseworthy, and, to a certain extent, may be adopted, by careful lining and judicious application of varnish." "Nevertheless," said Cranely, who began to feel uncomfortable under a lecture which, by insinuation, accused him of knavery, "pictures of the Italian school are often repaired, to the satisfaction of judges." "Ay," said the artist, "that means no more than that they have been repaired as well as could be expected; but that was not restoring those pictures. Restoration is impossible. Improper varnish has expedited the ruin of many a picture on panel, by cracking on its surface, which, opening in forms resembling a spider's web, no longer protects the colour beneath. This is very injurious, particularly in the shades where the colour is thin. Exposure on a damp or unsound wall hastens the decomposition of canvass—destruction frequently commences from behind. The air insinuates itself through a thousand minute apertures, staining their edges, till the painting appears like a piece of Mosaic workmanship. Effect of heat from the sun is slow in its progress, but it causes the varnish and colour to shrink from the canvass, giving an appearance of shagreen in different degrees of roughness and blackness. These are a few operations of that silent agent which is resolving all into dust; all we can do is to give them a little protracted oblivion, and with this we should be satisfied." George shook his head. "Why," continued the artist, "facts are stubborn things; and your experience must have taught you that to attempt more is to fail, to promise more is to deceive; therefore, reform it altogether, and leave such disgraceful dealings to those who possess neither taste, truth, nor love of country." The friend whom he thus lectured shrugged up his shoulders. "Ay," said he, "that is all very fine talking. You must excuse me remaining a dealer in old pictures a few years longer; and then, if I can afford to have a conscience, I shall certainly revert to my original simplicity; but, pardon me for the present; the richer part of the English nation have a rage for the things which I manufacture. I need their money, and supply their wants; and what need there be any further philosophising on the subject?"

BIOGRAPHIC SKETCHES.

LOTT CARY.

In a former number of the Journal, we presented a sketch of the rise and prospects of the American Colonization Society, established for the purpose of colonizing the black population of the United States on the newly-founded colony of Liberia, on the coast of Africa. The comparative success which has attended this philanthropic, and—as regards the States—salutary project, has been, it seems, partly produced by the efforts of some of the civilized blacks themselves, who have, in various instances, warmly seconded the views of the society. It is very pleasing to find the descendants of native Africans—men born in slavery, with skins of the darkest hue, and whose moral culture has been totally and wilfully neglected—occasionally, by the efforts of that native genius which the Creator has not limited to any particular race of men, shining forth among their fellows, and in their conduct setting an example even to their white and more favoured brethren.

In the United States of America an instance occurred during last century of a coloured man shewing extraordinary mental abilities. His name was Richard Banneker, and he belonged to Maryland. He was altogether self-taught, and having directed his attention to the study of astronomy, his calculations were so thorough and exact as to excite the approbation of such men as Pitt, Fox, Wilberforce, and other eminent men, and an almanack which he composed was produced in the House of Commons, as an argument in favour of the mental cultivation of coloured people, and of their liberation from their wretched thralldom.

The object of the present sketch is, however, one of a still more interesting character, inasmuch as he was immediately connected with the scheme of colonizing the coast of Africa with persons of his own colour. This self-taught African genius was named Lott Cary. He was born a slave in Charles city county, about thirty miles below Richmond, Virginia, on the estate of Mr William A. Christian. He was the only child of parents who were themselves slaves, but, it appears, of a pious turn of mind; and though he had no instruction from books, it may be supposed that the admonitions of his father and

mother may have laid the foundations of his future usefulness. In the year 1804, the young slave was sent to Richmond, and hired out by the year as a common labourer, at a warehouse in the place. While in this employment, he happened to hear a sermon, which implanted in his uncultivated mind a strong desire to be able to read, chiefly with a view of becoming acquainted with the nature of certain transactions recorded in the New Testament. Having, somehow, procured a copy of this work, he commenced learning his letters, by trying to read the chapter he had heard illustrated in the sermon; and by dint of perseverance, and the kind assistance of young gentlemen who called at the warehouse, he was in a little time able to read, which gave him great satisfaction. This acquisition immediately created in him a desire to be able to write; an accomplishment he soon also mastered. He now became more useful to his employers, by being able to check and superintend the shipping of tobacco; and having, in the course of time, saved the sum of 850 dollars, or nearly £170 sterling, he purchased his own freedom and that of two children, left him on the death of his first wife. "Of the real value of his services while in this employment (says the author of the American publication from whence these facts are extracted), it has been remarked, that no one but a dealer in tobacco can form an idea. Notwithstanding the hundreds of hogsheads which were committed to his charge, he could produce any one the moment it was called for; and the shipments were made with a promptness and correctness such as no person, white or coloured, has equalled in the same situation. The last year in which he remained in the warehouse, his salary was 800 dollars. For his ability in his work, he was highly esteemed and frequently rewarded by the merchant with a five dollar bank note. He was also allowed to sell, for his own benefit, many small parcels of damaged tobacco. It was by saving the little sums obtained in this way, with the aid of subscriptions by the merchants, to whose interests he had been attentive, that he was enabled to purchase the freedom of his family. When the colonists were fitted out for Africa, he was enabled to bear a considerable part of his own expenses. He also purchased a house and some land in Richmond. It is said, that while employed at the warehouse, he often devoted his leisure time to reading, and that a gentleman, on one occasion, taking up a book, which he had left for a few moments, found it to be 'Smith's Wealth of Nations.'"

As early as the year 1815, this intelligent emancipated slave began to feel special interest in the cause of African missions, and contributed, probably, more than any other person, in giving origin and character to the African Missionary Society, established during that year in Richmond. His benevolence was practical, and whenever and wherever good objects were to be effected, he was ready to lend his aid. Mr Cary was among the earliest emigrants to Africa. Here he saw before him a wide and interesting field, demanding various and powerful talents, and the most devoted piety. His intellectual ability, firmness of purpose, unbending integrity, correct judgment, and disinterested benevolence, soon placed him in a conspicuous station, and gave him wide and commanding influence. Though naturally diffident and retiring, his worth was too evident to allow of his remaining in obscurity. The difficulties which were encountered in founding a settlement at Cape Montserado were appalling, and it was proposed on one occasion that the emigrants should remove to Sierra Leone, whose climate is of the most destructive character; but the resolution of Lott Cary to remain was not shaken, and his decision had no small effect towards inducing others to imitate his example. In the event, they suffered severely. More than eight hundred natives attacked them in November 1822, but were repulsed; and a few weeks later, a body of fifteen hundred attacked them again at day-break; several of the colonists were killed and wounded; but with no more than thirty-seven effective men and boys, and the aid of a small piece of artillery, they again achieved a victory over the natives. In these scenes, the intrepid Cary necessarily bore a conspicuous part. In one of his letters, he remarks, that, like the Jews in rebuilding their city, they had to toil with their arms beside them, and rest upon their arms every night; but he declared after this, in the most emphatic terms, that "there never had been an hour or a minute, no, not even when the balls were flying round his head, when he could wish himself back in America again."

The peculiar exposure of the early emigrants, the scantiness of their supplies, and the want of adequate medical attentions, subjected them to severe and complicated sufferings. To relieve, if possible, these sufferings, Mr Cary obtained all the information in his power concerning the diseases of the climate, and the proper remedies. He made liberal sacrifices of his property in behalf of the poor and distressed, and devoted his time almost exclusively to the relief of the destitute, the sick, and the afflicted. His services as a physician to the colony were invaluable, and were, for a long time, rendered without hope of reward. But amid his multiplied cares and efforts for the colony, he never forgot or neglected to promote the joint cause of civilization and christianity among the natives.

In 1806, Mr Cary was elected vice-agent of the colony, and he discharged the duties of that important

office till his death, which occurred in 1828, in the most melancholy manner. One evening, while he and several others were engaged in making cartridges in the old agency house at Monrovia—the chief town in the settlement—in preparation to defend the rights of the colony against a slave-trader, a candle appears to have accidentally overturned, which caught some loose powder, and almost instantaneously reached the entire ammunition, producing an explosion which resulted in the death of eight persons. Mr Cary survived for two days.—Such was the unfortunate death of this active coloured apostle of civilization on the coast of Africa, where his memory will continue long to be cherished. The career which he pursued, and the intelligence which marked his character, might prove, to the satisfaction of all impartial thinkers, that the miserable race of blacks is not destitute of moral worth and innate genius, and that their culture would liberally produce an abundant harvest of the best principles and their results, which dignify human nature.

WATERTON'S ACCOUNT OF THE SLOTH.

THE character and habits of that singular animal, the Sloth, according to Charles Waterton, the enthusiastic traveller in the wilds of South America, have been strangely misrepresented by naturalists. "This singular animal (says he) is destined by nature to be produced, to live, and to die, in the trees. He is a scarce and solitary animal, and, being good food, he is never allowed to escape. He inhabits remote and gloomy forests, where snakes take up their abode, and where cruelly-stinging ants and scorpions, and swamps, and innumerable thorny shrubs and bushes, obstruct the steps of civilized men. This, then, is the proper place to go in quest of the Sloth. We will first take a near view of him. By obtaining a knowledge of his anatomy, we will be enabled to account for his movements. His fore-legs, or, more correctly speaking, his arms, are apparently much too long, while his hind-legs are very short, and look as if they could be bent almost to the shape of a corkscrew. Both the fore and hind legs, by their form, and by the manner in which they are joined to the body, are quite incapacitated from acting in a perpendicular direction, or in supporting it on the earth, as the bodies of other quadrupeds are supported, by their legs. Hence, when you place him on the floor, his belly touches the ground. Now, granted that he supported himself on his legs like other animals, nevertheless he would be in pain, for he has no soles to his feet, and his claws are very sharp and long, and curved; so that, were his body supported by his feet, it would be by their extremities, just as your body would be, were you to throw yourself on all-fours, and try to support it on the ends of your toes and fingers. Were the floor of a polished surface, the sloth would actually be quite stationary; but as the ground is generally rough, with little protuberances upon it, such as stones, or roots of grass, this just suits the Sloth, and he moves his fore-legs in all directions, in order to find something to lay hold of; and when he has succeeded, he pulls himself forwards, and is thus enabled to travel onwards, but, at the same time, in so tardy and awkward a manner, as to acquire him the name of the Sloth. Indeed, his looks and his gestures evidently betray his uncomfortable situation; and as a sigh every now and then escapes him, we may be entitled to conclude that he is actually in pain.

"Some years ago I kept a Sloth in my room for several months. I often took him out of the house, and placed him upon the ground, in order to have an opportunity of observing his motions. If the ground were rough, he would pull himself forwards by means of his fore-legs, at a pretty good pace; and he invariably shaped his course towards the nearest tree. His favourite abode was the back of a chair; and after getting all his legs in a line upon the topmost part of it, he would hang there for hours together, and often, with a low and inward cry, would seem to invite me to take notice of him. The Sloth, in its wild state, spends its whole life in the trees, and never leaves them but through force, or by accident. An all-ruling Providence has ordered man to tread on the surface of the earth, the eagle to soar in the expanse of the skies, and the monkey and squirrel to inhabit the trees; still these change their relative situations without feeling much inconvenience; but the Sloth is doomed to spend his whole life in the trees; and, what is more extraordinary, not upon the branches, like the squirrel and the monkey, but under them. He moves suspended from the branch, he rests suspended from it, and he sleeps suspended from it. To enable him to do this, he must have a very different formation from that of any other known quadruped. Hence, his seemingly bungled conformation is at once accounted for; and in lieu of the Sloth leading a painful life, and entailing a melancholy and miserable existence on its progeny, it is but fair to surmise that it just enjoys life as much as any other animal, and that its extraordinary formation and singular habits are but farther proofs to engage us to admire the wonderful works of Omnipotence.

"It must be observed, that the Sloth does not hang head-downwards, like the vampire. When asleep, he supports himself from a branch parallel to the earth. He first seizes the branch with one arm, and then with the other; and after that, brings up both his

legs, one by one, to the same branch, so that all the four are in a line: he seems perfectly at rest in this position. As the Sloth is an inhabitant of forests within the tropics, where the trees touch each other in the greatest profusion, there seems to be no reason why he should confine himself to one tree alone for food, and entirely strip it of its leaves. During the many years I have ranged the forests, I have never seen a tree in such a state of nudity; indeed, I would hazard a conjecture, that by the time the animal has finished the last of the old leaves, there would be a new crop on the part of the tree he had stripped first, ready for him to begin again, so quick is the process of vegetation in these countries." In an experiment tried by the traveller of putting a dog to death by means of the exceedingly subtle wourali poison, made by the South American Indians, "some faint resistance on the part of nature (says he) was observed, as if existence struggled for superiority; but in the following instance of the Sloth, life sunk in death without the least apparent contention, without a cry, without a struggle, and without a groan. This was the Ai, or three-toed Sloth. It was in the possession of a gentleman who was collecting curiosities. He wished to have it killed, in order to preserve the skin, and the wourali poison was resorted to as the easiest death. Of all animals, not even the toad and tortoise excepted, this poor ill-formed creature is the most tenacious of life. It exists long after it has received wounds which would have destroyed any other animal; and it may be said, on seeing a mortally wounded Sloth, that life disputes with death every inch of flesh in its body. The Ai was wounded in the leg, and put down on the floor, about two feet from the table; it contrived to reach the leg of the table, and fastened itself on it, as if wishful to ascend. But this was its last advancing step; life was ebbing fast, though imperceptibly; nor could this singular production of nature, which has been formed of a texture to resist death in a thousand shapes, make any stand against the wourali poison. First, one fore-leg let go its hold, and dropped down motionless by its side; the other gradually did the same. The fore-legs having now lost their strength, the Sloth slowly doubled its body, and placed its head betwixt its hind-legs, which still adhered to the table; but when the poison had affected these also, it sunk to the ground, but sunk so gently, that you could not distinguish the movement from an ordinary motion; and had you been ignorant that it was wounded with a poisoned arrow, you would never have suspected that it was dying. During the tenth minute from the time it was wounded, it stirred, and that was all; and the minute after, life's last spark was out."

EFFECTS OF THE PRINCIPAL ARTS, TRADES, AND PROFESSIONS.

SECOND ARTICLE.

THE next division of the labouring class that comes under the attention of Mr Thackrah, in his ingenious work entitled "The Effects of the Principal Arts, Trades, and Professions, on Health and Longevity," is that in which the employments are carried on in an atmosphere confined and impure.

"Though all inhabitants of large towns (he proceeds) suffer in a greater or less degree from the impurity of the atmosphere, yet it is obvious that those who are most crowded together will be chiefly affected, particularly if ventilation be imperfect. A serious addition to the evils of a confined atmosphere is the defect of muscular exercise. Certain classes of muscles are for twelve or fourteen hours a-day scarcely moved, and postures maintained injurious to the proper actions of the internal organs.

TAILORS are very unfortunately situated in this respect. Sitting all day in a confined atmosphere, and often in a room too crowded, with the legs crossed, and the spine bowed, they cannot have respiration, circulation, or digestion well performed. The employment, we must admit, produces few acute diseases. But disorders of the stomach and bowels are general, and often obstinate. Pulmonary consumption is also frequent. Some of the men state their liability to pains of the chest; but the majority make no complaint. It is nevertheless apparent, even from observing only the expression of countenance, the complexion, and the gait, that the functions of the stomach and the heart are greatly impaired, even in those who consider themselves well. We see no plump and rosy tailors; none of fine form and strong muscle. The spine is generally curved. The reduction in the circumference of the chest is not so much as we might expect. The average of our measurements presented 33 to 34 inches, while that of other artisans is about 36. The capacity of the lungs, as evinced by measuring the air thrown out at expiration, is not less than common. The average of six individuals was seven pints, two-thirds. The prejudicial influence of their employ is more insidious than urgent; it undermines rather than destroys life. Apprenticed at an early age, tailors have their constitution modified to their employment. But its native vigour, drawn off in youth to this adaptation of organs to external circumstances, gradually declines, and finally ceases before the natural termination of life. Of 22 of the workmen employed in Leeds, not one had attained the age of 60; 2 had passed 50; and of the rest, not more than two had reached 40. We heard of an instance or two of great age, but the individuals had lived chiefly in the country. The evils attendant on the employment are in many cases greatly aggravated by bad habits. Like other men whom circumstances have physically depressed, the tailor often seeks the baneful comfort of ale and ardent spirit. The time of relief from work is generally

spent, not in invigorating the animal frame, but in aggravating his complaints, and converting functional into organic disease.

Can we correct these evils? The position of the tailor might be amended. He now sits cross-legged on a board; because in the ordinary sitting posture he could not hold a heavy piece of cloth high enough for his eyes to direct his needle. Let a hole be made in the board of the circumference of his body, and let his seat be placed below it. The eyes and the hands will then be sufficiently near his work; his spine will not be unnaturally bent, and his chest and abdomen will be free.

STAY-MAKERS are exposed, though in less degree, to the same physical evils as the tailors. We do not find, however, that they are equally intemperate. Though health is impaired by confinement, life is not apparently shortened. Among the few stay-makers who live in Leeds, there are several instances of considerable age.

MILLINERS, DRESS-MAKERS, and STRAW-BONNET-MAKERS are often crowded in apartments of disproportionate size, and kept at work for an improper length of time. Their ordinary hours are ten or twelve in the day, but they are confined not unfrequently from five or six in the morning till twelve at night. The bent posture in which they sit, tends to injure the digestive organs, as well as the circulation and the breathing. Hence girls from the country, fresh-looking and robust, soon become pale and thin. The constant direction of the eyes also to minute work, affects these organs. Sometimes it induces slight ophthalmia (*inflammation of the eyes*), and sometimes at length a much more serious disease, palsy of the optic nerve (*and consequently blindness*). In stoving straw-bonnets, sulphur is largely used. The fumes, in some houses, spread through every apartment, and the inmates even sleep in an atmosphere impregnated with these offensive vapours! Sulphurous gas, I need scarcely add, greatly affects respiration. It induces at the time a violent cough, and the irritation, if frequently repeated, tends to the development of pulmonary disease. Might not the sulphurous fumes be absorbed or confined in the process? Water in a large shallow dish would take up a considerable proportion. A small out building for the operation would be a more decisive remedy. This indeed is used by some straw-bonnet-makers. Remedies for the other evils to which this class is exposed are obvious—ventilation, reduction of the hours of work, and brisk exercise in the open air. The great cause of the ill-health of females who make ladies' dresses, is the lowness of their wages. To obtain a livelihood, they are obliged to work in excess.

WEAVERS have a confined atmosphere, and, though the limbs are fully exercised, the trunk is kept comparatively fixed, and the chest is not expanded. This stooping, however, is somewhat diminished by the mode of casting the shuttle with a string, instead of the hand. When weaving is carried on at home, the rooms are often small and ill ventilated; and among the Irish we find a sad want of cleanliness. Fever is rather frequent among weavers, but other acute diseases are rare; the men, however, seldom enjoy health. Digestion is imperfect, asthma and other affections of the chest are common. They complain of the smell from the oil-lamps. This no doubt annoys the lungs, but their reduction of health is attributable chiefly to the confinement. The susceptibility to fever may arise from the frequent defect of proper nourishment. The weavers of stuffs have low wages, and are often out of employ. There are more old men in the occupation of weaving than in most others.

SHOEMAKERS, it is well known, are placed in a very bad posture—a posture second only to that of the tailors. The abdominal viscera, and especially the stomach and liver, are compressed. Lads put to this employ often suffer so much from head-ache and general indisposition, that they are obliged to leave it; and men who have been able to bear it for years, lose appetite and strength. Digestion and circulation are so much impaired, that the countenance would mark a shoemaker almost as well as a tailor. We suppose that, from the reduction of perspiration and other evacuations, in this and similar employments, the blood is impure, and, consequently, the complexion darkened. The secretion of bile is generally unhealthy, and bowel complaints are frequent. The capacity of the lungs in the individuals examined we found to average six and one-third, and the circumference of the chest 35 inches. In the few shoemakers who live to old age, there is often a remarkable hollow at the base of the breast bone, occasioned by the pressure of the last. Are shoemakers subject to popliteal aneurism, or a swelling of the artery in the ham? Morgagni asserts this; but I am not aware that a similar observation is now made. Much as posture injures shoemakers, bad habits injure more. Working late on Saturday night, they often lie in bed all Sunday morning, lounge in listlessness during the afternoon, drink all Monday, are sick and taking physic on Tuesday, and return to work on Wednesday.

CURRIERS and LEATHER-DRESSERS are subjected to no injurious agent, except the bent posture in the process of "shaving." This affects the head. The smell of the leather produces no disagreeable effect. The men are generally very healthy, and a considerable proportion live to old age.

SADDLERS are obliged to lean forwards, and are confined to this position. Hence they are subject to head-ache and indigestion.

PRINTERS are kept in a confined atmosphere, and generally want exercise. Pressmen, however, have good and varied labour. Compositors are often subjected to injury from the types. These, a compound of lead and antimony, emit, when heated, a fume which affects respiration, and are said also to produce partial palsy of the hands. Among the printers, however, of whom we have inquired, care is generally taken to avoid composing till the types are cold, and thus no injury is sustained. The constant application of the eyes to minute objects gradually enfeebles these organs. The standing posture long maintained here, as well as in other occupations, tends to injure the digestive organs. Some printers complain of disorder of the stomach and head; and few appear to enjoy full health. Consumption is frequent. We can

scarcely find or hear of any compositor above the age of 50. In many towns printers are intemperate.

BOOKBINDERS and POCKET-BOOK-MAKERS are similar employments. The work is remarkably easy, and keeps no muscles fixed, nor demands excessive action from any. The workmen suffer no annoyance, but they are often very dissipated. One master informed us that several of his people have died from consumption. This, however, I should attribute, not to the employ, but to intemperance.

CARVERS and GILDERS are kept in a confined atmosphere, and often for long periods in a leaning posture. Hence they sometimes suffer from headache. Though the pallid appearance, general among these workmen, indicates a reduction of health and vigour, life is not abbreviated in a marked degree.

CLOCKMAKERS have little objectionable in their occupation; for though the making and fitting up are carried on in the house, the posture is varied, and the men are frequently travelling to repair clocks in the country. They are generally healthy, and attain often advanced life. WATCHMAKERS have a much worse employ. They sit all day with the trunk bent forward. The digestive organs almost always suffer, and the lungs are sometimes affected. The close and continued application also greatly injures the eyes. Many youths apprenticed to watch-making are obliged to leave the employ, and the individuals who remain rarely live to old age.

SMITHS have an employment remarkably conducive to muscular power. The use of the large hammer powerfully excites all the muscles, and especially those of the arms, throwing on them a large supply of blood, and, consequently, producing their enlargement. Exertion like this, moreover, has a considerable effect on the circulation in general, and the functions with which it is connected. For youths of strong constitution no labour is better than that of the smith. For those, however, naturally delicate, the exertion is too great, and young men of scrofulous constitution are particularly liable to sink under the employ. Smiths are subjected to high temperature, and frequent changes of temperature, but with no obvious injury. They are rarely affected with rheumatism and catarrh. The employ subjects the eye to the annoyance of smoke, and to excitement from the glow of the heated iron. But our examination of the smiths in this neighbourhood does not prove them subject to ophthalmia (*inflammation of the eyes*); nor does it show that vision is impaired by the excitement of the retina (*nervous coat of the eye*). When smiths are ill, the cause is most frequently intemperance. They do not, however, arrive at great age.

CABINET-MAKERS are generally healthy, though employed within doors. The labour is good; and there is no hurtful accompaniment, with the exception of the dust which is produced by sawing certain kinds of wood."

THE LONE INDIAN.

"A white man, gazing on the scene,
Would say a lovely spot was here,
And praise the lawns so fresh and green,
Between the hills so sheer,
Like it not—I would the plan
Lay in its tall old groves again."

BRYANT.

POWONTONAMO was the son of a mighty chief. He looked on his tribe with such a fiery glance, that they called him the Eagle of the Mohawks. His eye never blinked in the sunbeam, and he leaped along the chase like the untiring waves of the Niagara. Even when a little boy, his tiny arrow would hit the frisking squirrel in the ear, and bring down the humming bird on her rapid wing. He was his father's pride and joy. He loved to toss him high in his sinewy arms, and shout "Look, Eagle-eye, look! and see the big hunting grounds of the Mohawks! Powontonomo will be their chief. The winds will tell his brave deeds. When men speak of him, they will not speak loud; but as if the Great Spirit had breathed in thunder."

The prophecy was fulfilled. When Powontonomo became a man, the fame of his beauty and courage reached the tribes of Illinois; and even the distant Osage showed his white teeth with delight, when he heard the wild deeds of the Mohawk Eagle. Yet was his spirit frank, chivalrous, and kind. When the white men came to buy land, he met them with an open palm, and spread his buffalo for the traveller. The old chiefs loved the bold youth, and offered their daughters in marriage. The eyes of the young Indian girls sparkled when he looked on them; but he treated them all with the stern indifference of a warrior, until he saw Soonsetah raise her long dark eyelash. Then his heart melted beneath the beaming glance of beauty. Soonsetah was the fairest of the Oneidas. The young men of her tribe called her the Sunny-eye. She was smaller than her nation usually are; and her slight graceful figure was so elastic in its motions, that the tall grass would rise up and shake off its dew-drops, after her pretty moccasins had pressed it. Many a famous chief had sought her love; but when they brought the choicest furs, she would smile disdainfully, and say, "Soonsetah's foot is warm. Has not her father an arrow?" When they offered her food, according to the Indian custom, her answer was, "Soonsetah has not seen all the warriors. She will eat with the bravest." The hunters told the young Eagle that Sunny-eye of Oneida was beautiful as the bright birds in the hunting land beyond the sky; but that her heart was proud, and she said the great chiefs were not good enough to dress venison for her. When Powontonomo listened to these accounts, his lip would curl slightly, as he threw back his fur-edged mantle, and placed his firm, springy foot forward, so that the beads and shells of his rich moccasin might be seen to vibrate at every sound of his tremendous war-song. If there were vanity in the act, there was likewise becoming pride. Soonsetah heard of his haughty smile, and resolved in her own heart that no Oneida should

sit beside her, till she had seen the chieftain of the Mohawks. Before many moons had passed away, he sought her father's wigwam, to carry delicate furs and shining shells to the young coquette of the wilderness. She did not raise her bright melting eye to his, when he came near her; but when he said, "will the Sunny-eye look on the gift of a Mohawk? his barbed arrow is swift; his foot never turned from the foe;" the colour on her brown cheek was glowing as an autumnal twilight. Her voice was like the troubled note of the wren, as she answered, "the furs of Powontonomo are soft and warm to the foot of Soonsetah. She will weave the shells in the wampum belt of the Mohawk Eagle." The exulting lover sat by her side, and offered her venison and parched corn. She raised her timid eye, as she tasted the food; and then the young Eagle knew that Sunny-eye would be his wife.

There were feasting and dancing, and the marriage song rang merrily in Mohawk cabins, when the Oneida came among them. Powontonomo loved her as his own heart's blood. He delighted to bring her the fattest deers of the forest, and load her with the ribbons and beads of the English. The prophets of his people liked it not that the strangers grew so numerous in the land. They shook their heads mournfully, and said, "the moose and the beaver will not live within sound of the white man's gun. They will go beyond the lakes, and the Indians must follow their trail." But the young chief laughed them to scorn. He said, "the land is very big. The mountain eagle could not fly over it in many days. Surely the wigwams of the English will never cover it." Yet when he held his son in his arms, as his father had done before him, he sighed to hear the strokes of the axe levelling the old trees of his forests. Sometimes he looked sorrowfully on his baby boy, and thought he had perchance done him much wrong, when he smoked a pipe in the wigwam of the stranger.

One day, he left his home before the grey mist of morning had gone from the hills, to seek food for his wife and child. The polar star was bright in the heavens ere he returned; yet his hands were empty. The white man's gun had scared the beasts of the forest, and the arrow of the Indian was sharpened in vain. Powontonomo entered his wigwam with a cloudy brow. He did not look at Soonsetah; he did not speak to her boy; but, silent and sullen, he sat leaning on the head of his arrow. He wept not, for an Indian may not weep; but the muscles of his face betrayed the struggle within his soul. The Sunny-eye approached fearfully, and laid her little hand upon his brawny shoulder, as she asked, "why is the Eagle's eye on the earth? What has Soonsetah done, that her child dare not look in the face of his father?" Slowly the warrior turned his gaze upon her. The expression of sadness deepened, as he answered, "the Eagle has taken a snake to his nest: how can his young sleep in it?" The Indian boy, all unconscious of the forebodings which stirred his father's spirit, moved to his side, and peeped up in his face with a mingled expression of love and fear.

The heart of the generous savage was full, even to bursting. His hand trembled, as he placed it on the sleek black hair of his only son. "The Great Spirit bless thee! the Great Spirit bless thee, and give thee back the hunting ground of the Mohawk!" he exclaimed. Then folding him, for an instant, in an almost crushing embrace, he gave him to his mother, and darted from the wigwam.

Two hours he remained in the open air, but the clear breath of heaven brought no relief to his noble and suffering soul. Wherever he looked abroad, the ravages of the civilized destroyer met his eye. Where were the trees, under which he had frolicked in infancy, sported in boyhood, and rested after the fatigues of the battle? They formed the English boat, or lined the English dwelling. Where were the hoary sacrifice-heaps of his people? The stones were taken to fence in the land, which the intruder dared to call his own. Where was his father's grave? The stranger's road passed over it, and his cattle trampled on the ground where the mighty Mohawk slumbered. Where was his once powerful tribe? Alas, in the white man's wars they joined with the British, in the vain hope of recovering their lost privileges. Hundreds had gone to their last home; others had joined distant tribes; and some pitiful wretches, whom he scorned to call brethren, consented to live on the white man's bounty. These were corroding reflections; and well might fierce thoughts of vengeance pass through the mind of the deserted prince; but he was powerless now; and the English swarmed like vultures around the dying. "It is the work of the Great Spirit," said he. "The Englishman's god made the Indian's heart afraid; and now he is like a wounded buffalo, when hungry wolves are on his trail."

When Powontonomo returned to his hut, his countenance, though severe, was composed. He spoke to the Sunny-eye with more kindness than the savage generally addresses the wife of his youth; but his look told her that she must not ask the grief which had put a woman's heart within the breast of the far-famed Mohawk Eagle.

The next day, when the young chieftain went out on a hunting expedition, he was accosted by a rough, square-built farmer. "Powow," said he, "your squaw has been stripping a dozen of my trees, and I don't like it over much." It was a moment when the Indian could ill brook a white man's insolence. "Listen, Buffalo-head," shouted he; and as he spoke,

he seized the shaggy pate of the unconscious offender, and eyed him with the concentrated venom of an ambushed rattlesnake—"Listen to the chief of the Mohawks! These broad lands are all his own. When the white man first left his cursed foot-print in the forest, the Great Bear looked down upon the big tribes of Iroquois and Abnakis. The wigwams of the noble Delawares were thick, where the soft winds dwell. The rising sun glanced on the fierce Pequods; and the Illinois, the Miamies, and warlike tribes, like the hairs of your head, marked his going down. Had the red man struck you then, your tribes would have been as dry grass to the lightning! Go—shall the Sunny-eye of Oneida ask the pale face for a basket?" He breathed out a quick, convulsive laugh, and his white teeth showed through his parted lips, as he shook the farmer from him, with the strength and fury of a raging panther.

After that, his path was unmolested, for no one dared to awaken his wrath; but a smile never again visited the dark countenance of the degraded chief. The wild beasts had fled so far from the settlements, that he would hunt days and days without success. Soonseth sometimes begged him to join the remnant of Oneidas, and persuade them to go far off, toward the setting sun. Powontonomo replied, "this is the burial-place of my fathers;" and the Sunny-eye dared say no more.

At last, their boy sickened and died of a fever he had taken among the English. They buried him beneath a spreading oak, on the banks of the Mohawk, and heaped stones upon his grave, without a tear. "He must lie near the water," said the desolate chief, "else the white man's horses will tread on him."

The young mother did not weep, but her heart had received its death-wound. The fever seized her, and she grew paler and weaker every day. One morning, Powontonomo returned with some delicate food he had been seeking for her. "Will Soonseth eat?" said he. He spoke in a tone of subdued tenderness; but she answered not. The foot which was wont to bound forward to meet him, lay motionless and cold. He raised the blanket which partly concealed her face, and saw that the Sunny-eye was closed in death. One hand was pressed hard against her heart, as if her last moments had been painful. The other grasped the beads which the young Eagle had given her in the happy days of courtship. One heart-rending shriek was wrung from the bosom of the agonized savage. He tossed his arms wildly above his head, and threw himself beside the body of her he had loved as fondly, deeply, and passionately as ever a white man loved. After the first burst of grief had subsided, he carefully untied the necklace from her full, beautiful bosom, crossed her hands over the sacred relic, and put back the shining black hair from her smooth forehead. For hours he watched the corpse in silence. Then he arose, and carried it from the wigwam. He dug a grave by the side of his lost boy; laid the head of Soonseth toward the rising sun; heaped the earth upon it, and covered it with stones, according to the custom of his people.

Night was closing in, and still the bereaved Mohawk stood at the grave of Sunny-eye, as motionless as its cold inmate. A white man as he passed, paused, and looked in pity on him. "Are you sick?" asked he. "Yes; me sick. Me very sick here," answered Powontonomo, laying his hand upon his swelling heart. "Will you go home?" "Home!" exclaimed the heart-broken chief, in tones so thrilling, that the white man started. Then, slowly, and with a half vacant look, he added, "Yes; me go home. By and by me go home." Not another word would he speak; and the white man left him, and went his way. A little while longer he stood watching the changing heavens; and then, with reluctant step, retired to his solitary wigwam.

The next day a tree, which Soonseth had often said was just as old as their boy, was placed near the mother and child. A wild vine was straggling among the loose stones, and Powontonomo carefully twined it around the tree. "The young oak is the Eagle of the Mohawks," he said; "and now the Sunny-eye has her arms around him." He spoke in the wild music of his native tongue; but there was none to answer. "Yes; Powontonomo will go home," sighed he. "He will go where the sun sets in the ocean, and the white man's eyes have never looked upon it." One long, one lingering glance at the graves of his kindred, and the Eagle of the Mohawks bade farewell to the land of his fathers.

For many a returning autumn, a lone Indian was seen standing at the consecrated spot we have mentioned; but just thirty years after the death of Soonseth, he was noticed for the last time. His step was then firm, and his figure erect, though he seemed old and way-worn. Age had not dimmed the fire of his eye, but an expression of deep melancholy had settled on his wrinkled brow. It was Powontonomo—he who had once been the Eagle of the Mohawks! He came to lie down and die beneath the broad oak which shadowed the grave of Sunny-eye. Alas! the white man's axe had been there! The tree he had planted was dead; and the vine, which had leaped so vigorously from branch to branch, now yellow and withering, was falling to the ground. A deep groan burst from the soul of the savage. For thirty wearisome years, he had watched that oak, with its twining tendrils. They were the only things left in the wide

world for him to love, and they were gone! He looked abroad. The hunting land of his tribe was changed, like its chieftain. No light canoe now shot down the river, like a bird upon the wing. The laden boat of the white man alone broke its smooth surface. The Englishman's road wound like a serpent around the banks of the Mohawk; and iron hoofs had so beaten down the war-path, that a hawk's eye could not discover an Indian track. The last wigwam was destroyed; and the sun looked boldly down upon spots he had visited, only by stealth, during thousands and thousands of moons. The few remaining trees, clothed in the fantastic mourning of autumn; the long line of heavy clouds, melting away before the coming sun; and the distant mountain, seen through the blue mist of departing twilight, alone remained as he had seen them in his boyhood. All things spoke a sad language to the heart of the desolate Indian. "Yes," said he, "the young oak and the vine are like the Eagle and the Sunny-eye. They are cut down, torn, and trampled on, the leaves are falling, and the clouds are scattering, like my people. I wish I could once more see the trees standing thick, as they did when my mother held me to her bosom, and sung the warlike deeds of the Mohawks."

A mingled expression of grief and anger passed over his face, as he watched a loaded boat in its passage across the stream. "The white man carries food to his wife and children, and he finds them in his home," said he. "Where is the squaw and the papoose of the red man? They are here!" As he spoke, he fixed his eye thoughtfully upon the grave. After a gloomy silence, he again looked round upon the fair scene, with a wandering and troubled gaze. "The pale face may like it," murmured he; "but an Indian cannot die here in peace." So saying, he broke his bowstring, snipped his arrows, threw them on the burial place of his fathers, and departed for ever.

None ever knew where Powontonomo laid his dying head. The hunters from the west said, a red man had been among them, whose tracks were far off toward the rising sun; that he seemed like one who had lost his way, and was sick to go home to the Great Spirit. Perchance, he slept his last sleep where the distant Mississippi receives its hundred streams. Alone, and unfriended, he may have laid him down to die, where no man called him brother; and the wolves of the desert, long ere this, may have howled the death-song of the Mohawk Eagle.—*From the Western Coronet (an American publication), by Mrs Child.*

Column for the Boys.

Boys are fond of birds. They like to have pigeons of their own, which they can sort and feed at any leisure time they have; they also like to keep ordinary singing birds in cages hung in their own rooms, or in the kitchen, and which they sometimes breed under their own care. Birds, in fact, divide their attention with rabbits; and when the winter comes on, as it is now doing, and when the snows cover the ground in all directions, then, if they have any convenient place for the experiment, they perhaps try to catch old birds with different kinds of traps. I am now going to give my young friends, the Boys, some directions how to manage all these sort of things. Suppose we begin with the art of

CATCHING BIRDS.

Bird-lime, a sticky, pitchy kind of matter, is sometimes used by small twigs, and which birds settle on when they are passing a call-bird, or decoy; but as few boys possess one of these trained call-birds, and as there are other means of catching fully as effectual, we need not say anything of that plan. The best way to catch birds, when the snow is on the ground, is to use nooses made of horse-hair; and this may be done either by lines, or with a hoop. If the former, get a hundred yards of packthread, and at every six inches fasten a noose, made with the horse-hair (two hairs twisted together being sufficient); at every twenty yards, thrust a little stick into the earth, by which the line may be fastened, to keep the nooses about the height the larks run; scatter oats from one end to the other. The birds will then flock to pick up the grain, and will be caught by the neck in the nooses. As the boy will be on the watch, he will run forward, and take the birds as soon as caught. This plan is recommended for taking larks. If boys prefer to try the hoop, which is much cheaper, let them get an ordinary barrel hoop, and draw packthread across it from side to side, leaving openings between the strings, of about two inches wide. This being done, let them attach white horse-hair nooses to the lines, so that they may lie nice and flat when the whole is laid down. Scatter oats or even crumbs on the snow at a conspicuous place for birds, and lay the hoop with its nooses above it. If the winter be severe, and the birds plentiful, they will soon recognise the food, and, lighting among the nooses, will be caught by the feet, when the boys will dash forward, and catch them. There is yet another capital plan, and that is with the sieve-trap, which is made thus: In the winter season, when the ground is thickly covered with snow, sweep a round spot clean, the size of your sieve; sprinkle some ashes on the spot, and a few crumbs of bread; prop up the sieve over the spot with a bit of stick, with thin twine fastened to its centre, and long enough to reach to a window, at which you must be seated, and watch the birds getting under the sieve, when the string should be instantly jerked; this, if dexterously done, and no noise be made to scare away the birds, will occasion the sieve to fall, and the birds to be caught. You then take a cloth, and draw it under the sieve along the ground, taking care not to lift it so high that the bird can escape; and, by drawing up the cloth to its centre, you will be able to carry the sieve, with the bird under it, into the house. When birds are caught, they ought to be put into cages adapted for them, and partially secluded, till they become accustomed to their imprisonment. As boys in towns have not an opportunity of exercising their ingenuity in catching birds in the manner described, they may buy any kind they have a fancy to from the men who deal in them.

THE LINNET

Is a fine bird, and will learn either to pipe or whistle any other bird's note. The author of that nice little work, the "Boy's Own Book," thus describes how linnets ought to be managed:—"Feed the young with a little white bread soaked in milk, previously boiled; let it be very stiff, like a hasty-pudding; make but a little at a time, as it is very soon grows sour. When they feel themselves able to eat a little scalded rape-seed. They may be caught with clap-nets. When taken, place them in a large cage, and get some of the seeds you find they feed upon, which put into the cage with a little hemp-seed ground or bruised; set them in a place where they may not be disturbed, and feed them with this for three or four days; then cage up the cock and hen separately; feed them

with rape, and a small quantity of canary-seed amongst it, with some few corns of hemp. If dull, give them lettuce-seed, beet-leaf, or a little seeded chickweed now and then; and, if troubled with a looseness, some chalk and bruised hemp-seed, a stalk of plantain-seed, and put saffron in their water." The linnet will acquire the song of the canary sooner than any other bird. They commonly breed three or four times in the year." The linnet is not a greater favourite among boys than

THE CANARY.

These birds, which were formerly brought from the Canary Islands, are remarkable for their power of song, their beautiful pale yellow colour, and their great mettle. You are directed, by the above authority, to "choose a young and sprightly bird, sleek and straight, and one who boldly struts and shakes himself. Take notice of the dung, which ought to dry quickly, and be thick, hard, round, of a fine white on the outside, and darkish in the middle. If the bird emit only a white slime, with no black in it, it is a certain sign of speedy death. If possible, hear him sing before you buy him. The hens never sing, although many have, by a sort of jabbering noise, deceived unskilful persons. The hen is always smaller and shorter. The colour above the bill of the cock, and likewise under his throat, and on the pinion of his wing, is a brighter yellow. The canary breeds four or five times a year, and lays four, five, or even six eggs at a time; they sit fourteen days. You should not match them till the middle of March. If convenient, let their cage be toward the east, because the birds love warmth, and sunshine in the room in the morning makes it warm all day. If you breed them in a cage, let it be twice as large as common breeding-cages, so that they may have room to fly. If you breed them up by hand, feed them as linnets, and take them away at fourteen days old; for if you let them remain longer with the old ones, they grow sullen, and will not feed; but if you let the old ones bring them up, leave them till the latter hatch again. When taken away, feed them thus: Boil an egg hard, take a little of the yolk, a little quantity of the best bread, and a little scalded rape-seed; bruise the whole as finely as possible. This is the best food for young canary birds. Begin to feed at six in the morning, and feed them anew at the end of every hour or hour and a half. Nothing is so good for their nests as a little fine hay and hair. When the weather is hot, or when they require something cooling or cleansing, let them have a little chickweed or lettuce." The canary is rather a delicate bird for boys to bring up, and many prefer to have one or two sprightly

BLACKBIRDS.

These native birds are kept in wicker cages, but they must be kept very clean, and care taken of their feeding. Blackbirds breed very early in the year, and the young may be taken at ten or twelve days old; feed them once in two hours with cheese curd, white bread and milk, with sheep's or cow's heart, or any other sort of lean meat, cut very small, mixed up with a little bread, and made very moist. When grown up, they may be fed with flesh meat, boiled, raw, or roasted; but flesh meat mixed with a little bread is best. If you find them out of order, give them a good large spider. Blackbirds will imitate any kind of whistle; but it is best to leave them to their own clear "wood-notes wild." Now for a word or two upon

PIGEONS.

"The life of this beautiful and useful bird (continues our authority) is said to extend to about eight years; but it is useless for the purpose of breeding after it has attained that age, and ought then to be destroyed, or it will molest those which are in the prime. The pigeon lays two white eggs, and sits fifteen days after the second egg is laid. The female keeps to the nest from four or five o'clock in the evening until nine the next morning; she then goes off to feed, and the cock takes her place during the day. If the hen delays, the cock leaves the nest at the usual time, seeks her out, and drives her to her nest, and the same is the case in case of negligence in this respect on the part of the cock. The young ones are usually of different sexes. For the first three days after they are hatched, the female seldom leaves them; after that time, the cock and hen attend to feed them indiscriminately. The way in which the old supply the young with food is singular: the parent birds collect a quantity of grain and water in their crops, which are very capacious; and, after it has lain there until soft and matted, they regurgitate it, and answer the young by shewing it, they cast it up into the throats of the young ones. As the young birds acquire strength, the old ones give the food less preparation, and, at last, drive them out to provide for them for themselves. But they are often seen feeding their young ones even when the latter are able to fly, and they themselves are going to nest again. After six months old, the young pigeons are full grown."

THE DOVECOOT.

There are various kinds of houses for keeping pigeons, but those which can be most conveniently used by boys consist of wooden boxes placed against the wall, or at the top of a pole—in both cases out of the reach of cats. The former are most common, and are generally made in a triangular shape, with a slope on each side. They have three or four stories, and are divided into compartments, which they require a great quantity; but, if necessary, offer them barley or oats, or any kind of crumbs. Pigeons breed very fast, and afford a frequent relish to the table, in the shape of a nicely baked PIGEON PYE.

Gardening.—JANUARY.

THE FRUIT GARDEN.—Trench and manure ground for early planting. Prune nail, and tread espalier trees; gooseberries, currants, raspberry, and nuts. Figs must not be pruned till April. Plant out fruit-trees, gooseberries, currants, raspberries, and nuts, if not already done. Look over fruit in the fruit-room; keep out frost, and pick out all decayed fruit. Force strawberries; the roseberry is now the best. Should the weather prove mild, those pots of strawberries which are in frames for the purpose of furnishing a succession, must have plenty of air during the day; but the glasses must be shut down in the night, in order to secure them against frost.

KITCHEN GARDEN.—Trench and manure ground for early crops. Prepare hot-beds for asparagus, cucumbers, mint, potatoes, and small saladings. Force Eford rhubarb and sea kale in pits, in the mushroom-house, or under large pots; also kidney beans in the pits; the best sort for this purpose are the long-keg and early purple-speckled. Sow black-seeded gourd, brown Dutch, and grand admirable cabbage lettuces, as well as those of the Bath and Egyptian Cos. Sow curled parsley for transplanting, frame peas, horn carrots, Mazagan beans, onions, if they are intended to be grown to a large size, radishes, round spinach, &c. Plant out cabbage plants, to succeed the first crop which had been planted out in the autumn; the best sort for this purpose are the large bed is well covered with dry straw; it ought to be at least twelve inches thick; and, every precaution must be taken to keep out the frost.—*Lindley's Guide to the Orchard and Kitchen Garden.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

This Edition is published, with the permission of the Proprietors, by W. S. ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Pauly Work.

SATURDAY, JANUARY 12, 1833.

PRICE THREE HALFPENCE.

A TALE OF THE PASSIONS.

ON the east coast of Scotland, there is a pleasant little village, within a quarter of a mile of the sea, chiefly inhabited by fishermen. Of this place I was, about thirty years ago, an inhabitant; and as I am fond of observing the lights and shades in character among the lower class, where in general concealment of the natural disposition is least practised, I quickly got acquainted with my humble neighbours. It was thus not long before I knew the history, and could estimate the feelings of many individuals, who, though unknown to fame, passed not away without leaving a moral lesson behind them. In most small communities, there is some one who is singled out by their fellows as possessing some advantage over them, which is either real or imaginary. Among the dwellers in this sequestered spot, there was an old woman, named Margaret Dun, who was honoured by a celebrity arising from a cause which will be at once acknowledged to come under the head of the latter. I have said honoured, but it may be doubted whether the term is properly applied, when it is told, that, instead of the name I have mentioned, that of *Peg the Witch* was more frequently applied to her. How she first acquired her reputation as an emissary of Satan, I could not learn. Probably it was from her sagacity in frequently prophesying about her neighbours' concerns what came to pass, and from her possessing a bold determined spirit, which seldom failed to carry her through any enterprise in which she engaged, and which caused her to be more prosperous in her domestic concerns than is generally the fate of those in her class who do not possess the same energy of mind. Be this as it may, the light in which she was regarded by the people around her, made her view their ignorance with scorn, not unmixed with resentment, and had the effect of confining her sympathies within the narrow boundary of her own family, where she ruled with an undisputed and despotic sway. But though her authority over her children was imperious, it was in general cheerfully obeyed, for she was neither peevish nor sullen in her intercourse with them, and had always attended so diligently to all their wants, that they both loved and respected her.

At the time I first became acquainted with this woman, she had recently lost some of her children, and her family then consisted only of two sons and her husband. John Dun, the gudeman, was a mason by trade, and considered so clever at his business, that there was hardly a house or onstead erected for many miles round without his aid. Being thus much employed at a distance from home, his wife became the entire manager of the money earned by his industry, and laid it out so judiciously, that his cottage exhibited many little comforts unknown in those of his less fortunate neighbours. This was so apparent to all, that it excited a degree of envy, which continued to account for it in the old way; and many were the rumours that reached her ears of the effect of the supernatural gifts with which she was supposed to be endowed. Indignant at their folly, and wearied by their obstinate adherence to it, she at length determined to use her imputed character as a means of making the whole village subservient to her will; nor was there one individual who had the hardihood to resist it. I have no doubt but much of this strange influence was owing to the peculiar situation of the place, and the occupation of its inhabitants, whose bread was procured on the face of the mighty deep. Sailors in general are prone to superstition, and it is in vain that the well-educated and firm-minded among them deny the charge. The waters of the sea are as a mighty veil

thrown over innumerable mysteries; and where is the sailor or the fisherman who has not in fancy, amid a lonely watch, had it partially lifted, and some of them revealed to him—who has not held some communication with the world beneath him, and is thus led to believe that there are more "things in Heaven and earth than are dreamt of in the philosophy" of landsmen? The superstition of the ignorant leads to a belief in charms and amulets, and none of Margaret's neighbours would venture to sea without having about his person a piece of the mountain-ash, or, as it is more usually called in Scotland, the rowan-tree, which flourished in her little garden. Happy was the man who received this valuable boon from her own hand, for then a portion of her good-will was supposed to go with this potent charm, which ensured him a prosperous voyage and a boatful of fish, some of which he seldom failed to appropriate to her use. In short, had Margaret's disposition been greedy, she might have exacted from her poor neighbours all her living; but she contented herself with now and then receiving voluntary gifts, and only hinting to the small farmers in the neighbourhood that they might bring her home a sack or two of coals on their carts from the pits, free of the costs of carriage. At the time of casting peats, a similar hint was given, and each one at the moss contributed a share toward the stack destined for her use.

Thus things went on for some years till her eldest son attained the age of 20, and her youngest, of 17 years, and she lost her husband, who was killed by a fall from a building. Her eldest son now took the place of his father, for both he and his brother had been bred to their father's business, and the son and apprentice of so good a workman did not fail to find employment. Still his winnings, it may be supposed, were not equal to his father's. This, however, was no source of discontent to his mother, as long as they were all poured into her lap, and as long as she was obeyed, and her absolute sway still submitted to. But the time came when each succeeding week showed her, in some instance, that a change in the disposition of her first-born was rapidly taking place; and as she watched him with a jealous eye, she saw him gradually beginning to assert his independence as the chief supporter of the family. While her husband lived, she had ruled her sons with unquestioned authority, nor ever seemed to dream of any change taking place in her right of control. James now no longer owned this authority, as to his movements, but took work near or at a distance, just as it suited his fancy, without asking her consent; and when reproved by his mother, and threatened with her severe displeasure, he got angry, and so far forgot himself as to threaten in return. This was something altogether new to the imperious spirit of the widowed woman, whose will had so seldom been disputed. It seemed more bitter to her than if all the rest of mankind had risen up against her, that the son who used to submit, without reply, to all her mandates, should break through the trammels of the strict government to which she had subjected him from infancy, and brave all at once her utmost displeasure. It was too much for the indulged and haughty spirit of one who had, in her humble sphere, reigned in-doors and out; and though these struggles for the mastery between her and her eldest son lasted for a while, they became at length too violent to admit of their dwelling together. James did not, however, leave his mother's house without regret. Though he possessed too much of her own evil pride to confess it, and endeavoured to salve his conscience for taking so rash a step, by persuading himself that he was forced to it by his mother's

harshness, yet, had he understood and done justice to her feelings, he would not have wounded them so deeply; he would have recollected that much of the stern manner of which he complained had been the result of the peculiar situation in which she had been placed, for he was not ignorant of the aspersions which it pleased her foolish neighbours to cast upon her. He would also have felt, that, if she had ruled her children strictly, she had ever shown that she loved them with an intensity, out of which, in fact, their present quarrels had arisen; for she was tormented with a jealous fear that she had lost her influence over his heart as well as over his conduct. Something of all this did come across and smite the conscience of James, after he had quitted his mother's house, and he returned to tell her, that though he could not live with her any longer, it was his intention to give her half of his wages. This offer was, however, rejected by the misguided mother, with scorn and acrimony, as a bounty which was to be doled forth to her by a son who was voluntarily forsaking her, and depriving her, in her old age, of his society and protection; and, full of this bitter feeling, she exhausted every epithet of contumely and reproach, until the young man, who, I have said, possessed but too much of her own unhallowed spirit, was so exasperated, that he rushed from under the roof where he had drawn his first breath, with an oath never to enter beneath it again. Little, alas! did he dream of the dark future, or of the fate that was once more to place him under its shelter; and as little did the mother anticipate the burden of woe she was laying up in store for herself, while giving way to her evil pride—that unhallowed passion, with which no Christian virtue can dwell, and which blights alike the intercourse of mortals with heaven and with earth. Three years passed away without any reconciliation taking place between James and his offended mother, in whose heart there still rankled the deepest resentment against him. But during the third year, this hostility was less painful, as he removed from the village, in consequence of obtaining a large and lucrative job about thirty miles distant from the coast.

It was in one of my solitary rambles by the sea-side, that I encountered Margaret some time after her eldest son left the village. She was sitting on a little grassy hillock, under the shelter of a hedge, which grew wildly over the spot. At some little distance, on the sea-beach, I perceived a number of women and children, who had assembled there for the purpose of procuring fuel. While the women were digging up the stubborn roots of the whin, the elder children were every now and then bringing portions of them, which they reared in little heaps on the grass round the place where Margaret sat, her share of the task being to direct them in the dividing of the roots into pieces of a convenient size for carrying home, and to pick out what she chose for herself.

I had been in the habit of visiting Margaret's cottage for some years, and now greeting her as an acquaintance, I sat down beside her. This woman had been handsome in her youth, and now, at the age of nearly sixty, was yet so, in as far as she still retained her tall form unbent, and her dark eye undimmed, while her coal-black hair was but slightly grizzled. After the first salutations had passed, I remarked that I had not seen her youngest son for some time, and inquired where he was, when she informed me he had gone some distance up the country to build dykes for a gentleman who lived near, but had a distant farm, and gave him the most of his work when at home. "And this being the case," she continued, "I could not refuse to let him go; but I have had

many an eerie night since he left me; for when he is at home, I never get leave to weary." Here I remarked what a fine-looking young man he had grown, and that I was happy to hear he was so good a son. Margaret fixed upon me her keen eyes, which sparkled with delight. "Ay," she said; "is not my Willie a gallant youth? he is six feet high, and not out twenty years of age yet. He may match any gentle in the land for look part, and is as gude as I be bonny; and weel does he make up to me for all I hae lost. O," she continued with fervour, "he is husband, and son, and daughter to me; may God bless him for it."

Every look and tone of voice vouched for the truth of what she said, and told that she had set up this youth as the idol of her heart, and given him there that place which it is sin to bestow on one of earthly mould. All recollection of her eldest son seemed to have passed away from her mind, for she never, as I was informed, alluded to him on any occasion. I ventured, nevertheless, to ask where James was, and to express a hope that they were better friends. As I uttered these words, she rose up, with her face flushed, and her eyes flashing with anger, and, giving me an indignant glance, she said haughtily, "Hardly any body is sae unceivil as to mention him to me."

Grieved to see that she still cherished this implacable spirit, but no way daunted by her displeasure, I still went on. "Nay, do not be angry with me for interfering. I did but speak in the hope of hearing that you were reconciled to him, and had repented of what I could not help considering your harsh conduct to a son who always seemed really well inclined, and had the character in the main of being both dutiful and affectionate."

"And wha," she said, erecting her tall person, and looking me sternly in the face, "shall take upon them to judge the ill-used and disappointed mother—her wha brought him into the world wi' mickle pain and risk o' life; and nourished him at her breast wi' toil and watchfu' care; and prided her heart in him, as he grew to be a man; and thought to hae him aye beside her to look upon, and be her lamp o' light in the darkness o' her age? Wha, I say, shall dare to say to me, repent: or judge me for my rightfu' displeasure?"

"Surely, Margaret," I said earnestly, "we must forgive before we can hope to be forgiven. Nor do I doubt that James would humble himself to ask your pardon, did you give him any hope that you would grant it."

"Na, na," she said, with a smile of bitter irony, "he manna forswear himself, ye ken; and he took an oath when he left me, never more to enter below my roof. Ah, na: if ought should all her winsome Willie, the ald mother may starve in age and solitude, for ought he cares."

I was about to combat this uncharitable and harsh opinion, but she cut me short, by turning away suddenly, and calling to some of the children, who instantly flocked about her, to bind up the portions of fuel she had selected for her own use. While she was allotting to each the burden they were to carry to her cottage, I continued my walk by the sea-side, musing on what had just passed, and lamenting the obstinate perversity of disposition in this old woman, which spurned at the thought of receiving again to her favour a son who had once been so dearly loved. I felt, however, that it was vain to reason with one who had evidently shut her eyes upon the light of Christian precept, and allowed some of the worst passions of our nature to gain the mastery over her. And as I determined never again to attempt so hopeless a task, I could not help shuddering at the idea of the scene which the death-bed of one so remorseless was likely to present. It was long before I again saw Margaret, and her cup of sorrow had been meanwhile filled up to the brim. The particulars which follow, I learnt partly from common report, and partly from the village pastor, who, being a worthy pious man, frequently visited Margaret, and used unwearied pains to conquer her indomitable pride. It was from him I heard that her son William's stay up the country had been protracted much beyond the time she expected, and that she had been sorely disturbed, by hearing that he was much with his brother, who lived near to the place where his work lay; and still more by a report, that he was often seen in the company of a young woman, who, when a child, had lived in the same village with him, and, though of good character, was an orphan of the most destitute description, being one of those unfortunates of whose birth both parents being ashamed, she had been abandoned by them, and laid down at the door of the schoolmaster's house, to be brought up by the parish. I have said, Margaret was disturbed by this report, which annoyed her the more, as she remembered that her son and this young person had always shown a fondness for each other when children at school, and that she had felt pleased when the girl left the village for a more distant service. The time, however, soon came when she was no longer left to doubt on the subject, for William arrived and confirmed her worst fears, by asking her consent to marry this girl, and bring her home to live with her. This consent was sternly and flatly denied; and though he assured her that he had procured permanent work, which, with the industry of his Mary, would enable them all to live in comfort, her only answer was, that no wife of his should ever live with her; and that, if he was determined to marry before

he laid her head in the grave, he might leave her as his brother had done. When William found that all his efforts were vain to reconcile his mother to his wishes, he returned to finish his job with a mind totally undecided what course to pursue. In this dilemma he sought the counsel of his brother, who advised him to marry, and trust to the necessity his mother would soon feel of a reconciliation; at the same time assuring him that he would go with him and tell her of his own repentance of his rash oath, and join in entreaties for the pardon of both. We are too prone to believe what we ardently wish; and William, thus persuaded by his brother, and by his own inclination, prevailed upon Mary to consent to become his wife, a few days before he returned to his native village to deprecate the wrath of his mother. Many were the conjectures of the brothers during their long walk toward their mother's cottage, on the success of their enterprise; nor could they, as they approached it more nearly, prevent some misgivings which assailed them, and gained strength as they presented themselves at her door. It was there she met them; and, having stopped them till their story was told, it was in vain that they craved permission to enter within it, for it was soon closed upon them, after a short parley, in which the old woman, in her own strong and scornful language, utterly rejected all overtures toward peace, and reiterated her determination of living and dying in desolation. It was then that, had she possessed the supernatural powers attributed to her, the shafts of her utmost vengeance would have been launched against the girl who had dared to alienate from her the affections of her son, and thus deprive her of her last hope. She had indeed now spurned from her for ever the blessings offered to her by Providence, and filled up the measure of her sin and folly.

The two young men, who were greatly distressed by their mother's unnatural conduct, and tired and heated by their long walk, sought, when they parted from her, rest and refreshment in the village public-house, from whence they strolled down to the sea-beach. This had been the play-ground of their infancy; and, having sat for some time on the beach in deep consultation, the eldest one stripped off his clothes, and plunged into the sea to refresh himself by bathing. The sea was calm and glassy, and he swam about for a few minutes; but while his brother was looking at him, and preparing to follow, he all at once went down. This was no sooner observed by William than he hastily threw himself into the water, and, having swum out to the fatal spot where his brother disappeared, he also sunk to rise no more. Some boys who had been looking on flew to the village to give the intelligence. Numbers immediately repaired to the spot where the melancholy event had taken place, while others ran to procure boats and grappling tackle from a little neighbouring bay where their fishing-boats were moored. The search was, however, rendered vain, by the discovery that a quantity of loose sand forming a ridge had been lodged between two rocks, on which it was supposed the elder brother had attempted to gain a footing, and been instantly swallowed up by its closing above him. It was supposed, also, that the younger one had been deceived in the stable appearance of the quicksand, and had endeavoured to ascend it in order to look for his brother in the deep water beyond it. Be this as it may, the search, as I have said, was fruitless; and thus perished, in the very prime of their strength, two of the finest-looking young men I had ever beheld.

During the whole day on which this tragical incident took place, the sea was perfectly calm; but at night one of those violent but brief storms, which sometimes disturb the tranquillity of a summer sea, broke upon the coast, and the waves rolled in mountains to the shore. The sand was again shifted, and when the conflict of the elements had ceased, the brothers were both found stretched upon the beach. And she, the relentless and vindictive mother, how fared it now with her? True to her stern nature, she gave but small vent in words to her wretchedness; but the fearful cries she uttered when told the dreadful truth—every look—every sound—every movement—betokened the most intense agony of which the human breast is susceptible, and told of remorse the keenest and most horrible that could be borne out of the place of everlasting torment. Her retributive history seemed, indeed, as if marked in black and melancholy characters. No sooner were her sons lodged in their narrow bed in the village churchyard, than their grave became her nightly haunt; nor did she seem even to hear the entreaties made use of by her neighbours to keep her from this practice, till at length they desisted from the attempt. Whenever night-fall came, to hide her from the eyes of the passers-by, she took her lonely and darkling way; nor ceased from her gloomy vigils till the morning began to break. My friend the minister visited her often, but was always foiled in his attempts to give her any spiritual consolation, by her brief but peremptory injunction not to speak to her on her soul's concerns, accompanied with a solemn assurance that it was in vain, for she knew and felt that she was doomed to destruction. But though this assertion was delivered in a tone which made him shudder, he nevertheless persisted in his unwelcome visits, until an event happened, which formed a new era in the history of Margaret.

About ten days after the interment of the unfortunate brothers, the moon began to shine upon the place

of tombs, and though she could no longer visit it without being observed, no one molested her; and she persisted in what now seemed a habit necessary to her very existence. One night when she approached her usual seat, she found it already occupied by a young woman, dressed in decent widow's mourning, whose sobs were deep and suffocating. Taken by surprise, and believing it to be the widow of her lost son come to reproach her with her cruelty, she fixed her eyes on her for an instant, and fell to the earth with a piercing shriek. The poor girl had been terrified by the sight of her mother-in-law, whose countenance, wild and stern, with her hair escaped from her cap, and tossed about in the wind, made her look like a maniac. Roused, however, by her shriek and fall, she sprang toward her, and, finding that she was not in an insensible state, she raised and seated her on the grave, while she spoke to her the most soothing words, and prayed so fervently to God to comfort her, that, when Margaret looked upon her face, pale as death, but so meek and beautiful in its sorrow, and heard her breathe nothing but kindness, she felt a degree of astonishment, which took for a short time the place of all other emotions. There had hitherto been no feeling in her own breast which could lead her to comprehend the spirit of forgiveness and of meek resignation, which dictated all the words and actions of this young woman. She had, before the death of her sons, regarded her with rancour, and, since that event, with dread of ever seeing her, as if her reproaches were now the only thing in the world left for her to fear. It was by this fear acting on a form wasted by want of sustenance, and by the conflicts of her mind, that she was struck down as by a flash of lightning.

The youthful Mary, whose history I have in part related, and who was in the same week a bride and widow, had been early inured to misfortune. She had been taken into the house of the parish schoolmaster, when only nine years old, to assist his servant, but, from her cleverness and desire to learn, had shared in his children's education, who were taught by him some things in which the poorer class of his scholars did not participate. Mary seemed naturally of a humble and serious disposition; but, humble as she was, she often felt severely the taunting scorn with which she was treated, on account of her birth, by her companions, and sometimes by those who should have known better than them, when she happened, unwittingly, to give offence. In short, she had never known any one who seemed to understand her feelings, or show them any sympathy, except her schoolfellow William Dun, who had always been ready to take her part when she was ill used, to console her when sorrowful, and to play on the sea-beach with her when she had time. But when Mary grew somewhat older and stronger, she was offered a service far from the sea and William, and these comforts were lost. It was then, when she had none on earth to sympathise either in her joys or griefs, that she learned to look up to a higher source for comfort, for pity, and direction; and was strengthened to be the means of snatching the wretched Margaret from the destruction she seemed to court.

When the first overpowering sensation occasioned by Mary's words and looks had subsided, the old woman so far relaxed into her usual mood, that the poor girl's utmost entreaties could not prevail on her to allow of her becoming an inmate of her cottage. Nor did she consent, till touched by the earnestness with which Mary quoted the affecting words of Ruth—"Entreat me not to leave thee, or to return from following after thee; for whither thou goest, I will go; and where thou lodgest, I will lodge."

This, however, seemed the last struggle of self-will in that breast which had ever been the seat of turbulent and rebellious passions; and from that night in which her daughter-in-law returned with her from the churchyard, might be dated a change in her disposition as salutary as it was surprising. The proud nature of Margaret, broken down by suffering, and a heart goaded by remorse, prepared her for embracing the promises of mercy held out to her. These promises were constantly read to her and commented upon by Mary, who was become as her better angel, and whose unwearied attention soothed the few remaining years of her life, and was rewarded by seeing her hitherto stubborn nature daily softening down, till she became docile as a child in the school of Christianity. Still her heart felt, and her tongue expressed, all the hal- lowing and blessed effects of religion. Mary's constant efforts in behalf of her mother-in-law were of use to herself, for they gave her less time to dwell on her own sorrows; and the pale and interesting features of this meek and humble sufferer soon assumed an expression of subdued pensiveness, which, if it forbade the idea that they could ever be lighted up by mirth or gaiety, gave an assurance of inward peace and pious contentment. Temporal blessings also followed Mary to the cottage of Margaret; for her father, of whom she had never known any thing till his death, being a man of some property, and feeling remorse, it would appear, in his last illness, for his cruel conduct towards her, left her, by his will, soon after her change of residence, enough to support herself, and to supply the poor old woman with all those little comforts so necessary to old age and declining health, till the day arrived, when, full of true penitence, Margaret was laid in the same grave on which she had so often sat in all the wildness and horror of despair.

GAS LIGHT.

DAILY habit has the effect of so soon familiarising objects to us, that we seldom pause to think how they have had a commencement. Gas light is now as familiar to us as the light of the sun or moon. It even illumines cellars and recesses, where the rays of either of these luminaries never pierce; and yet we have only to go back a very few years, when it was totally unknown, at least for all useful purposes. We recollect, when gas first began to be talked of, a gentleman observing, in a pretty large assemblage, that he would not be surprised, in the course of a few years, to see the substance, as a common commodity, sold about the streets in pennyworths. The idea was received with that smile of incredulity which the vagaries of a fanciful mind often meet with; and yet those very few years had not expired when gas was actually conveyed through pipes into every street and dwelling, measured out by metres, and sold by the cubic foot.

The inflammable nature of coal-gas was first known from its dreadful explosive effects in mines, and received the name of *fire or choke-damp*. It was also observed to issue sometimes from crevices on the surface of the earth, when, on a lighted torch being presented to it, it would inflame, and continue to burn for a considerable period. In the year 1726, Stephen Hales procured an elastic air or gas from the distillation of common coal; and although some experiments of the inflammability of air so procured were occasionally made by individuals, and related in the scientific publications of the day, yet the subject excited little attention, and was ultimately thrown aside for a long period of years.

The most casual observer must have remarked, that, when a piece of coal becomes heated in the fire, it begins to swell; it then bursts at a particular part; a stream of air rushes out, and, coming in contact with the fire, ignites into a flame. If a common tobacco pipe is taken, a small piece of coal put into the bulb, the top of this cemented closely with moist clay, and the bulb then put into the fire, a stream of inflammable air will, in a short time, issue from the extremity of the pipe, and continue to do so till the whole gas the coal contains is exhausted. On examining the matter remaining, it will be found to be coke, or charcoal. Coal, then, by this mode of distillation, is found to consist of an inflammable gas, called carburetted hydrogen, and of charcoal. The extension of this long-known and simple experiment into a process of general usefulness, proceeded by gradual and oft-interrupted steps; and, as is usual in many important processes of the kind, the real inventor is involved in some degree of doubt. In the year 1792, a Mr Murdoch, residing at Redruth, in Cornwall, made use of coal-gas for lighting up his house and offices; and in 1797, he again made a similar use of it at Old Cumnock, in Ayrshire. In 1802, he was residing at Messrs Boulton and Watt's establishment, Soho, near Birmingham, where, under the combined talents of several ingenious engineers who were assembled at that highly liberal and celebrated seat of the arts and sciences, a splendid illumination of gas was exhibited on the occasion of the celebration of the peace of that year.

But some time previous to this public exhibition of gas illumination at Soho, it had been made use of in a similar manner at Paris, by a M. le Bon. In 1801, a friend of the gentlemen at Soho had written a letter from Paris, communicating the information that a gentleman of that city had lighted up his house and gardens, and had it in contemplation to light the streets of Paris with gas from wood and coal.

Adopting the hint from this gentleman, a Mr Winsor, a foreigner, came to London, in 1803, and publicly exhibited gas illumination, and explained its nature, and held out its numerous advantages, in a series of lectures at the Lyceum Theatre. Winsor was a mere quack, a man of little talent, but one of those active, bustling, indefatigable beings, well calculated to spread a new invention. For several years, under many failures and great disadvantages, he persevered in his projects, and, in 1807, lighted up a part of Pall Mall, which was the first instance of gas light being applied to such a purpose in Britain. Public attention was now roused; subscriptions were set a-going; various companies were formed; great improvements in the manufacture of the gas were introduced; its usefulness was fairly established; and its adoption in manufactories and public places soon became universal. Gas light first made its appearance in Edinburgh in the spring of 1818,* a company having been formed, and incorporated by act of Parliament, for that purpose. This establishment produces annually about 46,000,000 cubic feet of gas, consuming, for this purpose, about 4000 tons of cannel or parrot coal, besides 1000 tons of coal used in heating the retorts. The process of making gas is not complicated. The coal is put into large retorts of iron, and fire applied underneath. The gas, which is separated by this heat, then passes through an apparatus, where it is freed from an oily or tarry matter, which drops from it, and is afterwards purified by passing through lime water. It is then stored up into large reservoirs, or gasometers, from whence it is sent by pressure through pipes, laid under ground, to the various parts of the city.

* Two or three years before this period, certain shopkeepers manufactured gas for lighting their premises; and when they commenced doing so, crowds collected nightly to see the wonder of such a species of illumination.

The kind of coal best suited for the distillation of gas, is that which contains in its composition the greatest proportion of bituminous or inflammable matter. It is called parrot or cannel coal, and is only found in particular situations. The Edinburgh Gas Works are supplied from the coal pits of the Marquis of Lothian, near Dalkeith. Gas bids fair almost entirely to supersede oil or tallow as articles of illumination. It produces ten times the quantity of light at an equal or inferior rate of expense, and it can be increased or modified at pleasure. Objections have been made to the deleterious nature of the gas on the lungs. There can be no doubt, but, if inhaled in any quantity for a very short period, it will produce instantaneous death, and even, in less quantities, headaches and uncomfortable sensations; but this applies to the unburnt gas. If sufficient care is taken that the whole be accurately consumed by flame, there is no greater danger or inconvenience in its combustion than in that of any other inflammable substance.

The illumination of our streets with gas has been said, and with justice, to be one of our best preservatives against crime. How different are the streets of our populous cities now to what they were in former days! In the year 1417, Sir Henry Barton, then Mayor of London, ordained "lanterns with lights to be hanged out in the winter evenings between Hallow tide and Candlemass." The city of Paris was first lighted in 1524; and in the beginning of the 16th century, the streets being infested with robbers, the inhabitants were ordered to keep lights burning in the windows of all such houses as fronted the streets. The aqueducts of the ancients, by which they brought water from a distance for the supply of their cities, were contrivances much talked of, and certainly some of them appear to have been stupendous undertakings; but how would an ancient stare if he were shown the streets of a modern city, laid bare to view with its water and gas pipes passing along, and ramifying in all directions, like the arteries and air-vessels of an animal body, circulating, as from a centre, moisture and heat to the most remote extremities!

OLD ENGLISH ARCHITECTURE.

THE style of architecture used in the erection of gentlemen's country residences, is at present improving. In different parts of both England and Scotland, the tourist will not fail to perceive tasteful edifices, more or less after the elegant style which prevailed in the days of the Henries and Queen Elizabeth, very properly superseding the ungainly square Grecian mansions which characterised the reigns of George the Second and Third, and which seemed so much out of place in the midst of rural scenery. While such, therefore, is happily the case—and it being recollected that the exercise of good taste generally costs nothing—we beg to direct the attention of a certain class of our readers to the following excellent account of the origin and nature of the celebrated old English style of architecture, which we have abridged from a paper in the Quarterly Review for July 1831:—

"Every country has an architecture more or less peculiarly its own, formed, like the character and language of its inhabitants, by the blending of various foreign ingredients which have at different periods introduced and naturalized themselves, but which have been also in turn modified by the original stocks, as well as by the local peculiarities of climate, soil, social condition, and political history. The national character attaches itself far more to domestic architecture than to that which is displayed in public buildings, ecclesiastical or civil. In the erection of these, the architect, often himself a stranger, or taught abroad, has sometimes wholly copied a foreign model, and merely transferred the entire cathedral or palace from the banks of the Rhine or the Po, to those of the Thames and Isis. But in designing the residences of the opulent classes of any country, it became necessary to consult the manners, habits, and wants of the future occupants, the character of the climate, and the nature of the ordinary materials within reach. And in whatever degree the architect has neglected to adapt his design to the type required by these local circumstances, to that extent has he sinned against taste and propriety, and failed in producing that harmony of ideas, that association of ornament and purpose, which, as an essential element in the quality of beauty, it is the object of his art to create.

In the erection of a country residence, where the choice of a style is not fettered by the proximity of other buildings, associations of a general and imaginative nature come into play, and dictate the adoption of the national and indigenous architecture. In this country, which is still rich in the possession of numerous specimens of buildings, both ecclesiastical and domestic, belonging to the earlier ages of its history, the *old English style*, in some of its varieties, is that which we consider specially appropriate to a country residence. The natural scenery around presents congenial images in the venerable grove, and the ancient

oaks spreading their broad arms over the lawns and glades of the park. The local annals of the estate, of the site itself, or of the proprietor's family, combine to call for the employment of a style which is connected with so many of the most pleasing recollections of our national history. The irregularity of outline which it admits, and, indeed, almost requires, allows of an arrangement of the apartments which comfort or fancy may suggest, and accommodates it to all the varied wants of modern life. However, it is equally appropriate to every rank of habitation, from the princely palace, down to the snug parsonage, or humble cottage. To us, the Grecian temple is completely out of place in an English landscape, as would a cloistered abbey, or feudal castle, in the prairies of Kentucky or the Illinois.

Our Saxon ancestors reared few places of strength. Their habits were peaceful and agricultural, rather than warlike; and they lived in low and mean houses, having no pretensions either to splendour or strength. It was, indeed, the defenceless condition of the island which rendered it so easy a prey to the Norman conqueror. And it was to remedy this defect, and secure his newly acquired dominions, as well against invasions from without as rebellions within, that William lost no time in erecting strong castles in all the principal towns of his kingdom. His followers, among whom he had parcelled out the lands of the English, had likewise to protect themselves against the resentment of those they had despoiled, and imitated their masters' example, by building castles on their estates. 'The whole kingdom,' says the author of the *Saxon Chronicle*, 'was covered with them, and the poor people worn out with the forced labour of their erection.' Many of the castles of this age were of great size, and possessed a certain rude grandeur of design. After the age of Edward the Third, who both ameliorated the institutions of the country, and introduced into it a certain degree of elegance and refinement, we find a considerable improvement in the character of the habitations which remain to us. By degrees, it was found possible to associate much convenience and magnificence with the strength requisite for defence; and the confined plan of the close fortress expanded into a mixture of the castle and the mansion. At a later period, a still farther change took place. The reign of law had gradually succeeded to that of the strong hand. The peaceable were able to trust to the executive for the defence of their persons and property, rather than to the strength of their own walls, and roof-trees, or the falchions and iron mails of their friends and retainers. The residences of the nobility and rich landed proprietors again assumed, though by degrees, and with the exception of some districts like the borders of England and Scotland, a civil, in place of a military appearance. Beauty and ornament were consulted by the builders instead of strength, and the convenient accommodation of the ordinary indwellers, in lieu of the means for disposing of a crowded garrison, and its necessary provision in time of siege. The mansions erected under these circumstances partook but slightly of the castellated character. They usually retained the moat and battlemented gateway, and one or two strong turrets, to build which a royal licence was necessary; but their defensive strength could only have availed against a sudden and momentary attack. They were generally quadrangular in form; the larger class inclosing two open courts, of which one contained the stables, offices, and lodgings of the household; the second, the principal or state chambers, with the hall and chapel. Such buildings differed but little from the monastic residences of the same, or of an earlier date. Of the minor country residences of that and the earlier reigns, many interesting examples remain scattered through the island, sometimes fulfilling their original destination, but far more frequently employed only as farm-houses, and going fast to decay.

In a few of the houses built during the reign of Henry the Eighth, we may observe some slight traces of the *Italian* architecture, which, in the next reign, was more liberally introduced, and mixed up with the original Tudor,* or early English, into an irregular, certainly, but, in most instances, an exceedingly rich and effective composition. Whilst in England, and the north of Europe generally, the debased Roman architecture of the lower empire, which forms the foundation of the Saxon, Norman, or Lombard style, had been successively improved into those several beautiful modifications which are now classed indiscriminately under the term *Gothic*, the architects of Italy had never stepped out of their ancient track. With the seat of empire, the arts had migrated to Constantinople; and when the towns of Venice and Pisa were desirous of exhibiting their newly-born opulence in the erection of splendid cathedrals, it was in Constantinople, the capital of the lower empire, where St Sophia had already risen to astonish the eastern world, that they were compelled to seek a fitting artist. But on the revival of learning, the ancient Roman edifices were disinterred, and admired, and measured; and the eastern, or, as it is called in Italy, Lombard architecture, was in turn corrected, by reference to its classical original. The architects of Italy soon rose to eminence, and their fame was a subject of deep interest in this country, where the rage for building was no less strong and general than in Italy. In the

* Tudor was the family surname of the dynasty to which Henry belonged.

brilliant reign of Elizabeth, the English nobles and princely proprietors vied more than ever with each other in the magnificence of their mansions. It might have been supposed that the noble Tudor houses, with their panelled walls, buttresses, and battlements, traceried windows, sculptured dripstones, florid pinnacles, and embossed chimney-shafts, were sufficiently rich and gorgeous to satisfy the prevailing taste for splendour; but in their anxiety to strike and surprise the admiration of their countrymen, many deserted the native styles, and sought for designs, and even artists, from abroad. Italian architecture became, by degrees, the mode; and, even where the indigenous style was adhered to in the general design, many of the enrichments and ornamental features were borrowed from the Italian. First of all, the porch or gateway, as the most conspicuous points on which to exhibit these exotic novelties, were decorated on either side the entrance, and, perhaps, a second and third storey above with pilasters, belonging to the different Greek orders; the door-way itself exchanged the low pointed, or Tudor, for the circular arch; the deep, elegant, and sweeping Gothic mouldings, for the Vitruvian architecture,* cut across by the awkward projecting impost. Next was introduced the cupola, whose invention in Italy had made so much noise, that it appears our country squires were anxious to have miniature specimens of it at home. It was applied as a covering to the high turrets, round, square, or polygonal, which flanked the entrance or terminated the angles of the building, and, surmounted with gilded vanes, certainly produced a rich and imposing effect. Then followed the removal of the panelled battlements, and the substitution of a parapet, carved into fantastic notches or scrolls, or perforated with oval openings, and ornamented with obelisks, balls, busts, statues, and other singular decorations. These ran up the gables, which were often twisted into strange shapes, and sometimes wholly replaced by the level balustrade. And thus the most characteristic features of the old style, its numerous steep gables and spiry pinnacles, were succeeded by the uniform horizontal straight lines of the new. At length, the whole building was surrounded by columns or pilasters, rising, tier above tier, to the exhaustion sometimes of the five orders; open arcades took the place of the entrance porch, and nothing remained of the Tudor style but the mullioned window, which, however, was of itself sufficient to give a peculiarly picturesque and old-fashioned aspect to the whole building.

To us it has always appeared that this architecture of the Elizabethan age constitutes a style of its own—a compound of two extremely different modes, the Italian and the Tudor Gothic. It is evident that the Italian design was always greatly altered to suit the climate and the taste of England. Indeed, were we not afraid the comparison might be considered profane, we should say there is something in the rich irregularity of the Elizabethan architecture, its imposing dignity, gorgeous magnificence, and quaint and occasionally fantastic decoration, reminding us of the glorious visions that flitted across the imagination of Shakespeare, the immortal bard of the same age. He, like the architects of his day, borrowed largely from the foreigner, but made his importations appear exclusively his own. The architectural garden, which always accompanied this style of mansion, is not the least pleasing part of it. We delight in its wide and level terraces, decorated with rich stone balustrades, and these again with vases and statues, and connected by broad flights of stone steps—its clipped evergreen hedges—its embowered alleys—its formal yet intricate parterres, full of curious knots of flowers—its lively and musical fountains—its steep slopes of velvet turf—its trim bowling-green—and the labyrinth and wilderness which form its appropriate termination, and connect it with the ruder scenery without. This kind of ornamental garden came from Italy, with the change we have been discussing, in domestic architecture.

The quadrangular embattled mansion of the last Henries affords scope for the display of much grandeur and magnificence, and adapts itself more conveniently to the plan of a modern house. The carved oriel, and deep many-lighted bay window, often projecting in a multitude of capricious angles and curves, besides the regular octagon, the panelled angle-turrets, with richly-embossed finials, and the wreathed chimney-shafts, are characteristic beauties of this class of building. The gabled manor-house, together with these ornamental features, admits, at the same time, of a much greater irregularity of form and outline, so as to accommodate itself to every variety of disposition, and to buildings of every size, from the baronial residence to the parsonage and grange. All the forms which particularly mark the Elizabethan style, may be wrought in the cheapest materials with comparatively little labour; and a small portion of ornamental work, tastefully disposed, is capable of producing very considerable effect. Lastly, the Elizabethan house is distinguished by the number and size of its rectangular and many-mullioned windows, which give a peculiar lightness and elegance to its several parts. The roof-line may be either horizontal or broken with gables, turrets, and cupolas. In either case, it is enriched with perforated parapets, balustrades, or other architectural devices, while similar embellishments ornament the entrance, and the terraces which connect the building with the garden."

* Vitruvius was a Roman writer of the first century.

EFFECTS OF PANIC.

THE effect produced upon the human mind by terror, from the appearance of sudden and unexpected danger, is very extraordinary. Some it deprives of all self command; by it, others are dissolved in a flood of tears; but in what manner soever we may be affected, yet it is certain that every person is liable to be so, to a greater or a less degree.

When great crowds happen to assemble in churches, theatres, &c., the multitude seem to be prepared to catch any infection which chance may offer; and often the more frivolous and absurd that the cause happens to be, serious consequences the more readily follow. On such occasions, however, sometimes very ludicrous incidents occur. The following is an account, given by Fox in his Ecclesiastical History, of an event of this kind which took place at Oxford. Fox flourished in Queen Elizabeth's time, and it is related in his own words:—

"In the year 1541, there was one Mr Malary, Master of Arts in Cambridge, who, for certain opinions, was convened before the Bishops, and then sent to Oxford, openly to recant, and carry a faggot, to the terror of the students of this university. On a Sunday, he was brought into the church, many doctors, divines, and citizens being present. Dr Smith preached the recantation sermon, and Mr Malary stood before him with his faggot. About the midst of the sermon, there was, of a sudden, heard in the church the voice of one crying *Fire! fire!* in the streets, occasioned by a person who saw a chimney on fire in Allhallows's parish, and so, passing by the church, cried *Fire*, thinking no hurt. This sound of fire being heard in the church, went from one to another, till at length the doctors and preacher heard it themselves, who, amazed with sudden fear, began to look up to the top and walls of the church, which others seeing, looked up also; upon which, some began, in the midst of the crowd, to cry out *Fire, fire!* 'Where?' says one and another. 'In the church,' says one. The word *church* was scarce pronounced, when, in a moment, there was a great cry, '*The church is on fire, the church is set on fire!*' This inexpressible horror and confusion raised the dust like a smoke, which, with the outcries of the people, made them all so afraid, that, leaving the sermon, they began to run away; but so great was the press of the multitude crowding together, that the more they laboured, the harder it was to get out; for they stuck so fast in the door, that there was no moving forward nor backward. They ran to another little wicket on the north side, from thence to a door on the west; but there was so great a throng, that, with the force thereof, a great bar of iron, which is almost incredible, was pulled out and broken by the strength of men's hands, and yet could not the door be opened for the vast concourse of people. At last, despairing of getting out, they in great amazement ran up and down, crying out, that '*the devil had conspired their death.*' One said he plainly heard the fire; another affirmed he saw it; and a third swore he felt the melted lead dropping on his head and shoulders. None made more noise than the Doctor that preached, who first of all cried out in the pulpit, '*These are the subtleties of the devil against me—Lord have mercy upon me.*' &c. In all this consternation nothing was more feared than the melting of the lead, which many affirmed they felt dropping upon their bodies. The Doctors, finding authority and force could not prevail, fell to entreaties, one offering twenty pound, another his scarlet gown, so that any man would pull him out, though it were by the ears. A president of a college, pulling a board out from the pews, covered his head and shoulders therewith against the scalding lead, which they feared much more than the falling of the church. One thought to get out of a window, and had broken the glass, and got his head and one shoulder out, but then stuck fast between the iron bars, that he could move neither way; others stuck as fast in the doors, over the heads of whom some got out. A boy had climbed up on the top of the church door, and seeing an aged Doctor, who had got over men's heads, coming towards him, with a wide cowl hanging at his back, he thought it a good opportunity to make his escape, and prettily conveyed himself into the Doctor's cowl. He got out with the boy in his cowl, and, for a while, felt no weight; but at last feeling his cowl heavier than ordinary, and hearing a voice behind him, he was more afraid than while in the throng, believing that the evil spirit which had fired the church had flown into his cowl; whereupon he began to exorcise. '*In the name of God, I command thee to declare what thou art behind my back.*' '*I am Bertram's boy,*' said the other. '*But I,*' said the Doctor, '*adjure thee, in the name of the inseparable Trinity, that thou, wicked spirit, do tell me who thou art, and from whence thou comest, and that thou go hence.*' '*I am Bertram's boy,*' said he; '*and I pray, good master, let me go.*' When the Doctor perceived the matter, he took the boy out, who ran away as fast as he could. In the meantime, those without the church, seeing all things safe, made signs to them within to be quiet; but the noise being so great that no word could be heard, these signs increased their fear, supposing all the church without to be on fire, and that they were bid to tarry within, and not to venture out, because of the dropping of the lead, and the fall of other things. This hurry lasted many hours, but at length the mistake was discovered. The next day and week following, there was an incredible number of bills set upon the

church doors, to inquire for all manner of things then lost, there being but few in this garboyle (tumult), who, either through negligence lost, or through oblivion left not something behind."

CROSSING THE LINE.*

ONE lovely evening, when our gallant vessel was calmly floating on the unruffled bosom of the deep, within the tropics, and I sitting at the open port, gazing thoughtfully on the setting sun, I was suddenly startled from my meditations by the cry of, "A sail a-head! halo! Neptune! Neptune! a-hoy!" and, on gaining the deck, perceived a large tar-barrel flaming on the ocean, and gliding past our vessel, which, I was given to understand, was the royal barge of the venerable watery god, who had announced his intention of coming on board next morning, to superintend the shaving such of his children as had not previously crossed the great boundary of his dominions.

Next morning, accordingly, this august personage made his appearance on the quarter-deck, about half-past nine A.M., and advanced to seat himself on a gun-carriage, under a gorgeous canopy of various-coloured flags, and surrounded by innumerable streamers, which kept waving to and fro with every wandering breeze. His dress, consisting of a buffalo's hide, with such other varieties as could be procured on board, added to an iron-crowned hoary-bearded mask, rendered him a very grotesque figure. By his side was seated a gigantic white-robed mariner, something resembling an old weather-beaten woman, intended to represent Amphitrite. The royal chariot, preceded by a band of music, and drawn by sixteen men, painted from head to foot in the most ludicrous fashion, led the van of the procession, and was followed by the numerous constables, bearing their rods of office, all decorated in a singular manner. Next followed the important barber, with his train of necessary attendants, and his Oceanic Majesty's household brought up the rear.

After parading the quarter-deck with all due ceremony, the procession halted opposite the cuddy door (that is, the door of the great cabin on the upper deck), where his godship was welcomed by the officers, and accepted the offer of a glass of spirits; nor had his fair spouse any hesitation in swallowing a potent draught of the same inspiring nectar. When the barber (who did not fail to exhibit his huge iron razor) and several of the other attendants had also paid their devotions at the shrine of Bacchus, the car was drawn into the lee waist, where were prepared a deep cistern (composed of a tarred topsail, supported at the four corners by corresponding stanchions, and filled to the brim with the salt water of the tropical ocean), a covered throne for Neptune and his exquisite consort, a scaffolding for the barber and suite, and a narrow plank across the reservoir, on which were to be seated those unenviable individuals who were destined to undergo the ceremony of "shaving." At this moment the beating of the drums, the sound of the horns, the shouts of the mariners, and the cries of "Bring forth my sons! bring forth my sons!" indicated to the anxious beings below, on the gun-deck, that all was in readiness to commence the business of the day; and immediately a band of the horrid constables came to lead me, blindfolded, and with a palpitating heart, to the place of execution. No sooner had I gained the summit of the companion-ladder, than a deluge of salt water, from innumerable buckets, was discharged unceremoniously into my face; and when I attempted to gasp for breath, an unceasing stream from the fire-engine was directed, by some expert hand, right into my mouth. In this state, panting, and almost breathless, I rushed forwards, with much exertion, dragging constables and attendants after me, till I gained the foot of the ladder which led to the plank crossing the cistern. This I ascended with some difficulty amid the cheering of a merciless multitude, took my seat on the tottering plank, and awaited with anxious expectation the dreadful result of all this ceremony. I had not sat long till a rough brush (every hair of which seemed to be formed of a porcupine's quill) saluted my chin; then a sharp-toothed saw (intended to represent a razor) was passed over my cheeks; then a bucket of water was thrown into my face; then another dense stream from the fire-engine was directed into my mouth; and then the frail plank was withdrawn from under me, and I plunged headlong and breathless into the abyss below! This was not all. In the cistern was a shelf, and on this shelf a man (dressed in a bear's skin, and creeping on all fours), whose duty it was to hold the subject of their mirth for some time under the surface of the water. Struggling, as it were, for my existence, no sooner did I feel the horned clutches of the great bear, than I struck him such a blow on the head as caused him to let go his grasp; and, almost insensible, I scrambled up the sides of the cistern, and threw myself down on the deck below. Still no quarter was allowed me; I had yet to make my way through a deluge of water, showered on me from the fore-castle, the decks, the booms, and the tops, to the after-part of the vessel; which, had I not immediately accomplished, I verily

* When vessels cross the equinoctial line in their outward or homeward-bound voyages, the sailors on board usually hold a species of festival in honour of Neptune, the heathen god of the sea. Some of the frolicsome ceremonies on these occasions are here described by a young gentleman now in Edinburgh. The article appeared originally in an Edinburgh publication.

believe I should have sunk exhausted under the ordeal.

Notwithstanding all this roughing, however, I contrived, on the whole, to preserve my good humour; and I had no sooner recovered, and begun to look about me, than I seized a bucket, joined the enraptured performers of this busy scene, and was among the first to salute my hapless messmates, who next made their appearance.

After all the midshipmen had passed through the hands of the barber, the shaving of the seamen commenced. This was a more serious business, for the chins of many bled profusely, and their mouths and eyes were fearfully disfigured by the tarry brush of the barber, while torrents of their favourite element were showered on their hooded heads, without sympathy or restraint.

In the meantime, the shaving advanced with great rapidity; and before twelve o'clock, the procession returned, in all its pomp, to the cuddy door, in the same order as formerly, when the captain's health, with that of all the legitimate sons of Neptune, was drunk with loud and continued cheers, and then the sports of the morning concluded. But towards evening, the captain ordered a liberal supply of grog to be served out to each of the sailors; and the remainder of that night was spent in

"Draining the goblet, and singing the song."

CHIMNEYS.

CHIMNEYS have characters! I am convinced of that. They are a people, and have minds, dispositions, temperaments, and passions, like other folk. They have also diseases, like the human species, and do not want for their "doctors." Are they not affected by east winds just as much as any of us, and have they not their own inexplicable fits of the sullen, and are they not awfully testy when contradicted, just like ourselves?

The faculty of smoke-doctors may be a very learned and respectable faculty for anything I know; but who ever heard of a chimney being cured? Nobody! The truth is, a chimney's disorders generally proceed from its original physical constitution, and one might just as well talk of expelling a hereditary disease from an individual of the human race. The only way is to destroy the chimney altogether, and create it anew. A "doctor" will speak to you of "old wies," and of "cans" one-mouthed, two-mouthed, and poly-mouthed; but put no faith in smoke-doctors. You might just as well expect a human doctor to cure you, when on your death-bed, by ordering you a new nightcap.

But the maladies which affect chimneys often proceed from their situation in life. Circumstances govern us all, and chimneys too. A chimney of my acquaintance once testified this in a remarkable manner. It was a chimney that had just begun the world in the New Town, and belonged to a house three storeys in height. Now, this chimney was as well-behaved and well-regulated a chimney as one could have seen in a summer's day; and had a juvenile vivacity, which could not be repressed by the east wind itself. At last, however, it became all of a sudden very irregular in its conduct, and seemed to have lost all its former health and spirits. Doctors were called in, who examined the patient, and prescribed all kinds of cans, which were speedily got. All would not do, however; instead of recovering, it became worse, and seemed, by the increased vehemence with which it repelled the advances of the smoke, to indicate that the doctors did not understand the nature of its trouble. Alas! it was not the body, but the mind of the chimney, that was diseased! My sensitive young friend was affronted at the very idea of these fellows attempting to cure its grievances by commonplace applications. A full convocation of all the smoke-doctors in town being at length called, and their deliberations being assisted by some experienced builders, it was discovered that the cause of all its woes was the tall and over-topping gable of a contiguous house, whose chimneys carried their heads at least twenty feet higher than that of the afflicted chimney in question; so that envy—sheer envy alone, was the occasion of all its ailments. This was proved to my full satisfaction, by what happened afterwards; for the patient, being, as it were, continued into the tall gable, and allowed to carry as high a head as its neighbours, never gave its masters any more trouble; and when I last went to see how it did, I thought the smoke which issued so freely and complacently from its mouth, seemed to say, "You see I have at length gained my point."

Though I allow that chimneys may be jealous of each other's heights, and sometimes look with an evil can at the honour or prosperity of their neighbours, I do not think that they are in general a democratic people. Many a chimney do I know of very humble height, and even unadorned with cans, and yet very decent, quiet chimneys too. There is a spirit of meekness in some chimneys, which seems to fit them best for the lower walks of life, where they are content to exercise their vocations, perhaps, under the baronial protection of some neighbouring stack of chimneys, without fretting their souls with chimerical ideas of liberty and equality. I know some chimneys of this amiable sort in the Pleasance.

Chimneys necessarily cannot be a democratic people, for there are kings among them. There is the tall, red, regal chimney of the Coal Gas Work at the back of the Canongate, which, on state occasions, wears a splendid

crown of gas light, and stands pre-eminent over all the chimneys in the Old Town, like Saul among the people. No one can doubt that this is the King of Chimneys, whether for the importance of its avocations, or the grandeur of its appearance. The tall chimneys at Portobello and Pinkie are two solitary monarchs without subjects.

That chimneys are sentient beings, nobody can dispute. Le Sage, an author of no little discernment, says that they can speak. I must confess I never heard them pronounce articulate words, or carry on conversations; but there is one thing of which I am certain—they can howl! I have heard them howl in a high wind, in a very sensible style—almost like speaking—only the sentences not connected. In these cases, however, I consider them to be only expostulating or quarrelling with their enemy, the wind.

At the country town where I spent my youth, there were some thatched houses near the school, with chimneys of a very outré sort. My heart is smitten when I remember how cruel we were to these grotesque but inoffensive chimneys. There was one belonging to the cottage of a poor old widow woman, at which our scorn and our stones were particularly directed. It was constructed of turf, upon a frame-work of upright sticks—the whole so dilapidated, that there was scarcely anything but the sticks left. Most unfortunately for the chimney, it was not altogether of an upright character, but inclined a little to one side, and seemed to look down upon us school-boys with open mouth, inviting our attacks. We assuredly did not spare it; for every day, we employed the whole quarter of an hour previous to the opening of the school in throwing missiles of any sort we could lay our hands on, at and down its gaping crater; and not a day passed without old Luckie—coming into the school-room, complaining of our wickedness, and exhibiting the melancholy fragments of cutty pipes, and little black tea-pots, which, she said, had suffered from our stones, while lying innocuously by her fire-side.

Some of these cottage chimneys were very curious in their internal as well as external structure. As viewed from the fire-place below, they looked like the vast cone of a glass-house, or like an amphitheatre, peopled with spectator hams, and a huge black beam, from which depended by iron rods, chains, and hooks, various culinary vessels. These chimneys never required sweeping; though I remember hearing a traditional account of one being cleared of its venerable soot by the goodman, who had accomplished his singular task by going head foremost into a sack, and ascending by a ladder to the rattle-tree, where he stood and rubbed the sides of the chimney all round with his shoulders! This custom might be practised with effect in the cure of *lum-bago*!

Speaking of chimney-sweeping, we come to chimney-sweeps, who, by the by, are a very noticeable set of men. A friend of mine, in guarding against contact with them on the streets, calls them angels of darkness, in contradistinction to bakers, whom he denominates angels of light, though I consider the one tribe to be fully as great annoyances as the other. When I pass a chimney-sweep on the street, I myself wearing light-coloured clothes at the time, I may say, "*Conjuro te, Diabole!*" and avoid being rude to his person; but in my heart I envy and admire him. Chimney-sweeps see and explore a part of the world which nobody else can see and explore. They surpass the prodigal son in the "Vicar of Wakefield," who saw the outside of the best houses in Amsterdam, for any body may see that; but to chimney-sweeps alone is it reserved to see the roofs of the best houses. They walk in glorious pre-eminence over the heads of the rest of mankind, and cast their eyes over the surface of an upper world, which none of us children of the ground shall ever see. I have heard them tell strange and wild stories of the dangers they have passed, and the roofs of the lands they have seen, like sailors returned from distant voyages; and, what is very strange, there is scarcely a chimney in the town, of which they do not know the whole nature and character, as well as the owner of the house himself. Nay, I have often been surprised, on calling a chimney-sweeper to administer unto a moody or diseased vent, to observe how familiar he was with its history and peculiarities. How they acquire this wonderful knowledge, it is impossible to conceive. I suspect that they talk to each other of nothing but the various chimneys which have come under their hands, and so, each communicating to his neighbour the results of his experience, the whole become, as it were, universally acquainted. I remember once calling an old chimney-sweep to a very strange chimney, which, before ascending the gable, went across the ceiling of an adjoining room, and, indeed, was all at right angles. Before commencing operations upon this strange specimen of the crooked tribe of chimneys, he frightened me into the offer of a double fee, by some dreadful traditional recollections of boys being smothered in it forty years ago, when he was a climbing-boy himself, and of plummet-balls in later times being dispatched down its unimaginable angularities, in order to discover the bottom, and being never more heard of by their disconsolate owners, whose damages were of course made good by the then proprietor.

In short, the subject which I have thus imperfectly handled, is one well worthy the attention of the truly philosophical; and I hope, ere long, to see a separate volume allotted to it in Dr Lardner's Cyclopædia, or in the Library of Useful and Entertaining Knowledge.

BIOGRAPHIC SKETCHES.

HOWARD.

JOHN HOWARD, an Englishman, who has justly obtained a celebrity over the whole civilized world for his extraordinary and unceasing efforts in the cause of suffering humanity, and for which he has been generally and justly entitled "the Benevolent Howard," was born about the year 1727, at Clapton, in the parish of Hackney, a large village immediately adjoining London. To this place his father seems to have removed from the pursuit of his business as an upholsterer, in Long Lane, Smithfield, where he had acquired a considerable fortune. The education of young Howard was extremely superficial; and when he left school, he was put as an apprentice to a wholesale grocer in the city; but this situation not being at all to his taste, he embraced the opportunity, on coming of age, of purchasing from his master the remainder of his time. By his father's will, he was not to come into the possession of his fortune until he reached his twenty-fourth year, and then he became entitled to the sum of £7000, in addition to the whole of his father's landed property, his plate, furniture, pictures, &c. Coming thus into the possession of a respectable patrimony, he was now at liberty to follow out the bent of his inclinations, which he did by setting out on his travels through France and Italy. On his return, being of delicate health, and inclined to consumption, he was put upon a rigorous regimen, which is said to have laid the foundation of that extraordinary abstemiousness and indifference to the gratification of his palate, which ever after so much distinguished him. In 1752, while twenty-five years of age, he married a lady in her fifty-second year; a step he took in consequence of having received from her many marks of kind attention during a sickness with which he was overtaken. The death of his wife in a few years put an end to this somewhat imprudent connexion. Soon after the death of his wife, he resolved upon leaving England on another tour, with a view to direct his mind from the melancholy reflections which that event had occasioned.

The country which Howard first intended to visit was Portugal, then rendered particularly interesting by the situation of its capital, still smoking in ruins from the effects of a tremendous earthquake. A great part of its capital, Lisbon, and thousands of its inhabitants, had been embowelled in the earth. It was to this sublime spectacle that Mr Howard's attention was principally directed; and he accordingly took his passage in a vessel, which, unfortunately, was captured by a French privateer. This event, unlucky in itself, gave a turn to the fate of the young philanthropist, and proved ultimately beneficial to mankind. His captors used him with great cruelty, for, after having been kept forty hours without food or water, he was carried into Brest, and confined, with the other prisoners, in the castle of that place. Here, after being cast with the crew and the rest of the passengers into a filthy dungeon, and there kept a considerable time without nourishment, a joint of mutton was at length thrown into the midst of them, and, for want of a knife, they were obliged to tear it in pieces, and gnaw it like dogs. In this dungeon, he and his companions lay for six nights upon the floor, with nothing but straw. He was afterwards removed to Morlaix, and thence to Carpaix, where he was two months upon parole. He had no sooner obtained his own liberty, than he exerted all his influence to procure the liberation of some of his fellow-countrymen. Whilst at Carpaix, he obtained sufficient evidence of the English prisoners of war in France being treated with inhuman barbarity, and he did not rest till he influenced the government in their behalf. It is to this event that Mr Howard himself refers the first excitement of that attention to those who were sick, and in prison, which afterwards occupied the greater part of sixteen years. Soon after his return to England, he formed a connexion with an amiable young lady, whom he married, and with her assistance he carried into effect various schemes of benevolence, for meliorating the condition of his tenantry and the poor in his neighbourhood. Of this valuable assistance he was, however, soon deprived, by the death of his wife, soon after she had given birth to a son. In 1769-70, Mr Howard paid a third and fourth visit to the Continent, and of which he has left various memoranda, written in a strain of unaffected Christian piety. In 1773, while in his retirement in England, he was created High Sheriff of the county of Bedford. In this office he had numberless opportunities of inspecting the condition of the jails and bridewells under his jurisdiction, of remedying grievances, and alleviating the distress of poor prisoners. The more and more that this benevolent man saw of the condition of the English prisons, he became the more anxious to pursue his investigations all over the country. He proceeded upon tours into the counties of Hertford, Berks, Wilts, Dorset, Hants, Sussex, Surrey, &c. The scenes of misery which now came under his notice were truly deplorable. At Salisbury, just without the prison gate, was a chain passed through a round staple fixed in the wall, at each end of which a debtor, padlocked by the leg, stood offering to those who passed by, nets, laces, purses, &c., made in the prison. At Winchester, Mr Howard saw a destructive dungeon for felons, eleven steps under ground, dark, damp, and close. In it the surgeon of the jail informed him that twenty prisoners had died of the jail fever in one year. One

of the places which Mr Howard inspected in the course of his journey, was the bridewell of Surrey, at Guildford, in which he found neither bedding, straw, nor work. Soon after his return from making investigations into the condition of these abodes of vice and misery, he was examined before a committee of the House of Commons, touching the knowledge he had thus acquired; and, being called to the bar, the Speaker acquainted him that the house was very sensible of the humanity and zeal which had led him to visit the several jails of this kingdom, and conveyed to him the grateful thanks of the house and the country for his benevolent exertions in behalf of the most destitute and outcast members of the community.

Mr Howard continued, throughout the years 1773-74, to inspect the prisons and bridewells of England, and on one occasion extended his tour of philanthropy into Scotland and Ireland. In 1775, he proceeded to the Continent for the purpose of examining the jails in France, Holland, and part of Flanders, Germany, and Switzerland, mostly all of which he found under better management than those in Great Britain. He was particularly pleased with the prisons of Holland, which presented a model which, except in a few points, he wished to have seen adopted in England, and every nation on the globe. He found a good deal to interest him in Germany. In the towns in that country, he frequently saw the doors of sundry rooms in the prisons marked, *Ethiopia, India, Italy, France, England, &c.*; on inquiring what such words meant, he was informed that in these rooms, parents, by the authority of the magistrates, confined their dissolute children, answering, in the meanwhile, to the inquiries which might be made after them, that they were gone to whatever country might be written upon the place of their confinement. This seems a strange and harsh arrangement, though we have no doubt many parents in this country would occasionally be glad to have the same ready means of incarcerating their dissolute children. In travelling, Mr Howard lived in the plainest manner; generally carrying along with his luggage a teakettle and other utensils, as well as the materials for making tea, of which he was fond, for its simple exhilarating qualities. At the inns, however, he generally ordered the best victuals and wines, so that there might be no complaint as to his stinginess; but these luxuries he seldom tasted. When he considered himself ill-treated by postilions, he punished them by withholding extra fees; but to show that he did not do so for the purpose of saving money, he sent his servant to gather the poor of the place, and, in the presence of the postilion, distributed among them the sum he would have paid. These traits of character becoming widely known, he in time, was well known and carefully attended to wherever he travelled. On one occasion, he happened to visit a monastery at Prague, where he found the inmates feasting on a day which ought to have been devoted to abstinence. He was so much displeased with this breach of discipline, that he threatened to proceed to Rome to inform the Pope, and it was only after the monks had made the most humiliating apology, and expressed their contrition, that he promised to be silent on the subject to the head of their church. In 1781, he again departed from England on a tour of philanthropy, in order to proceed through Denmark, Sweden, Russia, and Poland, and some other countries in the north of Europe, and with the view of inspecting the prisons and hospitals on his route. Copenhagen, Stockholm, Petersburg, and Moscow, were respectively visited, and in each he collected valuable information on the state of the common jails, and modes of punishment. Having thus visited every state of Europe, whence he could hope to derive assistance for the completion of the great design which animated him, except the two southern kingdoms of Spain and Portugal, he next directed his course thither, and on this journey visited the prisons of Madrid, Lisbon, and other populous towns. This tour being completed, he returned to England, and finished his fourth general inspection of the English jails, preparatory to the publication of a second edition of his *Appendix to the State of Prisons*—a work he had some time before given to the public. When these journeys were finished, he summed up the number of miles which, in less than ten years, he had travelled in his own country, and abroad, on the reform of prisons, bridewells, and hospitals, and found that they formed a total of 42,033. When, in the spring of 1784, Mr Howard had laid before the public the result of his minute inspection of the prisons, and many of the hospitals of his own country, and of the principal states of Europe, he retired to his estate at Cardington, in whose calm seclusion he purposed to spend the remaining years of his existence. The benevolent Howard had now nothing to embitter his peace but the conduct of his son, who, having been sent to the University of Edinburgh, and placed under the care of the venerable Dr Blacklock, unhappily contracted habits of dissipation and extravagance, which were his own ruin, and well nigh broke his father's heart.

After having devoted more than eleven years of his valuable existence to the reformation of the jails, and the improvement of the hospitals of his own country, as well as those of foreign states, he determined again to quit his home on a journey of benevolence, more important to the interests of the human race, though fraught with greater danger to himself, than any he had yet undertaken. His plan was indeed the most humane and beneficent that ever entered into the mind of man, for it was to check the progress of de-

vouring pestilence, by inspecting the condition of the principal lazarettos in Europe, and, if possible, throwing a light on that most dreadful of all scourges of mankind—the plague. On this tour of mercy, he visited the Italian states, and from thence passed by sea to Turkey, in which country he examined the hospitals and prisons of Constantinople, Smyrna, and other places. While on this expedition he “succeeded” in getting on board a vessel with a foul bill of health; and while in at sea, the vessel was attacked by a Moorish privateer; in the engagement which took place, he fought with great bravery, and aided in repelling the attack of the barbarians. When, along with the crew, he arrived in Venice, he submitted to go through the most shocking privations in a loathsome lazaretto, in order to acquire knowledge of the management of those supposed to be labouring under plague. On all these trials his good spirits never forsook him. Being liberated in due course of time, he returned to England, and resumed his inspection of the town and county jails and bridewells. It is mentioned that he frequently exercised his liberality in relieving poor debtors from confinement, by paying their debts. “I have often seen him come to his lodgings,” says the journal of his attendant in most of his tours, “in such spirits and joy, when he would say to me, ‘I have made a poor woman happy; I have sent her husband home to her and her children.’” He was exceedingly methodical in spending his time. He generally declined every invitation to dinner or to supper whilst on his tours; abstained from visiting every object of curiosity, however attractive, and even from looking into a newspaper, lest his attention should be diverted from the grand purpose in which he was engaged.

In 1789-90, Mr Howard again proceeded on a journey, which was the seventh and last, to the Continent, to re-examine the prisons and hospitals of Holland, part of Germany, Prussia, and Russia. His plan was to have spent three years abroad. One object of his pursuit, and perhaps the principal one, was to obtain further information respecting the plague, by extending his visits to those parts of the world in which it rages with the greatest virulence, and on some of whose infectious coasts it is supposed to take its rise. As soon as he had resolved to undertake this hazardous journey, he became impressed with the belief that it would be his last; and when he took leave of one and another of his friends, he did it as one whose face they would see no more on this side the grave. These feelings were sadly verified. The benevolent Howard penetrated in his journey into the deserts of Tartary, to the confines of the Euxine Sea, every where examining the prisons and hospitals, and doing all in his power to alleviate the sufferings of the inmates. At Cherson, in the distant region of Russian Tartary, his visits to the infectious hospitals brought upon him the attacks of a severe fever, a species of plague, under which his constitution gave way. Every attention was paid to him by the authorities, but nothing could save his life, which he gave up with pious resignation and hope, on the morning of the 20th January 1790.—Thus died one of the brightest ornaments of English biography; a person whose name is associated with all that is virtuous and benevolent, and who will be remembered with feelings of admiration and respect for numberless ages, in every part of the civilized world.

TRADITIONS OF THE WESTERN HIGHLANDS.

MURDER OF LORD LORNE.

JOHN STEWART, Lord of Lorne, when far advanced in life, was a widower, and had three daughters, but no lawful son. By a woman above the common rank, named Maclaurin, he had an illegitimate son, whose name was Dugald. He was a young man of great promise, and had particularly distinguished himself on a recent occasion.

The sons of the chief of Macdougall, by the sister of Lord Lorne, were very desirous of marrying their cousins, the co-heiresses of Lorne, and were assiduous in their attention to their uncle, who resided in the castle of Dunstaffnage, once inhabited by the kings of Caledonia, and still one of the royal palaces of Scotland. They had passed the night at Dunstaffnage, and departed early next morning. But they had not gone far on their way, when they observed a number of boats approaching from the east, crowded with people, with pipes playing, and bearing flags. They found that these boats contained Dugald and his mother; and they soon discovered that old Lord Lorne had resolved to marry the mother of Dugald, and that they were now coming to celebrate the marriage. According to the Scotch law, this marriage would have made Dugald legitimate, and capable of inheriting the ample territories of Lorne. This event would have utterly disappointed the matrimonial schemes of the two nephews, and they instantly formed a dreadful resolution to prevent it. They returned, and asked admittance into the castle; but the door-keeper remarking a very fierce expression in their countenances, first consulted his master, who was displeased at his hesitating to admit his nephews. The door-keeper reluctantly received them; they forced their way into Lord Lorne's apartment, and instantly put him to death, to prevent the intended marriage. The brothers were, however, disappointed in their expectations—the heiresses escaped from Dunstaffnage by night, and carried away the

charts of the estate. They took refuge with the Earl of Argyll, who soon married the eldest daughter; the second was married to Campbell of Glenurchy, ancestor of the Earl of Breadalbane; and the third to Campbell of Ottar.

This murder was committed towards the end of the 15th century. The rock where the two Macdougalls stood when they discovered the approach of Dugald and his mother, and where they resolved to return and assassinate their uncle, is still well known. It is called in Gaelic by a name which, translated, means *The Rock of the Wicked Resolution*.

POPULAR MORALS.†

EVERY thoughtful person finds that inquiries arise in his mind of this nature, What am I? Whence am I? For what purposes do I exist? What is this which is called life? What is the power of thinking? Will the consciousness of being cease when this life ends? If not, will that consciousness relate to the acts done in this life? If so, in what manner, and with what consequences? If I doubt what answers I must give to these questions, why do I doubt? Is it beyond my power to remove my doubts? If I believe nothing of a future state of being as a consequence of the present being, have I done what I ought to do, to inform myself whether this be so or not? If I have a sentiment of being liable to account in a future life for my conduct in this, is it a mere sentiment, or is it founded in reason, and binding on me as a conviction, which I cannot free myself from?

Inquiries also arise in many minds of this nature: If there be a Supreme Being who created and who governs the universe, and who is supremely good and wise, why are the good and wise on earth sometimes subjected to suffering and to sorrow? Why is there, to such persons, so much of pain in body and in mind? Why do disappointments and afflictions fall on those who strive to perform their duty in all things? Why do not the punishments of divine justice fall on those who violate the laws of the Supreme Being? Why is it, that worldly prosperity, respect, and honour, are often bestowed on those who violate all the laws which the righteous Judge of all the earth must have prescribed?

Why is it that man is so commonly the bitter and relentless enemy of man? Why is it that he hazards the destruction of his own property, his own liberty, and even his own life, to destroy property, liberty, and life in others? Why is it that we take pleasure in depreciating the good qualities of others, and in presenting their faults, follies, and errors to the notice of those who were before ignorant of them? Why do we feel emotions of dissatisfaction when others prosper, and regard the welfare of others as though it were a wrong done to ourselves? Why do we mourn over that which is past and which cannot be recalled, and tremble at that which has not come, and which may never come? Why is it that kind acts done to others are frequently forgotten by them, and sometimes regarded by them as a grievous burthen, and sometimes repaid by acts of unkindness, and reproach, and even of injury? Why is it that so much of human life is spent in vain and profitless pursuits? Why is it, that, when disabled and suffering, in body or mind, that we can so rarely console ourselves with the fact, that we did not cause our own distress? Why is that family connexion (seemingly ordained as a necessary condition of human life) is so often a cause of irritation and vexation? Why are children sometimes inclined to regard parents rather as tyrannical and heartless rulers, than as affectionate and worthy governors; and why are parents sometimes led to regret that they have given birth to offspring, who are fastened on them by ties which cannot be broken? Why is it that unceasing parental care, and the wisest precaution in rearing children, are repaid by that bitter disappointment which must be hidden within the heart, and wept over unseen by any human eye? Why is it, that, when parental care has been successfully applied, and when we see the coming forth of fruits, intellectual and moral, that in one little moment the blast of destruction passes over, and the remaining act is, to close the sepulchre on the remnant of lost hopes and joys?

What is that principle of our nature that compels us to some sort of action; and which will drive us into such as is hurtful to ourselves and to others, if we are not directed to those of an opposite character? Whence comes that sense of disappointment when success has crowned our pursuits? Why is it that one, in the enjoyment of bodily ease, and of worldly wealth, and apparently in command of abundance in those things which the world calls good, and for which mortals submit to unceasing toil, is, sometimes, the most disgusted of all men with life; finding no pleasure in the smiling earth, in the busy haunts, nor any good under the

† From the Literary Gazette.

† Under this title we shall henceforth occasionally give a portion of an American book, which has lately fallen into our hands, and with which we have been much pleased. The original title of the work is, “The Moral Class-Book, by William Sullivan, Counsellor at Law, Boston, 1831.” We have found this small volume, on perusal, to contain a far more simple, lucid, and impressive view of the moral duties of man, than any that exists in this country; and we therefore feel, that, in transferring it entire to our pages, we are doing a service to our native literature. In many places, we shall be under the necessity of making alterations, for the purpose of adapting the matter to the circumstances of our own country; and in others, we shall endeavour, with all modesty, to enforce opinions of the author, by a few additional observations, always, however, to be indicated by brackets.

sun? Why is it that men need forcible and irresistible powers of government among themselves? Why do those who know that power is difficult to hold, and more difficult to use aright, earnestly desire it? Why is it that those who have power, either do not, or cannot, use it honourably to themselves and beneficially for others? Why are so many of the human race subjected to the most miserable poverty; so many wretched from the misuse and abuse of bodily and mental power; so many deprived of personal liberty; and so many hung up between the heavens and the earth, by order of their fellow men, in the presence of curious thousands, who laugh at the exhibition of death; admire the firmness, or despise the weakness of one who, in full possession of all his faculties, knows, that within a few moments he shall be dead by violence? How does it happen that good and virtuous men, in reflecting on the change which is soon to come, and when the places that have known them will know them no more for ever, do feel a sense of doubt, and even of dependency, as to their future destiny, and would gladly be assured that all they have habitually thought to be true, is unquestionably so?

Inquiries of this nature may be indefinitely multiplied. It is of little use to make them, if there be no answers to them. They have been answered, in general, among the learned, and in a learned manner. Can they be answered to the comprehension of the many, and especially of the young? Let us suppose that no small part of all that we see of folly, error, and crime, and consequent suffering and misery, arises, not from the laws of the Creator, but from ignorance of these laws, or wilful disobedience of them; then it would follow that the remedy lies in making these laws known. When and how is this to be done? Not by leaving to each individual to find out the meaning and force of these laws, through painful experience, and when the consequences of ignorance and disobedience are already fastened on him; but to makethem known, before the responsible action of adult life begins. If there be rules for human life, which come from a Law-giver who cannot err; if these rules are laid down for subjects who are entrusted with the liberty of obeying or disobeying, it is inadmissible to suppose that these rules cannot be found out, and made known to all who are to be affected by them.

To disclose these rules and make them operative, is a duty to ourselves, and to each other. The mode of doing it may be differently thought of by different persons. That which seems most likely to be effective is to address human reason, in a simple and intelligible manner, and in such manner that the opening mind may comprehend the truths which are taught. Such is our present purpose. No mysteries will be resorted to: no display of learning attempted. As these pages are intended for the use of young people, we shall address only their good sense. They will be called on to judge by the light of reason wherewith their Creator has blessed them. If the intention with which this work is undertaken be proper and practicable, those who will bestow the time and attention necessary to that end, may, it is humbly hoped, be enabled to answer many of the inquiries before suggested, so far as the enlightened minds which have left a record of their thoughts can assist and guide us in the search after truth.

The design of these papers is to prove that there is a Supreme Being; that he is the Creator and Governor of the Universe; that he created man as we see him to exist, in his earthly frame, in his intellectual powers, and with an immortal spirit; that there is placed within his reach the knowledge of the laws intended for government here; and that life here is connected with an existence, which is to be attained through the House appointed for all that have lived, that do live, and that are to live.

SOMERVILLE'S GUN.

A GOOD deal has been lately written in the newspapers relative to *Somerville's gun*, or the invention by which fire-arms are at all times prevented from going off accidentally. As, however, a regular account of this excellent piece of mechanism has not been given to the world in a popular form, we may now do so, quoting the description given by the inventor, the Rev. John Somerville, minister of Currie, a parish a few miles west from Edinburgh.

"The principle of these methods [there being several] of preventing accidental discharge, consists in calling in the aid of the *left hand*; so that while the ordinary gun in common use can be fired off solely by the action of the right hand, the gun now to be described requires both; the left hand to undo the stop, slide, or catch, by which the gun is locked, and the other to draw the trigger, the same as in an ordinary gun; the *left hand* being equally necessary to work the gun in the field as the right.

Here the inventor begs it to be explicitly understood, that he lays claim to every variation of this principle, however modified or combined, or by whatever name it may be called, in which the operation of the left hand, or the combined operation of both, is necessary to the proper working of the gun in the field. With safeties that are worked by the *right hand* only, the inventor has nothing to do—that is not his invention; but he claims as *exclusively* his, the safety that is worked by the *left hand*, as, previous to his, no other gun was so worked; and the man who borrows or steals from him the operation of the left hand, takes

from him all that is valuable, as the mode of procuring safety by the operation of this principle is almost endless; for, once having got a genuine principle, all the varieties naturally flow from it, as branches from one root, as springs from one source. Accordingly, the inventor can procure safety and dispatch sixteen or eighteen different ways, by the operation of this principle, which, however, can never be changed without destroying the utility of his invention, and losing completely both dispatch and security. Although the principle of operation by the left hand, as now mentioned, may be varied to a great extent, the inventor confines himself at present to the description of the two following methods:

I. The first method, then, here described, prevents accidental discharge by means of a stop, slide, or catch, situate on the trigger-plate, and either lying on or bedded into it, as the gunmaker or sportsman pleases. It is pressed forward into a nick in the trigger by a spring situate behind it, under the strap of the guard, or before it in the inside of the key, and thus prevents the trigger from acting or pressing by any accident on the sear of the lock, by which the gun would be discharged. On the fore-part of the guard, where the hand presses, is a moveable part, called a key, which may be removed at pleasure, and operates on the stop in the act of discharging the gun. When this key is removed, the gun cannot be used till it is replaced.

If the sportsman fires with the left hand forward on the stock of the gun, instead of the guard, then the key can be placed forward to any part of the stock; and in that case the end of the stop towards the left hand must run forward to that part of the stock, and then receive the key. This key, which may be of any form or size, is removable at pleasure.

II. The second method here described prevents accidental discharge by means of a peg screwed into the end of the main-spring next to the swivel, or into the swivel itself. The peg may be also solid, that is, a part of the swivel itself, the end of the swivel being lengthened, and shaped into the form of a peg. This peg, when the gun is fired, passes down through a hole or opening towards the trigger-plate of the gun. The gun is prevented from being discharged by means of a slide opening and shutting the hole at pleasure, through which the peg descends when the gun is fired. This slide is pressed forward into the hole or opening through which the peg passes, in a similar way to the one just now mentioned in the foregoing method. When the gun is fired, the left hand, by a gentle pressure, throws back the slide, and thus lays open the hole in the stock and trigger-plate, and allows the peg to pass downward, and, of course, the main-spring to traverse its full distance. Keys are fixed upon and removable at pleasure from this *gun*, the same as in the former method just described. For other varieties see the gunmakers' shops.

Having now described this gun, and stated the principle upon which the security is obtained, we now beg leave to mention, in a few words, some of its advantages.

The first advantage, then, which this gun has over the ordinary one in common use, is the *complete security* which it affords against accidental discharge, and the consequent preservation of human life. This is the first and great object of the present contrivance, and in this point of view was first thought of by the inventor. The other advantages which it possesses are all subordinate to this, and come in merely as subsidiary to the main object.

The waste of human life, by the accidental discharge of fire-arms, is truly deplorable. It is not without reason that writers have cautioned sportsmen to be careful in using them, and that parents have felt anxiety about their sons when engaged in field amusements, with weapons in their hands so precarious in the use, and so fatal in their effects. Too frequently the sprightly and spirited youth, in pursuit of pleasure, finds death! Not only every season, but almost every week of every season, brings accounts of the most valuable lives lost in this way. The inventor states it as an undeniable fact, that at an average there are not fewer than from twenty to thirty lives, throughout Great Britain and Ireland, lost every year in this way, besides more than double that number maimed and wounded. Now, against such fatalities the gun we are now speaking of presents the most *absolute* security. Any one may be satisfied of this, who will consider for a moment the principle upon which it is constructed. Morally speaking, accidental discharge with this gun is completely out of the question, at least the probability of it is so wide, that perhaps philosophy could not calculate when this gun would be discharged in any other way than by design. If accidental pressure shall touch the trigger, no evil happens, because it is locked; if it touch the key, no evil happens, because the pressure by that time is supposed removed from the trigger. The pressure must be against the trigger and on the key at the same instant of time, otherwise the lock won't work. If the trigger is touched the twinkling of an eye before the key, or the key before the trigger, then no evil can ensue; for, unless touched at the same instant of time, they mutually counteract and support one another, and thus prevent the gun going off.

The second advantage which this gun possesses over the ordinary fowling-piece, is *superior dispatch*. This is evident at first sight, as this invention enables the sportsman to go with his gun full-cocked, and thus, when game rises unexpectedly, saves all the

time lost, as well as detraction of thought occasioned by cocking the ordinary gun, and, consequently, he has only to present and discharge his piece, which he is enabled to do before the gun in ordinary use can be cocked and brought to the shoulder.

The third advantage which this gun has over others, is the *ease and tranquillity of mind* which it necessarily imparts, *not only* to the sportsman himself, but to his friends, parents, relations, or guardians at home, from the perfect security which it affords him. No man of ordinary feeling can he perfectly at ease when surrounded by his friends with a loaded gun in his hand, leaping walls, crossing ditches, brushing through thickets, underwood, and hedges, when all the while the life of his friends is within the reach of a mortal weapon, and the danger of that weapon guarded against only by the fallaciousness of memory, and the risk increased tenfold by the eagerness of pursuit, and the suspension of thought necessarily occasioned by a species of amusement which, more than any other, lays caution asleep, and occasions that flutter and hurry of spirits from which such fatal accidents generally spring.

The fourth advantage which this gun possesses, is the sociality of feeling which it will communicate to the favourite amusement of shooting. In the present state of the ordinary fowling-piece, the writer knows many gentlemen who will not shoot in company, from the uneasiness they feel both on their own account and on that of others.

The fifth advantage which this gun possesses, is the safety which one of the modes of it gives to the left hand, in case the gun should burst. All good writers on the subject of shooting strongly recommend the sportsman to press the gun to his shoulder with the left hand close on the fore-part of the bow of the guard. Notwithstanding, this caution and advice are frequently neglected; and the loss or laceration of many a left hand, by the bursting of the barrel, has taught the sportsman the folly of doing so. With the ordinary gun, indeed, a man may fire with his left hand close to the guard, and thus preserve it. With one of the modes on which this is constructed, he *must* do so, for there the safety-spring is placed, and until it is touched, the locks are immovable.

Nothing is more easily acquired than this mode of shooting, even though the sportsman has been accustomed to fire with the hand forward on the stock. The habit can be acquired by presenting an empty gun for a few times in this way, before going to the field; for, by an instinctive feeling, which perhaps it is not easy to explain, the left hand, after a very little practice, will come as infallibly to the fore-part of the guard, and even without the sportsman being sensible of it, as the right hand comes on the trigger.

With one of the keys of this gun, too, even though the sportsman should persist in shooting with the left hand forward, it will be rendered much safer than with the ordinary gun. This key is affixed to any part of the fore-stock the sportsman pleases, and is so made, that the left hand, which seizes it when the gun is presented, is completely prevented from coming in contact with the barrels, and, consequently, runs much less risk of injury should they burst on being discharged. For this we refer also to the gun.

The sixth advantage which this gun possesses over the ordinary one, is, that it avoids the wear and tear of the locks, necessarily occasioned by perpetually cocking and uncocking the locks of the ordinary gun in the field. With the ordinary gun, the moment the dogs point, or seem to point, both locks are cocked, and if there happens to be no game, or it rises beyond the reach, the gun must be uncocked again; so that with the ordinary gun the sportsman, during the whole day, is perpetually cocking and uncocking his gun. The wear and tear of the locks is thus immense, besides both the trouble and the *danger* it occasions.

The seventh advantage which the writer now states, is, that he thinks a steadier aim can be taken by his mode of holding the gun than in the ordinary way. He is convinced that one great cause of bad shooting is occasioned by grasping the gun too firmly with the right hand, or giving the right hand too much to do in the act of firing. The more easy the right hand holds the gun, and the less it has to do, with the greater precision it will act on the triggers at the proper time. The right hand, therefore, should hold the gun very loosely, and have only one thing to do, namely, to pull the trigger when the gun comes into the proper position to be fired. Now, the gun we are considering admits of this to the fullest extent. With it the left hand, as it were, does the whole work, except pulling the trigger. The safety-spring being worked solely by the left hand, it should press the gun firmly to the shoulder, by which the safety-spring will be unlocked, and thus leave the right hand at perfect freedom, and with nothing to do but merely to touch the trigger when the gun comes into the proper situation to be discharged. Thus, by giving the left hand more to do than in the ordinary gun, and therefore proportionally easing the right, the writer thinks his gun will be held more steadily to the shoulder, a surer aim will be taken, and greater execution done, than with the gun in common use, and in the ordinary mode of shooting.

The last advantage which he now states, is the security which it gives to loaded guns when lying in houses, or exposed to the curiosity of thoughtless or ignorant persons. Many a life has been lost by guns having been presented and fired off in a wanton and incautious manner. Such accidents cannot happen

with the present gun. To render it perfectly harmless, it is only necessary to take off the key, which is done by the slightest touch, and then the machinery which locks in the gun cannot be reached, and, consequently, cannot be fired. The key is restored with the same ease as it is removed, and thus the gun prepared for being fired, or not, at pleasure."

THE PYRENEAN REPUBLIC OF ANDORRE.

It is not very generally known that there exists an independent little nation among the mountains of the Pyrenees, called Andorre, governed by its own laws, and, in general, unmolested by its neighbours, the French or Spaniards. Of the nature and extent of this isolated community, the *Revue Encyclopedique*, a Parisian literary publication, for 1823, presents its readers with the following succinct account.

Andorre, the common language of which is Catalan, a dialect allied to the Spanish, is a neutral territory, situated on the southern side of that chain of the Pyrenees which forms the boundary of France. Most geographers have, nevertheless, comprehended it in the territory of Foix, with which, indeed, it was formerly not entirely unconnected.

This country, the extent of which is not a ninth part that of the department of the Ariège, forms a little republic, comprehending the six communities of Carillo, Encamp, Ordino, Massane, Andorre-la-Vieille, and Saint Julien; and a great number of villages or hamlets, all under the spiritual jurisdiction of the Bishop of Urgel. The village of Andorre-la-Vieille, from which the valley derives its name, is the chief place, and probably is the most ancient. It is there that the general council, composed of twenty-four members for life, six from each community, assembles. When a vacancy occurs, either from death, or from any other cause, the council nominates a successor from among those inhabitants of the community who have been public functionaries. The general council has two syndics, appointed by itself, who convoke the meetings of the council, and manage the public business.

Before the French revolution, the criminal tribunal was composed of two judges, called Viguiers, one appointed by the King of France, the other by the Bishop of Urgel: to whom were joined six inhabitants of the valley, nominated by the general council. This tribunal was called the Cortes. Each viguier appointed a Bailiff, from a list of six inhabitants presented to him by the general council. Before these bailiffs, all civil suits were in the first instance tried. An appeal lay from him to a judge, who held his situation for life, and who was appointed alternately by the King of France and the Bishop of Urgel. The same suits might ultimately be carried before a third tribunal. That tribunal was either the grand council of the King of France, or the council of the Bishop of Urgel, according as either the king or the bishop had appointed the judge by whom they had been determined in the second instance.

This country had some singular laws, especially as regarded the succession to property. The eldest son took almost every thing, leaving very little indeed for the younger branches of a family.

The police was under the direction of two consuls in each community, who were appointed by the general council, and changed every other year.

The country of Andorre is extremely mountainous, and most of the mountains are covered with forests of pines; it is, besides, not very fertile, and is bristled with rocks. It is watered by several rivers, which rise in it; the principal among them is the Embalire, which receives all the others, and then enters Spain, where it falls into the Sègre. At Ransol, in the community of Carillo, is an iron-mine, and there are four forges, at Encamp, at Caldes, at Ordino, and at the hamlet of Serrat, in the last-named community. The hamlet of Caldes is remarkable for its numerous warm springs.

The inhabitants of Andorre have not much arable land, but possess a great many cattle and extensive pasturage. They are in general shepherds. They used to pay four hundred and eighty francs a-year to the Bishop of Urgel, and twice that sum to the territory of Foix. They had a right to import every year from the latter country eighteen hundred loads of rye, and a certain quantity of cattle of every description; as also to import and export, without duty, all goods not prohibited, as well as the produce of the mines.

Every year, on the Sunday before Midsummer-day, they sent a deputation of three members of the general council to the village of Siguer in France, where they took, in the presence of the municipality, the oath of allegiance to the King of France. They also promised not to undertake any thing injurious to the interests of the community of Siguer, to give it intelligence in the event of war, and to furnish with lodging (upon being paid for it) such inhabitants of the village of Siguer as might find it necessary to make a journey into the valley of Andorre. Three of those inhabitants, selected by the mayor, took an oath, to the deputies, of similar import. They then played a game at nine-pins together, and the losers forfeited a tub of wine, which was drunk in the public square. It was remarked that the Andorrans never won the game. On the evening of their arrival, a supper was given them, and they had two meals the next day. The same ceremonies were performed in the village of Miglos. But, what will appear very singular, the inhabitants of the Spanish villages of Alins, Arren,

and Tor, sent, about the same periods, deputies to the village of Viedessos, where they took a similar oath, and were received much in the same manner; with this difference, that the Spaniards did not play at nine-pins; that they had but one supper, at an inn, for thirteen persons, for which they themselves paid; that the deputies and the municipal officers afterwards danced round the village; that they returned to the inn and had a collation, although after supper; that they then renewed dancing for a short time, and that ultimately every one retired. These and similar customs, on which we will not dwell, strongly recall the simplicity of old times.

The Andorrans paid no taxes. They rented the mountains on which they fed their cattle, and the produce of their farms was sufficient to pay all their expenses. Their justice, their police, and their finances, were, for the preservation of good order, placed under the inspection of the intendant of Perpignan.

At the present day they govern themselves as formerly; but in consequence of the revolution, they have become independent of France; and, since the year 1790, the administration of the department have refused to receive their contribution of nine hundred and sixty francs, which they regard as a feudal custom, and will not allow them to come in quest of grain. France gives them neither viguier nor civil judge; their public business is no longer superintended by any of her magistrates; their private differences are no longer carried by appeal to any of her tribunals; and they no longer send deputies to Miglos or to Siguer.

ANECDOTES

PICKED UP IN CONVERSATION.

THE KNOWING SHOPKEEPER.

Several years ago, when the north side of Edinburgh had hardly commenced either to be a place of residence or public resort, some ladies of distinction sauntering about in the High Street, one of them proposed a walk to the Meadows, being at that time the fashionable promenade. "I am very willing," answered another; "but first let us call at Milne, the silk-mercier's, merely to divert ourselves by turning over his goods." They were then at some little distance from the shop. Milne, however, though not observed by them, happened to be but a little way behind, and within hearing of the conversation. Being aware of the ladies' intention, he hastened to his shop, so as he might be behind the counter to receive them. The usual routine of a lady's shopping visit passed, in tumbling over the articles, and eager inquiries about prices and fashions. Mr Milne was all civility, though he knew well that no purchases were in view. At last, after gratifying themselves with the sight of every piece of finery worth seeing, they took their leave. "We are much obliged by your attention, Mr Milne." "Well, ladies," replied Milne, "may I now wish you a pleasant walk to the—Meadows."

THE PRECIOUS CAT.

A citizen of Bordeaux, by his will, ordered a fine horse he had to be sold, and the price given to some religious house. It so happened that all the rest of his effects were barely sufficient to pay his debts, and his widow and some children remained to be provided for. The monks appearing to claim the value of the horse, the widow desired her servant to take it to the market, at the same time directing him how to manage matters. This animal being of an uncommonly good appearance, it was not long before his price was asked. The servant answered, just a pistol. The intending purchaser was astonished at such a low price, and thought the seller was in jest. "Nay," says the latter, "I have brought a little cat which you must buy also, otherwise you cannot get the horse, and its price is no less than 300 pistoles." The money was accordingly paid without scruple, and the priests outwitted.

THE LETTER WRITER, READER, AND CARRIER.

In former times, when reading and writing were more uncommon accomplishments, even in Scotland, than they are at present; a certain person made it his business to travel from one large town to another with packets of letters, which were all of his own writing. Having a general acquaintance among the lower ranks, he offered his services when they had any communications to make to their friends at a distance. After getting his instructions, he proceeded to write their letters himself, and when a sufficient number were collected, he set off on foot with his bundle of intelligence. Having reached his place of destination, he waited upon those to whom his letters were directed, read them over, and solicited their answer. For all this trouble, no doubt, some small compensation was allowed him.

THE INCONSISTENT ADVERTISEMENT.

Two haberdashers in Edinburgh, of the name of A., happened to advertise in the same newspaper. The one of these, Mr D. A., was just opening shop, and, of course, in the usual style, meant to announce to his friends and the public that he had for sale an assortment of quite new and elegant articles. The other advertisement, however, by Mr W. A., was quite of an opposite description; meaning to give up business, he was offering his goods at very reduced prices. After both advertisements were sent to the printing-office, Mr W. A. thought of adding a short

paragraph, notifying that "he was ready to treat with any person willing to purchase his whole stock at so much per cent. below invoice prices, also for his counters, shelves, fixtures, &c." This supplement, in a note addressed to the printer, he requested might be annexed to Mr A.'s advertisement. It was annexed, indeed, to Mr A.'s advertisement, but it proved to be the wrong Mr A. For Mr D. A. no sooner got hold of the paper, than he found he was made a laughing-stock to his friends by the ludicrous effect of the printer's mistake; the first part of his advertisement implying that he was just commencing business, and the latter part that he was ready to dispose of every thing below cost, and even of his shelves and fixtures.

A SUBTERFUGE.

Two chimney-sweeps, coming along a bridge near Manchester, where a toll was levied on foot passengers, found, upon searching their pockets, that their joint stock amounted only to a halfpenny. The one not wishing to leave the other behind, it was agreed to toss up the halfpenny; and the winner, thrusting the loser into his soot-bag, and laying it over his shoulder, passed through the toll-bar, without any additional charge.

A SERIOUS MISTAKE.

Near some little town in North America, a carrier's horse happened to drop down dead. His owner immediately proceeded to the town in quest of a farrier to skin the animal. Not long after, another horse, in a farmer's cart, dropped down also near the same place; the driver, however, being sensible the horse was only in a swoon, went to get some oats in his hat by way of medicine. No sooner had he left his charge than the farrier made his appearance, and, mistaking the living horse for the dead one—as indeed there was very little difference in their appearance—proceeded to the operation of flaying. After making considerable progress, the animal began to revive, and, at the same time, the driver returned with the oats. The consternation of all parties may be easily conceived; but how the matter ended, the American paper, from which this occurrence is copied, does not say.

THE HORNED HORSE.

In Scotland, the male-servant of a country clergyman, known by the name of "the Minister's Man," used to be a person of some importance. One of these having rather an economical mistress, who grumbled particularly the expense of candle light, John contrived at least to make his master sensible of the inconvenience of darkness. It happened one night that the minister, being sent for in a hurry by one of his parishioners, who was taken ill, John thought proper to saddle the cow instead of the horse. After proceeding a little way, the minister turned back, and called out rather angrily, that the horse had got horns. "If there has been a mistake made," answered John, "the mistress must be responsible, as she chooses to send me to the stable always in the dark."

MUSICAL EPITAPH.

At Paris, in 1764, the premature decease of a young nobleman, ascribed to his violent attachment to Mademoiselle Miré, a public singer of a most abandoned character, gave rise to a witty epitaph on him, composed of five musical notes—

mî re la mî la
Miré l'a mî la.—Miré has laid him there.

MILITARY PRECISION.

When the soldiers were employed at the military roads in Scotland, it was remarked that they were so very exact in keeping the time for leaving off work, that one was observed, who had a spadeful of earth lifted from the ground, to let it fall again the instant he heard the first sound of the bell, though it would hardly have cost him any more labour to put it into his wheelbarrow, which was close beside him.

SECRECY CARRIED TOO FAR.

The Count de V—, Prime Minister to the King of Sardinia, affected mystery so much in all his transactions, both public and private, that, happening to hurt both his legs very severely, he employed a surgeon for each limb, while each was kept ignorant that the other was employed. The treatment, therefore, adopted by the medical men, and the nature of the drugs they administered, being quite inconsistent and contradictory, the consequences proved fatal to the Minister.

COMPARATIVE IMPORTANCE OF A MOTHER AND A COW.

"Weel, Sandy," said a neighbour to a little boy in the south of Fife, whose mother had been seriously indisposed, "how is your mother to-day?" "Deed I dinna ken very weel hoo she is," replied Sandy, scratching his head; "but the cow's taen ill, and that's war nor my mither."

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Junr. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Work.

AUTHOR OF "TRADITIONS OF EDINBURGH," "SCOTTISH BIOGRAPHICAL DICTIONARY," &c.

No. 51.

SATURDAY, JANUARY 19, 1833.

PRICE THREE HALFPENCE.

ENGLISH AND SCOTCH HOUSE-BUILDING.

THE English build their houses of brick, and the Scotch of stone. These peculiarities of taste and habit are so strongly associated with the character of the two nations, that they may be frequently observed wherever the English and Scotch are planted, especially in foreign countries. When a Scotchman crosses the Border, at almost any point, he wonders how the people come to have such a predominating taste for brick. Every house he sees seems to be built with no other material, and all the towns and villages he travels through seem but piles of so many brick-kilns set in rows. As he proceeds, he gets accustomed to this, as it appears to him, very strange fancy; but he always feels a certain degree of pity for those who are doomed to inhabit houses with walls so very thin, and so little able to keep out the cold. When an Englishman, in the same manner, enters Scotland, he is apt to be as much surprised at finding that the houses are all reared of solid stone, like so many castles or public edifices; and he is led to imagine that the Scotch are really an extravagant people, in building their dwellings with a material so dear and difficult to be wrought. When the Scotch settle in England, they generally conform to the fashion of brick houses; but an Englishman, on emigrating northward, will try, if possible, to resist the national custom, and erect his cottage with his dearly beloved brick. These contrary tastes are very observable in Ireland; the English in the south—in Dublin for instance—adhering staunchly to brick, and the Scotch in the north sticking to the stone, which is so characteristic of their country.

Some persons might be led to suppose that these diversities of taste in the architecture of dwelling-houses are the result of necessity; but they are by no means entirely so. In many parts of England which are covered with brick houses, the district abounds in excellent stone; while in Scotland, in places where clay is plentiful and stone is scarce, the latter material is transported by land carriage, at a heavy charge, in preference to brick, which could be easily and cheaply made. In erecting a brick house, the Englishman makes a point of consulting his own comfort and that of his family. He rears his dwelling with every imaginable convenience; sections it off into neat snug apartments, almost calculating where his own easy chair is to stand by the fire-side; surrounds the house with a pretty kitchen and flower-garden; encloses the whole with a smart green railing; and finishes his goodly work by attaching to the wicket a clear-burnished fanciful brass knocker. Now, the Scotchman's taste runs in an entirely different channel. He sets about his work by going through certain toilsome preliminaries, which are considered of paramount importance. His first object of search is a quarry whence he may have his stones dug, and transported to the spot where they are to be used; his second point of inquiry, is for a place to which he may convey the rubbish excavated from the foundation. When he has satisfied himself in these particulars, he commences operations on a scale of wonderful magnitude. He begins with the erection of a wooden house, something resembling the log-hut of a back-woodsman, which he plants immediately in front of the proposed edifice, as if preparing to besiege a fortress in regular form. The erection of this wooden house, technically called a *shed*, can, on no account, be dispensed with. In it he congregates half-a-dozen stone-masons, who there dress the blocks previous to their being used; but this preliminary erection occasionally stands long after the house is actually finished, and appears as if it were reckoned an ornament to the street. The

Englishman erects and finishes his house within the period of a month or two; but the Scotchman keeps working at his for the best part of a whole year, generally contriving to commence his labours with the first appearance of fine weather at the close of winter, so as to make sure of having the roof on and the walls plastered before Christmas. The Englishman erects his house for the comfort of those who are immediately to inhabit it; but the Scotchman invariably calculates on its uses to his posterity, or how "the property" will serve as a legacy to his descendants. He appears to take a delight in building for future ages; and, in order to make up a good rent-roll for his grandson, he will put himself to great inconveniences. The Englishman builds his house because he has two or three hundred pounds to spare, and thinks it could not be better laid out than on a dwelling for his family; and he builds a house accordingly, suitable to the capital he has at his command. It happens, however, that the Scotchman very seldom contents himself in this manner. His desire to be the *laird* of a large edifice, often impels him to go much beyond his means, and, by borrowing the deficiency, entails a comfortable debt on the premises, which his sons or his creditors have the pleasure of liquidating. So frequently, indeed, is this the result of such speculations, that it is a common enough expression, in explaining how a particular individual became a *victim*, to say "that he never rested till he built himself out of a house;" in other words, he did not desist till he had spent all his means, exhausted his credit, lost his property, and become a ruined man.

These different processes of house-building are partly the result of the English and Scotch modes of letting land for long periods. In England, it is the common practice to take leases of ground for building for a period of ninety-nine years, or perhaps less, and for this piece of ground a certain rent is charged annually, with the arrangement that the houses on the property shall fall into the hands of the lord of the manor at the expiry of the lease; and hence, in a great measure, the plan of building houses which will not last in good repair for more than a hundred years. The Scotch, being in every respect a more calculating people, despise the prospect of only a hundred years' possession—"what! some day to be turned out of our own house!" They, therefore, take leases of ground which shall endure till the end of the world, and think themselves very badly off, indeed, when they are restricted to the brief period of nine hundred and ninety-nine years! These perpetual leases they term *feus*, an expression importing that the lessee becomes *feudal* vassal of the ground landlord. "*Ground to Feu*," is therefore to be found on hundreds of sign-boards north of the Tweed, and to English visitants appears quite an incomprehensible announcement. In Edinburgh and its vicinity, the annual feu-duty is enormous, amounting sometimes to a charge of a guinea for every foot of ground in front; and this has to be paid as a chief rent for ever, under the penalty of loss of the property.

One good result from this peculiar conduct on the part of the Scotch: it tends to encourage a superior kind of architectural designs, and greatly improves the general aspect of the country. There can be no proper comparison of the beauty of stone and brick, and the Scotch act very wisely in building stone houses, if they can afford the cost; but the general exercise of this refined taste has an injurious effect on society, and is spoiling the large towns in the north. It limits the proprietary to a mere unit; raises up a body of large capitalists over the people, who are reduced to the character of yearly tenants; and prolongs

the very absurd custom of dividing houses into separate dwellings on the different floors. For example, there are few merchants, tradesmen, or shopkeepers in the large towns in Scotland, who live in what is termed self-contained houses; for the simple reason, that they cannot afford to build, or even rent a complete stone mansion. Yet they can frequently purchase a *flat*; that is, a house up two, three, or four stairs; whereas, for the sum they thus expend for a confined lodging, they could erect a sufficient brick house from top to bottom, calculated to last during the whole period of their own lives, and those of their immediate descendants. But the prejudices of society forbid that any such course should be pursued. "No, no; do not tell me of your shabby brick houses; give me a *good flat* in a respectable part of the town, where we have no trouble with area doors, or are bothered to keep the roof in order, and I will leave those to go to self-contained houses that like them better, or are silly enough to pay for them."

POPULAR INFORMATION ON HISTORY.

THE ROMANS.

The Monarchy and Republic.

THE Romans were distinguished above all other people in ancient times, for the extraordinary power of their government, the extent of their conquests, and their refinement in manners. The Jews have been remarkable for their antiquity, and the nature of their religion; the Egyptians for their knowledge of the arts, and the invention of letters; the Greeks for their philosophy and poetry; but the Romans have been celebrated for their courage as soldiers, their ability as lawyers, historians, and orators; the stupendous character of their works; the beauty of their language, which was what is now called Latin;* and, in particular, for the influence which they have had on the usages of most modern nations.

This remarkable people traced their origin to a handful of freebooters, who settled on a certain spot in their native country, Italy, and there laid the foundation of a city, which they called *ROME*, after the name of their leader, Romulus. This incident is said to have occurred 3252 years after the beginning of the world, or 752 years before the coming of Christ. The city, we are told, was at first almost square, containing about a thousand houses. It was near a mile in compass, and commanded a small territory round it, of about eight miles square. The first method made use of to increase the number of its inhabitants, was the opening a sanctuary for all malefactors, slaves, and such as were desirous of novelty. Some time afterwards, as historians mention, the young men of the city carried off by violence a great number of young women, the daughters of the Sabines, a neighbouring people, and thus procured themselves wives. The government of the Romans was constituted on exceedingly liberal principles. At first, it consisted of a king, who was elective; a senate, which was to act as councillors to the king, and which was composed of a hundred of the principal citizens, men whose age, wisdom, or valour, gave them a natural authority over their fellow-subjects: these senators were called patricians (from *pater*, a Latin word, signifying a father), and bore an analogy to our nobility; the third part of the legislature consisted of the plebeians (from *plebs*, a word signifying people), and these were the whole mass of the community. The plebeians did not appoint representatives, as in modern times; they met in large assemblies in a vast amphitheatre or

* The Latins, from whom this language took its name, were an obscure people in Italy, adjacent to the Romans.

forum, and there deliberated on the affairs of the state, approved or disapproved of measures of peace or war, and chose their own magistrates. It was chiefly by this open mode of discussion that the Romans attained that proficiency in oratory which distinguished them. Little is precisely known of the form of worship of the Romans; the greatest part of their religion consisted in a firm reliance upon the credit of soothsayers, who pretended, from observations on the flight of birds and the entrails of newly-killed beasts, to direct the present, and dive into futurity. They deified deceased warriors, and held in adoration and sacrificed to a multiplicity of imaginary gods; but though thus absolute heathens, they had the singular liberality never to interfere with the religion of the nations they conquered; and, as an instance of this, it will be remembered that it was with extreme repugnance they countenanced the crucifixion of Christ, at the instance of the Jews.

The Roman government continued in the form we have described it, for the space of 245 years from the founding of the city, during which period it numbered seven kings. The last of these sovereigns was named Tarquin, who, being of a tyrannical disposition, was chased with his family from Rome, principally by the intrepidity of a noble Roman, called Brutus. Few histories can show a succession of kings replete with more virtue and moderation than those who first governed in Rome. It was from their wise institutions that the people seemed to acquire all that courage and patriotism which afterwards enabled them to conquer the world. The regal power being overthrown, the senate acquired a greater share of authority, and the liberty of the people was, on the whole, very little increased by the change. Instead of a king, the people now chose two annual magistrates, whom they called *Consuls*, with power equal to that of the regal, and with the same privileges, and the same ensigns of authority. The government was now designated a republic or commonwealth. Brutus, who was styled the deliverer of his country, was elected one of the two first consuls. Beneficial as the consular system was, it was found, about ten years after its institution, to be rather impotent in cases of exigency; and, therefore, the people strengthened it by the creation of a temporary magistrate, styled a *Dictator*, to whom they gave uncontrolled power, not only over all ranks of the state, but even over the laws themselves. Some time afterwards, the people felt themselves to be in continual danger from the power of the senate; and to remedy this defect in the constitution, they created certain new officers from among themselves, with power to give redress to such of them as should be injured, and to plead the cause of the community. These functionaries were called *Tribunes of the People*.^{*} At first they were five in number, though afterwards their body was increased to ten. They were always annually elected by the people. They had the power of annulling all such decrees of the senate as they considered to press hard upon the people; and to show their readiness to protect the meanest, their doors stood open night and day to receive their complaints. They examined every decree, and, by saying the word *Veto*, or, *I forbid*, they could hinder it from being passed. The institution of these officers was not by any means perfect, for there were means of neutralizing their power; but the circumstance shows how the authority of the people increased, and threatened to subvert the exorbitant power of the senate. One of the earliest triumphs of the populace was their successful prosecution and exile of Coriolanus, a distinguished general whose part had been taken by the patricians.

For sixty years from the demise of the regal power, the commonwealth continued to fluctuate between the authority of dictators, consuls, senators, and tribunes, till at length the people were weary of the whole. They began to accuse the tribunes, in particular, of being, when it suited them, greater tyrants than the senators, and they now expressed a wish to be guided by a written body of laws, which, when known, might prevent wrongs as well as punish them. It was therefore agreed, that ambassadors should be sent to the Greek cities in Italy, and to Athens, to bring home such laws from thence, as, by experience, had been found most equitable and useful. This being done, it was next agreed that the whole of the rulers and magistrates should cease to exercise their authority, and that, till the laws were digested, the powers of the state should be entirely wielded by ten senators elected for the purpose. These new magistrates were called *Decemviri* (from *decem*, the Latin word for ten, and *viri*, men); and though they were only to rule for a certain period, it happened that they were not easily got quit of, after they had once tasted the pleasures of arbitrary authority. One of them, named Appius, was noted for his licentiousness and cruelty, as has been commemorated by the affecting tale of Virginia, and her father Virginius, a centurion. The decemvirate lasted only two years, when its members were expelled by violence; and the consular or republican government was resumed under certain modifications, and occasionally dictators had to be called in to settle the commotions of the state. To lighten the duty of the tribunes, new officers were created, under the name of *Censors*, who were to be chosen every fifth year;

their business was to take an estimate of the number and estates of the people, and to distribute them into their proper classes; to inspect the lives and manners of their fellow citizens; to degrade senators for misconduct; to dismount knights; and to turn down plebeians from one caste or tribe into another, in case of misdemeanour. The Roman army was also put under the command of officers called military tribunes.

The Roman government continued to be republican in its nature for about three hundred years after these arrangements had been made, or upwards of six hundred years from the date of the foundation of the city; and throughout this lengthened period, its history presents us with a continuous recital of internal dissensions among the people, and a struggle for power among the senators, tribunes, and other functionaries. Yet the progress of the state does not seem to have ever been impeded by these civil broils; it was only when at peace that the people broke out into factions; and the quarrels among the citizens never prevented the whole from coalescing to chastise invaders, or to push the conquests of the army to their utmost limits. During the consulates, the influence of Rome was gradually extended over a number of small states in the neighbourhood, no one of which was sufficiently strong to oppose it singly, and which had too little confidence in each other to unite for their mutual defence. The means by which the Romans gained their ascendancy, was chiefly the rigid discipline of their troops: there is no other nation mentioned in history whose military subordination was enforced so systematically, or so religiously complied with. The chief men of the state, being always accustomed to find their army obedient and successful, had the greatest confidence in its firmness, and never lost hope even under the most desperate circumstances. This persevering resolution of the Roman government was therefore one of the chief springs of its greatness.

The Roman army was constituted with great military skill. When in its most perfect state, it consisted of infantry and cavalry. The heavy armed infantry, which was its principal strength, was divided into ten cohorts, and fifty-five companies, under the orders of a corresponding number of tribunes and centurions. The first cohort, which always claimed the post of honour, and the custody of the eagle, was formed of eleven hundred and five soldiers, the most approved for valour and fidelity. The remaining nine cohorts consisted each of five hundred and fifty-five; and the whole body of the legion amounted to 6100 men. Their arms were uniform, and admirably adapted to the nature of their service: an open helmet, with a lofty crest; a breast-plate, or coat of mail; greaves on their legs; and an ample buckler on the left arm. Besides a lighter spear, the legionary soldier grasped in his right hand a formidable javelin, which he threw at his foe at the distance of ten or twelve paces. As soon as it was darted, he drew his sword, and rushed forwards to close with the enemy. His sword was a short well-tempered Spanish blade, that carried a double edge, and was alike suited to the purpose of striking or pushing. It was by this short sword, which was little more than double the length of our modern table knives, that the Romans conquered the world. The legion was usually drawn up eight deep, and the regular distance of three feet was left between the files, as well as ranks. The legions entrenched themselves in a camp in regular form every night while out on duty, and the remains of these square earthen ramparts are still observable in Britain, and most other countries they visited.

Having, by their consummate military skill, destroyed all rival pretensions in Italy, and gained a great victory over the Greeks, under the command of Pyrrhus (274 years before Christ), the reputation of the Romans was spread abroad, and they were inspired with an ambition to make conquests beyond the seas which envied their native country. Their principal rivals in power at this period were the Carthaginians, the people of Carthage, a city in Africa, on the south shore of the Mediterranean, near the place where Tunis now stands. This nation had extended its dominions along the coasts, and was in possession also of many of the principal islands in the Mediterranean Sea. But its chief strength lay in its fleets and commerce; by these its riches were become immense; and by money alone, it was enabled to hire and send forth armies to conquer, or to keep the neighbouring states in subjection. Having picked a quarrel with the Carthaginians, the Romans proclaimed war against them. This has been called by historians the First Punic War, and marks an era in the annals of the Romans. Another war ensued betwixt the same powers, called the Second Punic War; and in this the celebrated Hannibal acted as the general of the Carthaginians, and with an immense army invaded Italy, by advancing through Spain and crossing the Alps. In the encounter which ensued, the Romans were vanquished with great slaughter; but they were victorious in subsequent battles; and, by a Third Punic War, they completely subdued the Carthaginians. Carthage, their city, was demolished to the ground, so that travellers are now unable to say where it stood. The other towns of Africa became tributary to Rome; the people were carried off into slavery; and thus an end was put to one of the most opulent cities in ancient times. The Romans pursued their conquests into Greece, which they at last occupied (168 years before Christ); seized the island of Sicily;

established their dominion in Spain and Dalmatia (from 146 to 110); defeated Mithridates, and took possession of the whole of Asia Minor, Syria, and the Holy Land (66); conquered France, then named Gaul; and extended their dominions to Britain on the north, and Egypt on the south, comprehending almost all that was known of the world, and a great deal more than what was civilized. This terminated the conquests of the Republic, in which, latterly, Julius Cæsar acted a most conspicuous part.

One of the most important events in the civil history of Rome, during the republic, was what has been termed the sedition of the Gracchi. As this event is often noticed in modern writings, it is necessary to allude to it. After the destruction of Carthage, the Romans began to degenerate from their ancient modesty, plainness, and severity of life. The triumphs and the spoils of the countries they had conquered brought in a taste for splendid expense, and these produced avarice and inverted ambition. The poorer part of the citizens were oppressed by the rich, who, by wresting the laws, of which they had the management, in their own favour, seized upon all the property, and left the poor only the danger and fatigue of defending it. As for the senate, it was unjust, corrupt, and mercenary, and was only intent on covering its meanness by the dignity of foreign conquests. This was the state of parties, when Tiberius Gracchus (about 130 years before Christ) procured himself to be chosen tribune of the people. This noble-hearted Roman immediately set about avenging the cause of the poor and the oppressed. He endeavoured to put an ancient law in force, which was to the effect that no person should possess above five hundred acres of land, the remainder to be divided among the people. He also attempted other measures for restoring the balance of wealth in the state, and, therefore, met with the deadliest enmity of the senate and the richer part of the community. It was pretended that he wanted to become sovereign of Rome; a tumult was raised in the forum when he tried to make himself heard, in a speech defending the interests of the poor; and, in attempting to save his life, he was killed by the blow of a piece of one of the benches. The cause of the people was now taken up by his brother, Caius Gracchus. This equally great-minded man was more fortunate than his brother in punishing oppression; he extended the privileges of Roman citizenship; protected the people from monopolists, by fixing the standard price of corn, and procured a monthly distribution of it among the populace; he also convicted the senate of bribery, extortion, and the sale of offices; for at that time a total degeneracy appeared to have taken place. Caius Gracchus, by his wisdom, justice, and activity, was thus seemingly born to restore the ancient simplicity of Rome. But his career was soon cut short. The senate and the wealthy classes easily found means to raise up a clamour against him. Like his brother, he had to flee for his life through the streets of the city; a reward was offered for his head to the amount of its weight in gold; and being hotly pursued by a crowd of wretches, he prevailed on a slave who accompanied him to put him to death. The pursuers soon coming up, cut off his head; and one of them having taken it home, secretly took out the brain, filled it with lead in order to make it weigh heavier, and thus received 17 pounds of gold as his recompense. Thus ended what has most improperly been styled the *sedition of the Gracchi*. The poor now became reduced to a hopeless subjection; every species of corruption crept into the management of the state; and a perpetual dictatorship was speedily instituted, which was the first decisive step towards the ruin of the commonwealth.

A history of the decline and fall of the Roman empire will form the subject of another paper.

LELIA,

AN ITALIAN TALE.

THE Valley of Anzasca, in the north of Italy, has been for many centuries known for its gold mines, and is inhabited by *minerali*, or those whose occupation it is to look for the ore, and by farmers, who form two distinct classes. The occupation of the former, when pursued as a profession, is reckoned disreputable by the other inhabitants, who obtain their living by regular industry; and indeed the manners of the minerali offer some excuse for what might otherwise be reckoned an illiberal prejudice. They are addicted to drinking, quarrelsomeness, overbearing—at one moment rich, and at another starving; and, in short, they are subject to all the calamities, both moral and physical, which beset men who can have no dependence on the product of their labour.

They are, notwithstanding, a fine race of men—brave, hardy, and often handsome. They spend freely what they win lightly; and if one day they sleep off their hunger, lying like wild animals basking in the sun, the next, if fortune has been propitious, they swagger about, gallant and gay, the lords of the valley.

Francesco Martelli was the handsomest gold-seeker in the valley. He was wild, it is true, but that was the badge of his tribe; and he made up for this by so many good qualities, that the farmers themselves—at least such of them as had not marriageable daughters—delighted in his company. Francesco could sing ballads so sweetly and mournfully, that the old dames

^{*} The word *tribune* signifies a particular kind of seat or bench, and was applied to the functionaries who sat thereon, in the same manner as we now apply the title of the *bench* to the judges in a court of justice.

leant back in the chimney-corner to weep while he sung. He had that deep and melancholy voice which, when once heard, lingers in the ear, and when heard again, however unexpectedly, seems like a longing realized.

There was only one young lass in the valley who had never heard the songs of Francesco. All the others, seen or unseen, on some pretext or other, had gratified their curiosity. The exception was Lelia, the daughter of one of the richest farmers in Anzasca. Lelia was very young, being scarcely sixteen; but in her quality of an only daughter, with a dowry in expectancy equal to more than one thousand Austrian liras (the Austrian lira is equal to about eightpence halfpenny English), she attracted considerable observation. Her face, on minute inspection, was beautiful to absolute perfection; but her figure, although symmetrical, was so *petite*, and her manner so shy and girlish, that she was thought of more as a child than a young woman.

Her mother had died in giving her birth; and for many a year the life of the child had been preserved, or rather her death prevented, by what seemed a miracle. Even after the disease, whatever it might have been, had yielded to the sleepless care of her father, she remained in that state which is described in the expression "not unwell" rather than in perfect health; although the most troublesome mementos that remained of her illness was nothing more than a nervous timidity, which, in a more civilized part of the country, might have passed for delicacy of feeling.

While her body languished, the cultivation of her mind had advanced. Music, to which she was passionately attached, paved the way for poetry; and poetry unfitted her for association with the ignorant and unrefined. That Lelia, therefore, had never sought to hear the ballads of Francesco, was occasioned, it may readily be believed, by nothing more than an instinctive terror, mingled with the dislike with which the name of one of the ruffian miners inspired her.

There came one at last, however, to whom poor Lelia listened. She was sitting alone, according to her usual custom, at the bottom of her father's garden, singing, while she plied her knitting-needle, in the soft, low tone peculiar to her voice, and beyond which it had no compass. The only fence of the garden at this place was a belt of shrubs, which enriched the border of the deep ravine it overlooked. At the bottom of this ravine flowed the river, rapid and yet sullen; and beyond, scarcely distant two hundred yards, a range of precipitous cliffs shut in the horizon.

Her voice was rarely loud enough to be caught by the echoes of the opposite rocks; although sometimes it did happen that, carried away by enthusiasm, she produced a tone which was repeated by the fairy minstrels of the glen. On the present occasion, she listened with surprise to a similar effect, for her voice had died almost to a whisper. She sang another stanza in a louder key. The challenge was accepted; and a rich, sweet voice took up the strain of her favourite ballad where she had dropped it. Lelia's first impulse was to fly; her second, to sit still and watch for a renewal of the music; and her third, which she obeyed, to steal on tiptoe to the edge of the ravine, and look down into the abyss, from whence the voice seemed to proceed. The echo, she discovered, was a young man, engaged in navigating a raft down the river—such as is used by the peasantry of the Alps to float themselves and their wares to market, and which at this moment was stranded on the shore, at the foot of the garden. He leant upon an oar, as if in the act of pushing off his clumsy boat; but his face was upturned, like one watching for the appearance of a star; and Lelia felt a sudden conviction, she knew not why, that he had seen her through the trees while she sat singing, and had adopted this method of attracting her attention without alarming her. If such had been his purpose, he seemed to have no ulterior view; for, after gazing for an instant, he withdrew his eyes in confusion, and, pushing off the raft, dropped rapidly down the river, and was soon out of sight.

Lelia's life was as calm as a sleeping lake, which a cloud will blacken, and the wing of an insect disturb. Even this little incident was matter for thought, and entered into the soft reveries of sixteen.

It was a week before she again saw this Apollo of her girlish imagination. It seemed as if in the interval they had had time to get acquainted! They exchanged salutations—the next time they spoke—and the next time they conversed. There was nothing mysterious in their communications. He was probably a farmer's son of the upper valley, who had been attracted, like others, by the fame of the heiress of old Niccoli.

The world, before so monotonous, so blank, so drear, was now a heaven to poor Lelia. One thing only perplexed her: they were sufficiently long—according to the calculations of sixteen—and sufficiently well acquainted; their sentiments had been avowed without disguise; their faith plighted beyond recall: and as yet her lover had never mentioned his name! Lelia, reflecting on this circumstance, condemned, for the moment, her precipitation; but there was now no help for it, and she could only resolve to extort the secret, if secret it was, at the next meeting.

"My name!" said the lover, in reply to her frank and sudden question; "you will know it soon enough." "But I will not be said nay. You must tell me now—or at all events, to-morrow night."

"Why to-morrow night?" "Because a young rich suitor, on whom my father's heart is set, is then to propose, in proper form, for this poor hand; and let the confession cost what it may, I will not overthrow the dearest plans of my only parent without giving a reason which will satisfy even him. Oh, you do not know him! Wealth weighs as nothing in the scale against his daughter's happiness. You may be poor for aught I know; but you are good, and honourable, and, therefore, in his eyes, no unfitting match for Lelia." It was almost dark; but Lelia thought she perceived a smile on her lover's face while she spoke, and a gay suspicion flashed through her mind, which made her heart beat, and her cheeks tingle. He did not answer for many minutes; a struggle of some kind seemed to agitate him; but at length, in a suppressed voice, he said—"To-morrow night, then." "Here?" "No, in your father's house; in the presence of—my rival."

The morrow night arrived; and, with a ceremonious formality practised on such occasions in the valley, the lover of whom Lelia had spoken was presented to his mistress, to ask permission to pay his addresses; or, in other words—for there is but short shrift for an Anzascan maid—to demand her hand in marriage. This was indeed a match on which old Niccoli had set his heart; for the offer was by far the best that could have been found from the Val d'Ossola to Monte Rosa. The youth was rich, well-looking, and prudent even to coldness:—What more could a father desire?

Lelia had put off the minute of appearing in the porch, where the elders of both families had assembled, as long as possible. While mechanically arranging her dress, she continued to gaze out of the lattice, which commanded a view of the road and of the parties below, in expectation that increased to agony. Bitter were her reflections during that interval! She was almost tempted to believe that what had passed was nothing more than a dream—a figment of her imagination, disordered by poetry and solitude, and perhaps in some measure warped by disease. Had she been made the sport of an idle moment?—and was the smile she had observed on her lover's face only the herald of the laugh which perhaps at this moment testified his enjoyment of her perplexity and disappointment! His conduct presented itself in the double light of folly and ingratitude: and at length, in obedience to the repeated summons of her father, she descended to the porch with a trembling step and a fevered cheek.

The sight of the company that awaited her awed and depressed her. She shrank from them with more than morbid timidity; while their stony eyes, fixed upon her in all the rigidity of form and transmitted custom, seemed to freeze her very heart. There was one there, however, whose ideas of "propriety," strict as they were, could never prevent his eyes from glistening, and his arms from extending, at the approach of Lelia. Her father, after holding her for a moment at arm's length, as with a doating look his eyes wandered over the bravery of her new white dress, drew her close to his bosom, and blessed her. "My child," said he, smiling gaily through a gathering tear, "it is hard for an old man to think of parting with all he loves in the world: but the laws of nature must be respected. Young men will love, and young lasses will like, to the end of time; and new families will spring up out of their union. It is the way, girl—it is the fate of maids, and there's an end. For sixteen years have I watched over you, even like a miser watching his gold; and now, treasure of my life, I give you away! All I ask, on your part, is obedience—ay, and cheerful obedience—after the manner of our ancestors, and according to the laws of God."

Lelia fell on her father's neck, and sobbed aloud. So long and bitter was her sobbing, that the formality of the party was broken, and the circle narrowed anxiously around her. When at last she raised her head, it was seen that her cheeks were dry, and her face as white as the marble of Cordaglia.

A murmur of compassion ran through the bystanders, and the words "poor thing—still so delicate!—old hysterics!" were whisperingly repeated from one to the other. The father was alarmed, and hastened to cut short a ceremony which seemed so appalling to the nervous timidity of his daughter. "It is enough," said he; "all will be over in a moment. Lelia, do you accept of this young man for your suitor?—come, one little word, and it is done." Lelia tried in vain to speak, and she bowed her acquiescence. "Sirs," continued Niccoli, "my daughter accepts of the suitor you offer. It is enough; salute your mistress, my son, and let us go in, and pass round the cup of alliance." "The maiden hath not answered," observed a cold cautious voice among the relations of the suitor. "Speak, then," said Niccoli, casting an angry and disdainful look at the formalist; "it is but a word—a sound. Speak!" Lelia's dry, white lips had unclosed to obey, when the gate of the little court was wrenched open by one who was apparently too much in haste to find the latch, and a man rushed into the midst of the circle. "Speak not!" he shouted; "I forbid!" Lelia sprang towards him with a stifled cry, and would have thrown herself into his arms, had she not been suddenly caught midway by her father. "What is this?" demanded he sternly, but in rising alarm; "ruffian—drunkard—madman!—what would you here?" "You cannot provoke me, Niccoli," said the intruder, "were you to spit upon me! I come to demand your daughter

in marriage." "You!" shouted the enraged father. "You!" repeated the relations, in tones of wonder, scorn, rage, or ridicule, according to the temperament of the individual. "There needeth no more of this," said the same cold, cautious voice that had spoken before; "a wedding begun in a brawl will never end in a bedding. To demand a girl in legitimate marriage is neither sin nor shame; let the young man be answered even by the maiden herself, and then depart in peace." "He hath spoken well," said the more cautious among the old men; "speak, daughter; answer, and let the man be gone!" Lelia grew pale, and then red. She made a step forward—hesitated—looked at her father timidly—and then stood as still as a statue, pressing her clasped hands upon her bosom, as if to silence the throbbings that disturbed her reason. "Girl," said old Niccoli, in a voice of suppressed passion, as he seized her by the arm, "do you know that man?—did you ever see him before? Answer, can you tell me his name?" "No!" "No!—the insolent ruffian! Go, girl, present your cheek to your future husband, that the customs of our ancestors may be fulfilled, and leave me to clear my doorway of vagabonds!" She stepped forward mechanically; but when the legitimate suitor, extending his arms, ran forward to meet her, she eluded him with a sudden shriek, and staggered towards the intruder. "Hold—hold!" cried the relations; "you are mad—you know not what you do—it is Francesco, the mineralo!" She had reached the stranger, who did not move from where he stood; and, as the ill-omened name met her ear, she fainted in his arms.

The confusion that ensued was indescribable. Lelia was carried senseless into the house; and it required the efforts of half the party to hold back her father, who would have grappled with the mineralo upon the spot. Francesco stood for some time with folded arms, in mournful and moody silence; but when at length the voice of cursing, which Niccoli continued to pour forth against him, had sunk in exhaustion, he advanced and confronted him. "I can bear those names," said he, "from you. Some of them, you know well, are undeserved; and if others fit, it is more my misfortune than my fault. If to chastise insults, and render back scorn for scorn, is to be a ruffian, I am one; but no man can be called a vagabond who resides in the habitation and follows the trade of his ancestors. These things, however, are trifles—at best they are only words. Your real objection to me is that I am poor. It is a strong one. If I chose to take your daughter without a dowry, I would take her in spite of you all; but I will leave her—even to that thing without a soul—rather than subject so gentle and fragile a being to the privations and vicissitudes of a life like mine. I demand, therefore, not simply your daughter, but a dowry, if only a small one; and you have the right to require that on my part I shall not be empty-handed. She is young, and there can be, and ought to be, no hurry with her marriage: but give me only a year—a single year; name a reasonable sum; and if, by the appointed time, I cannot tell the money into your hand, I hereby engage to relinquish every claim, which her generous preference has given me, upon your daughter's hand." "It is well put," replied the cold and cautious voice in the assembly. "A year, at any rate, would have elapsed between the present betrothing and the damsel's marriage. If the young man, before the bells of twelve, on this night twelvemonth, layeth down upon the table, either in coined money, or in gold, or golden ore, the same sum which we were here ready to guarantee on the part of my grandson, why I, for one, shall not object to the maiden's whim—*provided it continues so long*—being consulted in the disposal of her hand, in preference to her father's judgment and desires. The sum is only three thousand liras!" A laugh of scorn and derision arose among the relations. "Yes, yes," said they, "it is but just. Let the mineralo produce three thousand liras, and he shall have his bride. Neighbour Niccoli, it is a fair proposal; allow us to intercede for Francesco, and beg your assent!" "Sirs," said Francesco, in perplexity mingled with anger, "the sum of three thousand liras!"—He was interrupted by another forced laugh of derision. "It is a fair proposal," repeated the relations; "agree, neighbour Niccoli, agree!" "I agree," said Niccoli disdainfully. "It is agreed!" replied Francesco, in a burst of haughty indignation; and with a swelling heart he withdrew.

A very remarkable change appeared to take place from that moment in the character and habits of the mineralo. He not only deserted the company of his riotous associates, but even that of the few respectable persons to whose houses he had obtained admission, either by his talents for singing, or the comparative propriety of his conduct. Day after day he laboured in his precarious avocation. The changes of the seasons were not now admitted as excuses. The storm did not drive him to the wine-shed, and the rain did not confine him to his hut. Day after day, and often night after night, he was to be found in the field—on the mountains—by the sides of the rain-courses—on the shores of the torrent.

He rarely indulged himself even in the recreation of meeting his mistress, for whom all this labour was submitted to. Gold, not as a means, but as an end, seemed to be his thought by day, and his dream by night, the object and end of his existence. When they did meet in darkness, and loneliness, and mya-

tery, it was but to exchange a few hurried sentences of hope and comfort, and affected reliance upon fortune. On these occasions, tears, and tremblings, and hysterical sobbings, sometimes told, on her part, at once the hollowness of her words, and the weakness of her constitution; but on his, all was, or seemed to be, enthusiasm and steadfast expectation.

Days and weeks, however, passed by—moons rolled away—the year was drawing to its wane, and a great part of the enormous sum was still in the womb of the mountains. Day by day, week by week, and month by month, the hopes of the mineralo became fainter. He could no longer bestow the comfort which did not cheer even his dreams. Gloomy and sad, he could only strain his mistress in his arms, without uttering a word, when she ventured an inquiry respecting his progress, and then hurry away to resume, mechanically, his hopeless task.

It is a strange, sometimes an awful thing, to look into the mystery of the female mind. Lelia's health had received a shock from the circumstances we have recorded, which left her cheek pale, and her limbs weak, for many months; and to this physical infirmity was now added the effect of those dumb, but too eloquent, interviews with her lover. The lower he sunk in despondency, however, and the more desperate grew their affairs, the higher her spirits rose, as if to quell and control their fortune. Her hopes seemed to grow in proportion with his fears, and the strength which deserted him went over as an ally and supporter to her weakness. Even her bodily health received its direction from her mind. Her nerves seemed to recover their tone, her cheek its hue, and her eye its brilliancy. The cold and sluggish imagination of a man is unacquainted with half the resources of a woman in such circumstances. Disappointed in her dependence on fortune and casualty, Lelia betook herself to the altars and gods of her people!

The year touched upon its close, and the sum which the gold-seeker had amassed, although great, almost to a miracle, was still far—very far from sufficient. The last day of the year arrived, ushered in by storm, and thunderings, and lightnings; and the evening fell cold and dark upon the despairing labours of Francesco. He was on the side of the mountain opposite Niccoli's house, and, as daylight died in the valley, he saw, with inexpressible bitterness of soul, by the number of lights in the windows, that the fete was not forgotten. Some trifling success, however, induced him, like a drowning man grasping at a straw, to continue his search. He was on the spot indicated by a dream of his enthusiastic mistress; and she had conjured him not to abandon the attempt till the bell of the distant church should silence their hopes for ever.

His success continued. He was working with the pickaxe, and had discovered a very small perpendicular vein; and it was just possible that this, although altogether inadequate in itself, might be crossed at a greater depth by a horizontal one, and thus form one of the *gruppi*, or nests, in which the ore is plentiful and easily extracted. To work, however, was difficult, and to work long, impossible. His strength was almost exhausted; the storm beat fiercely in his face; and the darkness increased every moment. His heart wholly failed him; his limbs trembled; a cold perspiration bedewed his brow; and, as the last rays of daylight departed from the mountain-side, he fell senseless upon the ground.

How long he remained in this state he did not know, but he was recalled to life by a sound resembling, as he imagined, a human cry. The storm howled more wildly than ever along the side of the mountain, and it was now pitch-dark; but on turning round his head he saw, at a little distance above where he lay, a small, steady light. Francesco's heart began to quake. The light advanced towards him, and he perceived that it was borne by a figure arrayed in white from head to foot. "Lelia!" cried he in amazement, mingled with superstitious terror, as he recognised the features of his young fair mistress. "Waste not time in words," said she; "much may yet be done, and I have the most perfect assurance that now at least I am not deceived. Up, and be of good heart! Work, for here is light. I will sit down in the shelter, bleak though it be, of the cliff, and aid you with my prayers, since I cannot with my hands." Francesco seized the axe, and stirred, half with shame, half with admiration, by the courage of the generous girl, resumed his labour with new vigour. "Be of good heart," continued Lelia, "and all will yet be well. Bravely—bravely done!—be sure the saints have heard us!" Only once she uttered any thing resembling a complaint—"It is so cold!" said she; "make haste, dearest, for I cannot find my way home, if I would, without the light." By and by she repeated more frequently the injunction to "make haste." Francesco's heart bled while he thought of the sufferings of the sick and delicate girl on such a night, in such a place; and his blows fell desperately on the stubborn rock. He was now at a little distance from the spot where she sat, and was just about to beg her to bring the light nearer, when she spoke again. "Make haste—make haste!" she said; "the time is almost come—I shall be wanted—I am wanted—I can stay no longer—farewell!" Francesco looked up, but the light was already gone.

It was so strange, this sudden desertion! If determined to go, why did she go alone?—aware, as she must have been, that his remaining in the dark could

be of no use. Could it be that her heart had changed, the moment her hopes had vanished? It was a bitter and ungenerous thought; nevertheless, it served to bridle the speed with which Francesco at first sprung forward to overtake his mistress.

With a lightened heart—for, compared with the phantom of the mind which had presented itself, all things seemed endurable—he began again to descend the mountain. In a place so singularly wild, where the rocks were piled around in combinations at once fantastic and sublime, it was not wonderful that the light carried by his mistress should be wholly invisible to him, even had it been much nearer than was by this time probable. Far less was it surprising that the shouts which ever and anon he uttered should not reach her ear; for he was on the lee-side of the storm, which raved among the cliffs with a fury that might have drowned the thunder.

Even to the practised feet of Francesco, the route, without the smallest light to guide his steps, was dangerous in the extreme; and to the occupation thus afforded to his thoughts, it was perhaps owing that he reached Niccoli's house in a state of mind to enable him to acquit himself in a manner not derogatory to the dignity of manhood. "Niccoli," said he, on entering the room, "I have come to return you thanks for the trial you have allowed me. I have failed, and, in terms of the engagement between us, I relinquish my claims to your daughter's hand." He would then have retired as suddenly as he had entered; but old Niccoli caught hold of his arm:—"Bid us farewell," said he, in a tremulous voice; "go not in anger. Forgive me for the harsh words I used when we last met. I have watched you, Francesco, from that day—and—" He wiped away a tear, as he looked upon the soiled and neglected apparel, and the haggard and ghastly face, of the young man—"No matter—my word is plighted—farewell. Now call my daughter," added he, "and I pray God that the business of this night end in no ill!"

Francesco lingered at the door. He would fain have seen but the skirt of Lelia's mantle before departing! "She is not in her room!" cried a voice of alarm. Francesco's heart quaked. Presently the whole house was astir. The sound of feet running here and there was heard, and agitated voices called out her name. The next moment the old man rushed out of the room, and, laying both his hands upon Francesco's shoulders, looked wildly in his face. "Know you aught of my daughter?" said he: "Speak, I conjure you, in the name of the Blessed Saviour! Tell me that you have married her, and I will forgive and bless you! Speak! Will you not speak? A single word! Where is my daughter? Where is my Lelia?—my life—my light—my hope—my child—my child!" The mineralo started, as if from a dream, and looked round, apparently without comprehending what had passed. A strong shudder then shook his frame for an instant. "Lights!" said he, "torches!—every one of you! Follow me!" and he rushed out into the night. He was speedily overtaken by the whole of the company, amounting to more than twelve men, with lighted torches, that flared like meteors in the storm. As for the leader himself, he seemed scarcely able to drag one limb after the other, and he staggered to and fro, like one who is drunken with wine.

They at length reached the place he sought; and, by the light of the torches, something white was seen at the base of the cliff. It was Lelia. She leant her back against the rock; one hand was pressed upon her heart, like a person who shrinks with cold, and in the other she held the lamp, the flame of which had expired in the socket. Francesco threw himself on his knees at one side, and the old man at the other, while a light, as strong as day, was shed by the torches upon the spot. She was dead—dead—stone dead!

After a time, the childless old man went to seek out the object of his daughter's love; but Francesco was never seen from that fatal night. A wailing sound is sometimes heard to this day upon the hills, and the peasants say that it is the voice of the mineralo seeking his mistress among the rocks; and every dark and stormy night the lamp of Lelia is still seen upon the mountain, as she lights her phantom-lover in his search for gold.*

A HIGHLAND CATTLE-LIFTER.

ARCHIBALD MACDONALD was perhaps the most perfect master of his hazardous profession of any who ever practised it. Archibald was by birth a gentleman, and proprietor of a small estate in Argyshire, which he however lost early in life. He soon distinguished himself as a cattle-lifter on an extensive scale; and weak as the arm of the law might then have been, he found it advisable to remove further from its influence, and he shifted his residence from his native district of Appin to the remote peninsula of Ardnamurchan, which was admirably adapted to his purpose, from its geographical position. He obtained a lease of an extensive farm, and he fitted up a large cowhouse, though his whole visible live stock consisted of one filly. His neighbours could not help making remarks on this subject, but he begged of them to have no anxiety on that head, assuring them that his byre would be full ere Christmas; and he was as good as his word. He had trained the filly to suit his purpose, and it was a prac-

tice of his to tie other horses to her tail; she then directed her course homeward by unfrequented routes, and always found her way in safety.

His expeditions were generally carried on by sea, and he annoyed the most distant of the Hebrides, both to the south and north. He often changed the colour of his boats and sails, and adopted whatever appeared best suited to his immediate purpose. In consequence of this artifice, his depredations were frequently ascribed to others, and sometimes to men of the first distinction in that country, so dexterously did he imitate their Birlings and their insignia. He held his land from Campbell of Lochnell, into whose favour he had insinuated himself, by his knowledge and address.

When Lochnell resided at the castle of Mingary, Archibald was often ordered to lie on a mattress in his bed-room, to entertain him at night with the recitation of the poems of Ossian, and with tales. Archibald contrived means to convert this circumstance to his advantage. He ordered his men to be in readiness, and he that night selected one of his longest poems. As he calculated, Lochnell fell asleep before he had finished the recital; the robber slunk out and soon joined his associates. He steered for the island of Mull, where some of his men had been previously sent to execute his orders; he carried off a whole fold of cattle, which he landed safely, and returned to his mattress before Lochnell awoke. When he lay down, he purposely snored so loudly that the sleeping chief was disturbed, and complained of the tremendous noise the fellow made, observing that, fond as he was of poetry, he must deprive himself of it in future on such conditions. To this Archibald had no objections; his principal object was then accomplished; and taking up the tale where he had stopped when his patron fell asleep, he finished it, and slept soundly to an advanced hour.

The cattle were immediately missed, and suspicion fell on Archibald; but he triumphantly referred to Lochnell for a proof of his innocence, and this he obtained. That gentleman solemnly declared that the robber had never been out of his room during that night, and the charge was of course dropped.

A wealthy man who resided in the neighbourhood was noted for his penurious habits, and he had incurred particular odium by refusing a supply of meal to a poor widow in distress. This man had sent a considerable quantity of grain to the mill, which, as usual, he attended himself, and was conveying the meal home at night on horseback. The horses were tied in a string, the halter of one fixed to the tail of another; and the owner led the foremost by a long tether. His road lay through a wood, and Archibald there watched his approach. The night was dark, and the man walked slowly, humming a song: the ground was soft, and the horses having no shoes (as is still usual in that country), their tread made no noise. Archibald ordered one of his men to loosen the tether from the head of the front horse, and to hold it, himself occupying the place of the horse, and walking on at the same pace. He thus got possession of the whole. The miser soon arrived at his own door, and called for assistance to deposit his winter store in safety, but, to his astonishment, found he had but the halter!

Availing himself of the credulity of his countrymen, he pretended to hold frequent intercourse with a spirit or genie, still much distinguished in the West Highlands under the appellation of *Glastig*. This he turned to excellent account, as the stories which his partisans fabricated of the command he had over the *Glastig*, and the connexion between them, terrified the people so much, that few could be prevailed upon to watch their cattle at night, and they thus fell an easy prey to this artful rogue.

Archibald's father having died early, his mother afterwards married a second husband, who resided in a neighbouring island. When she died, her son was out of favour with his stepfather, and he was refused the privilege of having the disposal of his mother's remains, nor did he think it prudent to appear openly at her funeral. He however obtained accurate information of the place where the corpse was lying; in a dark night, he made an opening in the thatched roof of the earthen hut, and the wakers being occupied in the feats of athletic exercise usually practised on these occasions, the body being excluded from their sight by a screen which hung across the house, Archibald carried it off to his boat like another *Æneas*. He also got possession of the stock of whisky intended for the occasion, as it lay in the same place—thus discharging the last duties of a pious son with little expense to himself.

A fatal event at length occurred, which rendered it necessary for the man to retire from trade. He made a descent on one of the small islands on that coast, and had collected the cattle, when the proprietor (who had information of the circumstance) made his appearance to rescue them. Archibald was compelled to yield up his prey, but one of the villains who accompanied him levelled his musket at the gentleman, and shot him dead from the boat.

The robber was fully aware of his danger, and, with the assistance of a fair wind, he shaped his course for the mainland. He pushed on with all possible speed, and arrived at Inverary before sunrise the following morning. Having information that Stewart of Appin was then in town, he watched his motions, and at an early hour saw him on the street in conversation with the sheriff of the county. Archibald, who was an old acquaintance, saluted him, and his salute was returned. When Appin parted with the sheriff, Archibald com-

* Abridged from "Travelling Sketches in the North of Italy, the Tyrol, and the Rhine." By Leitch Ritchie. (Heath's Picturesque Annual for 1832.)

plained that he had taken no notice of him the preceding day, when he accosted him in the same place. Appin said he was conscious of having seen him, but that he was much hurried at the time, and hoped he would excuse him. The robber's object was accomplished. Appin had no doubt of the truth of what he said; and on his trial for the murder, an alibi was established in his favour, from this very extraordinary piece of address. Some of his crew were afterwards taken in Ross-shire, and executed there by orders of the Earl of Seaforth, though the actual murderer escaped punishment. Archibald, however, never again plundered on a large scale. He died about the middle of the 17th century, and his name still stands unrivalled for cunning and address in his calling.*

GLASS MANUFACTURE.

M'CULLOCH, in his elaborate work, the Dictionary of Commerce, presents us with the following interesting account of the manufacture of glass, now one of the most valuable and beautiful articles in daily use:—

"The manufacture of glass is one of the very highest beauty and utility. It is most probable that we are indebted for this wonderful art, as we are for the gift of letters, to the Phœnicians. According to Pliny (a Roman historian), glass had been made for many ages, of sand found near the mouth of the small river Belus in Phœnicia. 'The report,' says he, 'is, that the crew of a merchant ship laden with nitre (fossile alkali) having used some pieces of it to support the kettles placed on the fires they had made on the sand, were surprised to see pieces formed of a translucent substance, or glass. This was a sufficient hint for the manufacture. Ingenuity (*astuta et ingeniosa solertia*) was immediately at work, to improve the process thus happily suggested. Hence the magnetical stone came to be added, from an idea that it contained not only iron, but glass. They also used clear pebbles, shells, and fossile sand. Indian glass is said to be formed of native crystal, and is, on that account, superior to every other. Phœnician glass is prepared with light dry wood, to which copper and nitre are added, the last being principally brought from Ophir. It is occasionally tinged with different colours. Sometimes it is brought to the desired shape by being blown, sometimes by being ground on a lathe, and sometimes it is embossed like silver.' Sidon, he adds, is famous for this manufacture. It was there that mirrors were first invented. In Pliny's time, glass was made in Italy of fine sand, on the shore between Cumæ and the Lucrine bay.

Glass was manufactured at Rome into various articles of convenience and ornament. Pliny mentions that Nero gave 6000 sesterces (£50,000, according to the ordinary method of reckoning) for two glass cups, each having two handles! These, however, must have been of an immense size, and of exquisite workmanship; for glass was then in common use for drinking vessels, and was used even in the form of bottles in which to keep wine.

There is no authentic evidence of glass being used in windows previously to the third or fourth century; and then, and for long after, it was used only in churches and other public buildings. In this country, even so late as the latter part of the fifteenth century, glass was very rarely met with. In a survey of Alnwick Castle, made in 1573, it is stated—'And, because throwe extreme winds, the glasse of the windowes of this, and other my lord's castles and houses here in the country dooth decay and waste, yt were good the whole leights of everie windowe, at the departure of his lordshippe from lyeinge at any of his said castles, and houses, and dowering the time of his lordship's absence, or others lyeinge in them, were taken doune, and lade up in safty: And at sooche time as ather his lordshippe or anie other sholde lye at anie of the said places, the same might then be set uppe of newe, with smale charges, whereas now the decaye thereof shall be verie costlie and chargeable to be repayed.' Sir F. M. Eden thinks it probable that glass windows were not introduced into farm-houses in England much before the reign of James the First. They are mentioned in a lease in 1615, in a parish in Suffolk. In Scotland, however, as late as 1661, the windows of ordinary country houses were not glazed, and only the upper parts of even those in the King's palaces had glass; the lower ones having two wooden shutters, to open at pleasure, and admit the fresh air. From a passage in Harrison's Description of England, it may be inferred that glass was introduced into country houses in the reign of Henry the Eighth. He says, 'Of old time (meaning, probably, the beginning of the century), our countrie houses, instead of glasse, did use much lattise, and that made either of wicker or fine rifts of oke in checkerwise. I read also that some of the better sort, in and before the time of the Saxons, did make panels of horne instead of glasse, and fix them in wooden calmes (casements); but as horne in windowes is now (1564) quite laid down in every place, so our lattices are also grown into disuse, because glasse is come to be so plentiful, and within very little so good, cheape, if not better than the other.' Glass is now introduced into the windows of almost every cottage of Great Britain; and in this cold, damp climate, it ought to be considered as a necessary, rather than as the most elegant and useful of conveni-

ences. What Dr Johnson has said as to glass deserves to be quoted—'By some fortuitous liquefaction was mankind taught to produce a body at once, in a high degree, solid and transparent, which might admit the light of the sun, and exclude the violence of the wind; which might extend the sight of the philosopher to new ranges of existence, and charm him at one time with the unbounded extent of the material creation, and at another with the endless subordination of animal life; and, what is yet of more importance, might supply the decays of nature, and succour old age with subsidiary sight. Thus was the first artificer in glass employed, though without his own knowledge or expectation. He was facilitating and prolonging the enjoyment of light; enlarging the avenues of science, and conferring the highest and most lasting pleasures; he was enabling the student to contemplate nature, and the beauty to behold herself.'

Venice, for a long time, excelled all Europe in the manufacture of glass, but was subsequently rivalled by France. The manufacture was early introduced into England; but it was not carried on to any extent previously to the sixteenth century. The first plates for looking-glasses and coach windows were made in 1673, at Lambeth, by Venetian artists, under the protection of the Duke of Buckingham. The British Plate Glass Company was incorporated in 1773, when it erected its extensive works at Ravenhead, near St Helen's, in Lancashire. The manufacture was at first conducted by workmen from France, whence we previously brought all our plate glass. But that which is now made at Ravenhead, at Liverpool, and London, is equal or superior to any imported from the Continent.

It is difficult to form any precise estimate of the value of the glass annually produced in Great Britain. We believe, however, that it cannot amount to less than £2,000,000; and that the workmen employed in the different departments of the manufacture exceed 50,000."

SOUTH OF FRANCE.

TOULOUSE.

THOUGH a steam-boat plies between Bourdeaux and Toulouse, I preferred the diligence and main road, having had enough of steam-boats and water in entering the country, to wish a continuation of their company; and it was well that I did so, for I afterwards understood, that, owing to mismanagement with regard to the tide, the boat had only accomplished half her journey, leaving the passengers to make the most of themselves and their baggage. It is rather a curious fact, and shows how thoroughly mercantile the notions of an Englishman are apt to be, that so much has been written in disparagement of the French mode of travelling. A diligence, to be sure, is one of the strangest anomalies in mechanics, and the snail-like progression of its unwieldy shell, compared with the quick joyous whirl of our stage-coaches, forms, at first, rather a melancholy contrast. But then, men do not always travel in a running match against time; they sometimes have a desire to have some little notion of the scenery and people through which they are moving; and, perched in the *banquette* of a French diligence, one feels as on an elephant's back, marching with circumspect slowness through the country, without fear of a dislocation of a joint, or fracture of a bone. The whole economy of the machine is different from that of our coaches, nor can it be radically altered with advantage, unless horses and roads undergo a previous revolution. The roads are in general causewayed, and require broad wheels, and the horses are powerful, hardy, and slow. Although the first grey of dawn was just glimmering, as the mighty leathern vehicle thundered through the streets of Bourdeaux, people were already bustling about, windows were opening, and black velvet nightcaps popping out. There were no symptoms of nocturnal orgies, no parties zig-zagging homewards, after a night of sleepless debauch; no broken lamps, or smashed shutters; but every thing bespoke the dawning of an active bustling day, after a peaceable night. The French are a proverbially sober people, and whatever their vices may be, intoxication is not one of them. The road as far as Agen is not peculiarly beautiful, passing chiefly through interminable vineyards, which, from the low thick manner of planting, are not very picturesque. We arrived at Agen the following day at day-break, after a lovely moonlight night, enlivened by the joyous carols of a Parisian and two Bordolais volunteers. They sung troubadour songs throughout the night, and, though they had never seen each other before, were the best friends in the world in a few hours. How different from the phlegmatic caution of British character! Agen is rather an extensive irregularly built town, surrounded by decayed ramparts, converted into public walks. The practice of building the houses in the fashion of bazaars, and the substitution of horn for glass in the windows of some of the poorer dwellings, gives a picturesque air to the town, as do the high overhanging vineyards which encircle it. The country between Agen and Moissac realized all my conceptions of the beauty and rich undulating fertility by which the south of France has always been characterised in descriptions. Fields of Indian corn, fruit trees, cypresses, vineyards, villages, and chateaux, with the Garonne either in the foreground or distance, dotted with active skiffs, are the chief features; but the de-

licious colouring, which already begins to "breathe of the warm south," gives a charm to the whole, which I have never seen equalled in the most favoured nook of England. We entered the venerable gateway of Toulouse about eight in the evening, with the time-worn city walls dimly seen through the night air, an hour which the solemn recollections of the place aptly suited; having thus performed a journey of 125 miles in 38 hours; i. e., at the rate of about three miles an hour.

Toulouse, the capital of Languedoc, in point of size, though not in number of inhabitants, ranks next to Paris. The population is, in fact, very small in proportion to the ground covered, being somewhere about 56,000; and though there still exists every appearance of abundance and industry, yet it is easy to perceive that both wealth and power have suffered a great diminution from what they were when a parliament sat within its walls, and the troubadours of Provence thronged to the floral games, giving a flip to the revival of literature, and scattering the darkness which had so long settled upon the intellect of Europe. It is a city interesting more from the recollections which it excites, than from its living associations. Its antiquity is great, having been one of the most flourishing cities of ancient Gaul, and a Roman colony; and though scarce a trace remains to mark that high antiquity, yet the knowledge of it will always give it an interest beyond the power of modern magnificence to bestow. It is here that the Mediterranean and Atlantic are united, by the union of the Languedoc canal with the Garonne; and had the people been of a mercantile, instead of an agricultural and literary cast, it possesses many advantages of a commercial nature, which would have given it no small consequence. But this is, in a small way, a sort of decayed Oxford; and though even yet two colleges, two public libraries, and three academies, remain at the service of the public, in the libraries the solitary figures one sees ensconced in the corner of a window, poring over some venerable tome, or the lazy creeping of a few students towards the gates of the schools, at once mark the autumnal condition of its literary institutions. As soon as the daylight broke into my bed-room in the Hotel de l'Europe, I ventured out with a small pocket-compass, instead of a cicerone; and though the town is most irregularly built, I contrived to find my way to the street and house I wanted. Monsieur Des Champs I found under the hands of his barber; yet, though his face was shrouded in a snowy cloud of lather, and a napkin dangled from under his chin, he instantly rose, and, with a bow of Grandisonian precision, motioned me to take a chair. I soon found that this gentleman was just the person most fitted to become my cicerone through the town, as he had lived in it for more than twenty years, and had imbibed the most profound veneration for every stone and brick which went towards its composition. It seemed also to afford him no small delight that a stranger had fallen into his hands, as he quickly dispatched his barber, and assumed his ivory-headed cane and old-fashioned hat.

Of the capital and amphitheatre which Tolosa once boasted under the Romans, he informed me nothing remained; but, as we passed the castle, he pointed out a particular portion of the foundations, which is considered to be of Roman workmanship; the castle is a modern Gothic building of little interest. As we continued threading our way through the streets, the strange intermingling of the magnificent with the wretched and dirty, struck me; but from the consideration of the latter, Monsieur Des Champs would continually draw my attention to some piece of quaint old carving, or, by diving down some toppling gateway, point out the quondam residence of some noble family. After visiting a succession of these decayed mansions, on which the old man dilated with many a sigh for past greatness, and bitter apostrophe on the causes which had produced it, we suddenly entered the *Place du Capitale*. This is a magnificent square, the town-hall, or *hotel de ville*, one of the finest in France, and enriched with marbles and sculpture, forming one side of it. It is also the market-place, and a truly noble one, with fountains in the centre, and *cafés* and gay shops stretching round it. When I saw it, it was crammed with all sorts of fruits and vegetables, so tastefully arranged, and so brilliant and fresh, that it was almost dazzling to look at them. But what gave it a very peculiar appearance, was the vast number of book-stalls sprinkled about, as if the very market people had inherited something of the literary penchant of its ancient inhabitants. After sauntering about, and admiring the never-ending displays of peaches, nectarines, plums, melons, apples, pears, *pommes d'amour*, &c., we entered the mansion-house, the interior of which is still more worthy of examination than the exterior. *La Salle des illustres Toulousains* is a fine hall, in which are placed in niches busts of all the citizens who have reflected honour on their birth-place. Here the rapturous admiration of my companion knew no bounds. One after another, he descanted on the character of men whose names are scarcely known out of Toulouse, as if their particular qualities had been as warmly appreciated by the world as by himself. But when we entered the hall of the Academy of the Floral Games, the interest I felt was fully commensurate with his. The floral games of Toulouse were instituted about the thirteenth century, for the advancement of poetry; and to their

* From "Traditions of the Western Highlands," in Literary Gazette.

influence, I believe, the gradual revival of letters was in some measure owing. The society originally consisted of seven troubadours, styled *Le Gai Consistoire*, who used to hold their meetings and distribute prizes in the open air, till Clemence Isaure, a lady of Toulouse, in the fifteenth century, presented the citizens with magnificent markets, erected at her private expense, on condition that the games should be afterwards celebrated within the hall which formed part of her princely donation, and that they should strew roses on her tomb: in case these injunctions be not attended to, the gift reverts to the king. She was one of the best poets of her day, generally presiding at the annual competitions, and awarding with her own hands the three golden flowers, the violet, the eglantine, and the marigold, as the prizes to the successful candidates. Her statue adorns the hall, and is religiously crowned with flowers each 3d of May. There are two other magnificent apartments, the last of which is semicircular, with the throne still remaining, erected on the occasion of some fête given to Napoleon, and from which the emperor could command a goodly vista of magnificent apartments. Monsieur Des Champs seemed vexed that the purple and gilding were not more faded, and stamped on the floor till a cloud of dust almost hid it from our sight. I could not help smiling; he perceived it, and walked away: I followed him, and we were soon on the banks of the river.

The bridge is not a very handsome one, from the irregularity of the arches, the widest not being in the centre; but it is curious, from the circumstance of a tower being attached to it, for the purpose of purifying the water, and sending it through pipes from one side of the river to the other. This is done by leading the water of the Garonne through a deep bed of sand, and then pumping it up to a sufficient level to take it across the bridge into the town. The view south from this point is extensive and lovely, the Garonne winding up through green meadow-lands towards the Pyrenees, till it becomes lost in a silver haze. By making a detour round the extensive promenade, we came in sight of the heights on which the Duke of Wellington engaged and defeated Marshal Soult.

In Toulouse, there are several churches of considerable interest, but none more so than St Sernin. The date of its erection is not known, but it was consecrated about the year 1090, by Pope Urban the Second, and it is a Roman piece of architecture, or what in England would be termed Saxon. It is stored with stone coffins, filled with saintly bones; and amongst others, those of St Saturnine, who lived as far back as the year 252, occupy a conspicuous position. This precious dust was once stolen, when the saint, with rather questionable justice, chose to inflict punishment, not upon the robber, but upon the robbed, by preventing either harvest or child-bearing during its absence. Here also lie the remains of the great Counts of Toulouse, with the illustrious Raymond, immortalized by Tasso, at their head. They are carelessly stowed away in a vault in one of the exterior walls; for nothing sacred attaches to their dust, at least they do not seem to be so particular about their positions as the saint. A bas relief, representing Calvin in the form of a sow preaching from a pulpit, with the motto, *Calvin le Porc prêchant*, enriches a portion of the choir, as also do a whole mass of relics.

In the Museum, the collection of ancient sculpture, and the gallery of paintings, have both many fine things. In the latter, I observed several artists at work copying, but their colouring struck me as harsh and glaring, from the colours not being sufficiently broken down—the distinguishing fault of the present French school of painting. In the evening, we visited the Theatre, which, though not so fine as that of Bordeaux, is spacious and good. Abroad, however, the appearance of the house is not so splendid as our own, from the absence of full dress in the boxes, and the want of light generally. The noise of talking and laughing is often so great as to drown the voices of the actors. The amusements were an opera, and an afterpiece called *The Four Days of July*, in which an Englishman, or rather a French version of one, figured away much to the amusement of the Tolosans. What seemed to be the chief subject of satire, was the cat-like sensibility of his nature, with a blundering bravery which generally rescued him from all his difficulties, though at the expense of his pocket. He was supposed to have landed in Paris just in the midst of the revolutionary struggles, and to have lost every thing but his courage. He appeared to afford them as much amusement as a Frenchman, when well represented, on our stage gives us, but I do not think he was so true to nature.

AN INTERESTING GERMAN VILLAGE.

There is near Halberstadt, in the kingdom of Prussia, a village named Ströbeck, where all the inhabitants, boys and girls, are chess-players. They were converted to the game some centuries since by a dignitary of the Cathedral of Halberstadt, who allowed them exemption from imposts as long as they should be winners in this game, and every year a person was sent down to try them. Since the secularisation of the bishopric of Halberstadt, and its union with the kingdom of Prussia, they lost a game, and since that time their immunity ceased, but their predilection for this useful amusement continues.—*Anglo-German Advertiser*

BIOGRAPHIC SKETCHES.

CAPTAIN CLAPPERTON.

HUGH CLAPPERTON, an enterprising and undaunted being, and one of the last victims of the attempts of British subjects to penetrate into the heart of Africa, was a Scotsman by birth, having been born of respectable parents, in the town of Annan, in Dumfriesshire, in the year 1788. In his youth he was known as an obliging, good-hearted boy, of robust frame, and an apt scholar, though his education was confined to the elementary branches, including a knowledge of practical mathematics, navigation, and trigonometry.

At the age of seventeen, young Clapperton was bound an apprentice to the sea service, and became the cabin-boy of Captain Smith, of the Postlethwaite of Maryport. The Postlethwaite, a vessel of large burden, traded between Liverpool and North America, and in her he repeatedly crossed the Atlantic, distinguished even when a mere youth for coolness, dexterity, and intrepidity. On one occasion, the ship, when at Liverpool, was partly laden with rock-salt, and as that commodity was then dear, the mistress of a house which the crew frequented very improperly enticed Clapperton to bring her a few pounds ashore in his handkerchief. After some entreaty, the youth complied, probably from his ignorance of the revenue laws, was caught in the act by a custom-house officer, and menaced with the terrors of trial and imprisonment unless he consented to go on board the Tender. He immediately chose the latter alternative, and after being sent round to the Nore, was drafted on board the *Clorinde* frigate, commanded by a very gallant officer, who is now the Hon. Captain Briggs. Here he was ranked as a man before the mast; but feeling a desire to better his situation, he addressed a letter, detailing his mishap and recent history, to a friend, Mr Scott, banker in Annan, who had always taken a warm interest in the family. Mr Scott, as the likeliest channel that occurred to him, applied to Mrs General Dirom, of Mount Annan, who happened to be related to the Hon. Captain Briggs; and through the influence of that lady, combined with his own professional merit, the brave Clapperton was speedily promoted to the rank of midshipman; a circumstance which tended, in no mean degree, to fix his destiny, and shape his future fortunes in life. It has often been remarked, that what at first appears to be a misfortune, is sometimes the happiest thing that can befall us; and so it chanced in the present instance. Had he remained in the American or coasting trade, he might have become first a mate, then a master, then ship's husband and part owner, and, finally, have returned to his native burgh with a fortune of a few thousand pounds, and vegetated tranquilly for ten or twenty years, reading the newspaper or playing at billiards in the forenoon, and smoking cigars and drinking whisky-punch or negus in the evening. But where would have been his laurels—where his glory—where his zeal in the cause of science—where his defiance of death and danger—where his place in the annals of Britain?

While on board the *Asia*, he distinguished himself by his intrepid exertions, and in particular by his excellent swordsmanship. Officers as well as men received instruction from him in the cutlass exercise; and his manly form, and sailor-like appearance on the quarter-deck, tended, in the opinion of all who saw him, to fix the attention, and improve the patriotic spirit of the crew. At his own as well as the other messes, where he had the honour of being a frequent guest, he was the very soul and life of the party; sung a good song, told a merry tale, painted scenes for the ship's theatricals, sketched views, drew caricatures, and, in one word, was an exceedingly amusing and interesting person. Even the admiral became very fond of him, and invited him to remain on board the *Asia*, under the promise of speedy promotion. But the warm work going forward on the Lakes had more attraction for his enterprising mind; and, having procured a passage in a vessel to Halifax, he bade adieu to the flag-ship, to the regret of every individual on board, from the venerable admiral down to the cabin-boys. From Halifax he proceeded to Upper Canada, and, shortly after his arrival, was made a lieutenant, and subsequently appointed to command the *Confiance* schooner, having on board nearly all the unmanageables of the squadron. To discipline these men was no easy task; but the measures adopted by Clapperton, although seldom enforced by flogging, at length made them so subordinate, that the *Confiance* became as proverbial for its good order, as it had hitherto been for its irregularities.

While the *Confiance* rode at anchor on the spacious shores of Lake Erie, or Lake Huron, her enterprising commander occasionally repaired to the woods, and, with his gun, kept himself in fresh provisions. In these excursions he cultivated an acquaintance with the aborigines, and was so much charmed with a mode of life full of romance, incident, and danger, that he at one time entertained serious thoughts of resigning his commission when the war was ended, and becoming a denizen of the forest himself. But the fit, fortunately, was not permanent; his country had stronger claims on his talents, and the tinge of romance, which formed a part of his nature, yielded to more patriotic impressions, and the spirit-stirring scenes in which he was engaged. At this time, he occasionally dined on shore; and as few men excelled him in swimming, he not unfrequently plunged into

the water, and made for the schooner, without either undressing or calling for a boat. This he did for the double purpose of showing his manhood, and keeping his crew on the *qui vive*.

In the year 1817, when our flotilla on the American lakes was dismantled, Lieutenant Clapperton returned to England, to be placed, like many others, on half-pay, and ultimately retired to his grandfather's native burgh of Lochmaben. There he remained till 1820, amusing himself with rural sports, when he removed to Edinburgh, and shortly after became acquainted with the amiable and lamented Dr Oudney. It was at Dr Oudney's suggestion that he first turned his thoughts to African discovery; and, through all the varieties of untoward fortune, suffering and sorrow, sickness and death, he clung to his friend with the constancy of a brother.

We have now arrived at that period of Clapperton's life in which he first became introduced to public notice, or, rather, when an opportunity first presented itself for the development of his active mind. On the death of Mr Ritchie, at Mourzouk, and the return of Captain Lyon, Earl Bathurst, then Secretary of State for the Colonial Department, relying on the strong assurances of his Majesty's consul at Tripoli, that the road from thence to Bornou was open and safe, resolved that a second mission should be sent to explore the state of this unhappy quarter of the globe, which annually sends forth so many thousands of its population into hopeless slavery. Dr Oudney, who was a naval surgeon, was appointed, on strong recommendations from Edinburgh, to proceed in the capacity of consul to Bornou, being allowed to take with him, as a friend and companion, Captain, then Lieutenant Clapperton. About that time, the late Colonel, then Lieutenant Denham, having volunteered his services in an attempt to pass from Tripoli to Timbuctoo, and it being intended that researches should be made from Bornou, as the fixed residence of the consul, to the east and to the west, Lord Bathurst added his name to the expedition. At a very early stage of the journey, Dr Oudney caught a severe cold, which fell on his lungs, and he died, January 12, 1824. Colonel Denham and Captain Clapperton returned to England; and their narratives were published, and have since gone through three editions. The portions of the expedition related by Captain Clapperton are a journey from Kouka to Murrur, from Murrur to Kano, and from Kano to Sackatoo, the capital of the Felatah empire.

Clapperton's narrative of his journey through the new and untroubled country of Soudan could not fail of being interesting, and the unaffected and manly style in which it is written is highly creditable to him. We will select a few of those particulars which will serve to illustrate his personal character.

After having passed through Kano, Captain Clapperton proceeded towards Sackatoo. On his road, he was met by an escort of 150 horsemen, with drums and trumpets, which Bello, the sultan, had sent to conduct him to his capital. Our traveller was now received at every town and village with flourishing of horns and trumpets, as the representative of the King of England.

On receiving the presents in the name of the King of England, the sultan examined them with great attention, and then exclaimed, "Every thing is wonderful, but you are the greatest curiosity of all!" and then added, "what can I give that is most acceptable to the King of England?" "I replied," says Captain Clapperton, "the most acceptable service you can render to the King of England, is to co-operate with his Majesty in putting a stop to the slave-trade on the coast." "What!" said he, "have you no slaves in England?" "No: whenever a slave sets his foot in England, he is from that moment free." "What do you then do for servants?" "We hire them for a stated period, and give them regular wages; nor is any person in England allowed to strike another; and the very soldiers are fed, clothed, and paid by government." "God is great," he exclaimed; "you are a beautiful people." He also appeared anxious to establish a friendly connexion with England, and in answer to an inquiry after our newspapers, when told that many thousands were printed every morning, he exclaimed, "God is great; you are a wonderful people!"

It is quite obvious that Captain Clapperton, in the various interviews which he had with Sultan Bello, succeeded in strongly inclining him to a friendly communication with England; for at every interview the subject was pressed—thus:—

"The sultan sent for me in the afternoon. I was taken to a part of his residence I had never before seen: it was a handsome apartment, within a square tower, the ceiling of which was a dome, supported by eight ornamented arches, with a bright plate of brass in its centre. Between the arches and the outer wall of the tower the dome was encircled by a neat balustrade in front of a gallery which led into an upper suite of rooms. We had a long conversation about Europe: he spoke of the ancient Moorish kingdom in Spain, and appeared well pleased when I told him that we were in possession of Gibraltar. He asked me to send him from England some Arabic books, and a map of the world; and, in recompense, promised his protection to as many of our learned men as chose to visit his dominions. He also spoke of the gold and silver to be obtained in the hills of Jacobs and Addmowa; but I assured him that we were less anxious about

gold mines than the establishment of commerce, and the extension of science. He now gave me a map of the country, and, after explaining it to me, he resumed the old theme of applying, by letter, to the King of England for the residence of a consul and a physician at Sackatoo."

When the traveller waited upon him to take leave, the sultan treated him in the most friendly manner. "After repeating the Fatha," says Clapperton, "and praying for my safe arrival in England and speedy return to Sackatoo, he affectionately bade me farewell." Of Bello's opinion of Captain Clapperton, the following passage in the letter of the chieftain, addressed to George IV., and brought home by Clapperton himself, affords a marked proof:—"Your Majesty's servant, Bayes-Abd-Allah (Clapperton's travelling name) came to us, and we found him a very intelligent and wise man; representing, in every respect, your greatness, wisdom, dignity, clemency, and penetration." It should be added, that Captain Clapperton always took care to impress upon the Africans, that he should be despised, on his return to England, if in any instance he acted deceitfully and treacherously, he being a "servant of the King of England."

On the 4th of May 1824, Captain Clapperton left Sackatoo on his return to Kouka, which he reached July 8, and where he was joined a few days afterwards by Colonel Denham, who did not know him, so altered was he by fatigue and illness. "On my arrival again at Kouka," says Colonel Denham, "I found that Captain Clapperton, with a small kafla, had returned from Soudan. It was nearly eight months since we had separated, and although it was mid-day, I went immediately to the hut where he was lodged; but so satisfied was I that the sunburnt sickly person that lay extended on the floor, rolled in a dark blue shirt, was not my companion, that I was about to leave the place, when he convinced me of my error by calling me by my name: the alteration was certainly in him most striking."

The travellers now prepared for their return to their native country. Their journey over the desert was exceedingly harassing. Having at length reached Tripoli, they there embarked for Leghorn. From Leghorn they crossed the Alps, and arrived in England on the 1st of June 1825.

Captain Clapperton was not allowed much time for repose. An answer being prepared to the letter from Sultan Bello to the King of England, it was, with a letter to El Kanemy, the Sheikh of Bornou, entrusted to Captain Clapperton, who, with Captain Pearce of the navy, Dr Morrison, and Mr Dickson, were conveyed in his Majesty's ship *Brazen*, to the coast of Africa. The first three were landed at Badagry, in the Bight of Benin, on the 28th of November 1825; Mr Dickson, at his own request, having previously been put on shore at Whydah. The King of Badagry readily undertook to afford to the travellers protection and assistance as far as his influence extended—namely, to a place called Jannah, the frontier town of the kingdom of Hio or Eyeeo, which was found to be in lat. 6° 56' N., and on the same meridian as Lagos. A great part of this journey was performed on foot, along narrow paths, leading through deep forests: they reached this spot on the 18th of December.

From Jannah to Katunga, the capital of Youriba, was described as a journey that would require thirty-three days. The passage of the low swampy forest produced the usual pestilential effects on some of the party; and on the 27th of December, Captain Pearce, after a few days' illness, died. He was an excellent officer, but of a delicate habit, and, in the opinion of his friends, not calculated to bear the heat and fatigue to which he would necessarily be exposed in the course of an expedition of this kind; but all remonstrances were in vain, and he determined to make the attempt. Dr Morrison also falling sick, was advised by Captain Clapperton to return to the coast, to which he readily assented; and Mr Houtson, a merchant, who had voluntarily undertaken to accompany the mission as far as Katunga, returned with him. They had proceeded no farther, however, than Jannah, when Morrison became alarmingly ill, and died in the course of the day.

Mr Houtson, having decently interred his companion, rejoined Captain Clapperton. They now proceeded across a mountainous and beautifully romantic country, which continued so for many days; and beyond this range, the surface became gradually more uniform, but still undulated with hill and dale, and in an excellent state of cultivation. Towns and villages were constantly occurring; the former generally surrounded with mud walls, and ditches, and many of them containing from 10,000 to 12,000 inhabitants; the people every where civil and obliging, and the head men receiving them with the utmost kindness and hospitality.

On the 26th of April, Mr James, a merchant residing on the coast, wrote from Whydah, that he had received authentic information of the safe arrival of Clapperton at the capital of his old friend in the Fatah country. Here ended all information respecting the traveller; and two whole years had elapsed without the least intimation respecting Captain Clapperton, when, some time in February 1828, his servant, Richard Lander, accompanied by a black man of the name of Pascoe, made their appearance at Badagry, having been nine months on their journey from Sackatoo. On the 24th of April, Lander arrived at Portsmouth, in the *Esk* sloop of war. From him it has been ascertained that Captain Clapperton died April

13, 1827, at Sackatoo, where he had been detained for five months, in consequence of the Sultan Bello not permitting him to proceed, on account of the war between him and the Sheikh of Bornou. He had waited there hoping to obtain permission to proceed to Timbuctoo, and lived in a small, circular, clay hut, belonging to the Sultan's brother, the size of which dwelling was about fifty yards each way. He was attacked with dysentery, and, latterly, fell away rapidly, and became much emaciated.

Lander states, that two days before he died, he requested that he might be shaved, as he was too weak to sit up. On its completion, he asked for a looking glass, and remarked he was "doing better," and should certainly "get over it." The morning on which he died he breathed loud, and became restless, and shortly afterwards expired in his servant's arms. He was buried by him at Jungali, a small village, five miles south-east of Sackatoo, and was followed to his grave by his faithful attendant and five slaves. The corpse was conveyed by a camel, and the place of interment marked by a small square house of clay, erected by Lander, who then obtained the Sultan's permission to return home. He accordingly journeyed to Badagry, which occupied him seven months, and was taken off the coast by Captain Laing, of the merchant brig *Maria* of London, in January 1828.

Captain Clapperton was, in the best sense of the phrase, "a fine fellow;" a term well calculated to express a general idea of his whole character. In person, he was about five feet eleven inches in height, with a high and commanding forehead (the index of a noble mind), and a set of features full of pleasing and intelligent expression. Previous to his death, at the age of thirty-eight, his fine athletic form was almost reduced to a skeleton. He is represented to have been a man of frank and generous disposition, and to have possessed a happy mode of adapting himself to circumstances—it will be owned, a valuable endowment for one whose short life was one continued scene of enterprise and hair-breadth escapes.

His conduct towards the natives even endeared him to them as if he had been one of their caste. He assumed the gravity of the Tauricks, their manners, and even their dress, and so completely identified himself with them, that they frequently expressed their belief that he would ultimately become a convert to Mohammedanism. We can readily imagine how companionable these qualities must have rendered him, especially in such a desert as that between Mourzouk and Bornou, a dreary waste, in which "towns, villages, wandering tribes, and kaflas, or caravans, sometimes occur to break the solitude of that dismal belt, which seems to stretch across Northern Africa, and on many parts of which not a living creature, even an insect, enlivens the scene. Still, however, the halting-places at the wells, and the wadeys or valleys, afford an endless source of amusement to the traveller, in witnessing the manners, and listening to the conversation, of the various tribes of natives, who, by their singing and dancing, their story-telling, their quarrelling and fighting, make him forget, for a time, the ennui and fatigue of the day's journey."

Fortunately, the whole of Captain Clapperton's journals were saved, and subsequently published. By the travels and investigations of Denham, Oudney, and Clapperton, a considerable amount of new information was ascertained, regarding the river Niger and the kingdoms on its banks; but as they did not trace it to the ocean, the place of its embouchure was left for future discovery. That important discovery has since been made by Lander, the attendant on Clapperton; and at present that young man and his brother are engaged in an expedition to penetrate into Central Africa, by means of steam and other vessels, on that famed and long mysterious stream.

AMUSEMENTS OF THE LEARNED.

MANY persons are of belief that authors are very grave and reserved in their manners, that they are constantly engaged in study, have no relish whatever for relaxation, and are careless of the ordinary pleasures of society. This is a ridiculous fallacy: authors just think and act like other men when not engaged in their literary avocations; and whatever may be the gravity of their writings, they are generally very merry fellows, and like to indulge in frivolous amusements as well as their neighbours. D'Israeli, who has taken the pains to enter into a minute investigation of many literary subjects, recites a number of instances of learned men indulging in different amusements by way of relaxation to their mind.

"Among the Jesuits (says he, in his *Curiosities of Literature*, a work we recommend to the perusal of our readers), it was a standing rule of the order, that after an application to study for two hours, the mind of the student should be unbent by some relaxation, however trifling. When Petavius was employed in his *Dogmata Theologica*, a work of the most profound and extensive erudition, the great recreation of the learned father was, at the end of every second hour, to twirl his chair for five minutes. After protracted studies, Spinoza would mix with the family-party where he lodged, and join in the most trivial conversations, or unbent his mind by setting spiders to fight each other; he observed their combats with so much interest, that he was often seized with immoderate fits of laughter. A continuity of labour deadens the soul, observes Seneca, in closing his

treatise on 'The Tranquillity of the Soul,' and the mind must unbend itself by certain amusements. Socrates did not blush to play with children; Cato, over his bottle, found an alleviation from the fatigues of government; a circumstance, he says in his manner, which rather gives honour to this defect, than the defect dishonours Cato. Some men of letters portioned out their day between repose and labour. Asinius Pollio would not suffer any business to occupy him beyond a stated hour; after that time he would not allow any letter to be opened during his hours of relaxation, that they might not be interrupted by unforeseen labours. In the senate, after the tenth hour, it was not allowed to make any new motion.

Tycho Brahe diverted himself with polishing glasses for all kinds of spectacles, and making mathematical instruments; an amusement too closely connected with his studies to be deemed as one.

D'Andilly, the translator of Josephus, after seven or eight hours of study every day, amused himself in cultivating trees; Barclay, the author of the *Argenis*, in his leisure hours was a florist; Balzac amused himself with a collection of crayon portraits; Peiresc found his amusement amongst his medals and antiquarian curiosities; the Abbé de Maroles with his prints; and Politian in singing airs to his lute. Descartes passed his afternoons in the conversation of a few friends, and in cultivating a little garden; in the morning, occupied by the system of the world, he relaxed his profound speculations by rearing delicate flowers.

Rohault wandered from shop to shop to observe the mechanics labour; Count Caylus passed his mornings in the studios of artists, and his evenings in writing his numerous works on art. This was the true life of an amateur.

Granville Sharp, amidst the severity of his studies, found a social relaxation in the amusement of a barge on the Thames, which was well known to the circle of his friends; there was festive hospitality with musical delight. It was resorted to by men of the most eminent talents and rank. His little voyages to Putney, to Kew, and to Richmond, and the literary intercourse they produced, were singularly happy ones. 'The history of his amusements cannot be told without adding to the dignity of his character,' observes Mr Prince Hoare, in the very curious life of this great philanthropist.

Some have found amusement in composing treatises on odd subjects. Seneca wrote a burlesque narrative of Claudian's death. Pierius Valerianus has written an eulogium on beards; and we have had a learned one recently, with due gravity and pleasantry, entitled 'Eloge de Perruques' (an *Eulogium on Wigs*).

Erasmus composed, to amuse himself when travelling in a post-chaise, his panegyric on *Moria*, or Folly; which, authorized by the pun, he dedicated to Sir Thomas More.

It seems, Johnson observes in his *Life of Sir Thomas Browne*, to have been in all ages the pride of art to show how it could exalt the low and amplify the little. To this ambition perhaps we owe the frogs of Homer; the gnat and the bees of Virgil; the butterfly of Spenser; the shadow of Wowerus; and the quincunx of Browne.

Cardinal de Richelieu, amongst all his great occupations, found a recreation in violent exercises; and he was once discovered jumping with his servant, to try who could reach the highest side of a wall. De Grammont, observing the cardinal to be jealous of his powers, offered to jump with him; and, in the true spirit of a courtier, having made some efforts which nearly reached the cardinal's, confessed the cardinal surpassed him. This was jumping like a politician; and by this means is said to have ingratiated himself with the minister.

The great Samuel Clarke was fond of robust exercise; and this profound logician has been found leaping over tables and chairs: once perceiving a pedantic fellow, he said, 'Now we must desist, for a fool is coming in.'

An eminent French lawyer, confined by his business to a Parisian life, amused himself with collecting from the classics all the passages which relate to a country life. The collection was published after his death.

Contemplative men seem to be fond of amusements which accord with their habits. The thoughtful game of chess, and the tranquil delight of angling, have been favourite recreations with the studious. Paley had himself painted with a rod and line in his hand; a strange characteristic of the author of 'Natural Theology.' Sir Henry Wotton called angling 'idle time not idly spent;' we may suppose that his meditations and his amusements were carried on at the same moment.

Seneca has observed on amusements proper for literary men, in regard to robust exercises, that these are a folly, an indecency to see a man of letters exult in the strength of his arm, or the breadth of his back! Such amusements diminish the activity of the mind. Too much fatigue exhausts the animal spirits, as too much food blunts the finer faculties; but elsewhere he allows his philosopher an occasional slight inebriation; an amusement which was very prevalent among our poets formerly. Seneca concludes admirably, 'whatever be the amusements you choose, return not slowly from those of the body to the mind; exercise the latter night and day. The mind is nourished at a cheap rate; neither cold nor heat, nor age itself, can interrupt this exercise; give, therefore, all your cares to a possession which ameliorates even in its old age!'

An ingenious writer has observed, that 'a garden just accommodates itself to the perambulations of a scholar, who would perhaps rather wish his walks abridged than extended.' There is a good characteristic account of the mode in which the literati take exercise, in Pope's letters. 'I, like a poor squirrel, am continually in motion indeed, but it is about a cage of three feet; my little excursions are like those of a shopkeeper, who walks every day a mile or two before his own door, but minds his business all the while.' A turn or two in a garden will often very happily close a fine period, mature an unripened thought, and raise up fresh associations, when the mind, like the body, becomes rigid by preserving the same posture. Buffon often quitted the apartment he studied in, which was placed in the midst of his garden, for a walk in it; Evelyn loved 'books and a garden.'"

BABOONS.

LIEUTENANT JOHN SHIP, in the account of his amusing military adventures, describes several rencounters he had with baboons near the Cape of Good Hope. "On these hills (says he), whole regiments of baboons assemble, for which this station is particularly famous. They stand six feet high, and in features and manners approach nearer to the human species than any other quadruped I have ever seen. These rascals, who are most abominable thieves, used to annoy us exceedingly. Our barracks were under the hills, and when we went to parade, we were invariably obliged to leave armed men for the protection of our property; and, even in spite of this, they have frequently stolen our blankets and greatcoats, or any thing else they could lay their claws on. A poor woman, a soldier's wife, had washed her blanket, and hung it out to dry, when some of these miscreants, who were ever on the watch, stole it, and ran off with it into the hills, which are high and woody. This drew upon them the indignation of the regiment, and we formed a strong party, armed with sticks and stones, to attack them, with the view of recovering the property, and inflicting such chastisement as might be a warning to them for the future. I was on the advance, with about twenty men, and I made a detour to cut them off from caverns, to which they always flew for shelter. They observed my movement, and immediately detached about fifty to guard the entrance, while the others kept their post; and we could distinctly see them collecting large stones, and other missiles. One old grey-headed one, in particular, who often paid us a visit at the barracks, and was known by the name of *Father Murphy*, was seen distributing his orders, and planning the attack, with the judgment of one of our best generals. Finding that my design was defeated, I joined the *corps de main*, and rushed on to the attack, when a scream from *Father Murphy* was a signal for a general encounter, and the host of baboons under his command rolled down enormous stones upon us, so that we were obliged to give up the contest, or some of us must inevitably have been killed. They actually followed us to our very doors, shouting, in indication of victory; and, during the whole night, we heard dreadful yells and screaming; so much so, that we expected a night attack. In the morning, however, we found that all this rioting had been created by disputes about the division of the blanket; for we saw eight or ten of them with pieces of it on their backs, as old women wear their cloaks. Amongst the number strutted *Father Murphy*. These rascals annoyed us day and night, and we dared not venture out, unless a party of five or six went together.

One morning, *Father Murphy* had the consummate impudence to walk straight into the grenadier barracks; and he was in the very act of purloining a sergeant's regimental coat, when a corporal's guard (which had just been relieved) took the liberty of stopping the gentleman at the door, and secured him. He was a most powerful brute, and, I am persuaded, too much for any single man. Notwithstanding his frequent misdemeanours, we did not like to kill the poor creature; so, having first taken the precaution of muzzling him, we determined on shaving his head and face, and then turning him loose. To this ceremony, strange to say, he submitted very quietly; and, when shaved, he was really an exceedingly good-looking fellow, and I have seen many a 'blood' in Bond Street not half so prepossessing in his appearance. We then started him up the hill, though he seemed rather reluctant to leave us. Some of his companions came down to meet him; but, from the alteration which shaving his head and face had made on him, they did not know him again, and, accordingly, pelted him with stones, and beat him with sticks, in so unmerciful a manner, that poor *Father Murphy* actually sought protection from his enemies, and he in time became quite domesticated and tame. There are many now alive, in his Majesty's 22d regiment, who can vouch for the truth of this anecdote."

THE PACHA OF EGYPT.

The present enterprising Pacha of Egypt, like all men who have succeeded in accomplishing great designs, is remarkably attentive to have his orders executed rapidly, no matter about what. An amusing instance of this activity occurred a few years ago. Having observed one of the European visitors wearing shoes, such as are usually worn in this country, and tied in a military fashion, he borrowed them as a pattern, and in less than twelve hours, a dozen pairs were ready; these were dispatched instantly to Cairo, with a peremptory order, that 40,000 pairs should be ready in a month. All the shoemakers in Cairo were instantly set to work, and the order completed in due time.

Column for Young Men.

We feel much pleasure in laying before the juvenile part of our female readers the following excellent advice on the subject of DOMESTIC ECONOMY, from *The Daughter's Own Book*, the author of which appears well acquainted with the various duties of social life.—

"I am willing, if your circumstances admit, that you should attend to drawing, painting, or music, or all of them, provided only you have a natural taste for them, and do not suffer them to interfere with your improvement in more important branches. I say, if you have a taste for them; for nothing seems to me more ridiculous than for a girl utterly destitute of taste, to spend months in trying to learn the use of the pencil, while neither she nor her friends are to reap any other reward of her labours, than is found in the awkward result of having a few pictures to amuse, or, as the case may be, to frighten, her younger sisters. If you have a talent for music, I am more than willing that you should cultivate it; for it will not only supply you with innocent, and, I may say, elegant amusement, but it may often banish melancholy from your mind, and refresh and invigorate the spirits of your friends. But let every accomplishment of this kind be suffered to hold only its proper place.

However much you may be distinguished for intellectual cultivation, or for proficiency in the more refined and ornamental branches, you can make no claim to a complete education, unless you are well acquainted with Domestic Economy. I am aware that this is a subject which, from some cause or other, many young females regard with strong aversion; and there is reason to fear that, in too many instances, this aversion is heightened by receiving in some degree the parental sanction; but you may rely on it there cannot be a greater mistake on the subject of female education, than to suppose that this branch of it may with safety be neglected. With regard to the extent to which it should be formed on this subject, I would say in general that you ought to have so much knowledge of it, as will enable you to regulate with advantage the concerns of a family. There are indeed some of the domestic arts which you can hardly be expected to acquire; and which, in the ordinary walks of domestic life, may not be important; but whatever relates to the immediate superintendence and direction of household concerns, you cannot neglect, without exposing yourself to inconvenience which no future exertions may be able completely to remedy.

It is important that you should cultivate a taste for the management of domestic concerns as early as possible. As no part of your education is more practical than this, it were unsafe to neglect it even for a short period; and, as the consequences of such neglect would probably be, that you would form other habits unbecomingly domestic employments, and which, perhaps, might give you an aversion to them which you would never overcome. Do not consider it a hardship therefore to be placed in circumstances which favour your attention to this subject, and even demand your active exertions. Every item of this kind of knowledge which you gain, you will be able, hereafter, to turn to some practical account, which will compensate many fold for the labour of attaining it.

It is not uncommon for young females in the higher walks of life to satisfy themselves in the neglect of this branch of education, on the ground that their lot is cast in circumstances of opulence and splendour. If this excuse could ever be sustained, you have no right to expect that your condition in life will allow you to avail yourself of it; for the reverse is, that it cannot be admitted in any case. There are many other reasons of great weight why this part of your education should not be neglected. Without a proper attention to it, you can never be qualified to preside in the concerns of a family. Though you should be placed in a station which might enable you to command all the conveniences and assistance which opulence can furnish, you will in your domestic economy, unless you have yourself that practical knowledge which will enable you to keep your house in order. You cannot realize half the value of your domestic aid, unless you are capable of exercising a general superintendence, and giving proper directions; and without such ability, you will be liable to constant impositions from those to whom you will be obliged to confide interests which ought to remain exclusively in your own hands. Many a large estate has been squandered, and many a family reduced to want, in consequence of a deficiency in this part of female education.

Let me add, if Providence should ever place you at the head of a family, and you are obliged, from ignorance of domestic economy, to entrust its concerns to another, you cannot maintain the dignity which appropriately belongs to such a station. You will be subject to a thousand painful mortifications from discovering that your concerns are improperly managed, and yet being unable to suggest the proper remedy; and though you may try to flatter yourself that your ignorance on this subject may pass for evidence of a genteel education, it is more than probable that the unsavoury food, which will sometimes chance to be placed before your guests, will lead them to regret that you happened to possess so unfortunate an accomplishment.

What I have said hitherto on this subject has been principally upon the supposition that you are to be placed in circumstances of external ease and affluence. But I hardly need say that this is by no means certain. Even if your prospects in this respect should be fair at the commencement of domestic life, there are a thousand changes which may await you, any one of which may cast around you the gloom and desolation of heart-breaking poverty. I could tell you of many who have begun life without a cloud being seen to settle upon their temporal prospects, and have closed it in all the degradation and wretchedness which the most abject want could occasion. It is impossible to tell what scenes of adversity this short period of life may bring before you, and it is not in the part of wisdom that you should be prepared for any lot to which Providence may call you. What, then, if you should be destined in a few years to the obscure and humble walks of poverty? What if, from a comfortable competence, you should sink to a condition upon which you have hitherto been scarcely able to look, without feelings of compassion and tears of sympathy? What if you should see around you a little domestic circle, in which the dreary evils of poverty clustering upon them in melancholy profusion? And what if, in the midst of all these circumstances of external depression, you should be found incapable of devising a plan or lifting a hand for the relief or comfort of yourself and family? In supposing this case, believe me, I am not dealing in fiction: I have seen an elegant, accomplished female, brought up in the lap of luxury, in these very circumstances; and who knows but that such a case may be their own? Sure I am that another argument cannot be necessary to impress you with the importance of the subject I am endeavouring to urge.

And now if I have gained your conviction to the importance of this branch of education, let me repeat the request that you will begin, without delay, to make a plan for its attainment. I know, indeed, that much depends in this case on maternal aid, and much effort; but I know too that there is in some young females an aversion to domestic employments which a mother's persevering exertions do not overcome; and I also know that little improvement can reasonably be expected in any department of knowledge, in which the mind does not act not only without constraint, but with cheerfulness. And I beg you to be so sensible of this, that unless you put your hand to it frequently, and learn to think it no dishonour to engage in anything appertaining to the economy of a family, you can never expect to become an accomplished housekeeper. In a preceding chapter I have urged upon you the importance of taking a good degree of exercise: let me here say that you cannot comply with that direction to better purpose, than by spending a part of every day in domestic employment. And while it will secure to you the benefit of relaxation from your studies, and of the exercise of your bodily powers, it will be an effectual and the only effectual means of preparing you to appear with honour and usefulness in this department, as the head of a family.

In connexion with this general subject I have a word to say in respect to the regulation of your expenses. In all your dealings I

would have you avoid even the appearance of being parsimonious: let no one ever have just occasion to say, in respect to any pecuniary transaction of yours, that it has not been perfectly liberal and honourable. Nevertheless, there is an ostentation of liberality which I would have you carefully avoid; for it is really a contemptible quality, and so it is with regard to it. There is also in some young females a spirit of extravagance—a disposition to incur expenses which their condition in life neither demands nor justifies—another quality which deserves severe reprobation. Let your expenditures be regulated, not merely by a regard to your ability, but to your accountability as a steward of the divine bounty. Regard economy as a virtue, and never be unwilling to be seen in the practice of it. It is honourable to contract your personal expenses as far as you may, that you may thereby have the more ability to succour the needy and distressed.

I will close this chapter by suggesting a hint or two on the subject of dress; as it is in relation to this, more perhaps than any thing else, that most young females are tempted to indulge in extravagance. I would always have you appear in this respect neat and decent, and do not care how much correct taste you display; but I beg you to avoid all gaudy and superfluous ornament. It is a good rule to follow the fashion in dress just so far that you shall not be marked as singular. But you may rely on it, that a disposition to take the lead in fashions, to shine forth in splendid apparel, and a gaudy glare of lace and gold, is always taken with discerning people as proof of a weak head or a proud heart."

TRAVELLING IN FORMER TIMES.

We give the following, from a correspondent, as corrective of a short notice on the same subject, which appeared in the 44th number of the Journal:—"A comparison of the rate of travelling in our own times with that of our forefathers, at no very remote period, has appeared, but is not altogether correct. It is true the modern wheel carriages have greatly the advantage over those which were in use even so late as the very end of last century. For instance, the Perth Fly, in 1797, took nearly twelve hours in running between Edinburgh and Perth. In old times, however, the feats of both equestrians and pedestrians were often surprising enough, and are hardly exceeded by anything similar we read of in this age of improvement. Two hundred years ago, King James's groom rode six days in succession between London and York, in day-light no doubt; it was in the month of May, but still it was a wonderful exertion. About the end of George II.'s reign, 1755 to 1760, the London and Edinburgh coach was advertised to run at the rate of fourteen days in summer, and sixteen in winter; but at this very time, the mail, conveyed on horseback, was only four days by the way, and might have come much sooner but for stoppages and bad arrangements. The post riders being usually boys, as being of light weight, in their course north and south, two of these usually met in Coldingham Moor, between Dunbar and Berwick, and at one time, contrived to have a game at the pennystones or quoits, regularly on their meeting. By these means the business of the nation was allowed to stand still often for two hours or more. This led to inquiries at the different post-offices; of course none of these would take with the delay, and it was some time before the ridiculous cause was discovered. The news of the battle of Minden, Westphalia, August 1759, reached Edinburgh, via London, nearly in as short a time as the accounts of Waterloo, in 1815. In 1748, the Edinburgh and Glasgow coach went the one day to Glasgow, and returned the next, but it is not true that it took a day and a half for the journey. At this time the soberest citizen of either town allowed himself just about seven hours on horseback for the journey. So late as 1760, in the inland parts of the south of Scotland, goods were uniformly conveyed on the backs of horses, and not in carts. Belonging to the town of Hawick there were carriers who went regularly to Edinburgh, to Berwick, and to Glasgow; each of these employed several horses, the first carrying usually bells to distinguish his place in the dark. Their route through the track of Gala Water was so much in the bottom of the valley, that they had to ford the Gala nineteen times between Heriot House and Galashiels. It is a ridiculous exaggeration, however, that a carrier required a fortnight to travel from Selkirk to Edinburgh and back, as the horses with their packs could accomplish this journey in about a day and a half or two days at most. As to pedestrians, the express runners and running footmen formerly were noted for the celerity of their motions. One of these, ordered to proceed from Dundee to Newcastle, instead of going by Leith and Edinburgh, shaped his course to the East Neuk of Fife, and, hiring a boat, crossed to Dunbar, and by this means accomplished his journey in an incredibly short time."

ANIMAL WEATHER-GLASS.

In Germany there will be found, in many country-houses, an amusing application of zoological knowledge for the purpose of prognosticating the weather. Two frogs are kept in a glass jar about 18 inches in height, and 6 inches in diameter, with the depth of 3 or 4 inches of water at the bottom, and a small ladder reaching to the top of the jar. On the approach of the dry weather the frogs mount the ladder; but when wet weather is expected, they descend into the water. These animals are of a bright green.—*Anglo-Ger. Ad.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 46, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 39, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by WILLIAM and ROBERT CHAMBERS, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLAN, Jun. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Walk.

SATURDAY, JANUARY 26, 1833.

PRICE THREE HALFPENCE.

MAGNANIMITY.

WE have learned with some regret, that, among the more dignified class of our readers—for the Journal is read by all classes, as well by those to whom its price is an inconceivable atom of money, as by the multitudinous children of industry to whom its low price barely renders it accessible—a few express themselves dissatisfied with the homeliness of those articles which fall under the description of sketches of society. This kind of society, they say, is not ours; it is that of our tradesmen, or something else that we know nothing of—there is not the least reference to what we consider society in the whole of it. Now, with deference, we think that this dissatisfaction arises from one of the least amiable peculiarities of those who do not require to labour for their bread. In the intercourse that we have had with what is technically called *good society*, we have always observed one thing as very conspicuous—an affected unconsciousness of all that is below—an assumed ignorance of all the many acts by which the multitude obtain the food which Providence has ordained for them—a complete exclusive supposition that there is no class in the world worthy of being thought of, but those who have what we can only describe as the singular good fortune of being enabled to live splendidly without ever having had the trouble of earning a penny. This peculiarity is, we fear, too essentially a part of our nature to be easily cured, or laughed out of countenance. And we see too much of the same disposition among the middling class, so far as circumstances permit it to be developed, to justify us in railing at those in whom it is most broadly observable. *It is surely, however, to be regretted that this general desire to appear as exalted as possible above the necessities which we inherit from nature, should lead so often as it does to a real contempt for those who are more subject to these necessities than ourselves, or rather so effectually as it does all the sympathy that might otherwise be experienced respecting the modes of thinking, action, and feeling of the less fortunate in life. We are all part of the same great family, all alike tending onwards to the same lofty fate, and only separated here by partitions which, when surveyed from a distance, do not appear: why should dust be disrespectful to dust, or the brief space of mortal life be filled with heartburnings and other self-brought evils, in addition to those which are inseparable from its condition?

It may be urged as a startling objection to what we are stating, that there are delineations of humble life, both in literature and art, which perhaps please the highest class more than even that to which they refer. The pictures of Teniers and Wilkie, and the gipsies, beggars, and peasants of Scott, are nowhere so highly relished as in the very loftiest circles of society—even the late Monarch of these islands having been a devoted admirer of what is called the Dutch school of painting. But this is, in reality, no objection. It is only when the subjects are from a class a *little* inferior to our own, that the antipathy is observable. The noble will easily tolerate the very humble, as a matter of curiosity; but they can cherish no kind feelings towards the class which immediately "galls their knee." In that class they see a perpetual attempt to imitate, and get upon the same level with themselves, which, when taken in connection with the symptoms of their real inferiority, provokes anger and contempt. In the former case, there is necessarily no hostility, for the very good reason that there is no competition. But in the other case it is found, as in all others where there is a possibility of self-love whispering "you are as good as he," that there can be no good fellowship.

It may be perceived that the sentiments to which we here refer are unfortunately fostered by the greater proportion of British writers, few of whom seem to consider it worth their while to depict the features of that great and varied middle class of society which forms one of the most striking characteristics of our country. They direct their efforts chiefly to the delineation of a highly artificial state of social life, in which nature has lost all its grace and warmth, thus strangely passing over what must be daily coming under their own observation, and which is susceptible of being turned to the best moral account, in order to satisfy the vitiated taste of a class who already perhaps know too little of the manners, the usages, and the feelings of those placed immediately below them.

This brings us to the other side of the subject—the invidious feeling which the inferior is apt to cherish towards the superior order; a feeling exactly corresponding in strength to the contempt which the superior is so unfortunately apt to entertain for the inferior. Unavoidable as both sentiments may be in a great measure, they are decidedly to be considered as among the most unworthy that beset our nature, and those which we are most called upon to contend against. To repine at the good of another is repugnant alike to human philosophy, and to Christian charity. It deprives us of that satisfaction which all of us are designed to have, each in his own temporary station, and places us virtually in a state of rebellion against the ordinances of the divine will. It is a cowardly, and, therefore, an ineffably mean passion; for in every one of its emotions, our imagination makes a stab at our neighbours, which our hand could not dare to do at his person. In general, no man who hopes to obtain any good by his own deservings, or feels within himself the power which will in time enable him to obtain it, will degrade himself by the most transient emotion of this passion; he will feel that nothing would so truly render him unworthy of ever attaining to what he desires, as to look with the sickly eye of envy upon the same good already obtained by others. It is, however, to a limited number, that the power is thus given of resisting such emotions. The only effectual guard against either contempt for our inferiors, or envy for our superiors, is the habit of mind called MAGNANIMITY.

Magnanimity is literally greatness of soul, and in general implies an elevation of mind which places us above all unworthy or degrading feelings. It should be the object of every one to cultivate this condition of mind as much as possible, or, if we have it not well developed within ourselves, we ought to place models of it before us, and only act and feel as we may suppose such persons would act and feel under similar circumstances. It is only in the magnanimous in any rank of life that there is real goodness; for unless the lower passions have been trampled down by this grand controller of the soul, there can be no clear stage for the better feelings to act upon. Above all things, magnanimity will place us above the aptitude to sneer at every thing that we think a little less informed, less fortunate, or less gifted with the world's honour, than what belongs to us—and also, and to the same degree, above all liability to this constant inward assassination of all whom we think somewhat better off than ourselves. The magnanimous person will not take a paltry revenge, either in speech or deed, for a trivial invasion of his rights of any kind: he has too much respect for himself to do so. He will speak no evil of a neighbour—not that he perhaps thinks it undeserved, but that he thinks it mean to do that, in the security of his neighbour's absence, which he could

not do to his face. His elevation above low feelings enables him to take a benevolent and philanthropic view of human nature, to make kind allowances for what is deficient in the conduct of some, and to award due praise for what is meritorious in others, and nowhere to permit a trivial personal interest, or a jot of his own self-love, to colour his estimate of a fellow creature, whether placed above or beneath him. By this means he preserves his own purity of character, and ensures a far more certain return of honour and respect in the long-run, than he could obtain by the most constant and successful habit of detracting from the merit of others.

STORY OF A VAGABOND, OR SCENES IN JAMAICA.

THE sun had not yet risen. It was the short grey twilight, which, in the tropics, intervenes between the total darkness of night and the perfect effulgence of day. The land-breeze was blowing delightfully fresh and cool, and as it came, in fitful gusts, up the precipitous gullies, tearing through the tall and willow-like clumps of bamboos that surrounded our dwelling, and swaying to and fro the gossamer mosquito-net that encircled my bed, having free ingress through the open *jealousies** of my bed-chamber, I felt a sensation almost of chilliness, which I enjoyed with all the zest of the thirst-parched traveller when his lip first touches the cool waters of the fountain in the sandy desert. The situation of the property on which I resided was a most picturesque, and to me, in many respects, a most frightful one. It was a narrow promontory, shooting out from, and at right angles with, the western ridge of the Blue Mountains, and inaccessible, on any side, but by roads, as near as might be, perpendicular. On our right flowed the Yallah's river, down to the channel of which, although one could almost pitch a stone into it, it was yet a good hour and half's ride; the road winding along the face of the bank somewhat in the form of a cork-screw, or rather after the fashion of those curvatures described by shower-drops on a glazed window in a rainy day. The *history* of the above river may give strangers to tropical climes some general idea of the fearful elemental convulsions which at times overtake them. The gentleman whose guest I was informed me that previous to 1815 it was a mere brook, which he could with ease step across. At that time he possessed a fine coffee plantation on its banks, the result of many long years of industry and economy; and as the West Indian trade was then in its high and palmy state, he had the prospect of speedily realising a fortune, large even beyond his wishes, and of returning to his native country, Scotland, to enjoy the fruits of his labours, long before he had reached the prime of manhood. In the foresaid year, a hurricane of wind and rain occurred which spread ruin and desolation over the island, and occasioned the loss of hundreds of lives. His house, being situated in a sheltered spot, was safe from the fury of the wind, but he soon saw grounds for apprehension from a foe equally terrific and resistless. The brook began to rise; and only those who have personally witnessed such a scene, can have any correct idea of the impetuous velocity with which the rains sweep down the sides of the mountains, often stripping the entire soil off the coffee plantations in their devastating career. As the Yallah's Burn, now swollen to a mighty torrent, began to approach the house and offices, the negroes, who firmly believed that nothing less than a second

* Similar to Venetian blinds, but upon a larger scale. They are fitted into the window-frame instead of glass, and can be opened or closed at pleasure.

deluge was at hand, crowded, with tears and lamentations, round their master, beseeching him to beg of "de big Spirit no to drown poor nigger man, till him learn to b'ave himself like good Christian;" and promising "neber to tief, nor tell lie, nor need fum fum (the whip), no mo, but do as Massa Busher bid them, and be good nigger eber after for no time at all." The waters soon reached the threshold, when my friend, seeing the peril every moment increasing, looked the doors of all his houses, and scrambled a considerable way up the bank, with his black companions. In less than half an hour, every vestige of his premises was under water, and the fugitives were driven higher up the bank—a second, and a third time. At last, as it began to grow dark, and it seemed quite uncertain where the rising of the torrent would terminate, they ascended about a mile up the mountain, and took shelter within a natural excavation in the rock. There they sojourned for three days and three nights, subsisting upon what wild roots and fruits they could collect, during which time the tempest raged with unceasing fury. The wind, my friend told me, appeared frequently to blow from all points of the compass at once, and often to descend, as it were, perpendicularly from the cloudy firmament; at which times the trees were smote or bent to the earth, and the branches riven from their trunks, after a fearful manner. In short, the whole elemental system was completely disorganised, and nature seemed about to resolve itself into its original chaos. At last the fearful visitation passed away; and as the waters subsided still faster than they rose, my friend watched eagerly and anxiously for the first glimpse of his late comfortable dwelling; but the torrent decreased and decreased until the brook shrunk into its former insignificant dimensions—but not a trace of house, offices, or property was to be seen! All had been swept down to the ocean by the overwhelming torrent, leaving only a wide channel-course, worn below the original elevation of the stream to a depth which there were no means of ascertaining—all the former local land-marks having disappeared, and the entire character of the scenery, indeed, changed. At the place where I crossed the stream, in order to reach my friend's present abode (which he had luckily saved money enough to purchase), the channel was upwards of two hundred yards wide.

On the other side of my friend's residence, ran another stream, called the Mullet Burn, from its abounding with the delicious fish of that name—something akin to, but much richer than, our burn-trout, and caught in a similar manner, with the rod and common fly. Although almost equally perpendicular in descent, the bank on this side was not nearly so profound in depth as on the other. The brow of the promontory or peak on which the house was situated, commanded a view of such magnificence as utterly to baffle the power of language to describe. How often have I stood there alone, gazing down on that singular and seldom-witnessed spectacle—a thunder-storm beneath my feet! The lightning, broad, blue, and fierce, darting hither and thither through the gloom-shrouded vale below, with a rapidity and waywardness which baffled the quickest eye-glance to follow its motions, followed on the instant by the thunder itself, not, as in our northern clime, rolling in a long and continuous roar, but expending itself in a series of explosions, like the rapid discharge of a park of artillery, augmented by the repetition of a thousand echoes, until the entire aerial space seems filled with the "strife of sound," and the senses reel beneath the shock of the awful elemental conflict. Through an opening in the mountains towards the south-east, our house commanded an extensive view of the Caribbean Sea, by which we could distinctly discern all vessels passing to and from Europe, North America, &c., by the windward passage, the examining the size and character of which, through a telescope, frequently constituted our sole occupation for the day. And this brings me back to the original purpose of my present narrative.

It was, as I have said, still grey dawn. The chirrup of the house lizard (something like the cry of our cricket) sounded loud and incessant, and the fire-flies, with their beautiful phosphorescent forms, ever and anon darted, like shooting stars, athwart my still dark apartment, when suddenly my attention was roused by the hoarse baying of the watch-dogs challenging the approach of some stranger, and immediately thereafter heard two voices talking loud and somewhat angrily, which I soon distinguished to be those of an Englishman and the negro watchman* for the night. The former seemed to be ordering, and the latter remonstrating in his own way; but was soon silenced. Presently, Philidore (the negro) passed by my window to that of his master—the door of whose apartment was directly opposite to mine, on the other side of the spacious hall—muttering and swearing to himself, in high wrath and broken English—

"Massa break Phil's head for waken him before shell-blow now.† What de debil make him de captain, dat he trabel as early? and him eye tare taring in him head, as if he seen one duffy!‡"

With these ejaculations, he proceeded to his un-

willing task of awakening his master, in, as I well recollect, the following fashion:—"Massa—Massa. (A gentle shake of the window, and a pause.)—Massa—Massa Busher! (Louder—another pause.) Massa Busher! you no hear now? (Losing patience, and shaking the window violently.) He hear no mo than if him head one pumpkin! Him augh, augh—(imitating the sound of snoring)—like one great trunk nigger!" Here he applied himself to the window again with such increased energy, that he at last succeeded in his purpose; and I heard my friend demanding, in great ire, what the black rascal meant by disturbing him so early?

"It no black rascal dat turb you, massa! it be de brown rascal."

"How, sir?"

"Dat is, massa, de person dat call himself Brown!"

"Who is he? or what does he want?"

"He no tell dat, massa; but he want de doctor."*

"Well, go round to the hall, and get it for him."

"But he want more than dat, massa," persisted Philidore; "he want de mule to carry him over de pass, and nigger to go wid him."

"The devil pass him!" ejaculated my worthy host, getting out of bed, with woeful reluctance, to perform the imperative duties of Jamaica hospitality.

I now heard my host leave his room, and admit his early visitant into the front hall, at the other side of the house, which was too distant for me to hear a word of what passed between them. Soon afterwards, they both went out; and as the sun was now hot, and high above the horizon, I arose, although it was scarcely five o'clock. My host returned at seven to breakfast, and, whilst discussing our plentiful meal of boiled yams, roasted plantains (which taste exactly, when young, like new-baked barley scones), salt pork and fish, eggs and fresh roasted coffee, seasoned with goats' milk and sugar as black as treacle, I adverted to the untimely visit he had received that morning.

"Poor wretch!" he replied, in a tone of commiseration, "he is one of the most miserable beings ever cursed with the burden of existence! And yet the scoundrel scarcely merits pity. He is one of those cold-hearted, cool-headed, calculating sensualists, whose whole thoughts are engrossed with the consideration of self, and the gratification of their animal passions. Handsome, pre-eminently handsome, in features and person, and with a singular plausibility of tongue and manner, he won a strong regard towards himself on his first arrival in the island about eight months since, not only amongst the female, but male coteries, to which he gained admittance. His red coat, besides, was a general introduction."

"He belongs to the army, then? What regiment?"

"He was a lieutenant in the —, now lying at Up-park camp."

"And what rank does he hold now?"

"That of a vagabond," answered my host, in a mingled tone of pity and bitterness.

I begged him to explain, my curiosity being aroused by the odd sort of *vice* he had mentioned.

"It is not more than eight months ago," pursued my friend, complying with my request, "since this man arrived at Kingston, and joined his regiment with a lieutenant's commission. Since his disgrace, some strange rumours have gone abroad respecting the reason of his leaving England. It is said that he was married, and has a wife, whom he deserted a few weeks after their union, still living there."

A chilly shuddering came over me.

"What is his name?" I asked, with much trepidation.

"Brown," was the reply. I felt indescribably relieved.

"Whether married or not," continued my friend, "he forthwith began to enact the modern Don Juan in Kingston and the neighbourhood, and soon became notorious for the gross viciousness of his conduct. How it happens, heaven alone knows: but it is a singular and melancholy fact, that women often prefer professed libertines to men of amiable disposition and good moral habits. And so it unfortunately happened, in regard to this man, with the daughter of a late old and valued friend of mine, residing with her uncle, a wealthy merchant in Kingston. Despite all the remonstrances and watchfulness of her uncle and relatives, to whom Brown's licentious conduct was well known, and who suspected truly the motives of his attentions to her, he succeeded in gaining her affections under promise of marriage. It was evident the scoundrel calculated upon his regiment being removed to a distant station; but fate willed it otherwise, and the case of the poor girl was no sooner disclosed, than her only brother hastened from Spanish Town to demand reparation. Brown, I believe, would have fulfilled his promise, but for one circumstance, which, however, to his selfish and unprincipled nature, was all-sufficient. She was penniless, and her uncle would not bestow a dollar on the man who had abused his hospitality. Upon his refusal to make amends for his treachery, there was, of course, only another alternative:—the brother and he met in the field of honour, as it is called, and the former was shot through the heart at the first fire! The cool baseness of the whole transaction, however, was so notorious, that he was not only sent to Co-

* A dram, or, as our break-of-day tipplers at home would term it, "their morning."

ventry by his brother officers, and excluded from all respectable society, but upon a memorial of the facts being sent home to the commander-in-chief, the next packet brought his unconditional dismissal from the army, couched in the severest terms of reprehension and opprobrium. Not having money enough to leave the island, the poor wretch has, since then (about four months ago), been wandering about the interior, an outcast and a vagabond. Every door is of course open to a white man here, nor is there a possibility of his starving; but he seems to bear the Cain-mark on his brow; he is shunned by every one, and the misery of his situation appears to be fast driving him to insanity. His appearance this morning was truly frightful, and the first thing he called for was a dram. I suppose he had been lying in the bush all night."

Some passages in my friend's short narrative had recalled some painful reminiscences to my mind; and to banish these, I strolled away down to a neighbouring property, situated on the Mullet Burn, to while away the forenoon over a game at chess with the kind-hearted proprietor. The first object that attracted my attention, on entering his house, was the figure of a man stretched on the sofa, with a cloak thrown over him.

"I am glad you are come," cried my host, "shaking my hand cordially; I have been pestered all the morning with a fellow here" (pointing to the sofa), "who has done nothing but call for rum, rum, every minute, till he has made himself beastly drunk. I wish I was quit of him."

It was the outcast Brown. We sat down to our game, nevertheless, and when I left to return to my friend's house to dinner, the wretched being was still sleeping the sleep of intoxication.

It was between five and six o'clock on the following morning that my host and myself were standing on the top of the bank above the Mullet Burn, chatting about various matters. It was a beautiful morning. The nightingales were trilling their lays from every tree, and the tiny, rainbow-decked humming-birds were all astir, sucking their food from the white flowers of the cashew tree, and the purple ipecacuanha plant. Suddenly, a cry of terror was heard about half way down the bank, and three large john or carrion crows rose hastily into the air, as if disturbed in the midst of one of their disgusting feasts. We stepped forward a few paces, and saw the negro Philidore running up towards us, his large eyes starting from their sockets, and bellowing and gesticulating like a madman. "Agh! agh! what me see now! De duffy noting to dat! It be worse than de debil mites! Agh! what me see!"

"What is wrong now, Sir?" shouted mine host.

"Agh, massa—you come dis way, massa," panted out the terrified negro—"me feared to tell what I see massa! De white man lie down dere in de gully, massa, wid him troat slice across, massa, like one pumpkin! Tead—tead—massa! and de john-crow, too!"

"Gracious Heaven!" exclaimed my friend, shuddering, "has there been murder going on!"

Calling to the negro to follow him, he hastened down the bank. I remained where I was, my situation enabling me to see all that passed below. The negro, I observed, ran on towards the house where I had been visiting the previous day, and presently the proprietor, attended by three or four negroes, hastened towards the spot where my friend was standing. After a few minutes' delay, I saw them lift the body of a man, and bear it down to the office-houses of the former. In a short while my friend returned up the bank, and detailed to me the horrid affair. The dead man was the outcast Brown, and he had evidently perished by his own hand. Immediate notice of the occurrence was despatched to the coroner of the district, who speedily attended; and as white men were somewhat scarce thereabouts, I was, most unwillingly, impressed into service as a jurymen, to examine the body. The suicide was lying upon a bench in an outhouse. He was dressed in a worn-out military blue frock-coat, torn and soiled. The soles were worn off his boots, through which his naked feet protruded; he had no linen upon him, and, in short, he looked the very picture of poverty and wretchedness. He was laid so that the horrid wound in his throat, which almost severed his head from his body, was fully displayed, and in his right hand was an open gore-clotted clasp-knife, grasped with the rigid tension of death. The jurors scrutinized the mangled corpse (for the john or carrion crows had been tugging and tearing at the gullet), and I was myself compelled to go through the revolting duty. An undefinable feeling of recognition thrilled through me, as I accidentally scanned the lower features of the face, which were beautifully moulded. I instinctively raised the head with my left hand to take a minuter inspection, and, oh! what a mortal sickness came over my heart, as I gazed, in speechless horror, on that countenance, every lineament of which was burnt into my soul as if with living fire! It was he! the beloved companion of my youth—my first, my only friend! It was he—the heartless villain! whose remorseless treachery had broken the heart of my grey-headed father, and driven my orphan sister, whom he had wedded and abandoned, into irremediable insanity! It was he! whom I had pursued for years—years which seemed ages—through every nook of Europe, tracking him with the steady and untiring determination of the sleuth-hound, thirsting, thirsting for vengeance; until it had pleased God to recall me to a better

* The negroes take this duty by turns, marching all night round the premises well armed.

† The horn that is blown to assemble the negroes to, and dismiss them from, labour.

‡ A ghost.

mind, and I resigned him to the chastisement of his Maker. Fearfully, indeed, had it at length overtaken him! His own hand had become the avenger of the crimes he had perpetrated. And, mysterious Providence! where? Even before the eyes of him whom he had most foully and deeply wronged, and in a far, distant nook of the earth, whither I had flown, expressly to forget, amid strange scenes and new occupations, the fatal consequences of his baseness! Yes! there he lay before me—the false friend, the seducer—the murderer—the SUICIDE! It was a fearful—a humiliating—a pitiable spectacle! And a strange change came over me, as I gazed and gazed on that once beloved face, unconscious—utterly unconscious—of the wondering group around me—and, for a time, all my injuries and sufferings were forgotten. My fancy was away back among the long happy years of blissful boyhood. My heart melted within me, and the blessed tear-drops were fast welling forth from my o'erburdened brain—but, in a moment, they rushed back to their source, and every fibre, vein, and muscle of my body, seemed each to become instantaneously possessed with a separate devil, as my eye fell upon a token which I knew right well. It was merely a paltry peach-coloured ribbon, to be sure; but, oh! what associations did it not conjure up! and how did these contrast with the spectacle that was now before me! I snatched at it, spotted and bedabbled as it all was with his guilty blood, and tore it from his neck with the fury and strength of a maniac, bringing along with it the small ivory locket which I guessed truly was still appended to it. It was the image of my sister, whose faultless features I had thus, in our days of bliss and innocence, attempted, with my own hands, to depict; intended, and with my own sanction given, as intended to—whom?—the abandoned of God and man, who now lay before me reeking in his self-shed gore—her betrayer—her worse than murderer! I dashed it to the earth, in utter phrenzy, and crushed it with my heel into a hundred atoms. With a humane delicacy, which was rather uncommon, no one questioned me as to the cause of my strange agitation. After all was concluded, I walked home with my friend, who was rejoiced to observe my composed demeanour, and hopeful that no bad consequences would ensue from the agitating scene through which I had passed. My reason had indeed been strained almost to cracking. But luckily I was in kind and considerate hands. By medical advice, a passage was taken for me in a merchant ship for Britain, of my going aboard which I have not the slightest recollection. Many weeks, indeed, elapsed ere my reflecting faculties awoke from their torpidity; nor was it until we were tumbling about among the bracing breezes of the north, off the banks of Newfoundland, that I regained the full and healthy use of my reason.

POPULAR INFORMATION ON HISTORY.

THE ROMANS.

The Empire—its Decline and Fall.

THE commonwealth of Rome was at the height of its power, after a lapse of seven centuries from the foundation of the city, or about the commencement of the Christian era. These seven centuries had been filled with a rapid succession of triumphs. Every country in Europe, Asia, and Africa, lying within reach of its legions, had become part of the Roman dominions by military conquest. At this period it reckoned about seven millions of citizens, and twice as many provincials, besides as many slaves. From being an obscure town, Rome had increased in magnitude to an inconceivable extent, and was adorned with majestic temples, public edifices, and palaces, whose ruins are still to be seen in that now degraded city. The public monuments of this remarkable people were placed, not only in the capital, but all over the provinces; and some of them are till this day reckoned among the greatest wonders of art. But the stupendous character of their undertakings was chiefly seen in their roads. All the cities of the empire were connected with each other, and with the capital, by public highways, which, issuing in various directions from the forum—or great central place of public assembly—of Rome, traversed Italy, pervaded the provinces, and were terminated only by the frontiers of the empire. On the north-west, the boundary of this extensive empire was the wall of Antoninus, built betwixt the Firths of Clyde and Forth, in Scotland, and on the south-east it was the ancient city of Jerusalem. If the distance between these two points be carefully traced, it will be found that the great chain of communication was drawn out to the length of 4060 Roman miles, or 3740 English measure. "The public roads" (says Gibbon) were accurately divided by milestones, and ran in a direct line from one city to another, with very little respect for the obstacles either of nature or private property. Mountains were perforated, and bold arches thrown over the broadest and most rapid streams. The middle part of the road was raised into a terrace, which commanded the adjacent country, consisted of several strata of sand, gravel, and cement, and was paved with large stones, or, in some places near the capital, with granite. Such was the solid construction of the Roman highways, whose firmness has not entirely yielded to the effort of fifteen centuries. They united the subjects of the most distant provinces by an easy and familiar intercourse; but their primary object had been to

facilitate the marches of the legions: nor was any country considered as completely subdued, till it had been rendered, in all its parts, puerile to the arms of the conqueror. The advantage of receiving the earliest intelligence, and of conveying their orders with celerity, induced the emperors to establish, throughout their extensive dominions, the regular institution of posts. Houses were every where erected at the distance of only five or six miles; each of them was constantly provided with forty horses, and, by the help of these relays, it was easy to travel an hundred miles in a day along the Roman roads." By these means the Romans maintained their ascendancy in every country, and diffused through the whole empire the improvements of social life. The arts and luxuries of the east were carried among the rude barbarians of the west. Almost all the flowers, the herbs, and the fruits that grow in our European gardens, were thus introduced from more genial climes. They brought the cultivation of flax from Egypt into Gaul; they every where gave encouragement to commerce and manufactures; the most remote countries were ransacked to supply the pomp and delicacy of Rome, by which means the arts were brought to a flourishing condition. The Romans governed their provinces by consuls or prætors, and, though they did not interfere with the conquered tribes in their religious observances, they ruled them by the enlightened laws of Rome; and in this manner gave a uniform tone and consistency to the governments of almost every country.

The Roman government, which was originally monarchical, had for several centuries existed as a republic, and under this popular form the state attained that pitch of grandeur we have already described; but the time was now arrived when the corruptions of the commonwealth were too great to admit of any cure but an absolute government. The power on this occasion fell into the hands of Julius Cæsar, a person who has been justly famed for his extraordinary abilities as a general. The magnitude and extent of the military exploits of this distinguished soldier promoted him from the office of chief consul and dictator to that of emperor. But this elevated rank he did not long enjoy, being openly assassinated by a band of conspirators, in the fifty-sixth year of his age, and about fourteen years after he began his extensive conquests. Before Julius Cæsar had been raised to the highest honours of his country, he was opposed in his ambitious designs by another distinguished leader, called Cato, who has been described as one of the most faultless characters in Roman history. This eminent patriot was, however, unable, by force of arms, to restore the liberties of the people, or to arrest Cæsar in his victorious and ambitious career. Being at last deserted by his friends, and dreading to fall into the hands of his enemy, after pondering a while on the nature of the immortality of the soul, he stabbed himself with his own sword. In committing this criminal act of suicide, Cato acted conformably to the harsh tenets of the ancient philosophers called Stoics, who maintained that life was a gift which all men might return to the donor when the present was no longer pleasing.

After Julius Cæsar, there ensued a long series of emperors of Rome, who possessed an almost unchecked sway over all orders of the people.* The second emperor, Augustus, or Augustus Cæsar, relinquished the ambitious designs of his predecessors; he endeavoured to consolidate the empire, instead of extending it to undue bounds, and introduced a spirit of moderation into the public councils hitherto unknown. Knowing the taste of the Romans, he indulged them in the pride of seeing the appearance of a republic, while he made them really happy in the effects of a most absolute monarchy, guided by the most consummate prudence. Historians delight in recounting the number of good deeds of Augustus, and the glories of his time; and from him the phrase of "the Augustan age," as applied by writers to periods in the history of nations remarkable for the prosperity and refinement which prevailed, has been derived. It was in the twenty-fifth year of the reign of this magnanimous prince that Jesus Christ was born, in the Roman province of Judea. In the year 14, Augustus was succeeded by Tiberius, a person of an entirely different character, and under whom the corruptions of the state became very perceptible. In the nineteenth year of his cruel reign, Christ was crucified, under Pontius Pilate, the Roman governor of Jerusalem. In the year 37, Tiberius was put to death, by smothering him with pillows, or, as some historians mention, by poison; and he was succeeded by Caligula, a person of vicious and still more cruel habits. He was also prodigal and extravagant to a degree almost inconceivable. The luxuries of former emperors were simplicity itself when compared to those which he practised. He contrived new ways of bathing, where the richest oils and most precious perfumes were exhausted with the utmost profusion. He found out dishes of immense value, and had even jewels, as we are told, dissolved among his sauces. He sometimes had services of pure gold presented before his guests instead of meat. But his prodigality was the most remarkable in regard to his horse. He built it a stable of

marble, and a manger of ivory. Whenever this animal, which he called Incitatus, was to run, he placed sentinels near its stable the night preceding, to prevent its slumbers from being broken. He appointed it a house, furniture, and a kitchen, in order to treat all its visitors with proper respect. He sometimes invited it to his own table, and presented it with gilt oats, and wine in a golden cup. He often swore by the safety of his horse; and historians mention, that he would have appointed it to a consulship, had not his death prevented. Caligula met a merited death by assassination, after a reign of less than four years; and of him it has been said, that nature seemed to have brought him forth, to show what was possible to be produced from the greatest vice, supported by the greatest authority. He was succeeded by Claudius, who was a feeble and contemptible emperor, and who was finally cut off by poison. Nero, the next emperor, was at once noted for his cruelty, his vanity, and his debased passions. The atrocities he committed go beyond the reach of language to describe, and are such as, perhaps, never entered into the mind of any other human being. All orders of men were at this time so depraved, that each seemed eager to contend which should be most instrumental in pushing him on to his excesses, and applauded him when he had committed them. A conspiracy, however, having been raised against him, and being at length hunted by assassins, he fell by a stroke of his own dagger. Of the succeeding emperors we need not here enter into a detail. Under Vespasian, the tenth, and Titus, the eleventh emperor, the state rallied a little, and justice and an appearance of decency were once more resumed; and under Trajan, the fourteenth emperor, were found the glories of the reign of Augustus. Trajan advanced the empire to a greater degree of splendour than it had hitherto acquired. He pursued his military conquests into new regions, even to Hindostan, and added greatly to the extent of the Roman territories; although this, however, was not ultimately attended with any good effect. Trajan is distinguished as the greatest and the best emperor of Rome. Having given peace and prosperity to the empire, he continued his reign, loved, honoured, and almost adored, by his subjects. A pillar commemorating his great actions, erected in Rome, is still in existence. His successor, Adrian, was also a good sovereign, and was distinguished for his abilities and literary acquirements. After this period, the empire was never under the authority of any emperor remarkable for his magnanimity. The greater part of the successors of Adrian were dissolute and vicious in their habits, and under them the empire waned to its close. The only one necessary to be noticed was Constantine, the forty-first emperor.

Constantine the Great, as he has been called, was the first emperor who embraced the Christian religion; yet this important event, which occurred about the year 311 of our common era, did not avert the evils which now pressed upon the Roman empire. Constantine most imprudently executed a resolution of transferring the seat of government from Rome to Byzantium, or Constantinople, as it was afterwards called in honour of his name. Whatever might have been the reasons which induced him to this undertaking—whether it was because he was offended at some affront he had received at Rome, or that he supposed Constantinople more in the centre of the empire, or that he thought the eastern parts more required his presence, experience has shown that they were all weak and groundless. The empire had long before been in a most declining state; but this division of its strength in a great measure gave precipitation to its downfall.

For a considerable period the Roman dominions were pressed upon on nearly all sides by ferocious tribes of barbarians. Immense armies of these savages issued from the north of Europe, from countries beyond the boundaries of the Roman states, and laid the empire continually under contribution. These barbarians were at first unknown to the Romans, and for some time after had been only inconvenient to them. But they were now become formidable, and arose in such numbers, that the earth seemed to produce a new race of mankind, to complete the empire's destruction. The emperors who had to contend with this people were most of them furnished neither with courage nor conduct to oppose. Their residence in Asia, to which they too often went, seemed to enervate their manners; and their soldiers, following their example, became effeminate, and unable to defend the ancient glories of their name. A large body of an uncivilized people called Goths, having been called in to assist the regular forces of the empire, under the command of Alaric their king, this prince took advantage of the impotent condition of the government. From an ally he became a dangerous foe; and finally marching to Rome, made himself master of the city, which he abandoned to be pillaged by his soldiers. Rome was afterwards plundered several times, and Italy overrun by barbarous invaders, under various denominations, from the remotest skirts of Europe. The inhabitants of Rome, who had sunk into the deepest vices by the overpowering influence of wealth and prosperity, were quite unable to make any defence. So debased had they become, or so ill-regulated was the balance of wealth, that for many years the whole of the lower classes had been fed daily by the emperors from the public granaries. The power of the state was

* A number of the imperial successors of Julius Cæsar assumed the title of *Cæsar*, in addition to their other designations, in the same manner as we find the appellations of Pharaoh and Ptolemy were assumed by many of the Egyptian sovereigns. The name of Cæsar has been curiously enough preserved until modern times, in the title of *Czar*, which is given by the Russians to their monarchs.

now entirely broken; the provinces were voluntarily abandoned, or rebelled, or were seized by the nearest barbarous powers. At length the title of Emperor of the West, which, on one occasion, was put up to public auction by the licentious soldiery, expired; and, to finish the melancholy account, one of the princes of the barbarians assumed the title of *King of all Italy*. "Such" (to quote the words of Goldsmith) "was the end of this great empire, that had conquered mankind with its arms, and instructed the world with its wisdom; that had risen by temperance, and that fell by luxury; that had been established by a spirit of patriotism, and that sunk into ruin when the empire was become so extensive, that a Roman citizen was but an empty name." Its final dissolution took place in the 480th year of the Christian era, or 1232 years from the date of the foundation of Rome.

[It may be advantageous at another opportunity to follow up the foregoing articles with an account of what ensued on the fall of the Roman empire, so as to show the connexion betwixt the history of ancient and modern times.]

A HIGHLAND ANECDOTE.

BY SIR WALTER SCOTT.

THE story is an old but not an ancient one: the actor and sufferer was not a very aged man, when I heard the anecdote in my early youth. Duncan, for so I shall call him, had been engaged in the affair of 1746, with others of his clan; and was supposed by many to have been an accomplice, if not the principal actor in a certain tragic affair, which made much noise a good many years after the rebellion. I am content with indicating this, in order to give some idea of the man's character, which was bold, fierce, and enterprising. Traces of this natural disposition still remained on Duncan's very good features, and in his keen grey eye. But the limbs, like those of the aged borderer in my former tale, had become unable to serve the purposes, and obey the dictates of his inclination. On the one side of his body he retained the proportions and firmness of an active mountaineer; on the other, he was a disabled cripple, scarce able to limp along the streets. The cause which reduced him to this state of infirmity was singular.

Twenty years or more before I knew Duncan, he assisted his brothers in farming a large grazing* in the Highlands, comprehending an extensive range of mountain and forest land, morass, lake, and precipice. It chanced that a sheep or goat was missed from the flock, and Duncan, not satisfied with despatching his shepherds in one direction, went himself in quest of the fugitive in another.

In the course of his researches, he was induced to ascend a small and narrow path, leading to the top of a high precipice. Dangerous as it was at first, the road became doubly so as he advanced. It was not much more than two feet broad, so rugged and difficult, and, at the same time, so terrible, that it would have been impracticable to any but the light step and steady brain of a Highlander. The precipice on the right rose like a wall, and on the left, sunk to a depth which it was giddy to look down upon; but Duncan passed cheerfully on, now whistling the gathering of his clan, now taking heed to his footsteps, when the difficulties of the path peculiarly required caution.

In this manner, he had more than half ascended the precipice, when in midway, and it might almost be said, in middle air, he encountered a buck of the red-deer species coming down the cliff by the same path in an opposite direction. If Duncan had had a gun, no rencontre could have been more agreeable; but as he had not this advantage over the denizen of the wilderness, the meeting was in the highest degree unwelcome. Neither party had the power of retreating, for the stag had not room to turn himself in the narrow path; and if Duncan had turned his back to go down, he knew enough of the creature's habits to be certain that he would rush upon him while engaged in the difficulties of the retreat. They stood therefore perfectly still, and looked at each other in mutual embarrassment for some space.

At length the deer, which was of the largest size, began to lower his formidable antlers, as they do when they are brought to bay, and are preparing to rush upon hound and huntsman. Duncan saw the danger of a conflict in which he must probably come by the worst, and, as a last resource, stretched himself on the little ledge of rock which he occupied, and thus awaited the resolution which the deer should take, not making the least motion for fear of alarming the wild and suspicious animal. They remained in this posture for three or four hours, in the midst of a rock which would have suited the pencil of Salvator, and which afforded barely room enough for the man and the stag, opposed to each other in this extraordinary manner.

At length the buck seemed to take the resolution of passing over the obstacle which lay in his path, and with this purpose approached towards Duncan very slowly, and with excessive caution. When he came close to the Highlander, he stooped his head down as if to examine him more closely, when the devil, or the untameable love of sport peculiar to his country, began to overcome Duncan's fears. Seeing the animal proceed so gently, he totally forgot not only the dangers of his position, but the implicit compact which certainly

might have been inferred from the circumstances of the situation. With one hand Duncan seized the deer's horn, whilst with the other he drew his dirk. But in the same instant the buck bounded over the precipice, carrying the Highlander along with him. They went thus down upwards of a hundred feet, and were found the next morning on the spot where they fell. Fortune, who does not always regard retributive justice in her dispensations, ordered that the deer should fall undermost, and be killed on the spot, while Duncan escaped with life, but with the fracture of a leg, an arm, and three ribs. In this state he was found lying on the carcass of the deer, and the injuries which he had received rendered him for the remainder of his life the cripple I have described. I never could approve of Duncan's conduct towards the deer in a moral point of view (although, as the man in the play said, he was my friend), but the temptation of a hart of grease, offering, as it were, his throat to the knife, would have subdued the virtue of almost any deer-stalker. Whether the anecdote is worth recording, or deserving of illustration, remains for your consideration. I have given you the story exactly as I recollect it.—*From the Keepsake for 1832.*

THE FLOWING OF WATER.

WHEN we begin minutely to investigate the laws of nature, nothing strikes us more than the admirable practical utility to which they are all conducive. Thus, the laws which regulate fluids differ considerably from those of solid bodies, and we shall find this very difference of the most vital importance to man. The minute particles of which any solid body is composed, as a piece of metal or stone, are compacted or glued together, forming one mass, which can only be moved as a whole; when raised up, it falls to the earth, by the general law of gravitation; and when placed on the ground, it retains its original shape and form. But it is quite different with a quantity of fluid, as water. The minute particles of which a fluid is composed, are perfectly free and independent of each other; instead of adhering close together, they have rather a tendency to press off on all sides, and, with the least agitation of the mass, are in continual motion, rolling about among themselves. Thus, when a common drinking glass is filled with water, the particles of the water press upwards, downwards, and on all sides of the glass equally; and if the glass were suddenly broken, the water, instead of retaining its shape like a solid, would instantly spread itself out on all sides, till the particles became completely diffused. The law of all fluids, then, is to press equally on every side, and, when set at liberty, to run along, or diffuse themselves, till they find the lowest possible level. But there is another law of fluids worthy of being noticed; it is what is called *capillary attraction*, or the tendency which water has to rise up of itself through a porous body; as, for instance, seen in the rising of the liquid through a piece of sugar at the bottom of a tea-cup. The tendency which water has to rise in porous bodies, or to creep up, as it were, betwixt two very closely joined bodies, produces the phenomena of springs. The water rises from great depths in the earth betwixt the most minute crevices of the rocks, or through sandy soils, till it reach the surface, or settle into a pool at the bottom of a well. When it comes to the surface, its natural tendency to find the lowest level causes it to flow in the shape of streams and rivers, downwards to the ocean. In the common water-pump, two fluids are called into action. The atmospheric air, which is a permanently elastic fluid, is made, by its pressure, to raise or force up a column of water, by means of the simple contrivance of a two-valved pump. The air which surrounds the globe presses on every part of it with a downward force, equal to 14 lbs. on every square inch; but, like water, it has also an upward and lateral pressure. When the hollow tube of the pump is immersed in water, and the air from within it is exhausted by means of the piston and valves, a very great pressure is removed from the surface of the water contained within the tube; the balance of equilibrium is also taken off from the air adjoining, and it presses downwards with a force sufficient to raise up a corresponding column of fluid in the pump, and this is continued to be done with every additional stroke of the piston. It is found that a column of water 34 feet high is exactly the weight of a column of air of the same diameter, extending the whole height of the atmosphere. Accordingly, water can never rise in a pump higher than 34 feet; for when it comes to this height, the pressure of the air, and the weight of the column of water, are the same; and they therefore equalise each other. When water is required to be raised higher, it must be received into a cistern, and a second pump constructed, which will raise it other 34 feet; or a forcing pump may be used, the construction of which admits of animal power, or the force of machinery, to impel water through tubes to any given height.

When water is caused to flow in a confined manner, as in tubes, it has then a disposition to reach the exact level of the place from which it set out. Thus, if we fill a tea-kettle with water, we shall find that the fluid has risen as high in the tube outside as in the vessel itself. This grand natural law in regard to fluids has been of immense benefit to the human race. By taking advantage of it, pipes are made to convey water from the tops of hills, or high grounds, down to low situations, and from thence to the summits of

the highest houses in cities. In all this process, the water is just trying to find the level of the place from whence it flowed; and as soon as it reaches this height, it stands still, and will go no higher, unless force be applied. The science which relates to this subject is called *Hydraulics*.

The city of Edinburgh is supplied with water brought from a distance of ten miles. A stream of pure water is diverted from its meandering course, and conveyed, by a long line of pipes, to the town. The place where it first enters the aqueduct is elevated by many hundred feet above the highest houses of the city, so that in its course it observes a gradual descent. It climbs many a hill, and descends many a valley, however, in its progress; and one cannot sufficiently admire the ingenuity of art, thus leading a copious and pellucid stream of the valley, and ramifying it over every part of the city, to cleanse, and purify, and refresh the abodes of its inhabitants. Thus, from its abundant and constant supply, we are apt to overlook it, as we do the other free gifts of Heaven; but if we think for a moment how a spring of water has been prized by many nations in former times, and even by many in some regions of the earth at the present day—if we consider what some of our great cities, what London was not farther back than two centuries ago, the free supply of water, both for domestic purposes and for the ablation of streets and sewers, must be looked upon as not one of the least achievements of modern art and public spirit. Before the introduction of water-pipes, the city of Edinburgh was supplied by a few wells placed at considerable intervals on the streets. As these wells were the common resort of all, it was a matter of some difficulty, and occupied a considerable portion of a servant's time, to carry water for domestic use; while in many of the houses extending to eight or ten storeys, or flights of stairs, such toil was beyond the efforts of ordinary domestics. It was the practice then to employ persons for the purpose, called water-cadies, or carriers, and thus additional expense was superadded to a scanty supply. In London, at one period, matters were little better, and those writers who have treated of the plague have enumerated, among other evident causes of disease, the stagnant unwashed streets, and the imperfect supply of pure water.

It has been by many supposed that the Romans were ignorant of those properties of fluids, by which they could be conducted in pipes as above described, and they have formed this opinion from that people having made use of the expedient of aqueducts to convey water at the same level, thus leading it over valleys and digging through mountains, at an immense expense of labour and stupendous architecture. That the Romans were intimately acquainted with these laws of hydraulics, however, at least in the later periods of their empire, is now evident, from several fountains and jet-d'eaux having been discovered in the ruins of Pompeii; probably they had not this knowledge at the period when the aqueducts that supplied the city of Rome were first constructed; or, as some writers have suggested, perhaps the art of forming pipes of sufficient size or in sufficient numbers was unknown.

LITERARY HISTORY OF THE BIBLE.

THIRD ARTICLE.

THE second and lesser division of the Bible relates entirely to the Christian religion, or the fulfilment of that which was predicted in the preceding and more ancient department of the work. This division of the Sacred Scriptures is generally styled the *New Testament*; and that portion of it which relates to the history of the life of Christ is called the *Gospel*, and by some the *Evangel*, both these words having the same meaning, and implying *good news*, or *glad tidings*, from the circumstance that the narratives contain an account of things which are to benefit mankind.

The New Testament, like the Old, is a compilation of books written by different inspired individuals, and all put together in a manner so as to exhibit a regular account of the birth, actions, and death of Christ—the doctrines he promulgated—and the prophecies regarding the future state of the church which he founded. The historical books are the four Gospels and the Acts of the Apostles, all these being of the character of narratives of events; the doctrinal are the Epistles of Saint Paul, and some others; the prophetic book is the last, and is called the Revelations, or Apocalypse of St John, having been written by that apostle while he was in the island of Patmos.

The writers of the books of the New Testament are generally well known, each having the name of the author affixed to it, with the exception of the Acts of the Apostles, which, it is presumed, was compiled by St Luke. It was long disputed whether St Paul was the writer of the Epistle to the Hebrews; Tertullian, an ancient Christian writer, and some others, attribute it to St Barnabas; others to St Luke; and others to St Clement; while some think, with greater probability, that St Paul dictated it, and St Luke acted as the writer; and that the reason why the name of the true author was not affixed to it, was because he was disliked by the Jews. The four Evangelists, or writers of the leading narratives, are St Matthew, St Mark, St Luke, and St John; these having been companions to Christ during his ministrations, and, therefore, personally acquainted with his life and

* A pastoral farm.

character. Each of the four books is principally a repetition of the history of Christ, yet they all possess a difference of style, and each mentions some circumstances omitted by the others, so that the whole is essential in making up a complete life of the Messiah. These distinctions in the tone of the narratives, and other peculiarities, are always considered as strong circumstantial evidence in proof of their authenticity, and of there having been no collusion on the part of the writers. But, indeed, the events they record are detailed in so exceedingly simple and unaffected a manner, that it is impossible to suppose that they were written with a view to impose on the credulity of mankind. The veracity and actual belief of the Evangelists themselves are placed beyond a doubt.

The first book is written by Matthew, who was by birth a Jew, and exercised the profession of a publican—that is, a collector of the public tax or assessment imposed upon the Jewish people by their conquerors, the Romans. Matthew, who was also called by the name of Levi, was one of the twelve apostles of Christ, and he is said to have written his narrative about eight years after the departure of his Master from the earth. Many of the ancients say that he wrote it in the Hebrew or Syriac language; but Dr Whitby is clearly of opinion that this tradition is entirely void of foundation, and that it was doubtless written in Greek, as the other parts of the New Testament were. Yet it is probable that there might be an edition of it in Hebrew, published by St Matthew himself, at the same time that he wrote it in Greek; the former for the Jews, the latter for the Gentiles, when he left Judea to preach among the heathens.

In regard to Mark, the writer of the second Gospel, it may be observed, that although *Mark* or *Marcus* was a Roman name, and a very common one, yet we have no reason to think but that he was by birth a Jew; but as Saul, when he went among the Gentiles, took the Roman name of *Paul*, so did this Evangelist take that of Mark, his Jewish name, perhaps, being *Marducal*, as Grotius observes. Jerome and Tertullian say, that he was a disciple of the Apostle Peter, and his interpreter or amanuensis. We have every reason to believe that both he and Luke were of the number of the seventy disciples who accompanied all along with the apostles, and who had a commission like to theirs; so that it is no diminution at all to the validity or value of this Gospel that Mark was not one of the Twelve, as Matthew and John were. Jerome says, that, after the writing of this Gospel, he went into Egypt, and was the first that preached the Gospel at Alexandria, where he founded a church, to which he was a great example of holy living.

The Gospel of St Mark is much shorter than that of Matthew, not giving so full an account of Christ's sermons as that did, but insisting chiefly on his miracles; and in regard to these also, it is very much a repetition of what we had in Matthew, many remarkable circumstances being added to the stories there related, but not many new matters. There is a tradition that it was first written in Latin, because it was written at Rome; but this is generally thought to be without foundation, and that it was written in Greek, as was St Paul's Epistle to the Romans, the Greek being the more universal language.

Luke, the name of the third Evangelist, is considered by some to be a contraction of *Lucilius*; and it is said by St Jerome to have been born at Antioch. Some think that he was the only one of all the penmen of the Scripture that was not of the Israelites; that he was a Jewish proselyte, and was converted to Christianity by the ministry of St Paul at Antioch, and, after his coming into Macedonia, he was his constant companion. He had employed himself in the study and practice of physic; and hence Paul calls him *Luke the beloved Physician*. It is more than probable, however, as is testified both by Origen and Epiphanius, that he was one of the seventy disciples, and a follower of Christ when he was upon earth; and, if so, he was most likely to be a native Israelite. Luke, most probably, wrote his Gospel at Rome, a little before he wrote his history of the *Acts of the Apostles*, which is a continuation of the former, when he was there with Paul, while he was a prisoner, and preaching in his own hired house, with which account the history of the *Acts* concludes. In this case, it must have been written about twenty-seven years after Christ's departure, and about the fourth year of the reign of Nero. Jerome says that St Luke died when he was eighty-four years of age, and that he was never married. Dr Cave observes, that "his way and manner of writing are accurate and exact, his style polite and elegant, sublime and lofty, yet perspicuous; and that he expresses himself in a vein of purer Greek than is to be found in the other writers of this holy history." Thus he relates several things more copiously than the other Evangelists, and thus he especially treats of those things which relate to the priestly office of Christ.

The fourth Evangelist, John, was one of the sons of Zebedee, a fisherman of Galilee, the brother of James, one of the Twelve Apostles, and distinguished by the honourable appellation of *that disciple whom Jesus loved*. The ancients tell us that John lived longest of all the Apostles, and was the only one of them that died a natural death, all the rest suffering martyrdom; and some of them say that he wrote this Gospel at Ephesus, at the request of the ministers of the several churches of Asia, in order to combat certain heresies. It seems most probable that he com-

posed it before his banishment into the isle of Patmos, for there he wrote his *Revelations*, the close of which seems designed for the closing up of the canon of Scripture; in which case, this Gospel could not be written after. It is clear that he wrote last of the four Evangelists, and, comparing his Gospel with theirs, we may observe, that he relates what they had omitted; and thus gleans up what they had passed by.

These four Gospels were early and constantly received by the primitive church, and read in Christian assemblies, as appears by the writings of Justin Martyr and Irenaeus, who lived little more than 100 years after the origin of Christianity; they declared that neither more nor fewer than four were received by the church. A Harmony of these four Evangelists was compiled by Tatian about that time, which he called *The Gospel out of the Four*. In the third and fourth centuries, there were gospels forged by divers sects, and published, one under the name of St Peter, another of St Thomas, another of St Philip, &c. But they were never owned by the church, nor was any credit given to them, as the learned Dr Whitby shows. And he gives this good reason why we should adhere to these written records, "because," says he, "whatever the pretences of tradition may be, it is not sufficient to preserve things with any certainty, as appears by experience. For whereas Christ said and did many memorable things, which were not written, tradition has not preserved any one of them to us, but all is lost except what was written; and that, therefore, is what we must abide by."

After the Gospel, or History of Jesus Christ, follows the history of what passed after his ascension, and was transacted by the Apostles. The book, therefore, which contains this history, is called *The Acts of the Apostles*. It is a history of the rising church for about the space of thirty years. It was written, as has been already observed, by St Luke the Evangelist, when he was with St Paul at Rome, during his imprisonment there. In the end of the book he mentions particularly his being with Paul in his dangerous voyage to Rome, when he was carried thither a prisoner; and it is evident that he was with him when, from his prison there, Paul wrote his epistles to the Colossians and Philemon, for in both of these he is named by him.

Next to this come the *Epistles of St Paul*, which are fourteen in number; one, to the Romans; two, to the Corinthians; one, to the Galatians; one, to the Ephesians; one, to the Philippians; one, to the Colossians; two, to the Thessalonians; two, to Timothy; one, to Titus; one, to Philemon; and one, to the Hebrews. They contain that part of ecclesiastical history which immediately follows after what is related in *The Acts*. The principal matter contained in them is the establishment or confirmation of the doctrine which Jesus Christ taught his disciples. According as the difficulties which raised disputes among the Christians, or the heresies which sprung up in the church from the first age of it, required, St Paul in these epistles clears up and proves all matters of faith, and gives excellent rules for morality. His epistles may be considered as a commentary on, or an interpretation of, the four books of the Gospel.

The Epistle to the *Romans* is placed first, not because of the priority of its date, but on account of its superlative excellence, it being one of the longest and fullest of all, and, perhaps, also, on account of the dignity of the place to which it is written. It is gathered from some passages in the epistle, that it was written in the year of Christ 56, from Corinth, while Paul made a short stay there in his way to Troas. He was then going up to Jerusalem, with the money that was given to the poor saints there; which is spoken of in the fifteenth chapter of the epistle.

The Two Epistles to the *Corinthians* were written about a year after that to the *Romans*, viz. A.D. 57; that to the *Galatians*, A.D. 56; to the *Ephesians*, A.D. 61; to the *Philippians*, A.D. 62; to the *Colossians*, A.D. 62; two to the *Thessalonians*, A.D. 51 and 52; the first to *Timothy*, A.D. 64; the second to *Timothy*, A.D. 66; to *Titus*, A.D. 65; to *Philemon*, A.D. 62; and that to the *Hebrews*, A.D. 62. From which chronology it appears, that the Epistles of St Paul are placed in the New Testament rather according to the dignity of the cities to which they were sent, than according to the order of time in which they were written; for the Epistles to the Thessalonians were those he wrote first, though that to the Romans is placed before them. Interpreters are agreed that the last epistle which he wrote was the second to *Timothy*.

St Paul wrote to the churches of some particular places, or to some particular persons; but the other epistles which follow his are called *Catholic*, because, with the exception of the second and third of St John, they were not addressed to any particular church, or individual, as his were, but to the whole church in general. These are, one, of St James; two, of St Peter; three, of St John; and one, of St Jude.

The date of most of these epistles is extremely uncertain, but the most generally received chronology of them is as follows:—That of St James, A.D. 61; of St Peter, A.D. 66 and 67; of St John, A.D. 80 and 90; of St Jude, A.D. 66.

It has sometimes occurred to the minds of many well-disposed persons, that it would have been better for Christianity had there never been any other record of its origin and doctrines than the writings of Matthew, Mark, Luke, and John. But however plain and satisfactory the histories of these Evangelists may be,

and however little they admit of controversy, it has to be remembered that it required the strong arguments and illustrations brought forward in the Epistles by Paul and others, to combat the sophistry of the Greeks, and the self-sufficient philosophies of other races of men. Paul, the chief of the epistle writers, who became a Christian by conversion, after Christ had departed from the earth, is the great champion of the faith, and exposes, in strong and dauntless language, the hidden depravities of the human heart; so that where the affecting discourses and sufferings of the Messiah fail to convert and to convince, the reasoning of this great writer is calculated to silence and subdue those who stubbornly resist the benignant influence of the Christian faith.

BIOGRAPHIC SKETCHES.

HOLCROFT.

THOMAS HOLCROFT, the author of a variety of productions in light literature, and whose life furnishes an example of the success which often attends the ardent pursuit of knowledge under difficulties, was born in London in the year 1745, at which time his father wrought as a shoemaker, and his mother dealt in greens and oysters. His father, who seems to have been a person of unsettled habits, though a well-meaning and upright man, knew very little of his business, to which he had not been regularly bred, and, in spite of the exertions both of himself and his wife, his affairs did not prosper. When young Holcroft was about six years old, the family were suddenly removed from London to a place in Berkshire, beyond Ascot Heath, where they remained for about twelve months. Thomas had as yet only been for a short time at a school where children were sent rather to keep them out of harm's way than to learn anything, and to which he used to be carried by an apprentice of his father's. This lad afterwards gained his warmest gratitude by making him a present of the first two books he ever possessed, the one being the History of Parismus and Parismenes, already mentioned as one of Gifford's early literary companions, and the other the Seven Champions of Christendom. It was while they resided in Berkshire that his father began teaching him to read. "The task," says he, "at first I found difficult, till the idea one day suddenly seized me, of catching all the sounds I had been taught from the arrangement of the letters; and my joy at this amazing discovery was so great, that the recollection of it has never been effaced. After that my progress was so rapid, that it astonished my father. He boasted of me to every body; and that I might lose no time, the task he set me was eleven chapters a-day in the Old Testament. I might, indeed, have deceived my father by skipping some of the chapters, but a dawning regard for truth, aided by the love I had of reading, and the wonderful histories I sometimes found in the Sacred Writings, generally induced me to go through the whole of my task. One day as I was sitting at the gate with my Bible in my hand, a neighbouring farmer, coming to see my father, asked me if I could read the Bible already. I answered, yes; and he desired me to let him hear me. I began at the place where the book was open, read fluently, and afterwards told him, that, if he pleased, he should hear the tenth chapter of Nehemiah. At this he seemed still more amazed, and wishing to be convinced, bade me read. After listening till he found I could really pronounce the uncouth Hebrew names so much better, and more easily, than he supposed to be within the power of so young a child, he patted my head, gave me a penny, and said I was an uncommon boy. It would be hard to say whether his praise or his gift was most flattering to me. Soon after, my father's apprentice, the kind-hearted Dick, who came backward and forward to my father on his affairs, brought me the two delightful histories I have above mentioned, which were among those then called Chapman's Books. It was scarcely possible for any thing to have been more grateful to me than this present. Parismus and Parismenes, with all the adventures detailed in the Seven Champions of Christendom, were soon as familiar to me as my catechism, or the daily prayers I repeated kneeling before my father."

On leaving their house in Berkshire, the family were obliged to adopt a wandering life, the mother turning pedlar, and hawking her wares through the outskirts and neighbourhood of London, while her son trotted after her, and the father, after a vain attempt to obtain some regular employment, in a short time joining the party, who now extended their peregrinations to remote parts of the country. While leading this life, they endured the greatest hardships, and upon one occasion, were so severely pressed, that Thomas was sent to beg from house to house in a village where they happened to be. At length the father managed to buy two or three asses, which he loaded with hampers of apples and pears, and drove about through the country. But this apparent improvement in their circumstances afforded no alleviation to the sufferings of the poor boy. "The bad nourishment I met with," says he, "the cold and wretched manner in which I was clothed; and the excessive weariness I endured in following these animals day after day, and being obliged to drive creatures perhaps still more weary than myself, were miseries much too great, and loaded my little heart with sorrows far too pungent ever to be forgotten. Bye roads and high roads were alike to be traversed, but the former far the oftenest, for they were then almost innumerable, and the state of

them in winter would scarcely at present be believed." In one instance he mentions that he travelled on foot thirty miles in one day; and he was at this time only a child of about ten years old. During all this time, he made little or no progress in reading. "I was too much pressed," he says, "by fatigue, hunger, cold, and nakedness." Yet as he continued to repeat his prayers and catechism morning and evening, and to read the Prayer-book and Bible on Sundays, he, at least, did not forget what he had formerly learned. On one occasion, too, he states, that the ballad of Chevy Chase having fallen into his hands, his father, who was very proud of what he conceived to be his son's talents, and particularly of his memory, set him to get by heart the whole song, by way of task, which he performed, in the midst of his toils, in three days. His father gave him a halfpenny for the achievement, which made him think himself at the time quite a rich man.

When in his eleventh or twelfth year, having been present at the Nottingham races, he was so much struck by the contrast between his own mean and ragged condition, and that of the clean, well-fed, and well-clothed stable-boys, that he determined to try if he could not find a master to engage him in that capacity in Newmarket. After much perseverance, and being turned off upon a short trial, first by one master, and then by another, from the little knowledge he was found to have of riding, he was at last taken into the service of a person who was considerate enough not to expect him to be a finished groom almost before he could have ever mounted a horse. He very soon began to distinguish himself by his expertness in his new occupation; and the language in which he speaks of his change of circumstances forcibly paints his sense of the miseries from which he had been extricated. Alluding to the hearty meal which he and his companions were wont to make every morning at nine o'clock, after four hours' exercise of their horses, he says, "Nothing, perhaps, can exceed the enjoyment of a stable-boy's breakfast: what, then, may not be said of mine, who had so long been used to suffer hunger, and so seldom found the means of satisfying it? For my own part," he adds, "so total and striking was the change which had taken place in my situation, that I could not but feel it very sensibly. I was more conscious of it than most boys would have been, and therefore not a little satisfied. The former part of my life had most of it been spent in turmoil, and often in singular wretchedness. I had been exposed to every want, every weariness, and every occasion of despondency, except that such poor sufferers become reconciled to, and almost insensible of, suffering; and boyhood and beggary are fortunately not prone to despond. Happy had been the meal where I had enough; rich to me was the rag that kept me warm; and heavenly the pillow, no matter what, or how hard, on which I could lay my head to sleep. Now I was warmly clothed, nay gorgeously; for I was proud of my new livery, and never suspected that there was disgrace in it; I fed voluptuously, not a prince on earth perhaps with half the appetite, and never-failing relish; and instead of being obliged to drag through the dirt after the most sluggish, obstinate, and despised among our animals, I was mounted on the noblest that the earth contains, had him under my care, and was borne by him over hill and dale, far outstripping the wings of the wind. Was not this a change such as might excite reflection even in the mind of a boy?"

We must, however, pass over the account which he gives of his life as a stable-boy, interesting as many of the details are into which he enters. During his wanderings through the country with his father, as has been already mentioned, he had scarcely had any opportunity of extending his knowledge of books; the Bible, and such old ballads as he met with by chance on the walls of cottages and ale-houses, constituting all his reading. "Books were not then," he remarks, "as they fortunately are now, great or small, on this subject or on that, to be found in almost every house. A book, except of prayers, or of daily religious use, was scarcely to be seen but among the opulent, or in the possession of the studious; and by the opulent they were often disregarded with a degree of neglect which would now be almost disgraceful." For some time after his arrival at Newmarket, he was not much better off. In about half a year, however, his father followed him to that place, where he at first found a little employment at his old trade of making shoes; and one of his shopmates, who happened to be fond of books, and to be in possession of a few, occasionally lent young Holcroft a volume from his collection. Among other works, this person put into his hands 'Gulliver's Travels,' and the 'Spectator,' with which, the former especially, he was much delighted. He mentions, also, the 'Whole Duty of Man,' the 'Pilgrim's Progress,' and other religious books, as at this time among his chief favourites. As he was one day passing the church, he heard some voices singing, and was immediately seized with a strong desire to learn the art. Having approached the church door, he found the persons within engaged in singing in four parts, under the direction of a Mr Langham. They asked him to join them, and his voice and ear being pronounced good, it was agreed that he should be taken into the class; the master offering to give up the entrance money of five shillings, in consideration of his being but a boy, whose wages could not be great, and the others agreeing to let him sing out of their books. "From the little," he proceeds, "I that day learned, and from

another lesson or two, I obtained a tolerable conception of striking intervals upwards or downwards, such as the third, the fourth, and the remainder of the octave, the chief feature in which I soon understood; but of course I found most difficulty in the third, sixth, and seventh. Previously, however, to any great progress, I was obliged to purchase 'Arnold's Psalmody;' and, studious over this divine treasure, I passed many a forenoon extended in the hay-loft."

His wages were four pounds a-year, and he paid five shillings a quarter to his singing master; but upon Mr Langham offering to give him lessons in arithmetic also for as much more, he agreed to the proposal, and attended him daily for three months. In that time he got so far as Practice, and the Rule-of-Three. "Except what I have already related," says he, "these three months, as far as others were concerned, may be truly called my course of education. At the age of two or three and thirty, indeed, when I was endeavouring to acquire the French language, I paid a Monsieur Raymond twenty shillings for a few lessons, but the good he did me was so little that it was money thrown away. At Newmarket, I was so intent on studying arithmetic, that for want of better apparatus I have often got an old nail, and cast up sums on the paling of the stable-yard." This will remind the reader of Gifford, with his leather for paper, and his blunted awl for a pen.

Holcroft continued at Newmarket for about two years and a half, when he determined to go to London once more to join his father, who now kept a cobbler's stall in South Audley Street. "My mind," he says, "having its own somewhat peculiar bias, circumstances had rather concurred to disgust me than to invite my stay. I despised my companions for the grossness of their ideas, and the total absence of every pursuit in which the mind appeared to have any share. It was even with sneers of contempt that they saw me intent on acquiring some small portion of knowledge; so that I was far from having any prompter either as a friend or a rival." He was at this time nearly sixteen. For some years he continued to make shoes with his father, and at last became an able workman. But he grew every day fonder of reading; and whenever he had a shilling to spare, spent it, we are told, in purchasing books. In 1765, having married, he attempted to open a school for teaching children to read, at Liverpool, but was obliged to abandon the project in about a year, when he returned to town, and resumed his trade of a shoemaker. Beside his dislike to this occupation, however, on other accounts, it brought back an asthmatic complaint he had had when a boy; and every consideration made him resolve to endeavour to escape from it. Even at this time he had become a writer for the newspapers, the editor of the 'Whitehall Evening Post' giving him five shillings a column for some essays which he sent to that journal. He again attempted to open a school in the neighbourhood of London; but after living for three months on potatoes and butter-milk, and obtaining only one scholar, he once more returned to town. Having acquired some notions of elocution at a debating club which he had been in the habit of attending, he next thought of going on the stage, and obtained an engagement from the manager of the Dublin Theatre, at a poor salary, which was very ill paid. He was so ill treated, indeed, in this situation, that he was obliged to leave it in about half a year. He then joined a strolling company in the north of England, and wandered about as an itinerant actor for seven years, during which time he suffered a great deal of misery, and was often reduced almost to starving. In the midst of all his sufferings, however, he retained his love of books, and had made himself extensively conversant with English literature. At last, in the end of the year 1777, he came up to London, and by means of an introduction to Mr Sheridan, obtained an engagement in a subordinate capacity at Drury Lane. He had just before this, as a desperate resource, sat down to compose a farce, which he called 'The Crisis;' and this turned out the commencement of a busy and extended literary career. The farce, although only acted once, was well received, and it soon encouraged him to new efforts of the same kind. Yet he continued for many years involved in difficulties, from which it required all his exertions to extricate himself. The remainder of Mr Holcroft's history, with the exception of a short but stormy period, during which he was subjected to very severe usage on account of certain political opinions which he was supposed to hold, is merely that of a life of authorship. He never became a good actor, and after some time dedicated himself entirely to literary occupation. His industry in his new profession is abundantly evidenced by the long list of his works, which comprise several of high talent and established popularity. In his maturer years, beside many other acquisitions, he made himself master of the French and German languages, from both of which he executed several well-known translations.

Mr Holcroft died in 1809. His life is in many respects admirably calculated to answer the design which he had in view, he tells us, in writing the account of the early part of it, namely, "to excite an ardent emulation in the breasts of youthful readers, by shewing them how difficulties may be endured, how they may be overcome, and how they may at last contribute, as a school of instruction, to bring forth hidden talent."†

THE LITTLE GIRL.

THE following excellent story, exemplifying the danger of giving way to the passion of anger, is given in a charming little book, entitled *The Infant Annual* (published by Waugh and Innes of Edinburgh; Whitaker and Co., London, and Curry and Co., Dublin), and which is eminently suited to cultivate virtuous principles in the minds of children.

"Little Harriet M—— was between four and five years old; she was in many respects a very good little girl. She was obedient, very affectionate to her friends, and very obliging and kind; but she had a very violent temper. When anything teased or provoked her, she would get into a perfect transport of fury, and tear and strike whatever was in her way. One day as her mamma was passing the nursery door, she heard a great noise within, and her little Harriet's voice speaking in a tone that made her sure she was bad; so she opened the door, and there she saw Harriet, with her little face swelled and distorted with rage, her curly hair all torn into disorder, while with feet and hands she was kicking and striking with all her force at one of the servants, and crying out, 'I don't love you, Mary, I don't love you, I hate you.' She stopped when she saw her mamma. 'What is the meaning of all this?' said Mrs M. to the servant. 'It is just this, ma'am,' said the servant, 'that Miss Harriet kept throwing water about the room, out of her little new jug; when I forbade her, she threw the water that was in the jug in my face; and when I attempted to take hold of her to carry her to you, as you desired, when she did wrong, she flew at me and struck me as you have seen.' Mrs M. looked very grave, and lifting the sobbing Harriet in her arms, carried her into her own room. She sat down with her on her lap, and remained quite silent till the angry sobs had almost ceased. She then placed her on her knees, and in a very solemn voice told her to repeat after her the following words: 'Oh, my heavenly Father, look down in mercy, with pardoning mercy, on my poor little silly wicked heart, at this moment throbbing with such dreadfully bad feelings as only the spirit of all evil could put into it: oh, my heavenly Father, drive away this bad spirit, help me with thy good spirit, and pardon me the evil I have done this day, for Christ Jesus' sake. Amen.' Harriet trembled exceedingly; but she repeated the words after her mother, and, as she did so, in her heart she wished that God might hear them. Her mamma again placed her on her lap, and asked if her rage was away. Harriet answered in a soft voice, 'Not quite, mamma; but it's better.' 'Very well,' said her mother, 'until it is quite away, I shall tell you a story that I was told when I was young, and I hope it will make as deep an impression on your mind, my poor child, as it did on mine, and tend as effectually to make you try yourself to check your bad and furious temper: Lord and Lady—— were very great and rich people. They had only one child, and it was a daughter. They were very, very fond of this child, and she was in truth a very fine little creature, very lively and merry, and affectionate, and exceedingly beautiful: but like you, Harriet, she had a bad, bad temper; like you, she got into transports of rage, when any thing vexed her, and, like you, would turn at, or strike, whoever provoked her; like you, after every fit of rage, she was grieved and ashamed of herself, and resolved never to be so bad again; but the next temptation all that was forgotten, and she was as angry as ever. When she was just your age, her mamma had a little son—a sweet, sweet little tender baby. Her papa and mamma were glad, glad—and little Eveline would have been glad too, but the servants very foolishly and wickedly teased and irritated her, by telling her that papa and mamma would not care for her now; all their love and pleasure would be this little brother, and they never would mind her. Poor Eveline burst into a passion of tears, and cried bitterly. 'You are a wicked woman to say so; mamma will always love me, I know she will, and I'll go this very moment and ask her, I will,' and she darted out of the nursery, and flew to her mamma's room, the servant in the nursery calling after her, 'Come, come, miss, you needn't go to your mamma's room; she won't see you now.' Eveline burst open the door of her mamma's room, but was instantly caught hold of by a stranger woman she had never seen before. 'My dear,' said this person, 'you cannot be allowed to see your mamma just now.' She would have said more; she would have told Eveline that the reason she could not see her mamma then, was because she was very sick, and must not be disturbed. But Eveline was too angry to listen; she screamed and kicked at the woman, who, finding her so unreasonable, lifted her by force out of the room, and, carrying her into the nursery, put her down, and said to the servant there, as she was going away, 'that she must prevent miss coming to her mamma's room.' Eveline heard this, and it added to her rage; and then this wicked servant burst out a-laughing, and said, 'I told you that, miss; you see mamma doesn't love you now!' The poor child became mad with fury; she darted at the cradle where lay the poor little innocent new-born baby. The maid whose duty it was to watch over it was lying asleep upon her chair; and oh, Harriet, Harriet! like as you did to Mary just now, she struck it with all her force—struck it on the little tender head—it gave one feeble struggling cry, and breathed no more." 'Why, mamma, mamma,' cried Harriet, bursting

† Abridged from an account in Library of Entertaining Knowledge.

into tears, 'why did it breathe no more?' 'It was dead—killed by its own sister.' 'Oh, mamma, mamma! what a dreadful, what a wicked little girl! Oh, mamma! I am not so wicked as her; I never killed a little baby,' sobbed Harriet, as she hid her face in her mother's bosom, and clung to her neck. 'My dear child,' said Mrs. M. solemnly, 'how dare you say you are not so wicked as Eveline? You are more wicked, and, but for the goodness of God to you, might have been at this moment as miserable. Were you not in as great a rage when I came to the nursery as she was? Were you not striking Mary with all your force, not one blow, but repeated blows? and had Mary been like the object of Eveline's rage, a little baby, you would have killed her. It was only because she was bigger and stronger than yourself that you did not actually do so; and only think for a moment on the difference between the provocation poor Eveline received, and that which you supposed Mary gave you. Indeed Mary gave you none—you were wrong, and she was right; whereas, no one can wonder Eveline was made angry by her wicked maid. Yet you may observe, that had she not got into such ungovernable rage as not to listen when she was spoken to by the person she saw in her mamma's room, she would then have heard, that it was from no change in her mamma's love that she had not seen her for several days, but because she was confined to bed.' 'And, mamma, what did Eveline's poor mamma say to her for killing the baby?' 'Eveline never again saw her dear and beautiful young mamma; she died that night of grief and horror on hearing that her sweet and lovely infant was murdered—and by whom.' 'Oh, dear—oh, dear mamma—was Eveline sorry?' 'My love, how can you ask such a question?' 'But, mamma, I mean how sorry was she? what way was she sorry enough?' 'Indeed, Harriet, it is not easy to know or to tell how she could be sorry enough. All I know is, that she lived to be a big lady—she lived to be herself a mother—and in her whole life no one ever saw her smile.' 'And, mamma, was it a quite true story?' 'It is so dreadful, mamma.' 'Yes, my child, it is a quite true story; that unfortunate child was the great-grandmother of the present Earl of E——.' 'My dearest mamma,' said Harriet, once more bursting into tears, 'let me go upon my knees again, and pray to God to take away my bad temper, lest I too become so miserable.' 'Yes, my love, pray to him for that, and he will hear and bless you; but also thank him for preserving you hitherto from the endless and incalculable wretchedness so often produced by one fit of sinful rage.'

The Editor of the London Literary Gazette, in noticing the foregoing story, mentions his belief of it being perfectly true. The unfortunate angry child (says he) was Anna Countess of Livingston. She was also Countess of Crawford; and, in her right, her son succeeded to the earldom of Errol. It was a smoothing-iron which, in her paroxysm of rage and terror, she snatched up and flung into the infant's cradle. A sad chance directed the blow, and the baby was murdered. No other child was ever born to the family; and the poor girl grew up, fully informed of the fatal deed by which she had attained so many deplorable honours. She was most amiable, and highly esteemed, but in all her life was never known to smile. When very young, she was married to the unfortunate William Earl of Kilmarnock—beheaded in 1746—who, whatever might be the motives of his loyalty to his king, was most disloyal to his wife, being as bad a husband as it is possible to conceive. Notwithstanding this, his excellent, unhappy lady hurried to London, and made every possible effort to obtain his pardon. Her want of success is known.

UNROOFING THE KIRK OF TULLIBODY.

THE parish of Tullibody, in Clackmannanshire, now united with Alloa, was, before the Reformation, an independent ecclesiastical district. The manner in which it lost its separate character is curious. In the year 1559, when Monsieur d'Oysel commanded the French troops on the coast of Fife, they were alarmed by the arrival of the English fleet, and thought of nothing but a hasty retreat. It was in the month of January, and at the breaking of a great storm. William Kirkaldy of Grange, commander of the congregational forces, attentive to the circumstances in which his enemies were caught, took advantage of this situation, and marched with great expedition towards Stirling, and cut the bridge of Tullibody, which was over the Devon, to prevent their retreat. By this manoeuvre the French found themselves completely enclosed. They were driven to an extremity which obliged them to resort to an extraordinary expedient to effect their escape. They lifted the roof off the church of Tullibody, and laid it along the broken part of the bridge, by which means they effected a safe retreat to Stirling.

Such a dilapidation of the church caused the Tullibodians to proceed to the adjacent kirk of Alloa, and, in a short time, the parish ceased to be independent. The burying ground around the ancient place of worship, now repaired, still remains; and on the north side of it, where there had been formerly an entry, there is a stone coffin, with a niche for the head, and two for the arms, covered with a thick hollowed lid, like a tureen. The lid is a good deal broken, but a curious tradition is preserved of the coffin. It is related that in early times a young lady of the neigh-

bourhood had declared her affection for the minister, who, either from his station, or want of inclination, made no returns. So vexed was the lady on perceiving his indifference, that, in a short while, she sickened, and at last died of grief. While on her deathbed, she left it as her last request, that she should not be buried in the earth, but that her body should be placed in a stone coffin, and laid at the entry to the church; which was done, and, till this day, the stone retains the name of the *Maiden's Stone*.

ARTIFICIAL MEMORY.

THE best systems of artificial memory, though in diligent hands they produce a surprising effect, depend upon very simple principles. Every person uses a kind of artificial memory, when he endeavours to fix in his mind anything he is little acquainted with, by means of another which he knows better. A person, for instance, wishes to recollect a house where he has some business, and for that purpose he notices that it is the third door, or fourth door, from some well-known corner; by this mark he will not fail to retrace it. A stranger, again, is often recollected when seen in company with one of our acquaintance, though we could never have called him to remembrance if he had passed us alone. Many schemes of artificial memory have been framed, but they depend merely on a systematic application of the principles we have mentioned, and differ from one another only in the ingenuity with which these are applied.

In passing along a road which we have formerly travelled with a friend, the sight of the different objects, as they come in view, often recalls the subjects of conversation which occurred at the same points in our first journey. We recollect every topic with the utmost freshness; and if there were any new ideas or remarkable expressions, the sight of the tree, ford, or narrow lane, where they were started, seldom fails to recall them. It is plain, therefore, that if we wished to imprint the contents of a book on our memory, we may be greatly assisted by reading it in the same way, as we pass along some favourite walk, associating each of its topics with remarkable points in the scenery. If every subject be thus, as it were, tied to some conspicuous point in regular succession, the facility of recollection which will be gained will be found of the greatest advantage; and long lists of facts may be exactly committed to memory, which otherwise we would hardly have thought of attempting to remember. In a town, let any one take, in regular succession, the streets which branch off from some principal line of thoroughfare, and if their names and order be familiar to him, he may use them in this way as resting places for his memory, where he may have arranged great numbers of circumstances which the mind could not otherwise have retained. Lists of the kings of England have in this way been taught to children effectually in two lessons, merely by connecting the successive names with some series of familiar streets, or well-known objects on a public road.

Instead of taking any succession of objects out of doors, it is sometimes convenient to use merely the walls of a room, and the familiar objects which occupy places upon them; if there be a number of pictures in the room, for instance, we may commit to memory a list of names by attaching each to one of the pictures in the order of their arrangement; and the names will not fail to recur as often as we choose to recall them in that connection. This method was reduced to system, and taught with great success, by a German professor, Mr Feinaigle; and in another paper we may perhaps give the details of his plan.

At present we shall only explain the same person's ingenious mode of teaching the memory of numbers. The simplicity of the process will be immediately apparent; and any person who practises it for two days, will acquire a facility in recollecting dates and numbers of which otherwise he could have had little idea.

The first thing to be done is to assign for each numeral figure a letter of the alphabet, which is to stand for it on all occasions. It is on this that the whole artifice depends; and the learner must first make himself familiar with these substitutions (which may be done in 20 minutes) before proceeding further. For the figure 1, use the letter *t*, because it is a single stroke.

For 2, use *n*, because it is two strokes combined.

For 3, use *m*, because it is three strokes.

For 4, use *r*, because *r* is found in the word denoting four in most languages.

For 5, use *l*, because in Roman numerals *L* denotes 5 tens.

For 6, use *d*, because the written *d* resembles 6 reversed.

For 7, use *k*, because *k* resembles two 7's joined at top; and for this figure use also *g*, *q*, *c* (hard), because they are all letters formed in the throat (gutturals), like the first one, *k*.

For 8, use *b*, which in writing is often made to resemble 8 a good deal; use also *w*, which is like an 8; and *v*, which is half of *w*.

9 is represented by *p*, from the similarity of figure; and also by *f*, both of which are united in the word *puff*, which proceeds from a *pipe* like a 9 figure.

For 0, use *s*, *x*, or *z*, for this reason, that O is like a grindstone, which gives out a hissing noise like these letters when it is in motion.

The reasons given for our choice of letters to represent the different figures will appear whimsical; but it must be recollected that they are adopted merely to assist memory, and that their oddity is, therefore, a recommendation rather than an objection. It will be observed, that neither *h* nor any of the vowels represent any figure.

This table of letters is applied to use as follows:—Suppose a person wishes, for instance, to recollect the numbers 547: 5 is represented by *t*; 4 by *r*; 7 by *k*; hence we have here *t*, *r*, *k*; among these letters insert the vowel *a*, and there will be *lar-k*, a word easily to be remembered; and as the vowel *a* denotes no figure, no mistake can arise from it to confuse the memory; so that the word *lar-k* on all occasions will be the sign for 547. The year in which King William the Fourth was born is 1765; here we have *t*, *k* (or *g*), *d*, *l*; by inserting vowels, and the letter *h* (which signifies no figure), these form the word *GOODY*; and in that shape will hardly escape the memory. The Queen was born in the year 1794; we have here *t*, *k*, *p* (or *f*), *r*; and by inserting vowels at pleasure, we make the words *They yoke fair*; a combination ludicrous enough, which will, however, greatly assist the memory as to the date, and that is all that is wanted.

Suppose we wish to recollect the dates of some principal geographical discoveries:

The Cape of Good Hope was discovered in 1486; here we have the letters *t*, *r*, *w*, *d*; these become *rain-wood*; there is a fable that the wreck of a Carthaginian ship was found here on its first discovery, which will make the word *rain-wood* memorable.

America was discovered in 1492; these figures are represented by *t*, *r*, *p*, *n*; which by inserting vowels become *to rapine*, because that discovery led to rapine by the first Spaniards.

The great South Sea was first discovered by Nunez de Balboa in 1513; this is *t*, *l*, *t*, *m*; by inserting *h*, and vowels, these letters form *tell them*; an expression denoting the importance of that discovery.

The Straits of Magellan were discovered in 1519; these figures become *t*, *l*, *t*, *p*; and may read *it let up*; because this strait *let up* the navigators into the land, and through to the Pacific Ocean.

New Holland was first discovered in 1525; the letters, because it is a lonely or insulated continent.

Baffin's Bay, discovered in 1616: Thy duty do, because Baffin's accuracy in this discovery, after being a long time doubted, was at last verified.

By these examples the method will now be sufficiently understood; and the reader may go on applying it to other cases as he finds occasion.

When it is required to recollect a long list of numbers in regular succession, the object may be effected by forming words out of each of them, and attaching the ideas belonging to these to any series of familiar objects. If we wish to recollect, for example, the numbers 748, 954, 7430, 241: take a road where we know four or five objects in succession—say, a *house*, a *tree*, a *hay-stack*, a *mill*; then we have for 748, *crib*, and we call the house a *crib*: next for 954, we have *flower*; there is a *flower* on the tree: for 7430, we have *grey mouse* in the hay-stack: and for 241, there is one *rat* in the mill. When we recall the principal objects according to their order, the numbers will also be remembered.

THE MIGRATION OF BIRDS.

WE beg to recommend to the attention of our readers, but especially the young, and those taking an interest in the delightful study of Natural History, a new periodical work, at a low price, entitled 'The Field Naturalist's Magazine,' conducted by Professor Rennie, of the King's College, London. In the first number there occur several pleasing papers; among others, one on the Migration of Birds, which we present as a specimen of the style in which the work is written.

"I shall here give some observations on the periodical and frequently long journeys performed by several species of erratic birds, and on the points of re-union and departure which they appear to select. The yearlings and the old ones rarely go together in these journeys, which are more or less extended, as the necessity of seeking a fresh supply of food for other climates, obliges them to quit those places which fail at certain seasons to furnish them with the means of subsistence. I think I have traced the separation of families, and their re-union in bands, of ages more or less equal, to a very natural cause, produced by the difference in the time of moulting in the old and young; and this also appears to be the cause that the bands composed of adults migrate to a much greater distance, whether in autumn, or at their return in spring, than the bands composed of young ones, which do not, in either season, extend their journey so far. The plumage of these birds being still imperfect, and the colours not yet durable, they are generally one or two years old before they are in a state to breed; they then choose those places where adults of their own species do not build their nests, the latter always expelling them from the districts which are to give birth to a new progeny. When the old ones extend their journey to the arctic regions, those of one or two years old are found in the middle countries of Europe; and when the old ones choose the temperate climates, the young ones remain at the south, or at farthest dis-

not pass the seas which separate Europe from the northern parts of Africa; countries in which the greater number of the largest species of our erratic birds, that do not perfect their growth within the first year, choose to reside in winter. It is from these countries, or the numerous islands of the Archipelago, and those of the Mediterranean and the Gulf of Venice, that they set off on their return in the spring; numerous flocks are then seen on all our southern coasts, especially where the sea forms large gulfs, such as the Archipelago, the Adriatic Gulf, and those of Genoa and Lyons. These meetings continue eight, ten, or at most fifteen days; in which time the passage of those countries is completed.

The routes taken by water-fowl and birds which frequent marshes, depend very much on the course of rivers, and the beds of the great lakes; the waters furnishing to each species its proper food, they seem to be impelled, by a wonderful instinct, to choose for a rallying point and place of departure, those spots whence the passage from the great sea to the lakes and rivers is shortest and least occupied by land. Thus the bands that assemble on the environs of Genoa and Lyons repair forthwith to the banks of the Po; following afterwards the passes of the great valleys of the Alps, which descend into Piedmont, they rise above the mountains, where different species of the birds in question are annually killed. From these points they appear to direct their flight towards the great lakes of Switzerland, particularly that of Geneva, which all the water and fen birds of Europe resort to for a short period, or pass more or less regularly; from this they seem to continue their journey by the lakes of Morat, Neuchâtel, and Bienné, and repair to the Rhine, the course of which they follow, and thus arrive at the Baltic, the great inland, and North Seas. These companies, already less numerous when they arrive in the north, disperse themselves soon afterwards. At this period, the individuals pair and attend to the wants of their new progeny. The route most frequented by all the water-birds is along the borders of the sea: those which come from the Gulf of Gascony, from Spain, and the coasts of Barbary, appear to follow that only; several species of waders follow it uniformly; and the same route is taken by all those birds which are unprovided with powerful means of flight. The divers, the grebes, and other fresh water-fowl, which seldom fly when occupied with the cares of pairing and breeding, are, however, endowed with great powers for this action; their flight is vigorous and long sustained; they rise even above the high mountains, for it is not rare to find individuals of these species on the lakes of the Alps, where the waders and web-footed species are often killed. It appears that the great flocks which assemble in the Ionian Isles, and the vast marshes between Venice and Trieste, follow in their travels the course of the Tagliamento, to arrive at the lakes in the environs of Villach and Klagenfurt; they visit the immense marshes which form the lakes Balaton and Neuzidél, where several species remain, while others re-ascend the Danube, and continue their journey to the Baltic Sea. On the lakes of Hungary, and upon the Danube, several species are found, which also visit the shores of the ocean. It appears to me that the species most peculiar to the western countries assemble in the Archipelago, and on the borders of the Black Sea; they re-ascend the Danube, and, following the course of the river, arrive in Hungary and Austria, countries that abound with various species of birds, in great numbers. I have not travelled over the whole extent of country crossed by the birds in the latter migration, nor that which takes place from the Gulf of Lyons by the mouths of the Rhone, along that river, and by the Doubs, the way by which their companions reach the Rhine. The banks of this river are peopled in spring and autumn by a great number of birds: we find in the part which forms the boundary of the western countries of Germany, all the species which go by the shores of the ocean and the Baltic Sea.

It is, however, very rarely that we see companies composed of old ones; these seem to come more frequently by chance, and separately: the yearlings of almost every species pass regularly by these parts of the sea, and they are generally young individuals, or only one or two years old, such as are killed on the great lakes of Switzerland and Italy. It should be understood that the species which do not continue their periodical journey so far as the North Sea and the Baltic, are exceptions; the old ones among the latter never stray to the northern climates, and it would be an extremely rare circumstance to find a young one there."

SLOW POISON.

PREPARATIONS having the power of weakening the vital powers, and finally cutting short the life of human beings, were at one time used to an incredible extent for the purpose of private murder; and no where with greater skill than in Italy—a country where assassination has always, in modern times, been deemed a light crime. The atrocities committed in Italy and France during the seventeenth century, by these diabolical preparations, have been noticed by Professor Beckmann, in his History of Inventions and Discoveries, in a narrative fitted to interest the reader.

"It was remarked at Rome (says he), about the year 1669, that many young married ladies suddenly became widows, and many husbands who were known

to have become disagreeable to their wives unexpectedly died. Suspicion fell on a society of females under the direction of an old woman, who pretended to foretell future events, and who had in fact correctly predicted the death of many persons, to those who were interested in the event. A spy was employed, who introduced herself to this sorceress as a person of distinction, suffering under the tyranny of an imperious husband, of whom she wished to be rid; and by means of this stratagem her secret was detected. The whole society were then arrested, and put to the torture; and the hag herself, whose name was Hieronyma Spara, along with several others, publicly executed. It appeared that many of the Roman nobility were implicated in this affair; and, notwithstanding the severity with which it was visited, traces of the same suspicious practices were remarked for a long time afterwards. Spara was a Sicilian, and was said to have acquired her knowledge from the celebrated Tofania; but the difference of their age renders it more probable that she was the instructress of the latter.

Tofania, if not the inventress of the far-famed drops which from her obtained the name of *acqua tofana*, at least carried the diabolical art of preparing them to the greatest perfection. She first resided at Palermo, but afterwards at Naples, where she was more particularly known, and whence the drops have also been commonly called *acquetti di Napoli*. There was, at Bari, in the kingdom of Naples, a miraculous old, said to distil from the tomb of St Nicholas; and the credulity of the people inducing them to employ it as a remedy for certain disorders, it was sold in small glass phials bearing the image of the saint, and an inscription purporting that they contained '*manna of St Nicholas of Bari*.' The apparent sanctity of these securing them from suspicion, Tofania employed them for the distribution of her drops; but it seems that, like her friend Spara, she reserved them for the service of those of her own sex to whom the yoke of matrimony had become irksome; and if the history of those times be not incorrect, the toilet of few married ladies of distinction at Naples, and other parts of Italy, was without a phial of the precious manna. This poison was limpid and tasteless as pure water, so that it was impossible to guard against its attacks; a few drops, administered at different periods, were sufficient to destroy a man by slow and imperceptible degrees; and it was supposed, that through its effects not fewer than six hundred persons perished.

Tofania lived to a great age; but suspicion having at length fallen on her, she took refuge in a monastery, from which she was dragged by the officers of justice, notwithstanding an outcry raised by the clergy at the violation of ecclesiastical privilege. Being put to the rack, she confessed her crimes, and acknowledged that, the day before she absconded, she had forwarded two boxes of manna to Rome, where it was actually found in the customhouse; but it never appeared who had ordered it. She was afterwards, it is said, privately strangled; but in the accounts of her fate there is considerable discrepancy; for Labat says that she was arrested in 1709; Keysler, another traveller, affirms, on the contrary, that she was still living at Naples in 1730, and resided in a convent, in which she was protected as in a sacred sanctuary, and where many strangers used to visit her from motives of curiosity; and Garelli, who was physician to Charles the Sixth, King of the Two Sicilies, and whose authority on this point is most to be relied on, writes to a friend, about 1719, that she was still in prison at Naples.

This infamous art, however, no where ever excited greater interest than at Paris. About the year 1670, Margaret d'Aubray, wife of the Marquis de Brinvilliers, a nobleman of large fortune, attached herself to a young officer of a distinguished but needy family, named Godin de Ste. Croix. After a short period, she lost her husband, whose property she had partly dissipated; and still openly continuing her intimacy with De Ste. Croix, her father procured a *lettre de cachet*, had him arrested, and thrown into the Bastille. He there got acquainted with an Italian, who instructed him in the manner of preparing poisons. After a year's imprisonment, he was released, and immediately flew to the Marchioness, to whom he communicated the baneful art, which she undertook to practise for the improvement of their circumstances. She then assumed the garb of a nun of the order of *Les Sœurs de la Charité*, distributed food to the poor, administered to the sick in the *Hôtel-Dieu*, and thus tried the effect of her poisons, undetected, on these helpless wretches. She bribed a servant to poison her own father and her brother, and endeavoured to poison her sister. The two former perished; but a suspicion having arisen of the cause of their death, the sister was on her guard, and thus escaped. She then, however, avoided detection, and the guilty pair continued their villainous practices in security, until they were at length providentially brought to light in the following manner:—

De Ste. Croix, while preparing poison, always wore a glass mask; but this once happening to drop off by accident, he was, as it is said, suffocated by the vapour, and was found dead on the floor of his laboratory. As he was without apparent heirs, government caused an inventory to be taken of his effects, among which there was found a sealed casket, with a label to the following effect:—'I hereby entreat that those into whose hands this box may fall, will have the kindness to deliver it into the hands of the Mar-

chioness de Brinvilliers, who resides in the *Rue neuve St Paul*, as its contents concern her alone, are her sole property, and can be of no use to any other person; and in case that she should die before me, I beg that it may be burned, with all that it contains, without opening it. That no one may plead ignorance, I swear by that God whom I adore, and by all that is sacred, that I advance nothing but the truth; and if these, my just and reasonable wishes, be not complied with, I charge the conscience of those who infringe them with the consequences, both in this world and the next, in order that I may relieve my own: protesting, at the same time, that this is my last will. Done at Paris, this 25th of May, in the afternoon, 1672.—DE SAINTE CROIX." The singularity of this request formed the strongest inducement not to comply with it: accordingly, the casket was opened, and in it were found various packets, with inscriptions signifying that they contained poisons, the effects of which had been proved by experiments on animals.

The Marchioness, having failed in an attempt to obtain possession of the casket, fled to England, and thence to Liege, where she took sanctuary in a convent. In order to entice her from this privileged abode, a police-officer, in the disguise of an Abbé, obtained an introduction to her, and, assuming the character of a lover, persuaded her to leave the convent on a party of pleasure, and then arrested her. At first she denied all that was laid to her charge; and while in prison, she behaved with great levity, passing the greater part of her time in playing at piquet. But she had been guilty of the extraordinary imprudence of making out a catalogue of her crimes, which, in her own hand-writing, was found among her effects in the convent. Upon this she was convicted; and having afterwards acknowledged the horrid detail, which contained a series of the most shocking atrocities, she was publicly beheaded, and afterwards burned at Paris, on the 16th of July 1676, and met her fate with a degree of resolution amounting almost to unconcern. It may afford matter for curious speculation to the disciples of Lavater to learn, that nature had not been sparing to the Marchioness of the beauties of her sex: her features were regular, the contour of her face extremely graceful, and her whole air wore that appearance of serenity, which is considered as an indication of virtue."

ENGLISH PORCELAIN.

The first manufactories of porcelain in England were those at Bow, and at Chelsea, near London. In these, however, nothing but soft porcelain was made. This was a mixture of white clay and fine white sand from Alum Bay, in the Isle of Wight, to which such a proportion of pounded glass was added, as, without causing the ware to soften so as to lose its form, would give it, when exposed to a full red heat, a semi-transparency resembling that of the fine porcelain of China. The Chelsea ware, besides bearing a very imperfect similarity in body to the Chinese, admitted only of a very fusible lead glaze, and in the taste of its patterns, and in the style of their execution, stood as low perhaps as any on the list. The china works at Derby come the next in date; then those of Worcester, established in 1751; and the most modern are those of Coalport, in Shropshire; of the neighbourhood of Newcastle in Staffordshire; and in other parts of that county. The porcelain clay used at present in all the English works is obtained in Cornwall, by pounding and washing over the gray disintegrated granite which occurs in several parts of that county; by this means the quartz and mica are got rid of, and the clay resulting from the decomposition of the felspar is procured in the form of a white, somewhat gritty powder. This clay is not fusible by the highest heat of our furnaces, though the felspar, from the decomposition of which it is derived, forms a spongy milk-white glass, or enamel, at a low white heat. But felspar, when decomposed by the percolation of water, while it forms a constituent of granite, loses the potash, which is one of its ingredients to the amount of about 15 per cent., and with it the fusibility that this latter substance imparts.—*Repertory of Patent Inventions.*

JAMAICA FIRE-FLIES.

I was in the habit, almost nightly, of enclosing a dozen or more of fire-flies under an inverted glass tumbler on my bedroom table, the light from whose bodies enabled me to read without difficulty. They are about the size of a bee, and perfectly harmless. Their coming forth in more than usual numbers is the certain harbinger of impending rain; and I have frequently, whilst travelling, met them in such myriads, that, be the night ever so dark, the pathway was as plain and visible almost as at noonday. The light they emit resembles exactly the lustre of the diamond, and I have been told that it is no uncommon thing for the Creole coquettes to insert a few of them, confined in pieces of thin gauze, amongst their hair, and in various parts of their dress, just as our belles at home avail themselves of the ingenuity of the paste-jeweller.—*Author of Scenes in Jamaica.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place. Sold also by JAMES CHAMBERS, 48, North Hanover Street, and by all other Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England, Wales, and Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by THOMAS ALLEN, Junr. Caledonian Mercury Office; and printed by BALLANTYNE and COMPANY, Paul's Walk.

CHAMBERS' EDINBURGH JOURNAL

LIFE OF SIR WALTER SCOTT.

ANCESTRY.

THE parentage of Sir Walter Scott connected him with baronial and professional rank of considerable eminence. His father, Walter Scott, Esq. a member of the respectable society of Writers to the Signet, was the son of Mr Robert Scott, settled at Sandyknowe in Roxburghshire,* whose father, Mr Walter Scott, was a younger son of Walter Scott of Raeburn, the third son of Sir Walter Scott of Harden, the ancestor of the present Lord Polwarth.

Scott of Raeburn, great-great-grandfather to the subject of this memoir, lived at the time of the Restoration, and embraced the tenets of Quakerism, which at that period made their way into Scotland. For this he endured a degree of persecution for which it is now difficult to assign a reason. The Scottish Privy Council, by an edict dated June 20, 1665, directed his brother, the existing representative of the Harden family, to take away his three children, and educate them separately, so that they might not become infected with the same heresy; and, for doing so, he was to be entitled to sue his brother for the maintenance of the children. By a second edict, dated July 5, 1666, the Council directed two thousand pounds Scots money to be paid by the Laird of Raeburn for this purpose; and as he was now confined in the tolbooth of Edinburgh, where he was liable to be further tainted by converse with others of the same sect there also imprisoned, the Council further ordered him to be transported to the jail of Jedburgh, where no one was to have access to him but such as might be expected to convert him from his present principles.

Walter, the second son of this gentleman, and father to the novelist's grandfather, received a good education at Glasgow College, under the protection of his uncle. He was a zealous Jacobite—a friend and correspondent of Dr Pitcairn—and made a vow never to shave his beard till the exiled house of Stuart should be restored.

Dr John Rutherford, maternal grandfather to the subject of this memoir, was the son of a minister of Yarrow, in Selkirkshire, whose monument, bearing that he died in 1709, is to be seen on the north wall of the church of that parish. Dr Rutherford was one of four Scottish pupils of Boerhaave, who, in the early part of the last century, contributed to establish the high character of the Edinburgh University as a school of medicine. He was the first Professor of the Practice of Physic in the University, to which office he was elected in 1727, and which he resigned in 1766, in favour of the celebrated Dr John Gregory. He was also the first person who delivered lectures on Clinical Medicine in the Infirmary. His son, Dr Daniel Rutherford, maternal uncle to the novelist, was afterwards, for a long period, Professor of Botany in the Edinburgh University. His daughter, Anne, was the mother of Sir Walter Scott.

The wife of Dr John Rutherford, and maternal grandmother of Sir Walter Scott, was Jean Swinton, daughter of Swinton of Swinton, in Berwickshire, one of the oldest families in Scotland, and at one period very powerful. Sir Walter has introduced a chivalric representative of this race into his drama of "Halidon Hill." The grandfather of Jean Swinton was Sir John Swinton, the twentieth baron in lineal descent, and the son of the celebrated Judge Swinton, to whom, along with Sir William Lockhart of Lee, Cromwell entrusted the chief management of civil affairs in Scotland, during his usurpation. Lord Swinton, as he was called in virtue of his judicial character, was seized, after the Restoration, and brought down to Scotland for trial, in the same vessel with the Marquis of Argyre. It was generally expected that one who had played so conspicuous a part in the late usurpation, would not elude the vengeance of the new government. He escaped, however, by suddenly adopting the tenets of the society to which Walter Scott of Raeburn afterwards attached himself. On being brought before the Parliament for trial, he rejected

all means of legal defence; and his simply penitent appearance and venerable aspect wrought so far with his judges, that he was acquitted, while less obnoxious men were condemned. It was from this extraordinary person, and while confined along with him in Edinburgh Castle, that Colonel David Barclay, father of Robert Barclay, the eminent author of the "Apology for the Quakers," contracted those sentiments which afterwards shone forth and attracted so much notice in his son.

FATHER.

While the ancestry of Sir Walter Scott is thus shown to have been somewhat more than respectable, it must be also stated, that, in his character as a man, a citizen, and a professional agent, there could not be a more worthy member of society than his immediate parent. Mr Walter Scott, born in 1729, and admitted as a writer to the signet in 1755, was by no means a man of shining abilities. He was, however, a steady, expert man of business, inasmuch as to prosper considerably in life; and nothing could exceed the gentleness, sincerity, and benevolence of his character. For many years, he held the honourable office of an elder in the parish church of Old Greyfriars, while Dr Robertson, the historian of America and Charles V., acted as one of the ministers. The other clergyman was Dr John Erskine, much more distinguished as a divine, and of whom Sir Walter has given an animated picture in his novel of "Guy Mannering." Mr Walter Scott, W.S. had been considered as extremely handsome. In early life, his friend Mrs Cockburn, author of the beautiful song of "the Flowers of the Forest," passed the following eulogium upon his various qualities of person and mind, in an extemporaneous series of toasts—

To a thing that's uncommon—a youth of discretion,
Who, though vastly handsome, despises flirtation;
To the friend in affliction, the soul of affection,
Who may hear the last trump without dread of detection.

MOTHER.

Mrs Scott, while she boasted a less prepossessing exterior than her husband, was enabled, partly by the more literary character of her connexions and education, and more perhaps by native powers of mind, to make a greater impression in conversation. It has thus become a conceded point, that Sir Walter derived his abilities almost exclusively from this parent. Without pretending to judge in a matter of such delicacy, it may at least be allowed that the young poet was at first chiefly indebted to his mother for an introduction to the literary society of which her father and brother were such distinguished ornaments. It has somewhere been alleged, that Mrs Scott, who was an intimate friend of Allan Ramsay, Blacklock, and other poetical wits of the last century, wrote verses, like them, in the vernacular language of Scotland. But this can be denied, upon the testimony of her own son. The mistake has probably arisen in consequence of a Mrs Scott of Wauchope, whose maiden name was likewise Rutherford, having published poetry of her own composition. Mrs Walter Scott, who was nevertheless a woman of powerful intellect, was, at an early age, deemed worthy by her father to be entrusted with the charge of his house, during his temporary widowhood; and thus she possessed opportunities enjoyed by few young ladies of her own age, and of the period when she lived, of mixing in literary society. It is unquestionable that this circumstance was likely to have some effect in later life upon her son, with the training of whose mind she must, in virtue of her maternal character, have had more to do than her husband. It may be further mentioned, that Mrs Scott had been principally educated by a reduced gentlewoman, a Mrs Euphemia Sinclair (granddaughter of Sir Robert Sinclair of Longformacus), who kept a school for young ladies, in the now wretched precincts of Blackfriars' Wynd, in Edinburgh, and who had the honour of educating many of the female nobility and gentry of Scotland, some of whom were her own relations. Sir Walter's own words respecting this person, are given in the work entitled "Traditions of Edinburgh." "To judge by the proficiency of her scholars, although much of what is called accomplishment might then be left untaught, she must have been possessed of uncommon talents for education; for all the ladies above mentioned" (the list includes Mrs Scott) "had well-cultivated minds, were fond of reading, wrote and

spelled admirably, were well acquainted with history and with the belles lettres, without neglecting the more homely duties of the needle and accompt-book; and while two of them" (meaning, as there is reason to believe, Mrs Scott and Mrs Murray Keith*) "were women of extraordinary talents, all of them were perfectly well bred in society."—Vol. iii. p. 128. Sir Walter further communicated, that his mother, and many others of Mrs Sinclair's pupils, were sent, according to a fashion then prevalent in good society, to be finished off by the Honourable Mrs Ogilvie, lady of the Honourable Patrick Ogilvie of Longmay, whose brother, the Earl of Seafield, was so instrumental, as Chancellor of Scotland, in carrying through the union with England. Mrs Ogilvie trained her young friends to a style of manners which would now be considered intolerably stiff: for instance, no young lady, in sitting, was permitted ever to touch the back of her chair. Such was the effect of this early training upon the mind of Mrs Scott, that even when she approached her eightieth year, she took as much care to avoid touching her chair with her back, as if she had still been under the stern eye of Mrs Ogilvie.

BIRTH—BIRTH-PLACE—EARLY SCENES.

Sir Walter Scott was born at Edinburgh on the 15th of August 1771. He was the third of a family, consisting of six sons and one daughter. The eldest son John attained to a majority in an infantry regiment, but was early obliged to retire from service on account of the delicate state of his health. The youngest brother Daniel was a sailor, but died in early life. Of him Sir Walter has often been heard to assert, that he was by far the cleverest and most interesting of the whole. Thomas, the next brother to Sir Walter, followed the father's profession, and was for some years factor to the Marquis of Abercorn, but eventually died in Canada in 1822, in the capacity of paymaster to the 70th regiment. Sir Walter himself entertained a fondly high opinion of the talents of this brother, but it is not borne out by the sense of his other friends. He possessed, however, some burlesque humour, and an acquaintance with Scottish manners and character—qualities which were apt to impose a little, and even induced some individuals to believe, for some time, that he, rather than his more gifted brother, was the author of "the Novels."

Existence opened upon the Author of Waverley in one of the duskiest parts of the ancient capital, which he has been pleased to apostrophise in *Marmion as his own romantic town*. At the time of his birth, and for some time after, his father lived at the head of the College Wynd, a narrow alley leading from the Cowgate to the gate of the College. The two lower floors of the house were occupied by Mr Keith, W.S., grandfather of the present Knight Marischal of Scotland, and Mr Walter Scott lodged *aux troisieme*, his part of the mansion being accessible by a stair behind. For a more particular account of the house, reference is made to the note below.†

It appears, however, that, before Sir Walter could receive any impressions from the romantic scenery of the Old Town of Edinburgh, he was removed, on account of the delicacy of his health, to the country, and lived for a considerable period under the charge of his paternal grandfather at Sandyknowe. This farm is situated upon high ground, near the bottom of Leader water, and overlooks a large part of the vale of Tweed. In the immediate neighbourhood of the farm-house, upon a rocky foundation, stood the Border fortlet called Smallholm Tower, which possessed many features to attract the attention of the young poet. But he has himself, in the introduction to the third canto

* The Mrs Bethune Balgool of the "Chronicles of the Canon gate."

† It was a house of what would now be considered humble aspect, but at that time neither humble from its individual appearance, nor from its vicinity. As it stood on the line necessary for the opening of a street along the north skirt of the new University buildings, it was destroyed on that occasion, and never rebuilt. Speaking of this house in a series of notes communicated to a local antiquary in 1825, Sir Walter said, "It consisted of two flats above Mr Keith's, and belonged to my father, Mr Walter Scott, Writer to the Signet; there I had the chance to be born, 15th August 1771. My father, soon after my birth, removed to George's Square, and let the house in the College Wynd, first to Mr Dundas of Philipstoun, and afterwards to Mr William Keith, father of Sir Alexander Keith. It was purchased by the public, together with Mr Keith's [the inferior floors], and pulled down to make way for the new College."

* "The Poet's grandfather, Mr Robert Scott of Sandyknowe, though both descended from and allied to several respectable Border families, was chiefly distinguished for the excellent good sense and independent spirit which enabled him to lead the way in agricultural improvement—then a pursuit abandoned to persons of a very inferior description. His memory was long preserved in Teviotdale, and still survives, as that of an active and intelligent farmer, and the father of a family all of whom were distinguished by talents, probity, and remarkable success in the pursuits which they adopted."—*Border Antiquities*, by Walter Scott, Esq. 2 vols. 4to. London, 1814.

of Marmion, described both the place and its inhabitants, as well as the various romantic associations which it established in his young bosom :—

Thus, while I ope the measure wild,
Of tales which charm'd me when a child,
Rude though they be, still with the chime
Return the thoughts of early time;
And feelings roused in life's first day,
Glow in the line and prompt the lay.
Then rise those crags, that mountain tower,
Which charm'd my fancy's wakening hour.
Though no broad river swept along,
To claim, perchance, heroic song;
Though sigh'd no groves in summer gale,
To prompt of love a softer tale;
Though scarce a puny streamlet's speed
Claimed homage from a shepherd's reed,
Yet was poetic impulse given;
By the green hill, and clear blue heaven.
It was a barren scene, and wild,
Where naked cliffs were rudely piled;
But ever and anon between
Lay velvet tufts of loveliest green;
And well the lonely infant knew
Recesses where the wallflower grew,
And honeysuckle loved to crawl
Up the low crag and ruin'd wall.
I deem'd such nooks the sweetest shade
The sun in all its rounds survey'd;
And still I thought that shatter'd tower
The mightiest work of human power;
And marvel'd, as the aged hind
With some strange tale bewitch'd my mind
Of foragers, who, with headlong force,
Down from that strength had spurred their horse,
Their southron rapine to renew,
Far in the distant Cheviots blue;
And, home-returning, fill'd the hall
With revel, wassel-rout, and brawl.
Methought that still with trump and clang
The gateway's broken arches rang;
Methought grim features, seamed with scars,
Glared through the window's rusty bars;
And ever, by the winter hearth,
Old tales I heard of woe, or mirth;
Of lovers' slights, of ladies' charms,
Of witches' spells, of warriors' arms;
Of patriot battles, one of old
By Wallace wight, and Bruce the bold;
Of later feuds of feud and fight,
When, pouring from their highland height,
The Scottish clans, in headlong sway,
Had swept the scarlet ranks away.
While stretched at length upon the floor,
Again I fought each combat o'er,
Pebbles and shells, in order laid,
The mimic ranks of war displayed.
And onward still the Scottish Lion bore,
And still the scatter'd Southron fled before.

Still with vain fondness, could I trace,
Anew, each kind familiar face,
That brighten'd at our evening fire,
From the thatch'd mansion's grey-hair'd sire,
Wise without learning, plain and good,
And sprung of Scotland's gentler blood;
Whose eye in age, quick, clear, and keen,
Show'd what in youth its glance had been;
Whose doom discording neighbours sought,
Content with equity unbought;
To him the venerable priest,
Our frequent and familiar guest,
Whose life and manners well could paint
Alike the student and the saint.
Alas! whose speech too oft I broke
With gambol rude and timeless joke:
For I was wayward, bold and wild,
A self-will'd imp, a grand-dame's child;
But half a plague, and half a jest,
Was still endured, beloved, caress'd.

SCHOOLBOY DAYS.

It is understood, that, at the "evening fire" of Sandyknowe, Sir Walter learned much of that Border lore which he afterwards wrought up in his fictions. In the meantime, his advance in the mechanical and elementary parts of education was greatly retarded by the ill health which rendered rustic recreation necessary. The school which he first attended is said to have been one at Kelso, kept by a Mr Launcelot Whale, where he was the contemporary and playmate of the Messrs Ballantyne, afterwards so conspicuously connected with him in the affairs of mature life. After an irregular attendance at this and other seminaries, he entered Fraser's class at the High School of Edinburgh, in the *third year*; that is to say, when that master had carried his class through one-half of the ordinary curriculum of the school; wherefore it is clear, that any earlier instruction he could have received must have been in some inferior institution, and very probably communicated in a hurried and imperfect manner. It is at the commencement of the school year in October 1779, that his name first appears in the school register; he must have then been eight years of age, which, it may be remarked, is an unusually early period for a boy to enter the third year of his classical course. What is further remarkable, his elder brother attended the same class. It is therefore to be suspected that his educational interests were sacrificed, in some measure, to the circumstances of the school, which were at that period in such an unhappy arrangement as to teachers, that parents often precipitated their children into a class for which they were unfitted, in order to escape a teacher whom they deemed unqualified for his duties, and secure the instructions of one who bore a superior character. Although Mr Luke Fraser was one of the severest flagellators even of the *old school*, he enjoyed the reputation of being a sound scholar, so far as scholarship was required for his duties, and also that of a most conscientious and pains-taking teacher. He first caused his scholars to get by heart Ruddiman's Rudiments; and as soon as they were thoroughly grounded in the declensions, the vocabulary of the same great grammarian was put into their hands,

and a small number of words prescribed to be repeated every morning. They then read in succession the Colloquies of Corderius, four or five lives of Cornelius Nepos, and the first four books of Cæsar's Commentaries. Ere this course was perfected, the greater part of Ruddiman's Grammatica Minora, in Latin, was got by heart. Select passages from Ovid's Metamorphoses, the Bucolics, and the first Æneid of Virgil, concluded the fourth year; after which, the boys were turned over to the Rector, by whom they were instructed for two years more, making the course in all six years. Every one of the three masters besides Mr Fraser pursued the same system, bringing forward a class from the first elements to the state in which it was fitted for the attention of the Rector; after which he returned once more to take up a new set of boys in the first class—and so forth for one lustrum after another, so long as he was connected with the school. If any teacher could have brought a boy over such a difficulty as that which attended the commencement of Sir Walter's career at the High School, it would have been Mr Fraser; for few of his profession at that time were more anxious to explain away every obstruction in the path of his pupils, or took so much pains to ascertain that they were carrying the understandings of the boys along with them through all the successive stages. Apparently, however, neither the care of the master, nor the inborn genius of the pupil, availed much in this case; for it is said that the twenty-fifth place was no uncommon situation in the class for the future author of the Waverley Novels.

After two years of instruction, commenced under these unfavourable circumstances, Sir Walter, in October 1781, entered the Rector's class, then taught by Dr Alexander Adam, the author of many excellent elementary books, and one of the most meritorious and most eminent teachers that Scotland has ever produced. The authors read by Dr Adam's class at this period, and probably during the whole of his career, were Virgil, Horace, Cicero, Sallust, Livy, and Terence; but it was not in reading and translating alone that an education under this eminent man consisted. Adam, who was an indefatigable student, as the number and excellence of his works testify, was a complete contrast to Mr Fraser, who hardly ever introduced a single remark, but what was intended to illustrate the *letter* of the author; whereas Dr Adam commented at great length upon whatever occurred in the course of reading in the class, whether it related to antiquities, customs, and manners, or to history. Adam was of so communicative a disposition, that whatever knowledge he had acquired in his private studies, he took the first opportunity of imparting to his class, paying little regard whether it was above the comprehension of the greater number of his scholars or not. He abounded in pleasant anecdote; and while he never neglected the proper business of his class, it is certain that he inspired a far higher love of knowledge and of literary history into the minds of his pupils than any other teacher of his day. At the same time he displayed a benevolence of character which won the hearts of his pupils, and nothing ever gave him so much pleasure as to hear of their success in after life. To this venerable person Sir Walter was always ready to acknowledge his obligations, and it is not improbable that some part of his literary character was moulded on that of Dr Adam.

As a scholar, nevertheless, the subject of this memoir never became remarkable for proficiency. There is his own authority for saying, that, even in the exercise of metrical translation, he fell far short of some of his companions; although others preserve a somewhat different recollection, and state that this was a department in which he always manifested a superiority. The following is the account of his habits at this early period of life, given by himself at the distance of nearly half a century :—

STORY-TELLING.

"I must refer to a very early period of my life, were I to point out my first achievements as a tale-teller; but I believe some of my old schoolfellows can still bear witness that I had a distinguished character for that talent, at a time when the applause of my companions was my recompense for the disgraces and punishments which the future romance-writer incurred for being idle himself, and keeping others idle, during hours that should have been employed on our tasks. The chief enjoyment of my holidays was to escape with a chosen friend, who had the same taste with myself, and alternately to recite to each other such wild adventures as we were able to devise. We told, each in turn, interminable tales of knight-errantry and battles and enchantments, which were continued from one day to another as opportunity offered, without our ever thinking of bringing them to a conclusion. As we observed a strict secrecy on the subject of this intercourse, it acquired all the character of a concealed pleasure; and we used to select for the scenes of our indulgence, long walks through the solitary and romantic environs of Arthur's Seat, Salisbury Crags, Braid Hills, and similar places in the vicinity of Edinburgh, and the recollection of those holidays still forms an oasis in the pilgrimage which I have to look back upon."

It was the effect unquestionably of this perverse love of tale-telling, that the future Author of Waverley left

* General Introduction to new edition of Waverley Novels, p. ii.

the High School in 1783, ranking only *eleventh* in the Rector's class.

ANECDOTE OF JUVENILE TEMPER.

It is the tradition of the family—and the fact is countenanced by this propensity to tales of chivalric adventure—that Sir Walter wished at this period of his life to become a soldier. The illness, however, which had beset his early years, rendered this wish bootless, even although his parents had been inclined to gratify it. His malady had had the effect of contracting his right leg, so that he could hardly walk erect, even with the toes of that foot upon the ground. It has been related by a member of his family, that, on this being represented to him as an insuperable obstacle to his entering the army, he left the room in an agony of mortified feeling, and was found some time afterwards suspended by the wrists from his bedroom window, somewhat after the manner of the unfortunate Knight of the Rueful Countenance, when beguiled by the treacherous Maritornes at the inn. On being asked the cause of this strange proceeding, he said he wished to prove to them, that, however unfitted by his limbs for the profession of a soldier, he was at least strong enough in the arms. He had remained in that uneasy and trying posture for upwards of an hour.*

MUSIC.

An attempt was made about the same time to give him instructions in music, which used to be a branch of ordinary education in Scotland. His preceptor was Mr Alexander Campbell, then organist of an Episcopal chapel in Edinburgh, but known in later life as the editor of "Albyn's Anthology," and author of various other publications. Mr Campbell's efforts were entirely in vain: he had to abandon his pupil in a short time, with the declaration that he was totally deficient in that indispensable requisite to musical education—an *ear*. It may appear strange, that he who wrote so many musical verses, should have wanted this natural gift; but there are other cases to show that a perception of metrical quantities does not depend on any such peculiarity. Dr Johnson is a splendid instance. Throughout life, Sir Walter, however capable of enjoying music, was incapable of producing two notes consecutively that were either in tune or in time. He used to be pressed, however, at an annual agricultural dinner, to contribute his proper quota to the cantations of the evening; on which occasions he would break forth with the song of "Tarry Woo," in a strain of unmusical vehemence, which never failed, on the same principle as Dick Tinto's famous sign, to put the company into good humour.

UNIVERSITY.

After having been two years under the Rector of the High School,† he was placed in the University of Edinburgh, October 1783. The usual course at this seminary is, for the first year, to attend the classes of Latin and Greek, to which, during the second, are added Mathematics and Logic; the third and last year of the course of a merely liberal education, is spent in attending the lectures on Moral and Natural Philosophy. It would appear that Sir Walter did not proceed regularly through this academical course. He was matriculated, or booked, in 1783, at once, for the Humanity or Latin class under Professor Hill, and the Greek class under Professor Dalryell; and for the latter, once more, in 1784. But the only other class for which he seems to have matriculated at the College, was that of Logic, under Professor Bruce, in 1785. Although he may perhaps have attended other classes without matriculation, there is reason to believe that his irregular health produced a corresponding irregularity in his academical studies. The result, it is to be feared, was, that he entered life much in the condition of his illustrious prototype, the Bard of Avon—that is, "with a little Latin and less Greek."

While still at the High School, he made his first attempt in original versification, the subject being a thunder-storm, which happened one day as he and his companions were amusing themselves in the yard. The poem consisted only of six lines, but when he repeated it, on his return home, to his mother, it produced a deep impression of pleasure and pride in her bosom, so that, after he had retired from her presence, she could not help addressing a person, who was then beside her, in an exclamation of the most passionate nature, respecting the promising intellect of her child.‡

* His parents made many efforts to cure his lameness. Edinburgh at this time boasted of an ingenious mechanist in leather, the first person who extended the use of that commodity beyond ordinary purposes; on which account there is an elaborate memoir of him in Doddsley's Annual Register for 1793. His name was Gavin Wilson, and, being something of a humorist, he exhibited a sign-board, intended to burlesque the vanity of his brother tradesmen—his profession being thus indicated, "Leather leg-maker, not to his Majesty." Honest Gavin, on the application of his parents, did all he could for Sir Walter, but in vain. Mr and Mrs Scott, with less creditable anxiety for their child's welfare, thought proper to apply to the celebrated quack James Graham, who came to Edinburgh in 1783. It is needless to say that Mr Graham's prescriptions were still less efficacious than those of Mr Wilson.

† His attendance at the High School stood distinctly thus :—Under Mr L. Fraser, during seasons 1779-80 and 1780-1.

Under the Rector, during seasons 1781-2 and 1782-3.

‡ One of Mrs Scott's female friends recollects hearing her mention the following anecdote of her distinguished son :—She was conversing with a gentleman respecting the almost perpetual drizzle which prevails in the west of Scotland—a fact for which both parties declared themselves at a loss to account, when Walter, popping his head up from below the table, said, "It is only Nature, weeping for the barrenness of her soil."

Some further notice of this and other juvenile attempts, will be found in a subsequent part of the present narrative.

READING.

"When boyhood advancing into youth," says Sir Walter, in the autobiographical chapter formerly quoted, "required more serious studies and graver cares, a long illness threw me back on the kingdom of fiction, as if it were by a species of fatality. My indisposition arose, in part at least, from my having broken a blood-vessel; and motion and speech were for a long time pronounced positively dangerous. For several weeks I was confined strictly to my bed, during which time I was not allowed to speak above a whisper, to eat more than a spoonful or two of boiled rice, or to have more covering than one thin counterpane. When the reader is informed that I was at this time a growing youth, with the spirits, appetite, and impatience of fifteen, and suffered of course greatly under this severe regimen, which the repeated return of my disorder rendered indispensable, he will not be surprised that I was abandoned to my own discretion, to far as reading (my almost sole amusement) was concerned, and still less so, that I abused the indulgence which left my time so much at my own disposal.

There was at this time a circulating library in Edinburgh, founded, I believe, by the celebrated Allan Ramsay, which, besides containing a most respectable collection of books of every description, was, as might have been expected, peculiarly rich in works of fiction.* It exhibited specimens of every kind, from the romances of chivalry, and the ponderous folios of Cyrus and Cassandra, down to the most approved works of later times. I was plunged into this great ocean of reading without compass or pilot; and unless when some one had the charity to play at chess with me, I was allowed to do nothing save read, from morning till night. I was, in kindness and pity, which was perhaps erroneous, however natural, permitted to select my subjects of study at my own pleasure, upon the same principle that the humours of children are indulged to keep them out of mischief. As my taste and appetite were gratified in nothing else, I indemnified myself by becoming a glutton of books. Accordingly, I believe I read almost all the old romances, old plays, and epic poetry, in that formidable collection, and no doubt was unconsciously amassing materials for the task in which it has been my lot to be so much employed.

At the same time, I did not in all respects abuse the licence permitted me. Familiar acquaintance with the specious miracles of fiction brought with it some degree of satiety, and I began by degrees to seek in histories, memoirs, voyages, and travels, and the like, events nearly as wonderful as those which were the work of the imagination, with the additional advantage that they were at least in a great measure true. The lapse of nearly two years, during which I was left to the exercise of my own free-will, was followed by a temporary residence in the country, where I was again very lonely, but for the amusement which I derived from a good though old-fashioned library. The vague and wild use which I made of this advantage I cannot describe better than by referring my reader to the desultory studies of Waverley in a similar situation; the passages concerning whose reading were imitated from recollections of my own."

It will thus be observed that Sir Walter's acquirements in his early years did not lie nearly so much in ordinary branches of education, as in a large stock of miscellaneous reading, taken up at the dictation of his own taste. His thirst for reading is perhaps not described in sufficiently emphatic terms, even in the above narrative. It amounted to an enthusiasm. He was at that time very much in the house of his uncle Dr. Rutherford,† and there, even at breakfast, he would constantly have a book open by his side, to refer to while sipping his coffee, like his own Oldbuck in the Antiquary. His uncle frequently commanded him to lay aside his book while eating, and Sir Walter would only ask permission first to read out the paragraph in which he was engaged. But this request resembled the miracle of *Balmerino's Eik* in conviviality,‡ and the doctor never could find that his nephew finished a paragraph in his life. It may be mentioned that Shakespeare was at this period frequently in his hands, and that, of all the plays, the Merchant of Venice was his favourite.

PROFESSION.

About his sixteenth year, Sir Walter's health experienced a sudden but most decisive change for the better. Though his lameness remained the same, his

* This venerable institution, as it might without impropriety be called, was then the property of Mr James Sibbald, a man of literary accomplishment, who for several years conducted his own excellent "Edinburgh Magazine," and afterwards published a collection of old Scottish poetry in four volumes. The library, of which Sir Walter speaks in such high terms, was finally sold off in 1831, and the shop is now occupied by persons of a different profession.

† At the bottom of Hyndford's Close, near the Netherbow. He also resided much in his youthful days with his paternal uncle, Captain Scott of Rosebank, near Kelso, who ultimately left him that property, from which, on selling it, he realised about £4000. This was immediately before his marriage.

‡ A way of drinking a whole night in one bowl, by means of perpetual but always partial replenishing. *Eik* signifies addition, and in this case sometimes referred to the sugar, sometimes to the liquor, and sometimes, but less frequently, to the water. Which of the Lords Balmerino was the inventor of this ingenious practice, is not recorded.

body became tall and robust, and he was thus enabled to apply himself with the necessary degree of energy to his studies for the bar. At the same time that he attended the lectures of Professor Dick on Civil Law in the College, he performed the duties of a writer's apprentice under his father; that being the most approved method by which a barrister could acquire a technical knowledge of his profession, though it has never been uniformly practised.* It generally happens, or used to happen, that when a young man of considerable abilities was coming forward to the bar, he was preceded by a crepuscular fame, resulting from his exhibitions either at College, or at the debating societies, in which the well-educated youth of Edinburgh first tried their powers of reasoning and eloquence. But Sir Walter had no prestige of this kind; he was never heard of at any of those clubs; and so far as he was known at all, it was only as a rather abstracted young man, very much given to reading, but not the kind of reading with which other persons of his age are conversant.

ENTERS AT THE SCOTTISH BAR.

On the 10th of July 1792, when just on the point of completing his twenty-first year, he passed advocate with the usual forms. The manner of admission to the Scottish bar was in those days somewhat different from the present. The candidate having made application to the Dean of the Faculty,† a day was appointed for his examination on the Civil and Scottish Law. Having passed with approbation through this trial, he published a thesis upon some head of the Pandects, which he was understood to be ready to defend.‡ The ceremony of admission to the bar took place afterwards, when the candidate addressed the whole court from the Bench in a Latin speech. On the division of the Court of Session into two Chambers, this form was dispensed with.

The young barrister was enabled, by the affluence of his father, to begin life in an elegant house in the most fashionable part of the town; but it was not his lot to acquire either wealth or distinction at the bar. He had perhaps some little employment at the provincial sittings of the criminal court, and occasionally acted in unimportant causes as a junior counsel; but he neither obtained, nor seemed qualified to obtain, a sufficient share of general business to insure an independency. The truth is, his mind was not yet emancipated from that enthusiastic pursuit of knowledge which had distinguished his youth. His necessities, with only himself to provide for, and a sure retreat behind him in the comfortable circumstances of his native home, were not so great as to make an exclusive application to his profession imperative; and he therefore seemed destined to join what a sarcastic barrister has termed, "the ranks of the gentlemen who are not anxious for business." Although he could speak readily and fluently at the bar, his intellect was not at all of a forensic cast. He appeared to be too much of the abstract and unworlthy scholar, to assume readily the habits of an adroit pleader; and even although he had been perfectly competent to the duties, it is a question if his external aspect and general reputation would have tempted the generality of agents to entrust them to his hands.

Throughout all the earlier years of his life as a bar-

* He has related a curious anecdote of this period of his life, in the notes to the recent edition of Rob Roy. The farm of Inverenty, in Balquidder, had been the scene of a murder committed by Robert Oig, son of Rob Roy, upon a man of the name of MacLaren. In reference to that incident, Sir Walter says:—

"The author is uncertain whether it is worth while to mention that he had a personal opportunity of observing, even in his own time, that the king's writ did not pass quite current in the Braes of Balquidder. There were very considerable debts due by Stewart of Appin (chiefly to the author's family), which were likely to be lost to the creditors, if they could not be made available out of this same farm of Inverenty, the scene of the murder done upon MacLaren.

His family, consisting of several strapping deer-stalkers, still possessed the farm, by virtue of a long lease for a trifling rent. There was no chance of any one buying it with such an encumbrance, and a transaction was entered into by the MacLarens, who being desirous to emigrate to America, agreed to sell their lease to the creditors for £500, and to remove at the next term of Whitsunday. But whether they repented their bargain, or desired to make a better, or whether from a mere point of honour, the MacLarens declared they would not permit a summons of removal to be executed against them, which was necessary for the legal completion of the bargain. And such was the general impression that they were men capable of resisting the legal execution of warning by very effectual means, no king's messenger would execute the summons without the support of a military force. An escort of a sergeant and six men was obtained from a Highland regiment lying at Stirling; and the author, then a writer's apprentice, equivalent to the honourable situation of an attorney's clerk, was entrusted with the superintendence of the expedition, with directions to see that the messenger discharged his duty fully, and that the gallant sergeant did not exceed his part by committing violence or plunder. And thus it happened, oddly enough, that the author first entered the romantic scenery of Loch Katrine, of which he may perhaps say he has somewhat extended the reputation, riding in all the dignity of danger, with a front and rear-guard, and loaded arms. The sergeant was absolutely a Highland Serjeant Kite, full of stories of Rob Roy and of himself, and a very good companion. We experienced no interruption whatever, and when we came to Inverenty, found the house deserted. We took up our quarters for the night, and used some of the victuals which we found there. On the morning we returned as unmolested as we came."

† The Scottish advocates form what is called a Faculty, at the head of which is an officer termed the Dean. The Dean on this occasion was the Hon. Henry Erskine (father of the present Earl of Buchan), "the wittiest and the best-honoured man living," as he has been termed by Sir Walter himself.

‡ Sir Walter's thesis was upon a curious subject—*De Cudaveribus Damnatorum*—and is unusually short, consisting only of eight small pages; it is dedicated to Robert Macqueen, better known by his judicial title of Lord Braxfield.

risters, he was constantly studying either one branch of knowledge or another. Unlike the most of young men of his order, he was little tempted from study into composition. With all the diligence which the present writer could exercise, he has not been able to detect any fugitive piece of Sir Walter's in any of the periodical publications of the day, nor even any attempt to get one intruded, unless the following notice in Dr Anderson's "Bee" for May 9, 1792, refers to him:—"The Editor regrets that the verses of W. S. are too defective for publication!"

POLITICAL OPINIONS—SOLDIERING.

From his earliest years, Sir Walter's political leanings were towards Toryism, or, as it may be explained, that principle which disposes men to wish for the preservation of existing institutions. "As for politics," says Shenstone in his Letters, "I think poets are Tories by nature, supposing them to be by nature poets. The love of an individual person or family that has worn a crown for many successions, is an inclination greatly adapted to the fanciful tribe. On the other hand, mathematicians, abstract reasoners, of no manner of attachment to persons, at least to the visible part of them, but prodigiously devoted to the ideas of virtue, liberty, and so forth, are generally Whigs." There is much in this passage that hits the particular case of Sir Walter Scott. But moods of political feeling are not confined to individuals—they sometimes become nearly general over entire nations. At the time when Sir Walter entered public life, almost all the respectable part of the community were filled with a Tory antipathy to the principles and policy of the French republic—a feeling roused to enthusiasm when the French, in 1797, threatened to invade the British islands. Numerous bodies of volunteer militia were consequently formed, for the purpose of local defence. In the beginning of the year 1797, it was judged necessary by the gentlemen of the Scottish capital to imitate the example already set by several counties, by embodying themselves in a cavalry corps. This association assumed the name of the Edinburgh Light Dragoons; and Mr Walter Scott had the honour to be appointed its quarter-master, for which office his lameness was considered no bar, especially as he happened to be a remarkably good equestrian. He was a signally zealous officer, and very popular in the regiment, on account of his extreme good humour and powers of social entertainment. His appointment partly resulted from, and partly led to, an intimacy with the most considerable man of his name, Henry Duke of Buccleuch, who had taken a great interest in the embodying of the corps. It was also perhaps the means, to a certain extent, of making him known to Mr Henry Dundas, who was now one of his Majesty's Secretaries of State, and a lively promoter of the scheme of national defence in Scotland. Quarter-master Scott composed a war-song, as he called it, for the Edinburgh Light Dragoons, which he afterwards published in the Border Minstrelsy.

DAWNINGS OF LITERARY AMBITION.

Heretofore, Sir Walter had only been remarkable for his qualifications as a relater of amusing and apposite stories in conversation, and for his activity as Adjutant to the Royal Mid-Lothian Yeomanry. Now, however, he became known within a small circle, as a person of poetical abilities. An account of this change in his circumstances is given by himself, in a narrative, written in latter life, introductory to the department of his Border Minstrelsy which consists of imitations of the ancient ballad.

"A period," says Sir Walter, "when this particular taste for the popular ballad was in the most extravagant degree of fashion, became the occasion, unexpectedly indeed, of my deserting the profession to which I was educated, and in which I had sufficiently advantageous prospects for a person of limited ambition. * * * I may remark, that, although the assertion has been made, it is a mistake to suppose that my situation in life or place in society were materially altered by such success as I attained in literary attempts. My birth, without giving the least pretension to distinction, was that of a gentleman, and connected me with several respectable families and accomplished persons. My education had been a good one, although I was deprived of its full benefit by indifferent health, just at the period when I ought to have been most sedulous in improving it. The young men with whom I was brought up, and lived most familiarly, were those who, from opportunities, birth, and talents, might be expected to make the greatest advances in the profession to which we were all destined; and I have the pleasure still to preserve my youthful intimacy with no inconsiderable number of them, whom their merit has carried forward to the highest honours of their profession. Neither was I in a situation to be embarrassed by the *res angusta domi*, which might have otherwise interrupted my progress in a profession in which progress is proverbially slow. I enjoyed a moderate degree of business for my standing, and the friendship of more than one person of consideration, efficiently disposed to aid my views in life. The private fortune, also, which I might expect, and finally inherited, from my family, did not, indeed, amount to affluence, but placed me beyond all apprehension of want. I mention these circumstances because they are true. * * I now proceed to detail the circumstances which engaged me in literary pursuits.

During the last ten years of the eighteenth century, the art of poetry was at a remarkably low ebb in Britain. Hayley, to whom fashion had some years before ascribed a higher degree of reputation than posterity has confirmed, had now lost his reputation for talent, although he still lived admired and respected as an amiable and accomplished man. The Bard of Memory slumbered on his laurels, and He of Hope had scarce begun to attract his share of public attention. Cowper, a poet of deep feeling and bright genius, was dead, and even while alive, the hypochondria, which was his mental malady, impeded his popularity. Burns, whose genius our southern neighbours could hardly yet comprehend, had long confined himself to song-writing. Names which are now known and distinguished wherever the English language is spoken, were then only beginning to be mentioned. The realms of Parnassus, like many a kingdom at the period, seemed to lie open to the first bold invader, whether he should be a daring usurper, or could show a legitimate title of sovereignty."

The author then details the rise of German literature, and its gradual introduction into this country. The Scottish literati were first made at all acquainted with its existence by Mr Henry Mackenzie, in a paper read to the Edinburgh Royal Society in August 1788.

STUDIES GERMAN.

"In Edinburgh," he continues, "where the remarkable coincidence between the German language and that of the Lowland Scottish, encouraged young men to approach this newly discovered mine, a class was formed, of six or seven intimate friends, who proposed to make themselves acquainted with the German language. They were in the habit of living much together, and the time they spent in this study was felt as a period of great amusement. One source of this diversion was the laziness of one of their number, the present author, who, adverse to the necessary toils of grammar and its rules, was in the practice of fighting his way to the knowledge of the German by his acquaintance with the Scottish and Anglo-Saxon dialects, and of course frequently committing blunders, which were not lost on his more accurate and more studious companions. A more general source of amusement was the despair of the teacher on finding it impossible to extract from his Scottish students the degree of sensibility necessary, as he thought, to enjoy the beauties of the author to whom he considered it proper first to introduce them. We were desirous to penetrate at once into the recesses of the Teutonic literature, and were ambitious of perusing Goëthe and Schiller, and others whose fame had been sounded by Mackenzie. Dr Willich (a medical gentleman), who was our teacher, was judiciously disposed to commence our studies with the more simple diction of Gesner, and prescribed to us 'The Death of Abel,' as the production from which our German tasks were to be drawn. The pietistic style of this author was ill adapted to attract young persons of our age and disposition. We could no more sympathise with the overstrained sentimentality of Adam and his family, than we could have had a fellow feeling with the jolly Faun of the same author, who broke his beautiful jug, and then made a song on it which might have affected all Staffordshire. To sum up the distresses of Dr Willich, we, with one consent, voted Abel an insufferable bore, and gave the pre-eminence, in point of masculine character, to his brother Cain, or even to Lucifer himself. * * * At length, in the midst of much laughing and little study, most of us acquired some knowledge, more or less extensive, of the German language, and selected for ourselves, some in the philosophy of Kant, some in the more animated works of the German dramatists, specimens more to our taste than 'The Death of Abel.'"

POETICAL ATTEMPTS.

Sir Walter next proceeds to mention his acquaintance at this period with Mr M. G. Lewis, author of 'The Monk,' who became almost a yearly visitor of Scotland, and to whom he was introduced by Lady Charlotte Campbell. Lewis had studied deeply in the German school, and already produced some imitations of the manner of their ballad poets, which had struck the public mind with all the charm of novelty.

"Out of this acquaintance," he continues, "consequences arose which altered almost all the Scottish ballad-maker's future prospects in life. In early youth I had been an eager student of ballad poetry, and the tree is still in my recollection, beneath which I lay and first entered upon the enchanting perusal of Percy's Reliques of Ancient Poetry, although it has long perished in the general blight which affected the whole race of Oriental platanus to which it belonged. The taste of another person had strongly encouraged my own researches into this species of legendary lore; but I had never dreamed of an attempt to imitate what gave me so much pleasure.

I had indeed tried the metrical translations which were occasionally recommended to us at the High School. I got credit for attempting to do what was enjoined, but very little for the mode in which the task was performed; and I used to feel not a little mortified when my verses were placed in contrast with others of admitted merit. At one period of my school-days, I was so far left to my own desires, as to become guilty of verses on a thunder-storm, which were much approved of, until a malevolent critic sprang up, in the shape of an apothecary's blue-buskin wife, who af-

firmed that my most sweet poetry was stolen from an old magazine. I never forgave the imputation, and even now I acknowledge some resentment against the poor woman's memory. She indeed accused me unjustly, when she said I had stolen my verses ready-made; but as I had, like most premature poets, copied all the words and ideas of which my verses consisted, she was so far right, that there was not an original word or thought in the whole six lines. I made one or two faint attempts at verse, after I had undergone this sort of dawlucking at the hands of the apothecary's wife; but some friend or other always advised me to put my verses in the fire; and, like Dorax in the play, I submitted, though 'with a swelling heart.' In short, except the usual tribute to a mistress's eyebrow, which is the language of passion rather than poetry, I had not for ten years indulged the wish to couple so much as *love* and *dove*, when, finding Lewis in possession of so much reputation, and conceiving that, if I fell behind him in poetical powers, I considerably exceeded him in general information, I suddenly took it into my head to attempt the style by which he had raised himself to fame."

About this period—that is, in the year 1793 or 1794—Mrs Barbauld paid a visit to Edinburgh. She lived in the house of Professor Dugald Stewart, and one evening she astonished the family circle to a great degree, by reading aloud a translation of Bürger's "Lenore," executed by Mr Taylor of Norwich. A friend who had heard it, told Sir Walter what impression the recitation had occasioned, and repeated to him the rude but striking passage, descriptive of the supernatural speed of the ghostly horseman and his mistress:—

Tramp, tramp, along the land they rode,
Splash, splash, along the sea,
Hurra, the dead can ride apace,
Dost fear to ride with me?

Inspired with a strong desire to see the original, Sir Walter, with great difficulty, obtained a copy from Germany, through the kind offices of Mrs Scott of Harden, who was a German by birth. The perusal, says Sir Walter, rather exceeded than disappointed the expectations which the report of Mr Stewart's family had induced me to form; and the book had only been a few hours in my possession, when "I found myself giving an animated account of the poem to a friend, and rashly added a promise to furnish a copy in English ballad verse. I well recollect that I began my task after supper, and finished it about day-break the next morning (it consists of sixty-six stanzas), by which time the ideas which the task had a tendency to summon up, were rather of an uncomfortable character."

FIRST PUBLICATION.

The young poet was so much pleased with his own success on this occasion, as to attempt a few more translations from Bürger, particularly of the poem entitled "Der Wilde Jäger." "In the course of a few weeks," says he, "my own vanity, and the favourable opinion of my friends, interested by the revival of a species of poetry, containing a germ of popularity, of which, perhaps, they were not themselves aware, urged me to the decisive step of sending a selection, at least, of my translations to the press, to save the numerous applications which were made for copies. When was an author deaf to such a recommendation? In 1796, the present author was prevailed on, by request of friends, to indulge his own vanity, by publishing the translation of 'Lenore,' with that of 'The Wild Huntsman,' in a thin quarto. * * * The fate of this, my first publication, was by no means flattering. I distributed so many copies among my friends as materially to interfere with the sale; and the number of translations which appeared in England about the same time, including that of Mr Taylor, to which I had been so much indebted, and which was published in the Monthly Magazine, were sufficient to exclude a provincial writer from competition. * * In a word, my adventure proved a dead loss; and a great part of the edition was condemned to the service of the trunk-maker."

SECOND PUBLICATION.

This failure, Sir Walter informs us, instead of disposing him to retire from the field of letters, rather tempted him to proceed, in order "to show the world that it had neglected something worth notice." He pursued the German language keenly, procured more books in that language from their native country, and extended his views to the dramatic authors. Though he does not mention the fact in this narrative, it must be stated, that early in 1799 he published "Goetz of Berlichingen, a tragedy translated from the German [of Goëthe]." London, 8vo.†

ATTEMPTS ORIGINAL BALLADS.

"The ballad poetry, in which I had made a bold attempt, was still my favourite. * * By degrees I acquired sufficient confidence to attempt the imitation of what I admired. The ballad called 'Glenfinlas,' was, I think, the first original poem which I ventured to compose. As it is supposed to be a translation from the Gaelic, I considered myself as liberated from imitating the antiquated language and rude rhythm of the Minstrel ballad. * * * After 'Glenfinlas,'

* The Chase; and William and Helen. Edinburgh, Manners and Miller, 1796. The translator's name was not given.

† The title-page bears, "By Walter Scott, Esq. Advocate, Edinburgh."

I undertook another ballad, called 'The Eve of St John.' The incidents, except the hints alluded to in the notes, are entirely imaginary; but the scene was that of my early childhood. Some idle persons had of late years, during the proprietor's absence, torn the iron-grated door of Smailholm Tower from its hinges, and thrown it down the rock. I was an earnest suitor to my friend and kinsman already mentioned (Mr Scott of Harden, the proprietor), that the dilapidation should be put a stop to, and the mischief repaired. This was readily promised, on condition that I should make a ballad, of which the scene should lie at Smailholm Tower, and among the crags where it is situated. The ballad was approved of, as well as 'Glenfinlas;' and I remember that they procured me many marks of attention and kindness from Duke John of Roxburghe, who gave me the unlimited use of that celebrated collection of volumes from which the Roxburghe Club derives its name."

MARRIAGE.

In autumn 1797, the young poet chanced to dine at the inn of Gillsland, in Cumberland, in the course of one of his rambles through the Borders. Amidst the company which the spa of that place had assembled at the common table of the inn, he met a gentleman who had three ladies under his charge, and who proved to be Dean Burd of Carlisle. The conversation which took place between Mr Scott and this party led to further intercourse, and, ere the evening elapsed, the youngest of the ladies had made such an impression upon his heart, as to induce him to give up the intention of immediately continuing his ramble. This young person was Miss Margaret Charlotte Carpenter, a native of Lyons, whom some delicate family circumstances had placed under the charge of the Marquis of Downshire. From her brother in India she enjoyed an annuity sufficient for her decent maintenance; and she was now temporarily entrusted by the marquis to the charge of Mr Burd, in order that she might be diverted from a girlish attachment which was threatening unpleasant consequences. During the fortnight which he spent at Gillsland, Mr Scott succeeded in making himself agreeable to Miss Carpenter, and a correspondence with Lord Downshire soon after opened the way to their union, which took place at Carlisle on the ensuing Christmas eve. The late Mr Hogg, who saw her a very few years after the marriage, described her as at that period "a lovely young creature, with a profusion of dark hair, a fine pale skin, and an elegant and slender person." She also possessed a kindness and gentleness of nature harmonising with the character of her husband, whose affections she enjoyed to the close of her life.

Soon after this period, Sir Walter established himself, during the vacations of the Court of Session, in a delightful retreat at Lasswade, on the banks of the Esk, about five miles to the south of Edinburgh. He was there visited, in the autumn of 1799, by Mr Stoddart (now Sir John Stoddart, Judge-Advocate at Malta), who was engaged in those tours which he afterwards embodied in his "Remarks on the Local Scenery and Manners of Scotland." * This cultivated Englishman appears to have been deeply struck with the amiable picture which Sir Walter presented in his domestic character; inasmuch that his feelings induced him to make a slight trespass upon the privileges of private life, by introducing the following passage into his work; a passage, however, of which we cannot sufficiently prize the value, as it does justice to those talents and virtues in their unfamed state, which afterwards all the world was delighted to honour.

Speaking of Lasswade, Mr Stoddart says—"The circumstance which particularly endears this spot to me, is the residence of my friend Mr Walter Scott, whose poetical talents are too well known to receive any accession of praise from me." (This must of course chiefly refer to a manuscript fame.) "I shall have a future occasion to speak of the pleasure and instruction which I derived from the society of such a companion in a subsequent part of my tour; yet I cannot withhold the immediate expression of my feelings; they oblige me to say something, and the fear of doing them injustice prevents my saying much. Though we cannot pay the debts of friendship in public, we should not be ashamed to acknowledge them: this false shame of our best feelings has indeed become almost fashionable; but it is a fashion ominous to general morals, and destructive of individual happiness. I cannot believe but that a reader of taste would be delighted with even a slight copy of that domestic picture which I contemplated with so much pleasure during my short visit to my friend—a man of native kindness and cultivated talent, passing the intervals of a learned profession amidst scenes highly favourable to his poetic inspirations, not in a churlish and rustic solitude, but in the daily exercise of the most precious sympathies, as a husband, a father, and a friend. To such an inhabitant, the simple, unostentatious elegance of the cottage at Lasswade is well suited; and its image will never recur to my memory without a throng of those pleasing associations, whose outline I have faintly sketched."—Vol. i. p. 126.

Mr Stoddart, in a subsequent part of his work, describes a tour of the south of Scotland, including Liddesdale, in which he was accompanied by Mr Scott. His narrative is here evidently enriched, in no slight degree, with the local knowledge of his companion,

* Two vols. 8vo. London, 1801.

and especially with his numerous traditionary anecdotes of the former inhabitants of the Border. "In return," we are informed by Sir Walter himself, "he (Mr Stoddart) made me better acquainted than I had hitherto been with the poetic effusions which have since made the Lakes of Westmoreland, and the authors by whom they have been sung, so famous wherever the English tongue is spoken." Upon these writers he partly formed the style of his *Lay of the Last Minstrel*.

MINSTRELSY OF THE BORDER.

For some years before the end of the century, Sir Walter had been in the habit of making, periodically, what he called "raids" into Liddesdale, for the purpose of collecting the ballad poetry of that romantic and most primitive district. The term *raids* was highly appropriate to those journeys, for the country was still in nearly the same secluded state as in the old riding times; and although ballads were a different ware from bullocks, the expedition was invested with much of the same adventurous character which must have belonged to a predatory incursion of the fifteenth century. Liddesdale, which forms the westerly extremity of the Scottish Border, is a wild pastoral vale, which in former times was almost exclusively occupied by the Elliots and Armstrongs, noted for their lawless character, and even now was possessed by a race of stock farmers of a remarkably unsophisticated description. The inhabitants of this vale, cut off, in a great measure, from all communion with the rest of the country, retained a strong impress of primeval manners, and were at least perfectly acquainted with the traditionary character of their ancestors, if they did not choose to imitate it. Sir Walter travelled thither, from the more civilised part of Roxburghshire, in an old gig, which also contained his early friend and local guide, Mr Robert Shortreed of Jedburgh, Sheriff-substitute of the county. Introduced by this gentleman, Sir Walter paid visits to many of the farmers and small proprietors, among whom, or among their retainers, he picked up several capital specimens of the popular poetry of the district, descriptive of adventures of renown which took place in the days of yore, besides impressing his mind with that perception of the character of the people, which he afterwards embodied in his *Dandie Dinmont*. Mr Shortreed, who was a most intelligent person, used to relate an amusing anecdote, illustrative of the shy manners of this sequestered race. On visiting a particular person, whose name and place of residence are sufficiently indicated by his usual designation of "Willie o' Milburn," the honest farmer was from home, but returned while Sir Walter was tying up his horse in the stable. On being told by Mr Shortreed that an Edinburgh advocate was come to see him, he expressed great alarm as to the character of his visitor, the old fear of the law being still so very rife in Liddesdale as even to extend to the simple person of any of its administrators. What idea Willie had formed of an Edinburgh barrister, cannot exactly be defined; but, having gone out to reconnoitre, he soon after came back with a countenance of so mischievous a cast as eminently bespoke a relieved mind. "Is yon the advocate?" he inquired of Mr Shortreed. "Yes, Willie," answered that gentleman. "Deil o' me's feared for them, then," cried the farmer; "yon's just a chield like ourself!"

It was not alone necessary on this occasion to write down old ballads from recitation; but the intending editor also thought proper to store up the materials of notes by which the ballads themselves might be illustrated. On this account he visited many scenes alluded to in the metrical narratives, and opened his ear to all the local anecdotes and legends which were handed down by the peasantry. He had a most peculiar, and, it may even be said, mysterious mode of committing these to memory. According to Mr Shortreed's distinct recollection, he used neither pencil nor pen, but, seizing upon any twig or piece of wood which he could find, marked it by means of a clasp-knife, with various notches, which his companion believed to represent particular ideas in his own mind; and these Mr Shortreed afterwards found strung up before him in his study at home, like the *nick-sticks* over a baker's desk, or the string alphabet of a blind man. He seemed to have invented this algebraic system of memorandum-making for his own use, and, to all appearance, was as conversant with its mysteries as he could be with the more common accomplishment of writing. When his own pockets were inconveniently stuffed with notes, he would request Mr Shortreed to take charge of a few; and often that gentleman has discharged as much timber from his various integuments, as, to use his own phrase, quoted from Burns, might have mended a mill.

His collections in Liddesdale, joined to various contributions from reciters in other parts of the country, among whom the Ettrick Shepherd was one, formed his first publication of any note, "the *Minstrelsy of the Scottish Border*." This work was issued in 1802, from the printing-press of his early friend Mr James Ballantyne of Kelso; and the elegance of its typography was not its least remarkable feature. It displayed a vast quantity of curious and abstruse learning, and, in particular, a most intimate acquaintance with a district of Scotland which had hitherto received hardly any attention either from the historian or the antiquary. At first it consisted of only two volumes, but a third was added on the reprinting of the work next year; by which means the editor was enabled to present a new

department of his subject—imitations, by himself and others, of the ancient ballad. The work was, upon the whole, a pleasing melange of history, poetry, and tradition; and it gained the author a considerable reputation, although certainly not that of an original poet in any great degree.

APPOINTMENT AS SHERIFF.

Previous to this period—in December 1799—he had been favoured, through the interest of his friends already alluded to, with the Crown appointment of Sheriff of Selkirkshire, to which was attached a salary of £300 a-year. This office, while it involved no oppressive duties, rendered it necessary that he should reside a certain part of the year in Selkirkshire; and he therefore engaged the house of Ashetell, on the banks of the Tweed, which continued to be his country residence till he removed to Abbotsford. The nomination was to him a peculiarly happy one, as he had many valued connexions in Selkirkshire and the immediately adjacent counties, while the office itself conferred both a general and local respectability, in the highest degree suited to his taste.

ROMANCE OF SIR TRISTREM.

It is here to be mentioned, that, in 1804, Mr Scott increased his reputation as a literary antiquary, by publishing the ancient minstrel tale of "Sir Tristrem," which he endeavoured, in a learned disquisition, to prove to be the composition of Thomas of Erildoune, commonly called Thomas the Rhymer, who lived at the end of the thirteenth century. Though it is now allowed that he has failed in the main object of his essay, the profound knowledge displayed in the general illustration of the poem cannot be disputed.

ABANDONMENT OF PROFESSIONAL LIFE.

For the ensuing circumstances of the poet's life, it will be best to resort to his own narrative, introductory to a late edition of the *Lay of the Last Minstrel*.

"At this time," says he, alluding to the era of 1803, "I stood personally in a different position from that which I occupied when I first dipped my desperate pen in ink, for other purposes than those of my profession. I had been for some time married—was the father of a rising family; and though fully enabled to meet the consequent demands upon me, it was my duty and my desire to place myself in a situation which would enable me to make honourable provision against the various contingencies of life. It may be readily supposed that the attempts which I had made in literature had been unfavourable to my success at the bar. The goddess Themis is, at Edinburgh, and I suppose every where else, of a peculiarly jealous disposition. She will not readily consent to share her authority, and sternly demands from her votaries, not only that real duty be carefully attended to and discharged, but that a certain air of business shall be observed even in the midst of total idleness. It is prudent, if not absolutely necessary, in a young barrister, to appear completely engrossed by his profession; however destitute of employment he may be, he ought to preserve, if possible, the appearance of full occupation. He should at least *seem* perpetually engaged in his law papers, dusting them, as it were; and, as Ovid advises of the fair,

* Si nullus erit pulvis, tamen exoute nullum.*

Perhaps such extremity of attention is more especially required, considering the great number of counsellors who are called to the bar, and how very small a number of them are finally disposed, or find encouragement, to follow the law as a profession. Hence the number of deserters is so great, that the least lingering look behind occasions a young novice to be set down as one of the intending fugitives. Certain it is, that the Scottish Themis was at this time peculiarly jealous of any flirtation with the Muses, on the part of those who had ranged themselves under her banners. * * *

The reader will not wonder that my open interference with matters of light literature diminished my employment in the weightier matters of the law. Nor did the solicitors, upon whose choice the counsel takes rank in his profession, do me less than justice by regarding others among my contemporaries as fitter to discharge the duty due to their clients, than a young man who was taken up with running after ballads, whether Teutonic or national. My profession and I, therefore, came to stand nearly upon the footing which honest Slender consoled himself with having established with Mrs Anne Page. "There was no great love between us at the beginning, and it pleased Heaven to decrease it on further acquaintance!" I became sensible that the time was come when I must either buckle myself resolutely to 'the toil by day, the lamp by night,' renouncing all the Dalilabs of my imagination, or bid adieu to the profession of the law, and hold another course.

I confess my own inclination revolted from the more severe choice, which might have been deemed by many the wiser alternative. My income, however, being equal to all the comforts, and some of the elegancies of life, I was not pressed to an irksome employment by necessity, that most powerful of motives; consequently I was the more easily seduced to choose the employment which was most agreeable. This was yet the easier, that, in 1800, I had obtained the preferment of Sheriff of Selkirkshire, about £300 a-year in value, and which was the more agreeable to me, as

in that county I had several friends and relations. But I did not abandon the profession to which I had been educated without certain prudential resolutions, which, at the risk of egotism, I will here mention—not without the hope that they may be useful to young persons who may stand in circumstances similar to those in which I then stood.

In the first place, upon considering the lives and fortunes of persons who had given themselves up to literature, or to the task of pleasing the public, it seemed to me that the circumstances which chiefly affected their happiness and character, were those from which Horace has bestowed upon authors the epithet of the Irritable Race. It requires no depth of philosophic reflection to perceive that the petty warfare of Pope with the dunces of his period, could not have been carried on without his suffering the most acute torture, such as a man must endure from musquitoes, by whose stings he suffers agony, although he can crush them in his grasp by myriads. Nor is it necessary to call to memory the many humiliating instances in which men of the greatest genius have, to avenge some pitiful quarrel, made themselves ridiculous during their lives, to become the still more degraded objects of pity to future times.

Upon the whole, as I had no pretension to the genius of the distinguished persons who had fallen into such errors, I concluded there could be no occasion for imitating them in such mistakes, or what I considered as such: and, in adopting literary pursuits as the principal occupation of my future life, I resolved, if possible, to avoid those weaknesses of temper which seemed to have most easily beset my more celebrated predecessors.

With this view, it was my first resolution to keep as far as was in my power abreast of society, continuing to maintain my place in general company without yielding to the very natural temptation of narrowing myself to what is called literary society. By doing so, I imagined I should escape the besetting sin of listening to language which from one motive or other ascribes a very undue degree of consequence to literary pursuits, as if they were indeed the business rather than the amusement of life. The opposite course can only be compared to the injudicious conduct of one who pampers himself with cordial and luscious draughts until he is unable to endure wholesome bitters. Like Gil Blas, therefore, I resolved to stick by the society of my *commis*, instead of seeking that of a more literary class, and to maintain my general interest in what was going on around me, reserving the man of letters for the desk and the library.

My second resolution was a corollary from my first. I determined that, without shutting my ears to the voice of true criticism, I would pay no regard to that which assumes the form of satire. I therefore resolved to arm myself with the triple brass of Horace against all the roving warfare of satire, parody, and sarcasm; to laugh, if the jest was a good one; or, if otherwise, to let it hum and buzz itself to sleep.

It is to the observance of these rules (according to my best belief), that, after a life of thirty years engaged in literary labours of various kinds, I attribute my never having been entangled in any literary quarrel or controversy; and, which is a more pleasing result, that I have been distinguished by the personal friendship of my most approved contemporaries of all parties.

The author then details his resolution to write a poem of considerable length in the ballad style, varied by the octo-syllabic measure; and the following is his account of the accident which dictated a subject:—

LAY OF THE LAST MINSTREL.

"The lovely young Countess of Dalkeith, afterwards Harriet, Duchess of Buccleuch, had come to the land of her husband, with the desire of making herself acquainted with its traditions and customs. All who remember this lady will agree, that the intellectual character of her extreme beauty, the amenity and courtesy of her manners, the soundness of her understanding, and her unbounded benevolence, gave more the idea of an angelic visitant than of a being belonging to this nether world; and such a thought was but too consistent with the short space she was permitted to tarry amongst us. Of course, where all made it a pride and pleasure to gratify her wishes, she soon heard enough of Border lore; among others, an aged gentleman of property,* near Langholm, communicated to her ladyship the story of Gilpin Horner, a tradition in which the narrator and many more of that county were firm believers. The young countess, much delighted with the legend, and the gravity and full confidence with which it was told, enjoined it on me as a task to compose a ballad on the subject. Of course, to hear was to obey;† and thus the goblin story, objected to by several critics as an excrescence upon the poem, was, in fact, the occasion of its being written.

It was finally published in 1805, and may be regarded as the first work in which the writer, who has been since so voluminous, laid his claim to be considered as an original author." The work produced to the author the sum of £600.

* Mr Beattie of Mickledeale, a man then considerably upwards of eighty.

† In a letter to Miss Seward, the poet has acknowledged that, if requested by the Countess of Dalkeith, he would have written a poem upon a broomstick.—*Seward's Letters*, vol. vi. 1811.

APPOINTED A PRINCIPAL CLERK OF SESSION.

About this period, the prospect of a situation which completely met his moderate wishes as to preferment, opened upon our author. This was the honourable and easy office of a principal clerk in the Court of Session. One of the officiating clerks, Mr George Home, who had served upwards of thirty years, and of whom it may be mentioned in passing, that he was one of the literary fraternity concerned in "The Mirror," found it about this time agreeable to his advanced age to retire, more especially as he had just succeeded to his paternal estate of Wedderburn, in consequence of the death of his brother. As hopes had been held out to Sir Walter from an influential quarter, that he would be provided for in a manner suitable to his wishes, and as Mr Pitt had himself expressed a wish to be of service to the author of the Lay of the Last Minstrel, he was induced to apply for the reversion of this office, upon an arrangement that Mr Home should continue during life to draw the emoluments, while Mr Scott should perform the duty. His desires were readily acceded to, and George III. is reported to have said when he signed the commission, "that he was happy he had it in his power to reward a man of genius, and a person of such distinguished merit." This document lay in the office, subscribed by his majesty, and Mr Scott was in London with Mr Home's resignation in his pocket, and nothing required for the completion of the affair, but his paying the proper fees, when Mr Pitt's death, on the 25th of January 1806, made way for the appointment of a new and opposite ministry. It is a very general impression that Sir Walter was indebted ultimately for his place to the grace and favour of an administration differing from himself in politics; but the real fact speaks less equivocally for the nominee, though quite as honourably for Mr Fox. That great statesman, who had previously been heard to express his admiration of Mr Scott's talents, no sooner learned the difficulty which had occurred respecting his appointment, than he gave directions for accelerating it, and that it should be conferred as a favour coming directly from his administration. The expectant, however, had previously applied, through Lord Stafford and Lord Somerville, to Earl Spencer, for the indulgence usual on a change of ministry, of passing such grants as are already in a certain state of progress, unless an impropriety can be challenged. His lordship at once acceded to the request as a matter of justice, but with the handsome declaration that he would have been glad if it could have been done as one of favour. The warrant was therefore in Mr Scott's possession, when the words of Mr Fox were repeated to him. He never had any thing else to say on this subject, than that he would have been proud to owe an obligation to a man of Mr Fox's brilliant qualifications, if it had been his fortune to be so distinguished, and provided that he could have done so without any dereliction of his own political opinions.

The appointment of Mr Walter Scott, a zealous Tory, to the situation of Principal Clerk of Session, was announced in the same Gazette (March 8, 1806) which contained the nomination of Messrs Erskine and Clerk to the offices of Lord Advocate and Solicitor-General, just vacated, according to custom, by the late Tory holders, Sir James Montgomery and Mr Robert Blair. It is also remarkable, that, at this period, Lord Melville, who had been the first to hold out hopes of this preferment, was under impeachment of the House of Commons, for supposed high crimes and misdemeanours.

The good fortune which placed the poet in an office so nearly a sinecure, must be held as also a fortunate event for the world; for it is evident from what he has himself said, that, without such a refuge against the contingencies of a literary life, he would not have thrown himself so much before the public as he now did, in the character of an author. Viewing the matter in this light, his friend, the Rev. John Marriot, wrote the following verses, which, whatever be their poetical merits, certainly bear what Burns calls "the frater feeling strong" in an eminent degree:—

The captive bird, from irksome durance freed,
Its heart quick-throbbing as in mirthful mood,
Battling the liquid air with joyous speed,
Regains the covert of its native wood;
There rests from toil its long unpractised wing,
And perch'd upon the hazel's topmast spray,
Makes the wild woodland's deep recesses ring,
Chanting sweet liberty's delightful lay,
Nor wearies of its song the live-long summer day.

So lightly pricketh on his way yon wight,
Who, long y-pent in dungeon dark and drear,
Full many a scroll did wearily indite,
Blotting the parchment oft with bootless tear;
How could he but by stealth (Oh stealth how sweet!)
Hold raptur'd converse with the sisters nine,
Whose colloquy doth fill the breast with heat,
Venus, how far more elevate than thine;
How far more heavenly pure, ethereal, and divine!

Him now they welcome to their green retreats,
Released from labour's dolorous abode,
No more to stray from those delightful seats,
No more to plod in Mammon's toilsome road;
How sweetly will he pour the flowing rhyme,
Resistless master of the smile and tear!
How sweetly tell the tale of olden time!
Oh, may it be my lot to wander near,
Some strains of his enchanting minstrelsy to hear!

Sir Walter continued for five or six years to perform the duties of his office without salary, when at length an alteration of the law respecting the mode of providing for superannuated officers, permitted his col-

league to retire upon an annuity, and he was left to enjoy the profits, as he also executed the labours, of the situation. These profits were never stationary, but seldom much below £1200 a-year, which, with the £300 which he enjoyed as Sheriff, might be said to make up a very respectable income, without regard to the result of his literary labours.

BALLADS AND LYRICAL PIECES.

During the year 1806, Sir Walter collected his original compositions in the ballad style into a small volume, which he published under the title of "Ballads and Lyrical Pieces." The volume contained several compositions which he had contributed to Mr M. G. Lewis's "Tales of Wonder," published in 1801.

MARMION.

In 1803, Sir Walter published his second poem of magnitude, "Marmion," in which, we are informed by himself, he took great pains, and was disposed to take still more, if the distresses of a friend had not rendered it convenient at least, if not necessary, to hasten its publication. The publishers," he continues, "of 'The Lay of the Last Minstrel,' emboldened by the success of that poem, willingly offered a thousand pounds for 'Marmion.' The transaction being no secret, afforded Lord Byron, who was then at general war with all who blacked paper, an opportunity to include me in his satire, entitled 'English Bards and Scotch Reviewers.' I never could conceive how an arrangement between an author and his publishers, if satisfactory to the persons concerned, could afford matter of censure to any third party. I had taken no unusual or ungenerous means of enhancing the value of my merchandise; I had never higgled a moment about the bargain, but accepted at once of what I considered the very handsome offer of my publishers. These gentlemen, at least, were not of opinion that they had been taken advantage of in the transaction, which was indeed of their own framing; on the contrary, the sale of the poem was so far beyond their own expectation, as to induce them to supply the author's cellars with what is always an acceptable present to a young Scotch housekeeper, namely, a hog'shead of excellent claret."

While "Marmion" was not exempt from some faults, which the critics did not fail to point out, it brought an immense increase of reputation to the author. Its more stately chivalric pictures, its stronger alliance to national history, and the broader scale on which it painted feudal manners, produced greater admiration than what had been excited by "The Lay." "By good fortune," says Sir Walter, "the novelty of the subject, and, if I may say so, some force and vivacity of description, were allowed to atone for many imperfections. Thus, the second experiment on the public patience, generally the most perilous—for the public are then most apt to judge with rigour, what in the first instance they had received, perhaps, with imprudent generosity—was, in my case, decidedly successful. I had the good fortune to pass this ordeal favourably, and the return of the sales before me† makes the copies amount to thirty-six thousand, printed between 1803 and 1825, besides a considerable sale since that period."

Sir Walter considered this as not only the crisis of his poetical reputation, but the climacteric of his poetical character. He has been heard to say, that he never had been in danger of becoming vain till the extraordinary success of "Marmion" had nearly made him so. He resisted the temptation, and it fled from him for ever. Previously to this period, he had generally felt a little anxious to see what the periodical critics said of his works; but now this anxiety ceased, and he rarely heeded either the voice of praise, or censure.

"Marmion" consisted of six cantos, and each was graced with a prefatory address or epistle to some friend of the poet, the principal object of which, probably, was to serve as interludes or breathing-spaces during the progress of the story. In the first of these pieces, addressed to Mr W. Stewart Rose, the poet breathed an affectionate requiem over the tomb of Pitt, and took occasion, from the well-known juxtaposition of that sepulchre to the grave of Fox, in Westminster Abbey, to introduce some highly graceful acknowledgments of the talents of the Whig statesman.

Nor yet suppress the generous sigh,
Because his rival slumbers nigh;
Nor be thy requiescent dumb,
Lest it be said o'er Fox's tomb.
For talents mourn, untimely lost,
When best employ'd and wanted most.‡
Mourn genius high and love profound,
And wit that loved to play, not wound;
And all the reasoning powers divine,
To penetrate, resolve, combine;
And feelings keen, and fancy's glow,
They sleep with him who sleeps below:
And if thou mourn'st they could not save
From error him who owns this grave,
Be every harsher thought suppress'd,
And sacred be his last long rest.

* Introduction to late edition of "Marmion."

† It was a peculiarity of Sir Walter Scott's literary conduct, that he always required to have an offer made to him by the bookseller. Till the offer was made, he was like a ghost uninvoked, and would hardly say any thing upon the subject; but when it was made, he was almost sure to accept it without demur.

‡ Writing in April 1830.

§ To explain the seeming inconsistency of this expression with Sir Walter's general opinions on politics, it may be mentioned, that the whole couplet was written by the late Marquis of Aberdeen (the patron and employer of Sir Walter's father, as afterwards of his brother Thomas), and inserted at his express request, while the sheet was in proof.

EDITION OF DRYDEN.

Marmion had been published at the commencement of the year 1803; within a few weeks thereafter appeared "The Works of John Dryden, now first collected, in eighteen volumes. Illustrated with Notes, Historical, Critical, and Explanatory, and a Life of the Author. By Walter Scott, Esq."* This publication manifested, in a striking manner, the great erudition of the poet of Marmion. In composing the Life of Dryden, he frankly confessed that the research of Malone, and the critical acumen of Johnson, had left him little to do in these different departments. "But something," he conceived, "remained for him who should consider these literary productions in their succession, as actuated by, and operating upon, the taste of an age, where they had so predominating an influence, and who might, at the same time, connect the Life of Dryden with the history of his publications." Accordingly, the most original and interesting part of his work consists in the view which it exhibits of the general literary character of Dryden's age, and of the one immediately preceding. The publication met with so much success as to demand a reprint at the end of a few years.

SADLER'S STATE-PAPERS—SOMERS'S TRACTS.

In 1809, Sir Walter assisted in editing "The State-Papers and Letters of Sir Ralph Sadler," which appeared in two expensive volumes, in quarto. Sadler was the negotiator, in behalf of Henry VIII., respecting the proposed marriage between Prince Edward and the infant Mary Queen of Scots; and his State-Papers throw much light, not only upon that political transaction, but upon the domestic circumstances of Scotland, in the early half of the sixteenth century. The Life of Sir Ralph, and a great variety of historical notes, were supplied by the subject of this memoir. In the same year, he contributed like assistance to a new edition of Lord Somers's invaluable collection of tracts, which appeared in twelve volumes quarto.

EDINBURGH ANNUAL REGISTER.

Some of the late labours of Mr Scott had showed that he was not disposed to confine himself to poetry, but had also the inclination to prepare more ordinary and familiar matter for the public taste. This arose, in some measure, from his connection with Mr John Ballantyne, a youthful friend and companion, who had now entered into business at Edinburgh as a bookseller and publisher on a large scale, and with whom it was the pleasure of our author to form an occult mercantile alliance. In order to promote the prosperity of an enterprise in which he was thus for various reasons interested, he devoted a portion of his time to editing various weighty publications, of which those above enumerated are the most remarkable. For the same reason he became a contributor to the Edinburgh Annual Register, a work which Mr Ballantyne began to publish in 1810, under the editorial charge of Mr Southey, and which was in several respects more ambitious in its plan than any of the respectable compilations previously existing. To the first volume, relating to the year 1808, Mr Scott contributed anonymously an able and pleasing paper "On the Living Poets of Great Britain," in which he was under the necessity of ranking himself as one of the three first-rate poets of the day. It must be allowed, however, that while the praise is in this case managed with some delicacy, the criticism contains a much severer view of his own faults than the delirious approbation of the public would permit any critic of its own body to take.

LADY OF THE LAKE.

It is necessary to have recourse to the poet's own narrative† for an account of the circumstances which directed his choice in his next poetical attempt:

"The ancient manners, the habits and customs, of the aboriginal race by whom the Highlands of Scotland were inhabited, had always appeared to me peculiarly adapted to poetry. The change in their manners, too, had taken place almost within my own time, or at least I had learned many particulars concerning the ancient state of the Highlands from the old men of the last generation. I had always thought the old Scottish Gael highly adapted for poetical composition. The feuds and political dissensions, which, half a century earlier, would have rendered the richer and wealthier part of the kingdom indisposed to countenance a poem, the scene of which was laid in the Highlands, were now sunk in the generous compassion which the English, more than any other nation, feel for the misfortunes of an honourable foe. The Poems of Ossian had, by their popularity, sufficiently shown, that, if writings on Highland subjects were qualified to interest the reader, mere national prejudices were, in the present day, very unlikely to interfere with their success.

I had also read a great deal, and heard more, concerning that romantic country, where I was in the habit of spending some time every autumn; and the scenery of Loch Katrine was connected with the recollection of many a dear friend and merry expedition of former days. This poem, the action of which lay among scenes so beautiful, and so deeply imprinted on my recollections, was a labour of love, and it was no less so to recall the manners and incidents introduced. The frequent custom of James IV., and particularly

* Price L.9. 9s.

† Introduction to late edition of the Lady of the Lake.

of James V., to walk through their kingdom in disguise, afforded me the hint of an incident, which never fails to be interesting, if managed with the slightest address or dexterity. * * *

I took uncommon pains to verify the accuracy of the local circumstances of this story. I recollect, in particular, that, to ascertain whether I was telling a probable tale, I went into Perthshire, to see whether King James could actually have ridden from the banks of Loch Vennachar to Stirling Castle within the time supposed in the poem, and had the pleasure to satisfy myself that it was quite practicable.

After a considerable delay, "The Lady of the Lake" appeared in June 1810; and its success was certainly so extraordinary as to induce me for the moment to conclude that I had at last fixed a nail in the proverbially inconstant wheel of Fortune, whose stability in behalf of an individual who had so boldly courted her favours for three successive times, had not as yet been shaken."

ROKEBY—LORD OF THE ISLES—SMALLER POEMS.

In "The Lady of the Lake," Sir Walter Scott appeared to have produced the finest specimen of which his genius was capable. His earlier efforts were less matured and refined; and the later are all, in various degrees, less spirited and effective. In 1811 appeared "Don Roderick," a dreamy vaticination of modern Spanish history; in 1813 he published "Rokeby," in which he attempted, but without success, to invest English scenery and a tale of the Civil War with the charm which he had already thrown over the Scottish Highlands and Borders, and their romantic inhabitants. Rokeby met with a decidedly unfavourable reception; and, it cannot be denied, the public enjoyed to a greater extent a burlesque, which appeared upon it, under the title of "Jokeby." The evil success of this poem induced him to make a desperate adventure to retrieve his laurels; and in 1814 he published "The Lord of the Isles." Even the name of Bruce, however, could not compensate the want of what had been the most captivating charm of his earlier productions—the development of new powers and styles of poetry. The public was now acquainted with his whole "fence," and could therefore take no longer the same interest in his exhibitions. This was strikingly proved by the silence in which two successive poems, entitled "Harold the Dauntless" and "The Bridal of Triermain," were allowed to fall from the press. Yet it may be asserted, that an individual, without national or other prepossessions, beginning to read the author's poetical works for the first time, would not find nearly so much difference between the early and late productions, as was found by the contemporary public. So much was the greater appreciation of the former owing to novelty.

WAVERLEY.

It now became evident to Sir Walter, without the use of any monitor like him employed by the Archbishop of Toledo, that his day as a poet was well nigh past. He saw that he must "change his hand," if he wished his lyre any longer to awaken sympathetic chords in the bosom of the public. About the close of the eighteenth century, he had commenced a tale of chivalry in prose, founded upon the legendary story of Thomas the Rhymer; but it never went beyond the first chapter. Subsequently, he resolved upon a prose romance relating to an age much nearer our own time. "My early recollections of the Highland scenery and customs made so favourable an impression in the poem called the Lady of the Lake, that I was induced to think of attempting something of the same kind in prose. I had been a good deal in the Highlands at a time when they were much less accessible, and much less visited, than they have been of late years, and was acquainted with many of the old warriors of 1745, who were, like most veterans, easily induced to fight their battles over again, for the benefit of a willing listener like myself. It naturally occurred to me that the ancient traditions and high spirit of a people, who, living in a civilised age and country, retained so strong a tincture of manners belonging to an early period of society, must afford a subject favourable for romance, if it should not prove a curious tale marred in the telling.

It was with some idea of this kind, that, about the year 1805, I threw together about one-third part of the first volume of Waverley.* It was advertised to be published by the late Mr John Ballantyne, bookseller in Edinburgh, under the name of 'Waverley, or, 'Tis Fifty Years since'—a title afterwards altered to "Tis Sixty Years since," that the actual date of publication might be made to correspond with the period in which the scene was laid.† Having proceeded as far, I think, as the seventh chapter, I showed my work to a critical friend, whose opinion was unfavour-

able; and having some poetical reputation, I was unwilling to risk the loss of it by attempting a new style of composition. I therefore threw aside the work I had commenced, without either reluctance or remonstrance. * * * This portion of the manuscript was laid aside in the drawers of an old writing-desk, which, on my first coming to reside at Abbotsford in 1811, was placed in a lumber garret, and entirely forgotten. Thus, though I sometimes, among other literary avocations, turned my thoughts to the continuation of the romance which I had commenced, yet, as I could not find what I had already written, after searching such repositories as were within my reach, and was too indolent to attempt to write it anew from memory, I as often laid aside all thoughts of that nature."

The author then adverts to two circumstances which particularly fixed in his mind the wish to continue this work to a close—namely, the success of Miss Edgeworth's delineations of Irish life, and his happening to be employed, in 1803, in finishing the romance of Queen-Hoo-Hall, left imperfect by Mr Strutt. "Accident," he continues, "at length threw the lost sheets in my way.

I happened to want some fishing-tackle for the use of a guest, when it occurred to me to search the old writing-desk already mentioned, in which I used to keep articles of that nature. I got access to it with some difficulty; and in looking for lines and flies, the long-lost manuscript presented itself. I immediately set to work to complete it, according to my original purpose. * * * Among other unfounded reports, it has been said that the copyright was, during the book's progress through the press, offered for sale to various booksellers in London at a very inconsiderable price. This was not the case. Messrs Constable and Cadell, who published the work, were the only persons acquainted with the contents of the publication, and they offered a large sum for it while in the course of printing, which, however, was declined, the author not choosing to part with the copyright.

Waverley was published in 1814, and as the title-page was without the name of the author, the work was left to win its way in the world without any of the usual recommendations. Its progress was for some time slow; but after the first two or three months, its popularity had increased in a degree which must have satisfied the expectations of the author, had these been far more sanguine than he ever entertained.

Great anxiety was expressed to learn the name of the author, but on this no authentic information could be attained. My original motive for publishing the work anonymously, was the consciousness that it was an experiment on the public taste, which might very probably fail, and therefore there was no occasion to take on myself the personal risk of discomfiture. For this purpose, considerable precautions were used to preserve secrecy. My old friend and schoolfellow, Mr James Ballantyne, who printed these novels, had the exclusive task of corresponding with the author, who thus had not only the advantage of his professional talents, but of his critical abilities.* The original manuscript, or, as it is technically called, *copy*, was transcribed under Mr Ballantyne's eye, by confidential persons; nor was there an instance of treachery during the many years in which these precautions were resorted to, although various individuals were employed at different times. Double proof-sheets were regularly printed off. One was forwarded to the author by Mr Ballantyne, and the alterations which it received, were, by his own hand, copied upon the other proof-sheet for the use of the printers, so that even the corrected proofs of the author were never seen in the printing-office; and thus the curiosity of such eager inquirers as made the most minute investigation was entirely at fault."

To this account of the publication of Waverley it is only to be added, that the popularity of the work became decided rather more quickly, and was, when decided, much higher than the author has given to be understood. It was read and admired universally, both in Scotland and England, so that, in a very short time, about twelve thousand copies were disposed of.

MIDDLE LIFE.

At this period we are called upon to turn a while from the literary to the domestic history of the poet. To continue our quotations from his own delightful narrative—†

"I shall not, I believe, be accused of ever having attempted to usurp a superiority over many men of genius, my contemporaries; but, in point of popularity, not of actual talent, the caprice of the public has certainly given me such a temporary superiority over men, of whom, in regard to poetical fancy and feeling, I scarcely thought myself worthy to loose the shoe-latch. On the other hand, it would be absurd affectation in me to deny, that I conceived myself to understand more perfectly than many of my contemporaries, the manner most likely to interest the great mass of mankind. Yet, even with this belief, I must truly and fairly say, that I always considered myself rather as one who held the bets, in time to be paid over to the winner, than as having any pretence to keep them in my own right.

* The carelessness of Sir Walter Scott in all his compositions, found a most fortunate correction in the taste and good sense of this gentleman, who had the fortune to be his printer from nearly the commencement of his literary career.

† Introduction to late edition of Rokeby.

In the meantime, years crept on, and not without their usual depredations on the passing generation. My sons had arrived at the age when the paternal home was no longer their best abode, as both were destined to active life. The field-sports to which I was peculiarly attached, had now less interest, and were replaced by other amusements of a more quiet character; and the means and opportunity of pursuing these were to be sought for. I had, indeed, for some years, attended to farming, a knowledge of which is, or at least was then, indispensable to the comforts of a family residing in a solitary country-house; but although this was the favourite amusement of many of my friends, I have never been able to consider it as a source of pleasure. I never could think it a matter of passing importance, that my cattle, or my crops, were better or more plentiful than those of my neighbours, and, nevertheless, I began to feel the necessity of some more quiet out-door occupation than I had hitherto pursued. I purchased a small farm of about one hundred acres, with the purpose of planting and improving it, to which property circumstances afterwards enabled me to make considerable additions; and thus an era took place in my life, almost equal to the important one mentioned by the Vicar of Wakefield, when he removed from the blue-room to the brown. In point of neighbourhood, at least, the change of residence made little more difference. Abbotsford, to which we removed, was only six or seven miles down the Tweed, and lay on the same beautiful stream. It did not possess the romantic character of Ashiestiel, my former residence; but it had a stretch of meadowland along the river, and possessed, in the phrase of the landscape gardener, considerable capabilities. Above all, the land was my own, like uncle Toby's bowling-green, to do what I would with. It had been, though the gratification was long postponed, an early wish of mine to connect myself with my mother-earth, and prosecute those experiments by which a species of creative power is exercised over the face of nature. I can trace, even to childhood, a pleasure derived from Dodsley's account of Shenstone's Leasowes, and envied the poet much more, for the pleasure of accomplishing the objects detailed in his friend's sketch of his grounds, than for the possession of pipe, crook, flock, and Phillis to the boot of all. My memory, also, tenacious of quaint expressions, still retained a phrase which it had gathered from an old almanack of Charles II.'s time (when every thing down to almanacks affected to be smart), in which the reader, in the month of June, is advised, for the sake of his health, to take a walk of a mile or two before breakfast, and, if he can possibly so manage, to let his exercise be taken upon his own land.

With the satisfaction of having attained the fulfilment of an early and long-cherished hope, I commenced my improvements, as delightful in their progress as those of the child who first makes a dress for a new doll. The nakedness of the land was in time hidden by woodlands of considerable extent—the smallest possible of cottages was progressively expanded into a sort of dream of a mansion-house, whimsical in the exterior, but convenient within. Nor did I forget what was the natural pleasure of every man who has been a reader, I mean the filling the shelves of a tolerably large library. All these objects I kept in view, to be executed as convenience should serve; and although I knew many years should elapse before they could be attained, I was of a disposition to comfort myself with the Spanish proverb, 'Time and I against any two.'

The difficult and indispensable point, of finding a permanent subject of occupation, was now at length attained; but there was annexed to it the necessity of becoming again a candidate for public favour; for as I was turned improver on the earth of the every-day world, it was under condition that the small tenement of Parnassus, which might be accessible to my labours, should not remain uncultivated."

Although the author has designed this to serve as an introduction to Rokeby, which appeared in 1813, it applies more extensively and properly to the early range of what have been called the Waverley Novels. Sir Walter soon found that the cultivation of poetry was not likely to encourage the cultivation, or at least the extension, of his estate; and he therefore resolved to try what could be done with prose. In the preceding passages he has perhaps understated the intensity of his desire of becoming a land proprietor. The writer of these pages is convinced that this was a passion which glowed more warmly in his bosom than any appetite which he ever entertained for literary fame. The whole cast of his mind, from the very beginning, was essentially aristocratic; and it is probable that he looked with more reverence upon an old title to a good estate, than upon the most ennobled title-page in the whole catalogue of contemporary genius. Thus it was a matter of astonishment to many, that, while totally insensible to flattery on the score of his works, and perfectly destitute of all the airs of a professed or practised author, he could not so well conceal his pride in the possession of a small patch of territory, or his sense of importance as a local dispenser of justice. As seen through the medium of his works, he rather appears like an old baron or chivalrous knight, displaying his own character and feelings, and surrounded by the ideal creatures which such an individual would have mixed with in actual life, than as an author of the modern world. It must have been in a great measure owing to the same ruling passion, that he kept the Waverley

* Sir Walter here seems partly to attribute to an event which happened in 1810 (his publication of the Lady of the Lake), a result which took place in 1805. It is evident that he only intended to imply that the success of the poem induced him to renew his prose attempt after it had been several years cast aside. See sequel.

† We have here another curious anachronism. Sir Walter overlooks that the era of 1745 was in reality sixty years antecedent to that of 1805, and that if any alteration was required to be made for the date of publication (1814), it ought to have been to "seventy years since." What makes this the more strange, is, that in the introduction to the novel as published, where he persuades himself to be writing in 1805, as seems to have really been the case, he gives the space of time rightly enough, namely, "Sixty years since."

secret with such pertinacious closeness—being unwilling to be considered as an author writing for fortune, which he must have thought somewhat degrading to the Baronet of Abbotsford. It was now the principal spring of his actions to add as much as possible to the little realm of Abbotsford, in order that he might take his place—not among the great literary names which posterity is to revere, but among the country gentlemen of Roxburghshire.* The nucleus of his property was a small farm, called by the plain name of Cartley-Hole, which he purchased from the late Dr Douglas, minister of the neighbouring parish of Galashiels, and upon which he conferred the more elegant title of Abbotsford, adopted with reference to a neighbouring ford in the Tweed, coupled with the adjacent Abbey of Melrose. The situation of the house was generally considered unfortunate, as it lay on a northern slope towards the river, and was bounded close at hand by a public road. The adjacent land was also of such a kind† as to promise the poet, when he should purchase it, rather more amusement in bringing it up, than is generally wished even by the most enthusiastic improvers.

EARLIER CLASS OF NOVELS.

It was chiefly, nevertheless, to his desire of forming an estate on this spot, which he might hand down to his descendants, that the world is indebted for a series of the most delightful fictions that ever appeared. It is not necessary here to say much regarding these works; it may be enough to subjoin little more than a list of them, with their respective dates of publication. To *Waverley* succeeded, in 1815, *Guy Rannering*; in 1816, the *Antiquary*, and the *First Series* of the *Tales of My Landlord*, containing the *Black Dwarf* and *Old Mortality*; in 1818, *Rob Roy*, and the *Second Series* of the *Tales of My Landlord*, containing the *Heart of Mid-Lothian*; and in 1819, the *Third Series* of *Tales of My Landlord*, containing the *Bride of Lammermoor* and *A Legend of Montrose*.

Sir Walter, having early been instructed in the disposition of the public to tire of the repeated appearances of even a favourite author, had, in the *Tales of My Landlord*, assumed a new incognito, which, however, was easily seen through. It was impossible, without utterly abandoning the gifts he possessed, to assume a style sufficiently discrepant to impose upon the public. The same great magician was seen to be at work in both series, and the artifice had therefore only the effect of giving a slight fillip to public curiosity.

It was not the least remarkable feature of these works, that, while there was so much to delight, there was hardly a passage that jarred with any existing prejudices, or could be interpreted into offence by any class of men. The author in only one instance permitted his own prepossessions to wound the feelings of his countrymen. This was in the tale of *Old Mortality*, where he was thought to have given a somewhat too favourable picture of the Cavaliers, and an unjust delineation of their opponents. The Scottish people, who insensibly have paid a far worse compliment to the Presbyterians of those days by deserting all their standards of faith, yet entertain a very laudable feeling of reverence for men who considered it their duty, in a tyrannical reign, to lay down their lives in the cause of popular rights. They therefore expressed a very general sense of the injustice of the Author of *Waverley* towards those martyrs; and it soon received shape from the pen of Dr McCrie, who wrote a very acrimonious pamphlet upon the subject, published at first in the *Christian Instructor*. In expiation of an error, which was probably in a great degree the result of inadvertency, Sir Walter has taken care, in his *Tales of a Grandfather*, to do ample justice to the children of the covenant. But, while the smart occasioned by the pen of Dr McCrie was still fresh, he seems to have been unable to resist the temptation to retaliate, in a slight measure, for the unduly severe terms in which his offence had been spoken of. If his descent from Judge Swinton be recollected, the force of the following passage in the introduction to the second series of the *Tales of My Landlord*, will be readily appreciated:—

"It has been demanded of me, Jedediah Cleishbotham, by what right I am entitled to constitute myself an impartial judge of their discrepancies of opinion, seeing (as it is stated) that I must necessarily have been descended from one or other of the contending parties, and be of course wedded, for better for worse, according to the reasonable practice of Scotland, to its dogmata or opinions, and bound, as it were, by the tie matrimonial, or, to speak without metaphor, *ex jure sanguinis*, to maintain them in preference to all others.

But, nothing denying the rationality of the rule, which calls on all now living to rule their political and religious opinions by those of their great-grandfathers,

* As this view of the character of Sir Walter Scott has been somewhat uncourtously challenged, the editors think it proper to mention, that when these pages were passing through the press of Ballantyne and Company, Mr James Ballantyne gave the speculations in question his full and valuable sanction, by writing along the margin, "This is admirably true."

† Most of the Abbotsford estate is very bad land. Part of it was formerly subject to what is called a *serotidness of soil* and *divot* in favour of the villagers of Dunsick and Melrose; and thus, as its vegetable surface was periodically pared off, it at length came to lose almost all natural pith, and was reduced to what in Scripture is termed a field of stones. For this land his anxiety to possess, and his ability to pay, caused him to give about three times its present value. The whole rental of what he must have bought at something approaching half a plum, is not above seven hundred a-year.

and inevitable as seems the one or other horn of the dilemma betwixt which my adversaries conceive they have pinned me to the wall, I yet spy some means of refuge, and claim a privilege to write and speak of both parties with impartiality. For oh, ye Powers of Logic! when the Prelatists and Presbyterians of old times went together by the ears in this unlucky country, my ancestor (venerated be his memory!) was one of the people called Quakers, and suffered severe handling from either side, even to the extenuation of his purse, and incarceration of his person."

LATER CLASS OF NOVELS.

Having now drawn upon public curiosity to the extent of twelve volumes in each of his two incognitos, he seems to have thought it necessary to adopt a third, and accordingly he intended *Ivanhoe*, which appeared in the beginning of 1820, to come forth as the first work of a new candidate for public favour—namely, Lawrence Templeton. From this design he was diverted by a circumstance of trivial importance, the publication of a novel at London, pretending to be a fourth series of the *Tales of My Landlord*. It was therefore judged necessary that *Ivanhoe* should appear as a veritable production of the Author of *Waverley*. To it succeeded, in the course of the same year, the *Monastery* and the *Abbot*, which were judged as the least meritorious of all his prose tales. In the beginning of the year 1821, appeared *Kenilworth*, making twelve volumes, if not written, at least published, in as many months. In 1822, he produced the *Pirate* and the *Fortunes of Nigel*; in 1823, *Peveril of the Peak** and *Quentin Durward*; in 1824, *St Ronan's Well* and *Redgauntlet*; in 1825, *Tales of the Crusaders*†; in 1826, *Woodstock*; in 1827, *Chronicles of the Canon-gate, first series*;‡ in 1828, *Chronicles of the Canon-gate, second series*; in 1829, *Anne of Geierstein*; and in 1831, a fourth series of *Tales of My Landlord*, in four volumes, containing two tales, respectively entitled *Count Robert of Paris*, and *Castle Dangerous*. The whole of these novels, except where otherwise specified, consisted of three volumes, and, with those formerly enumerated, make up the amount of his fictitious prose compositions to the enormous sum of seventy-four volumes.

MINOR AND FUGITIVE WORKS.

Throughout the whole of his career, both as a poet and novelist, Sir Walter was in the habit of turning aside occasionally to less important avocations of a literary character. He was a contributor to the *Edinburgh Review* during the first few years of its existence. To the *Quarterly Review* he was a more frequent contributor, especially for the last five or six years of his life, during which the work was conducted by his son-in-law, Mr Lockhart. To the *Supplement* of the Sixth Edition of the *Encyclopædia Britannica*, he contributed the articles "Chivalry," "Romance," and the "Drama." In 1818, he wrote one or two small prose articles for a periodical, after the manner of the *Spectator*, which was started by his friend Mr John Ballantyne, under the title of "The Saleroom," and was soon after dropped for want of encouragement. In 1814, he edited "The Works of Swift," in 19 volumes, with a Life of the Author. In 1814, Sir Walter gave his name and an elaborate introductory essay to a work entitled "Border Antiquities" (two volumes 4to), which consisted of engravings of the principal antique objects on both sides of the Border, accompanied by descriptive letter-press. In 1815, he made a tour of France and Belgium, visiting the scene of the recent victory over Napoleon. The result was a lively traveller's volume, under the title of "Paul's Letters to his Kinsfolk," and a poem styled "The Field of Waterloo." In the same year he joined with Mr Robert Jamieson and Mr Henry Weber in composing a quarto on *Icelandic Antiquities*. In 1819, he published "An Account of the Regalia of Scotland," and undertook to furnish the letter-press to a second collection of engravings, under the title of "Provincial Antiquities and Picturesque Scenery of Scotland," one of the most elegant books which has ever been published respecting the native country of the editor.

POLITICAL APPEARANCES.

In the year 1820, the agitated state of the country was much regretted by Sir Walter Scott; and he endeavoured to prove the absurdity of the popular excitement in favour of a more extended kind of parliamentary representation, by three papers which he inserted in the *Edinburgh Weekly Journal* newspaper, under the title of "The Visionary." However well intended, these were not by any means happy specimens of political disquisition. Some months afterwards, it was deemed necessary by a few Tory gentlemen and lawyers to establish a newspaper in which the more violent of the radical prints should be met upon their own grounds, and reprisals made for a long course of aggressions which had hitherto been endured with patience. To this association Sir Walter subscribed, and, by means partly furnished upon his credit, a weekly journal was commenced under the title of "The Beacon." As the scurrilities of this print inflicted much pain in respectable quarters, and finally led to the death of one of the writers in a duel, it sank, after an existence of a few months, amidst general execration. Sir Walter Scott, though he probably never contemplated, and perhaps was hardly aware of

the guilt of the Beacon, was loudly, but perhaps inconsiderately, blamed for his connection with it.

MINOR POETICAL WORKS.

In 1822, Sir Walter edited "Trivial Poems and Triplets, by P. Carey, with a Preface;" and, in 1822, appeared his dramatic poem of "Haildon Hill." In the succeeding year, he contributed a smaller dramatic poem, under the title of "Macduff's Cross," to a collection of Miss Joanna Bailie. The sum of his remaining poetical works may here be made up, by adding "The Doom of Devorgoil," and "The Auchindrane Tragedy," which appeared in one volume in 1830. It cannot be said of any of these compositions that they have made any considerable impression upon the public.

PRIVATE LIFE—BARONETCY—KING'S VISIT TO SCOTLAND.

It has already been mentioned that Mr Scott had entered into a commercial alliance with his friend Mr John Ballantyne, and endeavoured to promote the prosperity of the concern by editing several large works, which appeared in an expensive style of typography, such as was then fashionable. The temptation to this step was probably a prudent anxiety on the part of the poet to establish another regular stay against the precariousness of a literary source of income. After a few years' trial, it became apparent, from the embarrassments of the firm of John Ballantyne and Company, that loss rather than profit was likely to accrue from the design; and, in 1813, the subject of our memoir deemed it necessary to accede to an arrangement, by which Messrs Archibald Constable and Company purchased a great part of the stock of the other establishment, with an understanding, or at least an expectation, that with them should thenceforward rest the honour and profit of publishing the productions of Mr Scott. The sum advanced on this occasion, in bills, was about nine thousand pounds; but the transfer was to Sir Walter only a change from connection with one embarrassed firm to a scarcely less intimate and fatal connection with another. From that time, his works were, with scarcely an exception, published by Constable and Company, a copartnership which will long be memorable for its enterprising spirit, and the impulse which it gave to native literature, whatever blame may be charged against it on the score of imprudence. Sir Walter was not a partner in this firm, as he had been in that of John Ballantyne and Company; but he was gradually led to engage his credit to a great amount for the purpose of supplying it with capital.

The great success of the earlier novels had encouraged Messrs Constable and Company to give large sums for those works; and, previous to 1824, it was understood that the author had spent from fifty to a hundred thousand pounds, thus acquired, upon his house and estate of Abbotsford. During the months which his official duties permitted him to spend in the country—that is, the whole of the more genial part of the year, from March till November, excepting the months of May and June—he kept seat, like a wealthy country gentleman, at this delightful seat, where he was visited by many distinguished persons from England, and from the Continent. As he scarcely ever spent any other hours than those between seven and eleven, A.M., in composition, he was able to devote the greater part of the morning to country exercise, and the superintendence of his planting and agricultural operations, while the evenings were, in a great measure, devoted to his guests. Almost every day he used to ride a considerable distance—sometimes not less than twenty miles—on horseback. He also walked a great deal; and, lame as he was, would sometimes tire the stoutest of his companions.

Among the eminent persons to whom he had been recommended by his genius, and its productions, the late King George IV. was one, and not the least warm in his admiration. The poet of *Marmion* had been honoured with many interviews by his sovereign, when Prince of Wales and Prince Regent; and his Majesty was pleased, in March 1820, to create him a Baronet of the United Kingdom, being the first to whom he had extended that honour after his accession to the crown.

In 1822, when his Majesty visited Scotland, Sir Walter found the duty imposed upon him, as in some measure the most prominent man in the country, of acting as a kind of Master of Ceremonies, as well as a sort of dragoman, or mediator, between the sovereign and his people. It was an occasion for the revival of all kinds of historical and family reminiscences; and Sir Walter's acquaintance with national antiquities, not less than his universally honoured character, caused him to be resorted to by innumerable individuals, and many public bodies, for information and advice. On the evening of the 14th of August, when his Majesty cast anchor in Leith Roads, Sir Walter went in a boat, commissioned by the LADIES OF SCOTLAND, to welcome the King, and to present his Majesty with an elegant jewelled cross of St Andrew, to be worn on his breast as a national emblem. When the King was informed of Sir Walter's approach, he exclaimed, "What! Sir Walter Scott? The man in Scotland I most wish to see! Let him come up." Sir Walter

* A friend started to him a report that he was to be made a Knight. "Am I?" was his characteristic response. "More than I know. No, no."

† I like not the grinning honour which Sir Walter hath."

* Four volumes. † Four volumes. ‡ Two volumes.

accordingly ascended the ship, and was presented to the king on the quarter-deck, where he met with a most gracious reception. After an appropriate speech, Sir Walter presented his gift, and then knelt and kissed the King's hand. He had afterwards the honour of dining with his Majesty, being placed on his right hand.

In the arrangements for his Majesty's residence at Dalkeith, Sir Walter bore a conspicuous part; and in the whole of these difficult and delicate transactions, although the novelty of the circumstances might well have occasioned mistakes, he performed his part with faultless address and propriety. The whole affair of the royal visit seemed to take its character from Sir Walter Scott; or, at least, it must be allowed that, but for the taste which his works had awakened for ancient national recollections, and the cast which his own interposition gave to almost every scene, the King's visit would have had a very different external appearance, and one not nearly so well calculated to delight either the visitor or the visited.

Immediately after this grand national jubilee, Sir Walter had the honour to be appointed one of the deputy-lieutenants of the county of Roxburgh, in which his house of Abbotsford is situated.

FAMILY.

By his wife, Lady Scott, Sir Walter had four children—two sons and two daughters. The elder daughter, Sophia Charlotte, was married, April 28, 1820, to Mr J. G. Lockhart, advocate. The elder son Walter, who entered the army, was married to Miss Jobson, a young lady of fortune. The younger son Charles was attached to the Legation of the King of the Two Sicilies. We may here close Sir Walter's family history, by mentioning that Lady Scott died May 15, 1826, and that his second daughter only survived himself a few months, dying unmarried.

PECUNIARY MISFORTUNES.

In 1825, Mr Constable having projected a cheap series of original and selected works, engaged Sir Walter to compose a life of Bonaparte. This work was in progress, when, in January 1826, Messrs Constable and Company became bankrupt. For many years before, Sir Walter had been in the habit of drawing bills, at long dates, upon his publishers, as payment of the copyrights of his works; and as he occasionally was obliged with their acceptances in reference to works not yet written, he was in some measure compelled, by a sense of gratitude, to give his name to other obligations which were incurred by the house for the purpose of retiring the original engagements. Thus, although Sir Walter appeared to receive payment for his literary labours in a very prompt manner, he was pledging away his name all the while for sums perhaps not much inferior in amount to those which he realised; so that, in the long-run, he stood engaged to certain banks, in behalf of Messrs Constable and Company, for, it is said, about £60,000; in other words, a great portion of the earnings of his literary life.

The blow was endured with a magnanimity worthy of the greatest writer of the age. On the very day after the calamity had been made known to him, a friend accosted him as he was issuing from his house, and presented the condolences proper to such a melancholy occasion.

"It is very hard," said he, "thus to lose all the labours of a lifetime, and be made a poor man at last, when I ought to have been otherwise. But if God grant me health and strength for a few years longer, I have no doubt that I shall redeem it all."

In conferring, accordingly, with those who had claims upon him, he only requested time in order to satisfy them in full. At the same time, to make sure that his sudden and early death should not altogether balk his design, he effected an insurance of £22,000 upon his life. A trust-deed was then executed, in which he was considered as a member of the printing firm of James Ballantyne and Company; and it appeared that the whole debts, including what must have been contracted under the name of that firm, amounted to £102,000. The commercial world in general receives great honour for the forbearance manifested on this occasion by a few of its members, who are even said to have proposed a scheme of settlement more advantageous to their debtor than what his sense of honour would admit of.

MALAGROWTHER'S LETTERS.

The commercial distresses of the country were at this period very great, and in the case of Scotland they were threatened to be much increased by the Parliamentary regulations then in progress, for reducing the monetary system to an equality with that of England. There was perhaps abstract justice in the proposal of the government; but yet to have suddenly altered a system so interwoven with the commercial existence of the country as that of the small bank-notes, was generally felt by men of sense, without the least regard to national feeling, as calculated to produce something little short of total ruin. There can be little doubt, however, that the clamours of the people themselves would have had no effect in staying the hand of Parliament, interpreted as they were sure to be into a selfish regard to personal interest, if his country's Genius, Sir Walter Scott, had not stepped forward, and undertaken to show the fallacy upon which men in power were proceeding. On the 22d February [1826],

he published a letter in the Weekly Journal newspaper, under the signature of Malachi Malagrowther, in which he delineated the absurdity of the Parliamentary scheme in language so rich in argument, humour, and pathos, as to produce a most extraordinary sensation. His feelings on this occasion were roused to an unusual pitch, and perhaps his own recent calamity contributed to give them force and pungency. Two days after the letter had appeared, he was in the printing-house with his friend Mr Ballantyne, when the latter remarked that he had been more solicitous and careful about the proof of this little composition, than he had ever observed him to be respecting any of his productions. "Yes," said he, in a tone that electrified even this familiar friend, who had heard him speak before under all varieties of circumstances, "my former works were for myself, but this—this is for my country!" Two other letters in the same strain followed, and notwithstanding an answer to them, written by no less powerful a pen than that of Mr J. W. Croker, they had the happy effect of procuring an exemption for Scotland from the contemplated enactments.

LIFE OF NAPOLEON BONAPARTE.

He then sat down, at fifty-five years of age, to the task of redeeming a debt exceeding a hundred thousand pounds. In the first place, he sold his furniture and house in Edinburgh, and retreated into a humble lodging in a second-rate street.* During the vacations, when resident at Abbotsford, he almost entirely gave up seeing company; a resolution the more easily carried into effect, as Lady Scott was now dead. His expenses were thus much reduced; and yet, we are told, he never lived more agreeably in the days of his brightest splendour, than he now did in the company of his younger daughter alone, with a task before him which might have appalled many younger hearts. He was at this time labouring at his *Life of Napoleon*, which expanded under his hands to a bulk much beyond what was originally contemplated. In the autumn of 1826, he paid a visit to Paris, in company with Miss Scott, in order to acquaint himself with several local and historical details necessary for his work. On this occasion he was received in the kindest manner by the reigning monarch, Charles X. "The *Life of Napoleon Bonaparte*" appeared in summer 1827, in nine volumes 8vo, and produced to him, it is understood, the sum of £12,000, being at a rate of about £33 a-day for the time he had been engaged on it. This, with other earnings and accessory resources, enabled him to pay a large dividend to his creditors.

ANNOUNCEMENT OF THE WAVERLEY SECRET.

Till the failure of Messrs Constable and Company, the Waverley secret was kept inviolate, though entrusted, as he has himself acknowledged, to a considerable number of persons. The inquiries which took place into the affairs of the house, rendered it no longer possible to conceal the nature of its connection with Sir Walter Scott; and he now accordingly stood fully detected as the Author of Waverley, though he did not himself think proper to make any overt claim to the honour. It may be mentioned, that, at the time of the failure, Sir Walter was in possession of bills for the novel of Woodstock, of which but a small part had as yet been written. A demand was made by the creditors of Messrs Constable and Company upon the creditors of Sir Walter Scott, for the benefits of this work, when it should be made public. But the author, not reckoning this either just or legal, was resolved not to comply. The bills, he said, were a mere promise to pay; since, then, he had only promised to write, and they to pay, he would simply not write, and then the transaction would fall to the ground. On the claim being further pressed, he said, "The work is in my head, and there it shall remain." The question, however, was eventually submitted to arbitration, and decided in favour of the creditors of the author, for whose benefit the work was soon after published.

The fact of the authorship continued to waver between secrecy and divulgement till the 23d of February 1827, when Sir Walter presided at the first annual dinner of the Edinburgh Theatrical Fund Association, in the Assembly Rooms. There, Lord Meadowbank,† in proposing the health of the chairman, used language to the following effect: "It was no longer possible, consistently with the respect to one's auditors, to use upon this subject terms either of mystification, or of obscure or indirect allusion. The clouds have been dispelled—the darkness visible has been cleared away—and the Great Unknown—the Minstrel of our native land—the mighty Magician who has rolled back the current of time, and conjured up before our living senses the men and manners of days which have long passed away, stands revealed to the hearts and the eyes of his affectionate and admiring countrymen." Sir Walter, though somewhat taken by surprise, immediately resolved to throw off a mantle, which, as he afterwards remarked to the writer of these notices, was getting somewhat tattered. "He did not think," he said, "that, in coming here to-day, he should have the task of acknowledging before three hundred gentlemen, a secret which, considering that it was communicated to more than twenty people, had been remarkably well kept. He was now before the bar of his country, and might be understood to be on trial before Lord Meadowbank as an offender; yet he was sure that every impartial jury would bring in a verdict of *Not Proven*." He did

not now think it necessary to enter into the reasons of his long silence. Perhaps caprice had a great share in it. He had now to say, however, that the merits of these works, if they had any, and their faults, were entirely imputable to himself." [Here the audience broke into an absolute shout of surprise and delight.] "He was afraid to think on what he had done. 'Look on't again I dare not.' He had thus far unbosomed himself, and he knew that it would be reported to the public. He meant, then, seriously to state, that when he said he was the author, he was the total and undivided author. With the exception of quotations, there was not a single word written that was not derived from himself, or suggested in the course of his reading. The wand was now broken, and the rod buried. His audience would allow him further to say, with Prospero, 'Your breath has filled my sails.'"

He soon after followed up this confession with one more at large, in his Preface to the *Chronicles of the Canongate*.

NEW EDITION OF THE WAVERLEY NOVELS.

About the same time, the copyright of all his past novels was brought to the hammer, as part of the bankrupt stock of Messrs Constable and Company. It was bought by Mr Robert Cadell, of the late firm of Archibald Constable and Company, at £8,400, for the purpose of republishing the whole of these delightful works in a cheap uniform series of volumes, illustrated by notes and prefaces, and amended in many parts by the finishing touches of the author. Sir Walter or his creditors were to have half the profits, and a gratuity of a hundred pounds upon each volume, in consideration of his literary aid.

This was a most fortunate design. The new edition began to appear in June 1829; and such was its adaptation to the public convenience, and the eagerness of all ranks of people to contribute in a way convenient to themselves, towards the reconstruction of the author's fortunes, that the sale soon reached an average of twenty-three thousand copies. To give the reader an idea of the magnitude of this concern—speaking commercially—it may be stated that, in the mere production of the work, not to speak of its sale, about a thousand persons, or nearly a hundredth part of the population of Edinburgh, were supported. The author was now chiefly employed in preparing these narratives for the new impression; but he nevertheless found time occasionally to produce original works. In November 1828, he published the first part of a juvenile History of Scotland, under the title of "Tales of a Grandfather," being addressed to his grandchild, John Hugh Lockhart, whom he typified under the appellation of Hugh Littlejohn, Esq. In 1829, appeared the second, and in 1830, the third and concluding series of this charming book, which fairly fulfilled a half-sportive expression that had escaped him many years before, in the company of his children, "that he would yet make the History of Scotland as familiar in the nurseries of England, as lullaby rhymes." In 1830, he also contributed a graver History of Scotland, in two volumes, to the periodical work called "Lardner's Cabinet Cyclopaedia." In the same year, appeared his *Letters on Demonology and Witchcraft*, as a volume of Mr Murray's "Family Library."

The profits of these various publications, but especially his share of the profits of the new edition of his novels, enabled him, towards the end of the year 1830, to pay a dividend of three shillings in the pound, which, but for the accumulation of interest, would have reduced his debts to nearly one-half. Of £54,000 which had now been paid, all except six or seven thousand had been produced by his own literary labours. Besides this sum, Sir Walter had also paid up the premium of the policy upon his life, which, as already mentioned, secured a *post obit* interest of £22,000 to his creditors.

RETIREMENT FROM OFFICE.

About the same time—that is, in November 1830—Sir Walter retired from his office as a Principal Clerk of the Court of Session, retaining a large share of the salary appropriated to that office. It is much to the honour of the government of the day, that, without regard to the opposite principles of this illustrious public servant, they offered him a pension sufficient to make up the full amount of his usual salary—which, however, he respectfully but firmly declined.

His health, from his sixteenth year, had been very good, except during the years 1818 and 1819, when he suffered severely under spasms in the stomach, brought on by over-exertion and excitement. It may be mentioned, however, that this illness, though accompanied by very acute pain, did not materially interrupt or retard his intellectual labours. He was only reduced to the necessity of employing an amanuensis, to whom he dictated from his bed. The humorous character, Dugald Dalgetty, in the third series of the *Tales of My Landlord*, and the splendid scene of the siege of Torquilston in *Ivanhoe*, were created under these circumstances. Mr William Laidlaw, his ground-steward, who at one time performed the task of amanuensis, has described how he would sometimes be stopped in the midst of some of the most amusing or most elevated scenes, by an attack of pain—which, being past, he would recommence in the same tone at the point where he had left off, and so on for day after day, till the novel was finished.

It happened very unfortunately that the severe task which he imposed upon himself, for the purpose of

discharging his obligations, came at a period of life when he was least able to accomplish it. It will hardly be believed that, even when so far occupied with his official duties in town, he seldom permitted a day to pass over his head without writing as much as to fill a sheet of print, or sixteen pages; and this whether it was of a historical nature, with of course the duty of consulting documents, or of fictitious matter spun from the loom of his fancy. Although this labour was alleviated in the country by considerable exercise, it nevertheless must have pressed severely upon the powers of a man verging upon sixty. The reader may judge how strong must have been that principle of integrity, which could command such a degree of exertion and self-denial, not so much to pay debts contracted by himself, as to discharge obligations in which he was involved by others. He can only be likened, indeed, to the generous elephant, which, being set to a task above its powers, performed it at the expense of life, and then fell dead at the feet of its master.

His retirement from official duty might have been expected to relieve in some measure the pains of intense mental application. It was now too late, however, to redeem the health that had fled. During the succeeding winter, symptoms of gradual paralysis, a disease hereditary in his family, began to be manifested. His contracted limb became gradually weaker and more painful, and his tongue less readily obeyed the dictate of the will.

REFORM QUESTION.

As a high monarchist in principle, and attached personally to the royal family of France, Sir Walter contemplated the revolution of July 1830 with a different feeling from what was generally manifested upon the occasion by his countrymen. He feared that the new monarchy of Louis Philippe was only the commencement of a new series of ruinous changes, similar to those which followed the revolution of 1789. Sir Walter also beheld with alarm the impulse given by the popular triumphs in France to innovatory principles in Britain, and could not conceal that he believed the Reform Bill, consequently introduced into the House of Commons, to be the first step towards the destruction of this mighty empire. In the eyes of the majority of readers, this interpretation of their favourite measure will perhaps be held as indicating great political blindness, or else an interest in the continuance of those abuses which the Reform Bill was designed to abolish. But political leanings are oftener a matter of temperament than of reason, and to suppose that Conservative principles arise invariably either from an interest in a bad system, or a deliberate preference of the bad to the good, only argues blindness in those who maintain such doctrines. It is to be hoped, though it might be convenient in the fervour of the question to throw these imputations upon the Tories, as it was convenient for William III. in his manifesto to stigmatise the son of James II. as an impostor, the triumphant party will eventually allow that many well-meaning and even liberal thinkers opposed the measure only from a fear for the consequences of so sudden and so great a change. That Sir Walter Scott had no objections but of this sort, must be clear to every person who is in the least acquainted with his circumstances and personal character.

In March 1831, the freeholders of Roxburghshire held a meeting at Jedburgh, in order to express their opinion of the Reform Bill, recently introduced by Lord John Russell. Sir Walter Scott, notwithstanding his declining health, felt it to be his duty to attend this meeting, in order to enter his protest against the contemplated measure. A gentleman who saw him on this occasion, describes his face as "shrunken, ill-coloured, and unhealthy, his voice hollow and tremulous, and his entire frame shaken, feeble, and diminished. But," continued this informant, "the leaven of Lionheart was still strong within him. He sat in evident disquiet during the speeches of the ministerialists, till nearly the end of the meeting. He then rose with much of his wonted dignity, when addressing an assembly (for you know his manner then is eminently noble and graceful), and told the meeting that he had come there that day with great reluctance, and at much personal inconvenience, as he had been for some time contending with severe indisposition. 'But, gentlemen,' said he, clenching his iron fist, and giving it an energetic downward motion, 'had I known that I should shed my blood on these boards, I would have spent my last breath in opposing this measure.' He proceeded further to argue the inexpediency of following French political fashions, and ended by saying, 'I must take leave of you, gentlemen; and I shall do it in the well-known adage of the gladiator to the Emperor—*MORITURI VOS SALUTAT*.*' In the course of this speech he was hissed by a few individuals who were present only as auditors—of which he took no notice; but in replying to the gentleman who rose next, when the sound was repeated, he turned quick upon those who were expressing their disapprobation, and said that he cared no more for their hissing than for the braying of the beasts of the field." His feelings, nevertheless, are known to have been so much hurt by this great reverse—for to him it might be so

considered—that, on his way home, he was observed to be in tears. There can be no doubt that the Jedburgh meeting, and the continued excitement upon the Reform question, did much to sadden the last days of this illustrious man, and perhaps also to accelerate his decline.

LAST ILLNESS.

During the summer of 1831, the symptoms of his disorder became gradually more violent; and to add to the distress of those around him, his temper, formerly so benevolent and so imperturbable, became peevish and testy, insomuch that his most familiar relations could hardly venture, on some occasions, to address him. At this period, in writing to a friend, he thus expressed himself—"Although it is said in the newspapers, I am actually far from well, and instead of exercising on a brother novelist, Chateaubriand, my influence to decide him to raise an insurrection in France, which is the very probable employment allotted to me by some of the papers, I am keeping my head as cool as I can, and speaking with some difficulty.

"I have owed you a letter longer than I intended, but write with pain, and in general use the hand of a friend. I sign with my initials, as enough to express the poor half of me that is left. But I am still much yours, W. S."

Since the early part of the year, he had in a great measure abandoned the pen for the purposes of authorship. This, however, he did with some difficulty, and it is to be feared that he resumed it more frequently than he ought to have done. "Dr Abercromby," says he, in a letter dated March 7, "threatens me with death if I write so much; and die, I suppose, I must, if I give it up suddenly. I must assist Lockhart a little, for you are aware of our connection, and he has always showed me the duties of a son; but, except that, and my own necessary work at the edition of the Waverley Novels, as they call them, I can hardly pretend to put pen to paper; for, after all, this same dying is a ceremony one would put off as long as they could."

VISIT TO THE CONTINENT.

In the autumn, his physicians recommended a residence in Italy, as a means of delaying the approaches of his illness. To this scheme he felt the strongest repugnance, as he feared he should die on a foreign soil, far from the mountain-land which was so endeared to himself, and which he had done so much to endear to others; but by the intervention of some friends, whose advice he had been accustomed to respect from his earliest years, he was prevailed upon to comply. By the kind offices of Captain Basil Hall, liberty was obtained for him to sail in his Majesty's ship the *Barham*, which was then fitting out for Malta.

The illustrious invalid, on quitting the country, appended the following touching note to his Fourth Series of the *Tales of My Landlord*—the last words he was destined ever to address to his countrymen:—

"The gentle reader is acquainted that these are, in all probability, the last tales which it will be the lot of the author to submit to the public. He is now on the eve of visiting foreign parts; a ship of war is commissioned by its royal master to carry the Author of Waverley to climates in which he may readily obtain such a restoration of health as may serve him to spin his thread to an end in his own country. Had he continued to prosecute his usual literary labours, it seems indeed probable that, at the term of years he has already attained, the bowl, to use the pathetic language of Scripture, would have been broken at the fountain; and little can one, who has enjoyed on the whole an uncommon share of the most inestimable of worldly blessings, be entitled to complain, that life, advancing to its period, should be attended with its usual proportion of shadows and storms. They have affected him, at least, in no more painful manner than is inseparable from the discharge of this part of the debt of humanity. Of those whose relations to him in the ranks of life might have insured their sympathy under indisposition, many are now no more; and those who may yet follow in his wake, are entitled to expect, in bearing inevitable evils, an example of firmness and patience, more especially on the part of one who has enjoyed no small good fortune during the course of his pilgrimage.

The public have claims on his gratitude, for which the Author of Waverley has no adequate means of expression; but he may be permitted to hope that the powers of his mind, such as they are, may not have a different date from his body; and that he may again meet his patronising friends, if not exactly in his old fashion of literature, at least in some branch which may not call forth the remark, that

Superfluous lags the veteran on the stage."

He set sail in the *Barham* from Portsmouth on the 27th of October, and, after a pleasant voyage, during which his health seemed considerably improved, he arrived at Malta. From this place, after a short residence, he proceeded to Naples, where he landed on the 27th of December.

In April he proceeded to Rome, which he entered on the 21st, and here also he was received with every mark of attention and respect. He inspected the remains of Roman grandeur with great interest, and paid a visit to Tivoli, Albani, and Frascati. If any thing could have been effectual in re-illuminating that lamp which was now beginning to pale its mighty lustres, it might have been expected that this would

have been the ground on which the miracle was to take place. But he was himself conscious, even amidst the flatteries of his friends, that all hopes of this kind were at an end. Feeling that his strength was rapidly decaying, he determined upon returning with all possible speed to his native country, in order that his bones might not be laid (to use the language of his own favourite minstrelsy) "far from the Tweed." His journey was performed too rapidly for his strength. For six days he travelled seventeen hours a-day. The consequence was, that in passing down the Rhine he experienced a severe attack of his malady, which produced complete insensibility, and would have probably carried him off, but for the presence of mind of his servant, who bled him profusely. On his arrival in London, he was conveyed to the St James's Hotel, Jermyn Street, and immediately attended by Sir Henry Hallford and Dr Holland, as well as by his son-in-law and daughter. All help was now, however, useless. The disease had reached nearly its most virulent stage, producing a total insensibility to the presence of even his most beloved relatives—

— omni

Membrum damno major, dementia, quæ nec Nomina servorum, nec vultum agnoscit amici.

It is painful to think, that the unhappy condition to which he was now reduced had long been contemplated by him, as what would in all human probability be his ultimate fate. He recollected the circumstances preceding the death of his father,* and the premonitory symptoms were in himself the same. Under the feelings which this reflection inspired, he penned, in 1827, a description of the last days of his parent, which he inserted, with some disguising circumstances, into his novel called "Chronicles of the Canongate."

"The easy chair fitted with cushions, the extended limbs swathed in flannel, the wide wrapping-gown and nightcap, showed illness; but the dimmed eye, once so replete with living fire—the blabber lip, whose dilation and compression used to give such character to his animated countenance—the stammering tongue, that once poured forth such floods of masculine eloquence, and had often swayed the opinion of the sages whom he addressed—all these sad symptoms evinced that my friend was in the melancholy condition of those in whom the principle of animal life has unfortunately survived that of mental intelligence. He gazed a moment at me, but then seemed insensible of my presence, and went on—he, once the most courteous and well-bred—to babble unintelligible but violent reproaches against his niece and servant, because he himself had dropped a teacup in attempting to place it on a table at his elbow. His eye caught a momentary fire from his irritation; but he struggled in vain for words to express himself adequately, as, looking from his servant to his niece, and then to the table, he laboured to explain that they had placed it (though it touched his chair) at too great a distance from him."

After perusing this picture, the reader will be ready to catch up the language used by the physician of this fictitious patient, and turn it into a reference to the illustrious author himself.

"I have heard our poor friend, in one of the most eloquent of his pleadings, give a description of this very disease, which he compared to the tortures inflicted by Mezentius, when he chained the dead to the living. The soul, he said, is imprisoned in its dungeon of flesh, and, though retaining its natural and unalienable properties, can no more exert itself than the captive inclosed within a prison-house can act as a free-agent. *Alas! to see HIM, who could so well describe what this malady was in others, a prey himself to its infirmities!*"

After residing for some weeks in London, in the receipt of every attention which filial piety and medical skill could bestow, the expiring poet desired that, if possible, he might be removed to his native land—to his own home. It was resolved to gratify him in his dying wish, even at the hazard of accelerating his dissolution by the voyage. On the 7th July, he was taken in a carriage to Blackwall, accompanied by his two daughters and Mr Lockhart, and, by the help of a crane, brought on board the James Watt steam-packet, which was to conduct him to Leith. The circumstances of the embarkation were striking. The sailors, while working the machinery which swung the carriage from the shore to the deck, abstained from the wonted "yee hoe." All looked on in pitying and reverential silence. The scene was thus described, it is supposed, by Mr Lockhart—

What car is that the cautious sailors seek
So silently to hoist upon the deck?
What feeble form therein extended laid,
By every eye so curiously surveyed?
Pressed by a throng, all eager, yet not rude,
Anxious to scan, but fearing to intrude?
Well may they pause and gaze intently—Here
No vulgar cause excites the unbidden tear,
A scene like this may well draw sorrow forth;
Behold the mighty minstrel of the north!
Those palsied limbs which now so faintly move,
Sung Marston's valour and De Wilton's love,
Sounded Clan Alpine's gathering-cry to arms,
And sweetly whispered gentle Ellen's charms,
That fading eye which death has nearly sealed,
What brilliant visions hath it once beheld!
The court—the camp—the cottage, and the bower,
Alike were pensive to its searching power,
As all enraptured it read nature o'er,
From Scotland's crags to Syria's burning shore.

* Mr Walter Scott, W.S., lived to an age more advanced than his son. He died April 11, 1799, aged 70.

* The full effect of this very touching expression can only be obtained by general readers through the medium of a note. In the bloody games of ancient Rome, those swordsmen or gladiators who intended to combat till there were no longer any survivors on at least one side, were accustomed to pass first in review before the emperor, and, in anticipation of their probable death, said, *Morituri salutem*. "We dying men now bid you farewell."

Whilst by the bard I now admiring stand,
And sadly mark that scarcely moving hand,
The creatures of his skill appear to me,
Glittering in every bright variety;
The fiery chieftain, his devoted clan,
The gallant Graham—the sterner Puritan—
The virtuous Jeanie—Effie, prey to grief—
The Gipsy Sybil, wise beyond belief—
The princely Richard of the Lion heart,
The rival Soldan, great in every art—
The haughty Templar, and the Prior vain—
The Norman noble, and the Saxon Thane—
The bold freebooters of the olden time,
And Judah's maiden, simple, yet sublime;
All these, and more, how rapidly fit by,
Reflected in the glass of memory!
Ne'er shall the poet number them again—
The wizard sinks, although his spells remain;
To soothe his woe, how little they avail,
Less than to Roderick the old harper's tale!
Yet, though exhausted, will he cross the sea,
Still, Caledonia, still he turns to thee,
Drags his faint footsteps from a foreign strand,
And, dying, seeks his own, his native land;
Sighs for those scenes his pencil first made known,
And then, content, will draw his parting groan.
What though we weep to think upon his tomb,
None ever eune enjoyed so bright a doom!
Oh! what a glorious course 'twas his to run,
Delighting nations, yet offending none!
Ne'er touched by envy—ready to command—
His only rival proud to be his friend.
Rising above the flattery of fame,
Though either world with plaudits speak his name;
With satire's venom ever unembued,
So simply great, so eminently good,
Childhood was charmed, and sober age approved,
Admired by all, by all admiring, loved.

Arriving at Newhaven on the evening of the 9th, he was conveyed, with all possible care, to a hotel in his native city. After spending two nights and a day in Edinburgh, he was removed, on the morning of the 11th, to Abbotsford.

DEATH AND FUNERAL.

That intense love of home and of country which had urged his return from the Continent, here seemed to dispel for a moment the clouds of the mental atmosphere. In descending the vale of Gala, at the bottom of which the view of Abbotsford first opens, it was found difficult to keep him quiet in his carriage, so anxious was he to rear himself up, in order to catch an early glimpse of the beloved scene. On arriving at his house, he hardly recognised any body or anything. He looked vacantly on all the objects that met his gaze, except the well-remembered visage of his friend Laidlaw, whose hand he affectionately pressed, murmuring, "that now he knew he was at Abbotsford." He was here attended by most of the members of his family, including Mr Lockhart, while the general superintendence of his deathbed (now too certainly such) was committed to a local surgeon. For two months he lingered in a state of almost total insensibility and mental deprivation, sometimes raving frantically, but in general quite low and subdued. On one occasion he slept the uncommonly long period of twenty-seven hours; and it was hoped that, on awakening, there might be some change for the better. But in this hope his anxious friends were disappointed. He was now arrived at that melancholy state, when the friends of the patient can form no more affectionate wish than that Death may step in to claim his own. Yet day after day did the remnants of a robust constitution continue to hold out against the gloomy foe of life; until, notwithstanding every effort to the contrary, mortification commenced at several parts of the body. This was about twelve days before his demise, which at length took place on the 21st of September, at half-past one o'clock in the afternoon; the principles of life having been by that time so thoroughly worn out, that nothing remained by which pain could be either experienced or expressed.

The remains of this illustrious person were immediately consigned to a leaden coffin, which had been prepared as soon as the symptoms of mortification appeared. On Wednesday the 26th, he was interred in a place of sepulture belonging to his family,* amidst the ruins of the ancient Abbey of Dryburgh.†

* It originally belonged to the Halyburtons of Merton, an ancient and respectable baronial family, of which Sir Walter's paternal grandmother was a member. It is composed simply of the area comprehended by four pillars, in one of the aisles of the ruined building. On a side-wall is the following inscription:—*Sub hoc tumulo jacet Joannes Halyburtonus, Barro de Mertoun, vir religione et virtute clarus, qui obiit 17 die Augusti 1640;* below which there is a coat-of-arms. On the back wall, the latter history of the spot is expressed on a small tablet, as follows:—*"Hunc locum sepultura D. Seneschallus, Buchanica comes, Gualtero, Thomae, et Roberto Scott, nepotibus Halyburtoni, concessit, 1791."* That is to say, the Earl of Buchan (lately proprietor of the ruins and adjacent ground) granted this place of sepulture, in 1791, to Walter, Thomas, and Robert Scott, descendants of the Laird of Halyburton. The persons indicated were the father and uncles of Sir Walter Scott; but though all are dead, no other member of the family lies there, besides his uncle Robert and his deceased lady.

† The following account of the funeral was written by an eye-witness on the succeeding day. The company invited by Major Sir Walter Scott to take part in the ceremony, consisted chiefly of the neighbouring gentry and others acquainted with the deceased, besides a few of his more intimate associates from Edinburgh. Besides these, a few gentlemen had come unbidden from various distances. After a refectory in the style usually observed on such occasions, the funeral train set forward to Dryburgh. The procession consisted of about sixty vehicles of different kinds, and a few horsemen. It was melancholy at the very first to see the deceased carried out of a house which bore so many marks of his taste, and of which every point, and almost every article of furniture, was so identified with himself. But it was doubly touching to see him carried insensible and inurned through the beautiful scenery, which he has in different ways rendered, from its most majestic to its minutest fea-

AFFAIRS OF SIR WALTER SCOTT AT HIS DECEASE.

At the time of his decease, the remaining claims of his creditors amounted to about L.53,000. The dividends heretofore paid amounted to eleven shillings and eightpence per pound, leaving, exclusive of interest, less than nine shillings still due. To meet this residue of debt, there was L.22,000, which had been insured upon his life, and was now realised, besides considerable sums which had arisen from the profits of his works. On the 29th of October, at a meeting of the creditors, the family of the deceased were enabled to come forward with an offer of L.53,000, or nine shillings in the pound, as a complete payment for all, forming, with what had formerly been paid, a sum equal to the whole ranking against Sir Walter in 1826. The proposal was accepted by the meeting without a dissentient voice; and, in addition to other resolutions, the following was carried with the like unanimity:—

"The meeting think it a tribute justly due to the memory of Sir Walter Scott, to express, in the strongest manner, their deep sense of his most honourable conduct, and of the unparalleled benefits which they have derived from the extraordinary exertion of his unrivalled talents, under misfortunes and difficulties which would have paralysed the exertions of any one else, but in him only further proved the greatness of mind which enabled him to rise superior to them."

"In communicating this intelligence," said the newspaper which gave it to the world, "we cannot help expressing our gratification, in which we are sure that all will heartily sympathise, that this matter has been brought to a satisfactory conclusion. The conduct of Sir Walter Scott, under the heavy and unexpected trials to which he was exposed, is above all praise, and has been, indeed, a subject of universal admiration. The honourable feelings by which he was actuated in his incessant efforts to pay his debts, could not fail to be duly appreciated by his creditors; and their ready acceptance of the present offer, as a final settlement, is a further proof of their favourable disposition towards him, who, from his exalted genius, as well as his sterling moral worth, has left behind

tures, a matter of interest unto all time. There lay the grey and august ruin,* whose broken arches he has rebuilt in fancy, and whose deserted aisles he has re-peopled with all their former tenants—as lovely in its decay as ever; while he had given it all its charm, was passing by, unconscious of its existence, and never more to behold it. At every successive turn of the way, appeared some object which he had either loved because it was the subject of former song, or rendered delightful by his own—
from the Eildon Hills, renowned in the legendary history of Michael Scott—to

"Drygrange, with the milk-white yowes,
'Twas Tweed and Leader standing;†

to Cowdenknows, where once spear and helm

"Glanced gaily through the broom;‡

and so on to the heights above Gladwood, where Smallholm Castle appeared in sight—the scene of his childhood being thus brought, after all the transactions of a mighty and glorious life, into the same prospect with his grave. During the time of the funeral, all business was suspended at the burgh of Selkirk, and the villages of Darnick and Melrose; and in the former of these hamlets several of the signs of the traders were covered with black cloth, while a flag of crape was mounted on the old fortalice which rears itself in the midst of the inferior buildings. At every side avenue and opening, stood a group of villagers at gaze—few of them bearing the external signs of mourning, but all apparently impressed with a proper sense of the occasion. The village matrons and children, clustered in windows or in lanes, displayed mingled feeling of sorrow for the loss, and curiosity and wonder for the show. The husbandmen suspended their labour, and leant pensively over the enclosure. Old infirm people sat out of doors, where some of them, perhaps, were little accustomed to sit, surveying the passing cavalcade. Those forming the procession, so far as they could abstract themselves from the feeling of the occasion, were impressed with the extraordinary appearance which it bore, as it dragged its enormous length through the long reaches of the road—the hearse sometimes appearing on a far height, while the rear vehicles were stealing their way through a profound valley or chasm. The sky was appropriately hung, during the whole time of the ceremony, with a thick mass of cloud, which canopied the vale from one end to the other like a pall.

Towards nightfall the procession arrived within the umbrageous precincts of Dryburgh:§ and the coffin, being taken from the hearse, was borne along in slow and solemn way through the shady walks, the mourners following, to the amount of about three hundred. Before leaving Abbotsford, homage had been done to the religious customs of the country by the pronunciation of a prayer by Dr Baird; the funeral service of the Episcopal Church (to which the deceased belonged) was now read in the usual manner by the Rev. John Williams, whose distinction in literature and in scholarship eminently entitled him to this honour. The scene was at this time worthy of the occasion. In a small green space, surrounded by the broken but picturesque ruins of a Gothic Abbey, and overshadowed by wild foliage, just tinged with the melancholy hues of autumn, with mouldering statuary, and broken monuments meeting the eye wherever it attempted to pierce, stood the uncovered group of mourners, amongst whom could be detected but one feeling—a consciousness that the greatest man their country ever produced was here receiving from them the last attentions that man can pay to his brother man—which, however, in this case, reflected honour, not from the living to the dead, but (and to such a degree!) from the dead to the living. In this scene, where the efforts of man seemed struck with desolation, and those of nature crowned with beauty and triumph, the voice of prayer sounded with peculiar effect; for it is rare that the words of Holy Writ are pronounced in such a scene; and it must be confessed that they can seldom be pronounced over such a "departed brother." The grave was worthy of a poet—was worthy of Scott. And so there he lies, amidst his own loved scenes, awaiting throughout the duration of time the visits of yearly thousands, after which the awakening of eternity, when alone can he be reduced to a level with other men.

* Melrose Abbey.

† Old Song.

‡ Ballad of Thomas the Rhymer, in the Border Minstrelsy.

§ Dryburgh Abbey was founded in 1150 by David I., for monks of the kind called Premonstrates.—Hailie's Annals, i.

|| Of Balliol College, Oxford—Rector of the Edinburgh Academy, and since become Archdeacon of St David's.

him a name—"Above all Greek, above all Roman fame."

A will executed by the deceased, February 4, 1831, directed his executors (his two sons and Mr Lockhart) to sell his moveable property at Abbotsford (given back in 1830 by his creditors, as a present) to his eldest son, at L.5000, of which sum, L.2000 to be given to Mr Charles Scott, as much to Miss Anne Scott, and the remaining thousand to Mrs Lockhart, in order to make up her portion (with a like sum given at her marriage) to the same amount as the rest of the junior branches of his family. He then directed that the future profits of the work entitled "Tales of a Grandfather," and certain articles inserted in the *Annals*, all of which were written for his own immediate comfort and subsistence, be applied to discharge his debts incurred since the execution of the trust; the surplus, if any, to go to the trust. He next enumerated the means which he principally depended on for the payment of all his other debts. First, the new edition of his novels, or rather his share in the profits of that edition: then the similar edition, which was contemplated, of his poems. In the event of these being sufficient to discharge the debts under the trust, the further profits to go towards the redemption of an heritable bond of L.10,000, contracted upon the estate of Abbotsford for the support of Archibald Constable and Company; the still further profits, if any, to be divided among his family. "And if it be thought necessary," the document thus proceeds, "that any biographical sketch of the author himself be drawn up, to be attached to the said collection, I do request and entreat my affectionate son-in-law, the said John Gibson Lockhart, who has, during all his connection with me, shown me the duty and kindness of a son, to draw up such sketch, using in that matter such letters, correspondence, and diaries, as shall be found in my repositories; and I also request the said John Gibson Lockhart to carry on and conclude the publication of my poetical works as above mentioned, if I shall leave them incomplete, for behoof of the said trust, and also, for the same purpose, to correct and cut down the *Life of Bonaparte* to a less size, which may be done with a prospect of considerable advantage, or to suggest some competent person to do so; and in general I name the said John Gibson Lockhart my literary executor, assigning my son the said Charles Scott as his assistant, to spare his time as much as possible;" a recompence, he adds, being rendered to them, either by the trust, or by the assignees under this deed.

In the will, allusion is made to a bond upon the estate of Abbotsford to the amount of L.10,000. This burden, though the estate is worth at least five times as much, still operated to prevent Major Sir Walter Scott from being in a condition to take up his residence in his father's house. With a view to preserve, in its original state, a mansion so interesting to the present and all future generations, an association of gentlemen in London commenced a subscription, which was extended to all other districts of the country. In June 1836, the sum thus realised amounted to between seven and eight thousand pounds, which it was proposed to bestow upon the existing proprietor of Abbotsford, to aid him in redeeming the estate from the bond, on an understanding that the house and all contained in it should for ever remain in the condition in which they had been left by the deceased.

It only remains to be added, in this place, that immediately after the death of the illustrious novelist, the king bestowed a pension of L.200 upon his unmarried daughter, who, however, worn out by attendance upon her father's deathbed, did not live many months to enjoy the royal beneficence.

PERSONAL APPEARANCE.

In stature, Sir Walter Scott was upwards of six feet, bulky in the upper part of the body, but never inclining in the least to what is called corpulency. His right limb was shrunk from an early period of boyhood, and required to be supported by a staff, which he carried close to the toes, the heel turning a little inwards. The other limb was perfectly sound, but the foot was too long to bring it within the description of handsome. The chest, arms, and shoulders, were those of a strong man; but the frame, in its general movements, must have been much enfeebled by his lameness, which was such as to give an ungainly, though not inactive appearance, to the figure. The most remarkable part of Sir Walter's person was his head, which was so very tall and cylindrical as to be quite unique. The measurement of the part below the eyes was fully an inch and a half less than that above. In early life, the hair was of a sandy pale colour; but it was changed by his illness in 1819 to a light grey, and latterly had become rather thin. The eyebrows, of the same hue, were so shaggy and prominent, that, when he was reading or writing at a table, they completely shrouded the eyes beneath. The eyes were grey, and somewhat small, surrounded by humorous diverging lines, and possessing the extraordinary property of shutting as much from below as from above, when their possessor was excited by a ludicrous idea. The nose was the least elegant feature, though its effect in a front view was by no means unpleasant. The cheeks were firm and close, and the chin small and undistinguished. The mouth was straight in its general shape, and the lips rather thin. Between the nose and mouth was a considerable space, intersected by a hollow, which gave an air of firmness

to the visage. When walking alone, Sir Walter generally kept his eyes bent upon the ground, and had a somewhat abstracted and even repulsive aspect. But when animated by conversation, his countenance became full of pleasant expression. He may be said to have had three principal kinds of aspects: *First*, when totally unexcited, the face was heavy, with sometimes an appearance of vacancy, arising from a habit of drawing the under-lip far into his mouth, as if to facilitate breathing. *Second*, when stirred with some lively thought, the face broke into an agreeable smile, and the eyes twinkled with a peculiarly droll expression, the result of that elevation of the lower eyelids which has been just noticed. In no portrait is this aspect caught so happily as in that painted near the close of his life by Mr Watson Gordon (and of which a remarkably good engraving, by Horsburgh of Edinburgh, is prefixed to the revised edition of his novels), no other painter, apparently, having detected the extraordinary muscular movement which occasions the expression. The *third* aspect of Sir Walter Scott was one of a solemn kind, always assumed when he talked of any thing which he respected, or for which his good sense informed him that a solemn expression was appropriate. For example, if he had occasion to recite but a single verse of romantic ballad poetry, or if he were informed of any unfortunate occurrence in the least degree concerning the individual addressing him, his visage altered in a moment to an expression of deep veneration, or of grave sympathy. This aspect has been caught very happily in a bust by Joseph, now in the possession of Mr Bara Callander, of Prestonhall. The general tone of his mind being decidedly cheerful, the humorous aspect was that in which he most frequently appeared. It remains only to be mentioned, in an account of his personal peculiarities, that his voice was slightly affected by the indistinctness which is so general in the county of Northumberland in pronouncing the letter *r*, and that this was more observable when he spoke in a solemn manner, than on other occasions.

CHARACTER.

The leading feature of the character of Scott was an admiring and revering affection for the ancient and great—the sentiment of veneration, as we believe it is called in the language of a new philosophy. This gave a direction and a tone not only to his literary efforts, but to the whole strain of his existence. He delighted in whatever was removed by time or situation into a distance at which he could exercise this predominating sentiment upon it; though, from circumstances, it was chiefly in regard to mediæval European history and manners, and particularly those of his own country, that the faculty manifested activity. Whatever recalled the days and usages of feudalism, whether in the shape of architectural remains, the descendants of storied families, or the remnants of tale, and song, and history, which told of chivalrous deeds and semi-barbarous practices, awoke in his mind this sympathising feeling, and could not become to him the subject of either speech or writing without acquiring the hues of poetry. If we search in his writings, metrical and otherwise, for the charm which has rendered them the favourite reading of Europe, we shall find that it is divided between his power of pleasing the corresponding feeling in ourselves, and the general truth of his fictitious characters to nature. It was this master sentiment that animated him in his political prepossessions, in the respect he was thought to pay in an undue degree to the titled great, and in the task of acquiring sufficient property to establish his own posterity in the ranks of the gentry. It was thus the main source of nearly all for which he was admired, and all for which he was blamed.

He was endowed, in a scarcely inferior degree, with all the rest of the moral sentiments. His benevolence exemplified itself in a kind address to all around him, and in numberless acts of beneficence and useful intervention in favour of those who claimed or seemed to be needful of his generosity. The ties of kindred and of country exercised a powerful effect upon his mind: in this respect he was a thorough Scotchman. No moral stain of any kind is known to have marked his life at any of its stages. His integrity, his general prudence, and skill in the ways of the world, were as remarkable as his poetical genius. With all his anxiety to found an aristocratic name, he had no personal pride. He was much more disposed to pay than to exact homage. He possessed an immense fund of humorous anecdote, which he had gathered in the course of his life in all spheres of society, and which he applied with the greatest felicity in private conversation, as well as in his more familiar writings. This, and the extraordinary modesty and simplicity which marked his whole bearing, tend to prove the absence of all sense of personal importance from his character. If he possessed any inferior sentiment of

our nature in a considerable degree, it was that which the phrenologists term secretiveness. His exquisite sense of personal decorum in the various circumstances of life, his protracted concealment of the Waverley secret, and perhaps no small part of his powers in fiction, took their rise in this portion of his constitution. But, though largely bestowed upon him, it had no offensive manifestations.

HIS WRITINGS CRITICISED.

Of the character of his metrical works, some slight notices have been introduced in the course of this brief memoir. With respect to his prose fictions, we beg leave to adopt the following scraps of criticism from an able article on the subject in the *Edinburgh Review*.

"One of the points of view in which the Author of Waverley is first presented to us, is, as a delineator of human character. When we regard him in this light, we are struck at once by the fertility of his invention, and the force, novelty, and fidelity of his pictures. He brings to our minds, not abstract beings, but breathing, acting, speaking individuals. Then what variety! What originality! What numbers! What a gallery has he set before us! No writer but Shakespeare ever equalled him in this respect. Others may have equalled, perhaps surpassed him, in the elaborate finishing of some single portrait (witness the immortal Knight and Squire of Cervantes, Fielding's Adams, and Goldsmith's Vicar), or may have displayed, with greater skill, the morbid anatomy of human feeling—and our slighter foibles and finer sensibilities have been more exquisitely touched by female hands—but none save Shakespeare has ever contributed so largely, so valuably, to our collection of characters; of pictures so surprisingly original, yet, once seen, admitted immediately to be conformable to nature. Nay, even his anomalous beings are felt to be generally reconcilable with our code of probabilities; and, as has been said of the supernatural creations of Shakespeare, we are impressed with the belief, that if such beings did exist, they would be as he has represented them.

The descriptions of persons by the Author of Waverley are distinguished chiefly by their picturesqueness. We always seem to behold the individual described. Dress, manner, features, and bearing, are so vividly set before us, that the mental illusion is rendered as complete as words can make it. But if we feel thus familiar with the personage introduced, it is rather because the mind's eye has received his image, than because we are endowed with a knowledge of his character. It is the outward, not the inward man, that most engages our attention. The best drawn characters of the Author of Waverley make us feel as if we saw and heard them; those of Shakespeare as if we had lived with them, and they had opened their hearts to us in confidence. The female characters in the Waverley Novels are touched with much grace and spirit, though they are not, upon the whole, brought so vividly to our minds as the men—probably because they are more ideal. Such they must necessarily be. The course of woman's existence glides comparatively unobserved in the under-current of domestic life; and the records of past days furnish little note of their condition.

In the description of external objects, and particularly of what may be called natural scenery, Sir Walter Scott has been successful beyond all writers subsequent to Milton. From the various errors into which descriptive writers often fall, Sir Walter Scott is perhaps more exempt than any other. His descriptions of scenery, even in spite of a want of terseness with which his general style is chargeable, are in the highest degree clear, vivid, and intelligible. They have none of those affectations of gorgeous diction, which are the resource of ordinary writers: all is perspicuous, and reasonably concise; written as if the first object proposed was—to be understood; and the poetical associations which are strewn in the path serve to illustrate and impress the subject instead of leading us astray into the realms of fanciful speculation. These remarks are not applicable to such matters of mere detail as the description of costume, of equipments, or of furniture. Many of these, if we try them on a question of taste, will be admitted to be tedious; but we must view them in another light, and accept them as affording information which we could not have obtained, but at an expense of trouble and research, for which their real value would scarcely compensate. Good as are the descriptions of quiescent objects, it is in his treatment of events—of the visible operations of man, or of the elements—that the author displays most power. What have we finer of its kind than the storm in the Antiquary? Guy Mannering contains another masterpiece—the night attack of Portanferry, witnessed by Bertram. We feel as though we were that person—we see and hear all of which his eyes and ears had cognisance; and the im-

pression is the more strong, because the writer has told only *that*, and left the rest to our imagination. This illustrates one feature of the author's skill. He knows the effect producible by leaving circumstances in the incompleteness and obscurity in which they often present themselves to the senses of a single person: he tells just what that person could have perceived, and leaves the sketch to be finished by his reader.

That the Author of Waverley is a master of the pathetic, is evinced by several well-known passages. Such are the funeral of the fisherman's son in the *Antiquary*, the imprisonment and trial of Effie Deans and the demeanour of the sister and the broken-hearted father; the short narrative of the smuggler in *Redgauntlet*; many parts of *Kenilworth*; and of that finest of tragic tales, the *Bride of Lammermoor*. The plots in the Waverley Novels generally display much ingenuity, and are interestingly involved; but there is not one in the conduct of which it would not be easy to point out a blemish. None have that completeness which constitutes one of the chief merits of Fielding's *Tom Jones*. There is always either an improbability, or a forced expedient, or an incongruous incident, or an unpleasant break, or too much intricacy, or a hurried conclusion. They are usually languid in the commencement, and abrupt in the close; too slowly opened, and too hastily summed up. Guy Mannering is one of those in which these two faults are least apparent. The plot of *Peveril of the Peak* might perhaps, on the whole, have been considered the best, if it had not been spoiled by the finale.

It may be said of the novels of Sir Walter Scott, as of the plays of Shakespeare, that though they never exhibit an attempt to enforce any distinct moral, they are, on the whole, favourable to morality. They tend (to use a common expression) to keep the heart in its right place. They inspire generous emotions, and a warm-hearted and benevolent feeling towards our fellow-creatures; and for the most part afford a just and unperverted view of human character and conduct. There are, perhaps, no fictions exciting the imagination so strongly as the Waverley Novels, which have a less tendency to corrupt the heart; and it is chiefly because they do not exhibit flattering and delusive pictures of crime. The Author of Waverley is never chargeable with that sin so visible in modern literature, which Lord Byron lent his genius to promote, and which humbler writers in verse and prose industriously strive to spread. He has not laboured to diminish our confidence in virtue, and our abhorrence of vice. He does not teach us to believe that the villain probably has generous feelings, while the man who violates no law is as probably at heart a scoundrel. This right-headedness and right-heartedness, this healthy soundness of judgment and of principle in the Author of Waverley, are among those qualities for which posterity will lastingly admire him.

In reviewing the productions of a great writer, interesting as it may be to examine their general character, and the nature of those merits in which their fame is grounded, it is perhaps still more interesting to trace their influence upon literature. That of the Waverley Novels has been great beyond example. That they have invited a good deal of talent to employ itself in the cause of direct imitation, is but an insignificant part of their effects. Nor do we even lay most stress upon the impulse given to the composition of fictitious narrative of every kind. For novel-writing, in general, the Author of Waverley has done much: First, he has made it a more creditable exercise of ability than it was previously considered; and thus invited to it many writers who might otherwise have considered it unworthy of their regard. But, beyond this, he has shown them how they should pursue it. He has taught them that in whatever period, country, or sphere of society, their fictions may be laid, they must first look forth upon nature. They must not indulge the untaught promptings of a wild imagination, but set down only that which they have first ascertained to be in accordance with general truth. Though fiction may be truly the offspring of imagination, it cannot be successful unless tutored by experience. In consequence of this newly-enlarged view of the principles on which fiction should be written, we have, since the appearance of Waverley, seen the fruits of varied learning and experience displayed in that agreeable form; and we have even received from works of fiction what it would once have been thought preposterous to expect—information. From some, we have gathered more respecting the manners of different tribes than books of travels have ever told us; and have obtained a clearer insight into the eventful interior of a soldier or a sailor's life, and the real nature of war and its concomitants, than from all the gazettes that were ever published, and many biographies to boot. We have learnt, too, how greatly the sphere of the novel may be extended, and how capable it is of becoming the vehicle almost of every species of popular knowledge."

J. G.
